³Dong Hwa University, Taiwan, China

Abstract

We analyze tourism geography research conducted in Taiwan to gather a better picture of its development and evolution in the greater Chinese-speaking region and in the larger Asia-Pacific region. The history of geography education and research in Taiwan can be traced back seven decades. We use articles published in geography journals and tourism and recreation journals as our analysis sample. We classify the seven decades into five different periods—Gestation (1946–1959), Inception (1960–1974), Formative (1975–1989), Expansion (1990–2004), and Diversification (2005–2014)—and chart the development and evolution of Taiwan’s tourism geography according to its major research paradigms. Our analyses are organized based on the evolution of Taiwan’s geography thought and research paradigms, institutional development in the various geography subfields (tourism in particular), socio-economic changes, and the development of the tourism and recreation industry. We place the literature in the global context against the backdrop of the international geography research paradigm with regard to approaches and traditions. This research might contribute to an understanding of complexity and diversity of tourism geography internationally.

Research of Tourism Scenic Spots Economic Linkage and Spatial Organization--

Taking Hangzhou Metropolitan Circle 5A, 4A Scenic Spots as an Example

JU Sheng-Li^{1,2}, TAO Zhuo-Ming¹, HANG Yan-Lin², CHEN Hao³, LAI Zheng-Qing¹

Abstract

Tourism economic linkage and destination spatial characteristics are important research contents of tourism geography. This article puts forward concepts and models of scenic spot economic linkage intensity, introverted degree, extroverted degree and degree centrality. The scenic spots economic linkage spatial characteristics of Hangzhou metropolitan circle is measured on basis of Arcgis network, Matlab matrix calculation, Ucinet center analysis function. The space characteristics of the scenic spot economic linkage of Hangzhou metropolitan circle shows center periphery structure and obvious center of grading system. Interregional scenic economic linkage axis is the center of radiation. The district economic linkage shows obvious regional imbalance. On this basis, the paper puts forward a series of spatial organization strategies such as the integration, multi-level central radiation, nearest neighbor effect of function Scenic Area.

A Study on the Spatial-temporal Evolution and Dynamic Mechanism of Hotel Groups' International Expansion

Xiang Zhang, Yan Li, Ruilin Yu

College of Urban and Environmental Science of Central China Normal University, Wuhan, 430079, P. R. China,
znnyt@163.com

Abstract

The paper has teased the spatial-temporal evolution history of hotel groups' international expansion. With the ArcGIS clustering analysis, it has described the spatial expansion scale and direction evolution of typical case hotels' international expansion such as Cendant Corp. and Marriott International Inc. Then, it has measured and interpreted the situation and dynamic mechanism of the spatial concentration and diffusion of case hotels' international expansion by fragmentation index, unfirming index and agglomeration index. The study shows that: (1) The spatial scale of hotel groups' international expansion is expanding. (2) Hotel groups' international expansion shift from contagious diffusion to the mixture of contagious diffusion and hierarchical diffusion. (3) Hotel groups' international expansion display a characteristic which is homogeneous development from multicenter. (4) Hotel groups' international expansion display a characteristic which is spreading from the core region to the hinterland. (5) Hotel market attraction, market competition and transportation development is the important motivation of spatial concentration and diffusion of hotel groups' international expansion, among them, the market factors such as international tourism flows and business flows play a decisive role. The paper has important practical guiding significance for chinese native hotel groups to learn international expansion spatial law and experience from overseas hotel groups and implement transnational operation strategy.

Key words:

Hotel groups; international expansion; spatial-temporal evolution; concentration and diffusion; dynamic mechanism

Current Trends in the Development of Tourism in the Southern Regions of the Russian Federation

Minenkova V.V., Filobok A.A., Volkova T.A.

Kuban State University, Krasnodar, Russia, minenkova@inbox.ru

Abstract

Russia has high tourist and recreational potential. The southern regions of the country are the most attractive for tourists in terms of diversity of natural and cultural-historical recreation resources. Current processes of development of the tourist market in the southern regions are influenced by many factors of regional, national and global scale. Trends in the development of tourism define changes in the territorial organization of industry, redistribution of tourist flows, their quantitative and qualitative composition, direction of investment policy in tourism, management of natural. The changes require a careful study of the nature and the consequences for the sustainable development of tourist areas and their effective impact on the socio-economic development of regions.

Current trends are:

- New tourism areas and the development of existing tourist and recreation systems.
- The integration processes in the management of tourism.
- The increased role and participation of the state in the process of tourism development.
- Involvement of the local tourist market in the processes of globalization.
- Activation of event tourism to ensure the occupancy of Olympic infrastructure.
- Transformation of hotel services market as a result of the XXII Olympic and XI Paralympic Winter Games.
- Transformation of the tourist market under the influence of the new geo-economic and geo-political conditions in Russia and in the world.
- Safety and security control.

Key words:

tourism; current trends; South of Russia

Facilitating Cross-Administrative Scenic Spots' Cooperation Based on IWF Analysis: A Case Study of Grand Xiannvshan Tourism Area in Chongqing

LIU Yao, YANG Xiaoxia

School of Geographical Sciences, Southwest University, Chongqing, China, 13708324646@163.com

Abstract

The competition of regional tourism in China has been transformed into regional cooperation. Cooperation of scenic spots, an important part of regional tourism development, has been a hot topic. Grand Xiannvshan tourism area, an integration of several scenic spots at Fuling, Wulong and Fengdu, has been put forward by the government of Chongqing in 2010, but it turns out to be a disappointed performance. Importance-Willingness-Feasibility (IWF) analysis tool originated from IPA (Importance-Performance Analysis) has been used in this paper. Governments' perception of cooperation content from perspectives of importance, willingness and feasibility in the three counties has been investigated. Then, index and quadrant analyses have been conducted. The results shows: though the brand recognition of "Grand Xiannvshan" is high, it is a long way to realize; the cooperation of tourism planning, tourism transportation and tourist routes are low-hanging fruits now; the hindrance of marketing cooperation is mainly from subjective willingness while the obstacle of tourist bus system is from objective conditions. In addition, tourism website shows low importance for the cooperation; the setup of administrative committee, establishment of tourism enterprises and formation of profit distribution mechanism are next to impossible in the current. Therefore, the development of Grand Xiannvshan tourism area depends on the collaboration of local governments at present. The cooperation of tourism traffic can be considered as a breakthrough to strengthen communication and grow trust among local governments. Then, make the market mechanism function, expand the cooperation more widely and deeply. Meanwhile, each scenic spot needs to seek common points but reserve difference, in other words, showing complementary advantages in the light of the actual circumstances.

Key words:

cooperation of scenic spots; cross-administrative regions; IWF analysis; Grand Xiannvshan tourism area

Informal Economy of an Ephemeral Sacred Space: A Case Study of Magh Mela 2016 in Allahabad

Mishra, SATYAM, Sen, ANJAN

Ph.D. Research Scholar, Department of Geography, Delhi School of Economics, University of Delhi, Delhi – 110007, India. satyammishra06@gmail.com

Abstract

Allahabad an important city at state of Uttar Pradesh in India, also culturally known as Prayag, is eulogized in *Puranic* mythic as the “*tirtharaj*”, the king among all sacred places, situated picturesquely at the confluence of the rivers Ganga, Yamuna and invisible Saraswati. Every year pilgrims and devotees to Hinduism and its various sects come by the hundreds of thousands to the religious bath-fair at river banks of Ganges and Yamuna that is Magh Mela, it is known as Kumbh Mela after each 12 years.

Making of this temporary mega city inhabited by pilgrims and tourists requires proper planning and execution that is done by state Government of Uttar Pradesh, by the investment of huge capital and human-technical support. With the congregation of millions of visitors there, evolves a religious economy that consists from priests offering Moksha (salvation) to pilgrims to sellers of daily life goods, for a certain period time. This paper attempts to discuss the various kind of economic activities being run in Magh Mela and interrelation with livelihood of people involved.

This research paper is based on primary data collected through focus group discussion and individual interviews through questionnaires. It also uses secondary data and literature available on this particular topic. Inductive methodology has been used in this research paper to accomplish the objectives of the study.

Key words:

temporary city; Magh Mela; pilgrimage tourism; mass gathering; Sacred Economy; Prayagwals (Priests of Prayag)

Local Embeddedness and Failure of Transnational Retail Corporations: The Case of Gaziantep, Turkey

Yavan, Nuri¹, Kalelioğlu, Ragıp²

¹Ankara University, Department of Geography, Ankara, Turkey, nuri.yavan@ankara.edu.tr

²Gaziantep University, Department of Geography, Gaziantep, Turkey, rkalelioglu@hotmail.com

Abstract

Economic globalization has enabled global corporations to be able to move freely on a global, regional as well as local scale. In this respect, transnational retail corporations opened stores and dominated modern retail sector by expanding dramatically on a global scale and investing in almost any regions and local areas around the world. However, some large transnational retail corporations could not succeed in the competition for different reasons on local levels despite their supremacy in many areas. Therefore, the motivation behind this research is to reveal the reasons why two global retail companies, Carrefour and Real, were forced to close down their stores after the development of their local investment in the city of Gaziantep and their failure on the local level. In this context, the purpose of this paper is to analyze how the embedded, complex and structural relations between local agents and foreign retailers can be understood in terms of the failure of investments in Gaziantep, Turkey. To do so, in-depth interview with both these two foreign invested corporations and those of local retail firms, which benefited from the competition in local markets, have been conducted and the data gathered has been analyzed qualitatively. We found that these foreign corporations selected the wrong location to compete with other firms in the local market and ignored the socio-cultural backgrounds of local consumers as well as local consumption habits. The paper revealed that local embeddedness has vital importance for large global retail corporations in order to survive in local level.

Key words:

Retail sector, Transnational corporations, Failure, Super-hyper markets, Local embeddedness, Economic geography, Gaziantep, Turkey

Mapping the Relationship between World Heritage Sites and Regional Tourism Economics

Zhang HL, Lie ZH, Zhang JR, Chen JJ

School of Geographic and Oceanographic Sciences, Nanjing University, Nanjing, Jiangsu 210023, P. R. China,

zhanghonglei@nju.edu.cn

Abstract

World Heritage Sites, aimed to identify, recognize, and protect the sites with outstanding universal value, are increasingly used as a brand for tourism marketing. However, the real effect of World Heritage Sites on tourist arrivals and regional tourism economics is rarely been well investigated. Using difference-in-differences model and a set of GIS spatial statistical techniques, this paper investigates the spatial distribution of and relationships between World Heritage Sites and regional tourism economic growth in China with a county level. The difference-in-differences model indicates World Heritage Sites positively influence regional tourism economic growth at the county level. Furthermore, this positive influence presents regional variance and city level variance. Moreover, this paper describes and visualizes the spatial distribution of regional tourism economics and suggests the spatial relationships between spatial tourism clusters and World Heritage Sites. Based on the results, this paper shows that World Heritage Sites, as the most valuable brand of regional tourism marketing for either domestic and international market, can be an important market-based and geographical arrangement tool to accelerate regional tourism economic growth and balance the uneven development of regional tourism economic growth.

Key words:

World Heritage Sites; regional tourism economics; difference-in-differences model; spatial distribution

Regional Analysis of Domestic Tourist Flow in India: Evidence form Large-Scale Data

Kumar Rakesh , Prof Bhagat R. B

International Institute for Population Sciences, Mumbai, Department of Migration and Urban Studies, Id: rakesh@iips.net

Abstract

Regional tourism within developing countries is a growing phenomenon. This paper explores the spatial regional distribution of domestic tourist flows in India using exploratory spatial data analysis. This method is a set of GIS spatial statistical techniques that are useful in describing and visualizing the spatial distribution, detecting patterns of hot-spots, clustering of tourist destination and suggesting spatial regimes. Using national sample survey data on domestic tourism in India 2008-09. Which provide overall information about domestic tourism in both origin and destination as well as expenditure incurred for different purpose. A better distribution of tourism activities at regional level correlated with challenges of sustainable tourism and its sustainability will ensure attractiveness and quality of new tourist destinations. Result suggest that there are some pocket of region where the high cluster of tourist outflow for the different purpose like holidaying, leisure, recreation and social (Including visiting friends and relative, attending marriages, pilgrimage & religious activities, business education & training and health and medical. The Cluster & Outlier Analysis (Moran's I statistics) for domestic tourist outflows in the region reveal strong positive and significant spatial autocorrelation for different purpose and Hot Spot Analysis (Getis-Ord Gi*) were also indicate statistically significant Hot spot of tourist outflow from different region of India.

Key words:

regional development; Tourist flow and clustering and hot spots

Student Activities in Local Tourism Organizations in Japan

Asamizu M.

Yamaguchi University, Yamaguchi, Japan, masamizu@yamaguchi-u.ac.jp

Abstract

Japan recorded the highest number of inbound tourists in its history in 2015. Despite the rapidly increasing tourist numbers, some tourist destinations are still struggling working out how to attract tourists. Some municipalities believe they need something with international flavor to attract international visitors. There often remains a gap between what is offered by Japanese people and what is wanted by international visitors. Local people know local products quite well. However, to understand the needs of tourists, opinions from outside the community are essential.

The author of this paper is working at a Japanese University in a remote area. The author often sends students to tourist destinations to learn about local tourism. In many cases, students work as volunteers, and they contribute to human resources in aging and depopulating areas. The students and the local communities have a win-win relationship.

These off-campus activities are popular among both domestic and international students. Many international students are interested in attending something more local. The local way of life in Japan is seen to be very attractive by some international students, and some of these international students have made proposals for local authorities to invite international tourists in the future. For Japanese students, volunteer interpreter work is also popular.

Key words:

inbound tourism; international students; Japan

The Study of Tourism Demand in Small Island Developing States

Takahashi, K

Tokyo Metropolitan University, Hachioji, Tokyo, Japan, kanta69s@gmail.com

Abstract

This paper analyzed tourism demand in Small Island Developing States with two indicators; one is the number of tourists, the other is tourist expenditure per capita which shows demand indicators. One is the number of tourists; the other is tourist expenditures per capita. The number of tourist is often used as demand indicator, for instance, study of tourism flow with gravity equations. But the author questioned that the number of tourist is affected by the destination's social and economy size and might be possible that small destination is underestimated as indicators. Because of the reason above, this study uses the tourist expenditures per capita to analysis the island tourism demand as well as the number of tourist.

First, this paper put the both indicators into the ranking to compare the differences of these. As a result, the number of tourist is affected by social and economic size. Meanwhile, the tourist expenditures per capita shows resort islands tend to be high price.

Second, regression analysis is undertaken to see the factor of two indicators. We find the size of tourist would be increased by income and tourism infrastructures despite length of stay shows significant and negative. Meanwhile, tourist expenditures per capita would be increased by population density length of stay and ratio of tourist from suzerain states despite tourist expenditures per capita would be decreased by market size. Moreover, SIDS had experienced colony era, and relationship of suzerain state is still important factor to see the island tourism.

Key words:

Small Island Developing States; Tourism Demand; Tourism Expenditure per capita; Number of Tourist

Tourism – Planning, Regional Management and Development

Henrik Toft Jensen, Julie Skjelborg Frederiksen, Viggo Plum

Roskilde University, htj@ruc.dk

Abstract

Research in tourism is an interdisciplinary research field where several research disciplines have to collaborate to be able to understand the behavior and preferences of tourists and the tourist sector and how tourism contribute to the regional development. The activity in the tourist sector is at least in northern Europe very much depending on the season – a special employment structure.

Some of the tourist orientated activities are reasons for tourists to go to a place par example a famous manor house, restaurants with Michelin stars or good beaches. Other tourist orientated activities are reasons to stay at a place, for example good restaurants or interesting and clean urban environment. It is important to realize, what could be the reasons to go to the destination, and what could be the reasons to stay, this understanding could be a point of departure for marketing.

In this paper there is a discussion of management types in tourism, we are using the results of 40 interviews of tourist businesses - 20 in Denmark and 20 in Germany – to understand the priorities and offers from the tourist sector. We are also using nearly 1.300 interviews with passengers at the ferryboat between Roedby in Denmark and Fehmarn in Germany to understand the travel pattern and priorities of the tourists.

This article also inscribes itself in the research of a European cross-border region. The cross border region consisting of a part of northern Germany and the southeastern Denmark is in focus in the following discussion.

Key words:

Collaboration; Management; Marketing; Regional development; Tourist; Destination; Economy; Holistic

Uneven Development, Tourism and Production of Space in Brazil

Cruz, R. C. A.

University of São Paulo, São Paulo, Brazil, ritacruz@usp.br

Abstract

Tourism in Brazil produced particular geographies related to equipment and services such as tour operation, hotel infrastructure, second homes, maritime cruises and therefore to tourist flows which reveal a process of privatization of the territory settled on its corporative use. The spatialities produced by tourism activity is considered in this analysis as a cause and also as a consequence of an uneven development in the terms discussed contemporaneously by Neil Smith (2008). In this regard, we look for discussing, apart of supposed cultural determinations and through a political economy of territory, the logics that engender these spatialities taken over by tourism in Brazil and we met in the historical and dialectical materialist method the basis for the interpretation of this complex phenomenon in its relation to space. The notion of uneven development as the “systematic geographical expression of the contradictions inherent in the very constitution and structure of capital” (Smith, 2008: 4) is a conceptual pillar on which we sit our analysis. As a result of this analysis, we highlight the significant spatial concentration of tourist facilities and flows in Brazil as a historical product of processes of concentration and centralization of capital in its relationship to different Social and Territorial Divisions of Labour distributed over time and materialized in space.

Key words:

Uneven development; tourism; production of space; Brazil.

Environmental Accounting in Hotel Business

Tunçez H. A.

Selcuk University Aksehir Vocational High School, Aksehir / Konya / Turkey, hatuncez@selcuk.edu.tr

Abstract

Rapid decreasing of renewable land and water resources threaten economics of developing countries. Especially, high birth rate cause to high environmental subversion in natural sources dependent states. When natural sources are non-sustainable, economic activities are late as a result of capital poor and labor scarcity. From this point of view, the world's industrial companies take precautions to not-pollute the environment and also the full use of resources. These precautions raise escalation of costs.

Businesses use accounting system and financial statements with the output of this system as to inform the interest groups related to activities protecting natural environment. Difficulties of environmental activities about accounting issues revealed to understanding of environmental accounting in the traditional accounting system.

Environmental accounting is an important management tool to improve the environmental and economic performance of enterprises. It provides enterprises with useful information in taking rational environmental decisions, determining environmental strategies, managing environmental costs and reporting environmental performance. This study gives a road map for entering these precautions in the accounts.

Key words:

Hotel Establishments; Environmental Costs; Accounting For Environmental Costs

Informal Economy of Pilgrims in an Ephemeral Sacred-Space – Reading the Lifestyle of Kalpawasis during Magh-Mela in Allahabad

Sen Anjan, Sengupta Soma

University of Delhi, Delhi – 110007, India, dr.anjansen@gmail.com

Abstract

Allahabad is the site for Hindu religious fairs-cum-bathing festivals, the annual ‘Magh-Mela’, sexennial ‘Ardha Kumbh-Mela’ and duodecennial ‘Purna Kumbh-Mela’. Dubbed as the largest gathering of human being on earth, the mela of 2013 saw an attendance of over 100 million Hindu pilgrims from around the world.

The sacredness of the melas are defined by specific temporal and spatial dimensions. The fairs are organized in the Hindu lunar month ‘Magh’ (January and February), but precise moments and time periods on specific days or dates are the holiest for bathing, usually poornimas (full moon) or amavasyas (no moon), when the shahi snans (royal baths) are held. The melas are held at Triveni Sangam, which is the confluence of rivers Ganga, Yamuna and mythical Saraswati. The holiest site for bathing are located east of Allahabad fort, on the bank of Rivers Ganga and Yamuna.

Those pilgrims who stay for the entire period of the mela, i.e. ‘kalpawas’, have to follow a strict lifestyle of austerity. Getting up early before sunrise and complete daily chores; performing pujas, aartis and yoga; practising upwas, dan and dakshina; cooking and consuming simple saatvik food; participating in havans, bhajans and kirtans; and retiring early after sunset. During the extended stay, pilgrims are attached to different akharas, and live a life of dharma, to seek moksha. Those who are able to successfully complete the kalpawas, are honoured with the title of ‘kalpawasis’. They take a vow to live a pious life, and to return every year for the melas.

Key words:

Magh-Mela; Kalpawas; Kalpawasi

Research on the Change of the Spatial Distribution of Tourism Supply-Demand Market in Northeast City Under the Impact of Harbin-Dalian High-Speed Railway

Guo Jianke, Wang Shaobo

Liaoning Normal University Research Center of Ocean Economy and Sustainable Development, Liao Ning, Dalian, 116029

Abstract

Based on the GIS technology, the paper takes the 4A level and above attractions as the research object, from two perspectives of supply and demand. Separate the market potential model into two models: supply and demand market potential models. The study found that: ① High-speed Rail made northeast cities all spots accessibility level average compression in about 2.5 hours, the number of suitable for a tour and the two tour spots increased rapidly, it filled the blank of one day market and expanded the range of two days market, and last it formed in High-speed Rail as the center spread around, from the inside to the outside are a new development model for a day, two days, seven days for the tourism characteristics. ② The alteration of the potential of tourism market supply and demand presented the phenomenon that off high iron decay. Stimulating market supply and demand to gather in the high-speed railway line, led to the formation of high iron Tourism Economic Zone, at the same time, the northeast tourism spatial distribution characteristic is more obvious. ③ High speed rail made the short tour (day trips, two day tour) of the supply and demand market potential become better than seven days tour. ④ According to the core periphery theory, we divide the tourism market in the northeast into four kinds. Tourism market core area, tourism market peripheral zone, tourism market transition zone, tourism market edge area. This paper thinks: it is necessary to rely on high-speed rail and other fast transportation mode and tourism hub city, to improve the commuter network, and promote the optimization and docking of the regional tourism supply and demand space network.

Key words:

Attraction accessibility; supply and demand potential model; high speed rail tourism economic belt; Space distribution; northeast region

The Research of Exhibition Economy and the World Famous Tourism City

KANG Lili, WANG Chengyun

Shanghai Normal University, Shanghai, 200234, P.R.China, kklovesummer@foxmail.com

Abstract

Exhibition industry is played an increasing important role on the economy development of the city in the world. On the basis of analysis about the data and the index system of the world famous city, we easily find that Shanghai had become one of the leading cities on exhibition tourism in China. However, Shanghai is backward compared to Paris and Tokyo which are the world famous tourism city. Therefore, we research about the correlation between world famous tourism city and international conference and exhibition. The essay takes Shanghai as an example. We research the influence of exhibition economy on the development of tourist city and gives some advice on how to develop the world famous tourist city and international conference and exhibition by taking the advantage of exhibition economy.

Key words:

international conference and exhibition; world famous tourism city; Shanghai; relationship; research

Encounters with Jaws: Exploring shark cage diving in Gansbaai, South Africa - the Great White Shark capital of the world

Tracey McKay

UNISA, South Africa, mckaytjm@unisa.ac.za

Abstract

This study explored the commercialisation of shark cage diving in Gansbaai, a small fishing village two hours from Cape Town, South Africa. Gansbaai is located in the heart of Great White Shark migratory routes. The presence of these apex predators has enabled the establishment of 15 hard adventure tourism enterprises. The shark cage diving industry is a valuable one, attracting many wealthy international tourists. Most operators focus only on interactions with Great White Sharks, some have evolved into more complex operations or have carved specialised niches in order to counteract the negative effects of competing on price. One, for example, focusses on servicing the backpacker market, another has a supplementary souvenir shop and a third services the high end, ultra luxury segment of the market, catering for Hollywood super stars and billionaires. In the main, sales are driven by referrals from tour operators, guides, accommodation providers and other hospitality businesses; in conjunction with social media such as websites, Facebook, Twitter and YouTube. The industry faces a number of challenges. The cost of doing business is high, specifically purchasing diesel and chumming products. Some battled to secure operating permits. Theft and high insurance costs were another headache for the enterprises. Operations are highly weather dependent, as the treacherous Cape seas must be dealt with cautiously. Overall, the industry is a key segment of the local economy, although with most tourists being day-trippers, the positive impact the industry on the Gansbaai economy is less than it could be.

Key words:

Sharks; adventure; South Africa; tourism; commercialisation

Estimating Social Carrying Capacity in Protected Mediterranean Mountain Areas.

Methodological Orientation

Gómez-Moreno, M.L., Luque-Gil, A. Peláez-Fernández, M.A.

University of Málaga, Málaga, Spain, geolugom@uma.es

Abstract

The concept of social carrying capacity, though opens to debate and critique, is a valuable tool that enhances the management of recreational use in protected natural areas in order to planning visitor affluence to avoid crowded situations. In this paper, conducted in Sierra de las Nieves natural park (Spain), we first categorised the hikers making use of the park and then, from the profiles obtained, analysed their perception of crowding on the trails. This assessment was subsequently used to assess levels of user satisfaction and thus to determine the psychosocial carrying capacity of the park. The results obtained can be extrapolated to most of the Spanish natural parks in Mediterranean mountain areas, due to their comparable levels of visitor numbers and to the prevalence of recreational hiking use. The results suggest that management efforts should be directed toward relocating trails outside the core areas, such that user preferences may be satisfied while less impact is made on the areas of highest environmental value.

Key words :

Hiking; visitor classification; natural area planning and management; social carrying capacity

Study of Tourism Eco-Compensation Mechanism in Three-Gorge Reservoir Area of China

Zhou,Y.Q.

Zhongnan University of Economics & Laws, Wuhan, 430000, P. R. China, 528602891@qq.com

Abstract

Due to ecological disruption and even ecological disaster phenomenon some ecological sensitive areas, calling for the construction of ecological civilization is growing. As an ecological compensation mechanism in the field of the tourism, tourism ecological compensation system has become frontier problem of the current ecotourism and sustainable tourism economic development. Taking three-gorge reservoir area as example, this paper reviews the development history of ecological compensation as well as tourism ecological compensation, summarizes and analyzes tourism ecological compensation system from four aspects, including basis, host-guest, standard accounting and security mechanism. Meanwhile, this paper intends to provide relevant reference for the further development of three-gorge reservoir area ,increase the efficiency of three-gorge reservoir area's ecological compensation mechanism and form mutual balance relationship between local tourism economy and ecological environment .

Key words:

tourism ecological compensation; three-gorge reservoir area; compensation system

The Conservation of Residential Environment and Sustainable Development of Tourism for Chantang

gaqiang chongda

Gaqiangchongda, Earth Sciences and Resources Department, school of science of Tibet University; gajiangqd@126.com

Abstract

From the analysis of the Chantang case, this article also discusses the subject of how the Tibetan traditional culture and the sustainable tourism development can be mutually benefited to each other in general. Finally, this article gives some recommendations about how in the most feasible ways the Chantang's tourism to be boosted, environmentally sustained and the local peoples' livelihood be enhanced.

Key words:

The delivery of messages of environmental awareness and custodianship for canoe trails in Australia

Christopher Townsend, Ruth E Lawrence

Outdoor & Environmental Education, La Trobe University, Bendigo, Australia, r.lawrence@latrobe.edu.au

Abstract

The recent increase in private ownership of paddle-craft in Australia has resulted in a corresponding increase in participants seeking self-guided paddling experiences. Canoe trails have the capacity to provide participants with the necessary knowledge to safely engage in paddling activities as well as engender messages of river custodianship. An imbalance frequently exists between the information provided to enable safe passage along canoe trails and environmental interpretation of the natural and protected areas through which the canoe trail passes. In this quantitative text analysis survey of Australian canoe trails, it was found that some form of safety information was almost always communicated in published trail materials. However, only about half the trails provided either natural area interpretation or custodial messages of the riparian corridor through which the trail passed, indicating an underdeveloped market for environmental custodial advocacy.

Tourism and Conservation in the Tortuguero National Park (Costa Rica) and Ras Al. Hadd Turtle Nature Reserve (Oman)

Dudek A.

University of Warsaw, Faculty of Geography and Regional Studies, Warsaw, Poland, adudek@uw.edu.pl

Abstract

The paper presents the comparative study of two protected areas - in Costa Rica and Oman - which protect the habitats of several species of sea turtles, especially green turtle. Green turtles *Chelonia mydas* are classified as endangered species and are found around the world in warm ocean waters. Both protected areas are important nesting sites where sea turtle females lay eggs on beaches. In both countries, protected areas are also a major tourist attraction, popular among local and foreign tourists. Development of tourism in these areas could pose a threat to the population of sea turtles. The article presents the organizational models of tourism in both reserves. The comparative analysis includes: transport accessibility, tourism infrastructure, annual number of visitors, number of visitor groups, schedule of tours in the reserves, tourist information and educational programme. The paper highlights the principal challenges facing protected areas, including the threat posed by development of tourism activities and other factors impacting conservation efforts.

Key words:

conservation; tourism; Costa Rica; Oman; Tortuguero; Ras al. Hadd; sea turtle; protected area

Tourism Development, In Search of Livelihood Sustainability: A Comparative study of Gadhwal and Kumaun region of UttarakhandAtithi Pant¹, R.B Singh¹, V.S Negi²¹ Department of Geography, Delhi School of Economics, University of Delhi, atithibhu4@gmail.com²Department of Geography, Saheed Bhagat Singh College (Eve.), University of Delhi**Abstract**

The state of Uttarakhand is a storehouse of biodiversity and Natural resources. It has been a hot spot of tourism due to its magnificently diverse landscapes, numerous pilgrimages with religious tourist potential and rich cultural heritage. This has also generated a good source of income and employment to youths and rural masses. Since its inception, as a newly borne hilly state its resources have been immensely utilized rather over utilized in the names of revenue generation, employment, development, growth and many such related terms. It is very important that natural resources should be utilized in a viable and sustainable manner with co-existence with the development of socio-economic environment. Therefore, the purpose of this research is to adopt integrated approach and establishment of new plans for the sustainable development of tourism in Uttarakhand.

The study attempts to identify and describe different tourism zones in Gadhwal and Kumaun region of Uttarakhand with their unique resources. It will further emphasise the differences in the prevailing resources of both of the regions and utilize these differences by proposing a number of new and diverse products in locations of different natural and cultural importance.

Therefore, the purpose of this research is to make a comparative study with integrated approach and establishment of new plans for the sustainable development and livelihood security in Uttarakhand. And finally to synthesis all the findings and give feasible suggestions and recommendations for further development of tourism in this region.

Tourist crowding perception, perceived attractiveness and satisfaction: A second-order structural model

Li LI, Jie ZHANG, Sifeng NIAN

Nanjing University, China, lily1250000@126.com

Abstract

Drawing on the theories from stimulus overload and social interference, this study proposed a multidimensional way to measure tourist crowding perception with neutral crowding, personal crowding and social crowding. A second-order SEM is tested to analysis the relationships among crowding perception, perceived attractiveness and satisfaction. The result of a confirmatory factor analysis confirmed that crowding perception has negative effects on perceived attractiveness. However, the effect of crowding perception on tourist satisfaction is not significant. The findings of this study refined the multidimensional connotation of tourist crowding perception and provide another dimension to evaluation the quality of tourist experience apart from the universal construt satisfaction. The importance of managing tourist crowding perception is discussed to improve tourist experience.

Key words:

tourist crowding perception; tourist experience; satisfaction; perceived attractiveness; experience quality

A New Concept in Turkish Tourism: Floating Islands

Bulut, Ihsan; Artvinli, Eyup; Girgin, Mustafa; Hadimli, Halil; Zaman, Mehmet; Akbulut, Gülpınar; Kaya, Niyazi; Koç, Hakan;

Akdeniz University, Antalya, Turkey, ihsanbulut@akdeniz.edu.tr

Mugla Sıtkı Kocman University, Mugla, Turkey;

Usak University, Usak, Turkey;

Ataturk University, Erzurum, Turkey;

Cumhuriyet University, Sivas, Turkey

Abstract

Floating Islands become one of the important touristic values of Turkey. Especially the natural assets located in developing regions have an important role to play in economic life of those regions. The floating islands are one of these assets and have become an important research subjects lately. With many floating islands, Turkey is considered as a heaven of floating islands. Almost all geographical regions in Turkey has many floating islands located throughout landscape of the country. Turkey's Floating Islands is very important. This islands have not come to the attention of the researchers so far. By examining the islands we hope to bring the subject to the attention of nature conservation parishioners. We hope to contribute to the tourism literature by examining the potential of the area in terms of eco-tourism. Because these floating islands were discovered recently and because their use by human population has not been regulated, we are concerned with the sustainability issued as related to these places. In order to provide a sustainable use of the floating islands a committee should be established to register these areas throughout Turkey and develop management plans for sustainable use of them. Because of a high tourism potential tourism development plans should be prepared for each of the floating islands and a criteria should be set up to determine the nationally and internationally important areas. When the floating islands planned as a new tourism potential for national and international touristic routes they can bring a new concept to tourism variety in Turkey.

Key words:

Floating Islands; Solhan-Bingöl; Osmancik-Corum; Honaz-Denizli; Ladik-Samsun; Kackar-Camlıhemsin-Rize; Lake Zökün; Tortum-Erzurum

Ecosystem services assessment for tourism planning in the protected area

Tugjamba.N, Gantumur.A

University of the Humanities, Ulaanbaatar, 14200, Mongolia, tnavch@humanities.mn

Abstract

Assessing ecosystem services of the protected area and controlling and managing tourism impacts on the area is a core aspect of the park tourism. Defining the tourism carrying capacity is related to ecosystem service assessment. Based on the literature review and previous research studies, a general model of ecosystem service assessment was developed for tourism planning in the protected area of Mongolia. A model was used to assess ecosystem services and tourism carrying capacity of the Orkhon Valley National park (OVNP). Ecosystem assessment based ecosystem management issues in the main part of tourism planning and sustainable tourism.

To define ecosystem services of the OVNP, required information and data were generated from the park management plan. Assessing ecosystem services of the protected areas are very important to develop the sustainable tourism and improve the conservation management through tourism development. In terms of sustainable development, tourism needs to make a positive contribution to the natural and cultural environment, generate benefits for the host communities, not put at risk the future livelihood of local people, and strive to anticipate and prevent economic, environment, social and cultural degradation. However, it might be hard to assess ecosystem services in the certain protected areas because the lack of information and methodology; any initiatives and considerations would be essential to improve the natural protection through tourism development.

Key words:

Ecosystem services, tourism carrying capacity, park tourism planning, the protected area

Effects of Tourist Activity on Soil in Huangshan Scenic Spot

Chang Wang, Jinhe Zhang, Jinkun Sun, Yu Zhang

Nanjing University, Nanjing, 210023, P. R. China, 373098328@qq.com

Abstract

Taking state-level Huangshan natural scenic spot as the research object, and using the sampling investigation method, the author measured and analyzed such indicators as outboard soil hardness, soil organic matter, litter layer thickness, and soil humus layer thickness of four footpaths in the Huangshan Mountain, and explored the effects of tourist activity on the quality of outboard soil environment of the footpaths, in order to provide some exploratory suggestions for the development, management and planning of roadside environment of the Huangshan Mountain.

Key words:

tourist activity; Huangshan scenic spot; footpath; soil

Response of the sandy beach ecosystem to recreational activities at Liandao Beach, China

Wu Xiaowei ^{1,2,3}, Zou Xinqing ^{1,2,*}, Zhao Yifei ^{1,2}, Song Qiaochu ^{1,2}, Li Yali ^{1,2}, Zang Zheng ^{1,2}, Yu Wenwen ^{1,2}

³School of History, Culture and Tourism, Huaiyin Normal University, Huaian 223300, China Nanjing

Abstract

Sandy beaches are prime recreational assets underpinning many coastal economies and developments. However, the intense stressors to the ecology of sandy beaches that recreational activities bring are generally underestimated or ignored, and the related researches are rare. In this study, we quantified and evaluated the effects of human recreational activities on a sandy beach ecosystem using the macrobenthos as the bioindicator. Integrated geographical, ecological multi-discipline research method to recreational and tourism research, a contrast design approach that included spatial and temporal dimensions was used to assess the differences in the macrobenthic density and species richness between a beach section that is heavily recreationally impacted and another, less-impacted section. The data analysis showed sharp decrease in and loss of macrobenthic assemblages, which undeniably reflected the degradation of the ecological environment of Liandao Beach. On a spatial scale, the total macrobenthic richness and mean density on the heavily recreationally impacted beach section were substantially lower than the same values for the less-impacted section (total richness declined 70%, and mean density declined 91.07%); on a temporal scale, there were also significant differences between two periods, the period before the peak season and that during the peak season, total macrobenthic richness during the peak season was lower than that before the peak season (declined 75% from 12 to 5 species). These spatial and temporal variations in the macrobenthic community structure were directly related to the variation in the intensity of human recreational use. Furthermore, based on the contrast analysis, the beach ecosystem can not recover by itself under the continuous recreational influence. Conservation measures for recreational beaches are very challenging. However, practicable conservation measures might be implemented that could avoid or slow ecological degradation in recreational beaches. A number of management and conservation suggestions were put forward.

Key words:

beach ecosystem; sandy beach; recreational impacts; Bioindicator; beach management; coastal tourism

Role of Sustainable Tourism to Foster a Vibrant Industry in the Conservation of the Environment- The Case of Bhutan

Uttam Kumar

Assistant Professor in Geography, MMH College, Ghaziabad, uttam158@gmail.com

Abstract

The share of tourism industry in the total GDP of the world is around 10 percent. And surprisingly this is larger than the contribution of automobile or IT sector. Hence, almost all-Asian countries have seen the growing potentials of tourism sector for quite a long time. Now a day, though, it is expected that all kind of developmental approach should take place within the framework of sustainable development. Hence, Sustainable tourism or alternative Eco-tourism has become part of sustainable development within the sector of tourism. The mass tourism will consistently predominate in the world tourism, but pursuing ecotourism or alternative tourism like nature tourism programs are essential in overhauling the tourism sector and tapping of its potentials. Bhutan is among the few rather unique countries in the world, which believe in the preservation of environment – both physical and cultural at any cost. The Bhutanese doctrine of “high value low volume” is an important example to it. The current tourism policy of Bhutan clearly depicts the Bhutan’s tourism vision that gives more stress over the conservation of the environment and promotion of cultural heritage. This also reflects on the country’s desire to develop a responsible and sustainable tourism industry. The present paper endeavours to evaluate the current tourism policy of Bhutan, which tries to combine tourism advancement and transformation in the nation supported by the exceptional Bhutanese development model.

The Contribution of the Serra do Mar State Park in Promoting Knowledge of Its

Territory: An Analysis of Visitation

Sansolo, DG; Raimundo, S; Simões, E. Bussoloti, J.M

São Paulo State University (UNESP), Bioscience Institute, Laboratory of Environmental Planning and Coastal Management (LAPLAN). São Vicente, São Paulo, Brazil. dsansolo@clp.unesp.br

Abstract

The Serra do Mar State Park, located in São Paulo state on coastal zone is the largest protected area of Atlantic Rainforest in Brazil. It is located between the biggest metropolitan of Brazil and the coastal zone. One objective of the state park is to promote the environmental education and leisure. We consider that the environmental and territorial context is an essential content to delivery to the students, tourists and visitors. This research aims to evaluate the public-use program of the Park, specifically in Picinguaba that is one of the 10 administrative nucleus. This is a qualitative research, based on 7 interpretation keys about the park and its territory context. Structured Interviews were administered throughout the year 2015 for 48 visitors and students. The majority of respondents had no previous knowledge of the territorial and environmental context of the park. When they have finish the activities inside the park, they had not improved knowledge about the park and its context. The result reveals that the park offers leisure and entertainment in the natural space, but a few benefits for the visitor to interpret the landscape in such a way to broaden their knowledge about the conservation of nature contextualized in the territory in which the park operate.

The Relevance of Soundscapes and Acoustic Tourism: Examples from Hong Kong

Marafa, Lawal Mohammed

Department of Geography and Resource Management, The Chinese University of Hong Kong, China,

Immarafa@cuhk.edu.hk

Abstract

Although many people travel for visual experience, there are increasing trends for people travelling and visiting places to satisfy their tastes, and sonic interests. The soundscapes of places is increasingly becoming an issue of concern and when carefully studied and understood, can also represent a potential for promoting a location or can constitute an attraction by itself. Scholars like Trevor Cox have identified sonic wonders of the world and others like Carmen Braden have postulated that acoustic tourism can enrich a visitor's experience. The advantage of acoustic tourism is that it can be studied both in urban and rural areas.

In the urban area, the soundscapes of the tourist's attractions were similarly studied. Respondents were asked to categorize the sounds that they hear, their perception and the value of the acoustic environment that they are in. For this purpose, three country parks and two street markets were selected based on popularity and accessibility. Soundscape measurements and interviews were conducted on-site. Results were analyzed and interpreted in terms of representativeness, expressiveness and sentiment of the place as it relates to visitation. Findings from questionnaire surveys and interviews could help to further identify those soundscape attributes that are valued by people for the future of acoustic tourism.

The Response of Desert Ecological Environment to Tourism Activities

LI Long-tang, XUE Chen-hao, ZHANG Guan-le

College of Resources and Environmental, Ningxia University, Yinchuan 750021, lltang@nxu.edu.cn

Abstract

This paper studies the impact of tourists activities to swim trails, vegetation and soil crust of typical desert scenic area in Ningxia. Main results are as follows: Using a method of fait accompli calculates, the result shows that influence scope of tourism trampling to swim trails is 4m in the two scenic spot, but the north of Shapotou is less affected because of the palisade; The ticket office (sample with 1) of wet land park in Yellow sand ancient crossing is the most affected, and the average value of ILCI is as high as 74%; Because of the palisade on both sides of the plank road, the average value of ILCI in north of Shapotou (sample with 4) is less than 43%. The other three samples present the change of the "high - low - high" from swim trails edge to the remote sample region. Using the simulation method, results indicate: With the increase of tourist activity, the coverage of vegetation decline, the height of plant reduce, the quantity and kinds decrease, soil crust fragmentation increase. Because of different angle of sand dune, the impact of tourist activity to vegetation and soil is different. Vegetation and biological crust of sample C which is the biggest angle suffer from the devastation. The diversity of desert biological resources, the reputation of sand dune landscape, and the desert tourism environmental bearing capacity are affected by tourism activity greatly.

Key words:

tourist activities; interference; response; Desert ecological environment; Ningxia

Impact of Information Technology in the Tourism Industry of Madhya Pradesh state of India

Khan A.R.

C.R. Institute of Management UTD Barkatullah University, Bhopal, India, reach2raoof@gmail.com

Abstract

There is positive relationship between tourism and economic development, and information technology has played a vital role in promoting tourism. Recently, a number of studies provide the evidences that there is expedite and symbiotic relationship between Information Technology and tourism industry which not only changed the operational activities of tourism sector but also improved its efficiency which led to increase its contribution in the exchequer of the country in all over the world. Madhya Pradesh is the study area where tourism department provides several services through IT and claims that they are offering better services to its stakeholders than their other counterparts. This study explain the policies of the government at both center and state level and also investigate the perception of masses about the information technology on the basis of the selected stratified samples from the selected study area. The study basically concerned with metro city Bhopal and two other small towns Raisen and Vidisha of Madhya Pradesh state in India. To estimate the impact of IT on tourism industry the present study has been selected, variables like consumer services, domestic and foreign tourist arrival, foreign exchange receipt, information availability on tourism website in terms of, booking, tourist cost, transportation and accommodation etc. The information has been mainly collected from primary sources from selected 150 stratified samples of tourists from three districts Bhopal, Raisen and Vidisha. The study has taken domestic, foreign tourists arrival and foreign exchange receipt as dependent variable and the variables of information technology as independent variable in multivariate regression approach and found that there is positive and significant impact of IT in the tourism industry of Madhya Pradesh in India

Key words:

Tourism; Information Technology; Web Site; Madhya Pradesh

Sharing Economy and Tourism in Spanish Mountain Areas. The Role of ICT in New Tourism Developments

Sánchez-Aguilera D, Font-Garolera J

University of Barcelona, Barcelona, Spain, dsanchez.aguilera@gmail.com University of Barcelona, Barcelona, Spain, jaume.font@ub.edu

Abstract

During the two last decades, ICT have revealed as a dynamic engine for economic and social change. The exponential growth of social networks (Facebook, LinkedIn, Twitter) and linked to, the emergence of various exchange platforms and marketing of tourism products and services online, can contribute to transform the former touristic markets.

Sharing economy, especially the platforms offering tourist accommodation had a global success mainly in urban areas, with a wide offer of both tourist apartments and private homes. Studies examining the spread of these platforms (Airbnb, Couchsurfing, etc.) are preferably focused in urban areas. However, the territorial expansion of these new accommodation offers has reached rural areas and is growing in mountain areas. Despite the evidence of success of some products and some specific destinations, Spanish mountain destinations globally lose weight during the last fifteen years, in a scenario of strong competition from destinations in different environments (coastal, urban) and emergence of new products, addressed to satisfy the demand of "tourism experiences." The result is that the mountain loses strength and visibility as a touristic space and mountain touristic destinations need, in many cases, an urgent renewal.

The aim of this communication is to analyse the territorial diffusion of these new forms of accommodation related to sharing economy in two Spanish mountain areas (Val d'Aran and Sierra de Guadarrama) and its contribution to the renewal of these destinations. Knowledge of these new tourist offers can provide valuable information about future patterns of tourism in rural and mountain areas.

Key words:

mountain tourism; ICT; sharing economy

Tourism Mobility Research in the Age of the Smartphone

Shoval N, Birenboim A.

The Hebrew University of Jerusalem, Jerusalem, Israel, noamshoval@huji.ac.il

Abstract

At the end of 2014, over 93 percent of the world's population owned cellular phones, with penetration rates that exceeded 100 percent in most developed countries. Mobile phones have become an integral part of our lives and have had a significant impact on society—including on individuals' daily movement and mobility patterns. Cellular phones have also been utilized for research and have been employed to collect time-space data about the mobility of relatively large populations. In this presentation, we provide a review of the potential of advanced mobile phones—known as smartphones—in the investigation of the geographies of mobility. We discuss how these devices can be employed in research, tracking individuals in time and space and functioning as location-aware survey tools in real time, among other things. We also engage in a debate over the advantages, disadvantages, and limitations of smartphones in this context, and highlight new research trends that are beginning to appear following the introduction of smartphones.

Key words:

GPS; mobile sensing; sensors; tourism; smartphone; tracking

Toward A Location Theory Within Areal-Tradition: Mega-Spatial Structure of Potentiality of Tourist Flow (Mobility) With Background of the Mega-Areal Differentiation in China

Zhang J Zhang Z-L, Zhang H-L, Li L

School of geography, Nanjing University, China, jiezhangnju@sina.com

Abstract

Location theory is thought to be the typical one for the spatial tradition of the Robinson (1964)'s four geographical traditions, which is different from the study focusing on areal differentiation with areal tradition. Since location theory concern the spatial structure and spatial organization with functional mechanism. Yet in China with case of the potentiality of tourist mobility or tourist flow, it is easy to find the mega-areal differentiation pattern in national scale with background of HU Huan-Yong's Line, i.e., the N-S oriented line across the mainland of China that describes a mega-pattern of the discrepancy between East and West China in population. We developed a simplified geometric model of Hu's Line on the rectangular plane coordinate system:

$$E (\text{Longitude}) = 0.8697 * N (\text{Latitude}) - 60.639$$

With database of population and GDP of 2363 cities and counties in mainland of China, using space potential model, we successfully revealed characteristic location pattern of "Hu Line Location Effect" in three ways:

1st, the total tourist mobility potentials on different side of Hu Line of China as a whole;

2nd, the different spatial structure of tourist mobility potentials of the original geographical units on both side of Hu Line of China to a specific destination,

3rd, the different spatial structure of tourist mobility potentials among destinations with different location to Hu Line.

With so called Hu line location effects, the significance of a location analysis model with areal tradition was elucidated.

Key words:

Tourist mobility; Location theory; areal tradition; spatial structure; Hu's Line

On Spatial Structure and Behavior Mechanism of Urban Recreational Flow

Liang Y L, Cheng S W

China University of Geosciences, Wuhan, 430074, P. R. China, 939234076@qq.com

Huazhong Normal University, Wuhan, 430079, P. R. China

Abstract

Urban residents in China have increased demand for high-quality leisure life. However, research on micro-scale urban recreational flow remains fringe. In this paper, the authors combine leisure resident's behaviour space with their image space, a new classification criterion of urban recreational flow, together with the image index, behaviour index and the recreation index are proposed to summarize the recreational pattern, the spatial congregating and diffusing model of urban residents. Based on the questionnaire and on the spot investigation, the authors analyze leisure resident's behaviour and image characteristics in Wuhan City. Using Geographic Information System (GIS), the authors analyze the behaviour mechanism of recreational flow, and its subjective and objective influential factors. In this paper, the results illustrate that there is a significant interaction between the image spatial structure and behaviour structure of urban residents. So applying the urban image theory to the research on recreational behaviour is helpful to the design of more humanized urban recreational space. And GIS spatial statistical analysis techniques could play a big role in simulating the actual spatial structure of urban recreational flow.

Key words:

urban recreational flow; image index; behaviour index; recreation index; congregating and diffusing model; Wuhan city

Spatial Differentiation of Portal Websites in China's 5A Rated Tourism Attraction

Hu Yuna, Mei Lin, Chen Yan

School of Business, Ludong University, Yantai, 264025, China, huyuna0419@163.com

Abstract

Website is the portal and platform of information show for tourism attractions. This paper assesses the portal websites' quality of China's 112 5A rated tourism attractions and analysis the spatial distribution. It is shown that the distribution of websites' quality in China is spatially differentiated and presented a situation of relative concentration and centrality. Jiangsu and Zhejiang province have the most high quality websites, which represent the center of China's online business. With Sichuan, Chongqing, Anhui and Hubei together, these 6 provinces constitute a collective belt of highest quality websites which around Changjiang River. Another collective belt of higher quality websites is in the east of our country, which is consisted of Shandong, Jiangxi, Fujian, Guangxi and Hunan.

Besides, the results of each evaluation show that the spatially distribution of websites' quality are different. On the effect functionality, the gap between east and west of China isn't so big; on the content completeness, attributing to the close cooperation and collection between tourism attractions and other tourism enterprises, the gap is big; the user experience evaluation shows a state of relatively dispersion because of good performances from websites in the middle and west regions, that means the technical problem of interact experience on website is no longer the restriction to the construction of website; the result of technique support evaluation is more or less same with the overall evaluation result.

Key Words:

5A rated tourism attraction; portal websites; spatial differentiation

A Tale of two cities: The Nature of Business Tourism in Cameroon

Dr. Tichaawa, TM. Prof. Rogerson, CM

School of Tourism and Hospitality, University of Johannesburg, Johannesburg, South Africa, tembit@uj.ac.za

Abstract

Existing scholarship on business tourism as a whole suggest that most of such studies have been conducted mainly in the developed context with specific focus on the “formal sector” business tourist. In the context of Africa, although business tourism has been acknowledged as an important contributor to economic growth on the continent, its significance for many tourism economies continues to be overlooked in academic discourse. The overall aim of the study is to critically examine the nature of business tourism in Cameroon with specific focus on the hotel economy in Yaoundé (the capital city) and Douala (the economic capital). Interviews with hotel managers representing various tiers of hotel classification reveal similar trends in terms of hotel development in both cities. Majority of the hotels were fairly new in terms of existence, unbranded, locally owned, and not officially graded by the relevant authority. Managers indicated that most of their clients (largely domestic) were on work/business as opposed to leisure. Interestingly, the study found the emergence of “meubles” (self-catering accommodation) to be a very significant “new player” in the hotel economy in Cameroon. Furthermore, a major disconnect exists in terms of government policy objectives for hotel development and the intentions of local developers. The study concludes that business tourism largely drives the economy in both cities, and its pathways in Cameroon should be further examined by means of research that provide an understanding of the different forms of business tourism, and unpack associated impacts holistically.

Key words:

Tourism; business; hotel economy; Cameroon

Empowering Mobility: Russian Travellers' Forums Against Immigration and Customs Barriers

Golunov, S.V.

Kyushu University, Japan, sergei.golunov@gmail.com

Abstract

Development of online interaction technologies (Web 2.0) potentially makes more capable even those categories of people whose representatives do not communicate to each other routinely and normally are not able to act jointly for defending their interests. In cases when establishing online networks involves sharing practices and knowledge while 'most of the members are unknown to one another' online communities can be referred as 'networks of practice' (Brown and Duguid 2000). This kind of networks can give some hope to some categories of border crossers, including tourists.

The proposed paper focuses on the role of online travel communities for empowering tourists taking as a case study discussions concerning those border issues that Russian tourists face while travelling to the most popular destination countries. The author concludes that online travel communities can successfully supply tourists with a range of efficient practices on how behave in typical formal situations (e.g. during visa application and border control) and how to circumvent restrictions by employing logistical solutions or tricks. At the same time, online travel communities currently hardly can mobilize tourists for some joint actions to advocate their common interests.

Key words:

Forms of Language Tourism Facilitated Through Multi-Layered Human Mobility: The Japanese Case in Vancouver

Kojima D.

Nagasaki International University, Sasebo, Japan, d-kojima@niu.ac.jp

Abstract

This study explores the forms of multi-layered human mobility that are facilitated through language tourism. In particular this paper will examine the case of Japanese tourists in Vancouver, Canada.

The first example of human mobility that enables language tourism is that of the entrepreneurs from language travel agents in Vancouver who target Japanese people as potential customers. Two thirds of these agencies are Japanese businesses that were established when the founder entered the market from another sector, such as the travel industry, an education-related business, or another language travel agency.

The second example of human mobility that enables language tourism concerns the employees of the language travel agents. These can be former international students who are employed as counselors but some also work as recruiters.

The third example of human mobility concerns the language tourists themselves. After the third or fourth month of their stay, they subsequently exchange information, part-time jobs, and accommodation with each other in various ways such as through the classified section of Japanese-language local papers, the bulletin board at language travel agents, or on the Internet. This means that mobility for consumption changes to mobility for production.

The Japanese case in Vancouver suggests that the presence of constant flows of language tourists in a destination creates the coexistence of a variety of forms of tourist stages, and that the exchange and communication made by this multi-layered human mobility enables such a form of tourism.

Kaliningrad as a tourism enclave/exclave. Influence of cross-border cooperation

Sebentsov A.B., Kolosov V.A., Zotova M.V.

Dr., research fellow, Centre of Geopolitical Studies, Institute of Geography Russian Academy of Sciences, Moscow, Russia, sebentsov.igu@gmail.com

Abstract

The objective of the paper is to analyze the influence of cross-border cooperation (CBC) in Russia-Poland borderland on the development of tourism in Kaliningrad region (KR). Tourism as an industry of the KR's economy has a big potential for its development. Many researchers concern on internal conditions (many objects of the Heritage of the Culture and Nature, maritime location etc.) and limitations (lack of the medium-priced hotel, scarcity of English-speaking staff in service sector etc.) for the development of the tourism. A part of the scientists distinguishes CBC as a relevant factor of development for tourism industry. At the same time, neighbors of KR are usually perceived as business rivals, which offer a good services and low prices. When local-border traffic regime in the Russia-Poland borderlands was established, more and more Kaliningraders became visiting Poland not only as a consumers, but and as a tourists too. Many Kaliningrad tourists visit the neighbor Polish voivodeships for outdoor recreation on holidays and vacations, combining it with buying consumer goods. As for Polish citizens in KR, they cross the border only to buy limited list of the goods (petrol, alcohol). To change the asymmetry of touristic flows it is crucially important to revalue the role of CBC for KR. CBC is a chance to attract the tourists from the neighboring countries and promote cross-border touristic products that would be common for both countries. At the same time, some local experts are prone to perceive such cooperation as challenge for regional identity.

Key words:

Cross-border cooperation; Kaliningrad region; development of tourism

Reflections on Tourism and Freedom

Jim Butcher

Canterbury Christ Church University, United Kingdom, jim.butcher@canterbury.ac.uk

Abstract

Tourism has long been associated with freedom, both material freedom borne of economic and technological advance, and spatial freedoms to travel for leisure. Such freedoms were both celebrated and criticised in the nineteenth century: celebrated as progress, in a spirit of optimism with economic development; criticised as extending travel to those deemed incapable of benefiting from it.

One of Jack Kerouac's travelling characters in *Dharma Bums* says: 'I saw that my life was a vast glowing empty page, and I could do anything I wanted'. For post war tourists, likewise, the world was becoming, according to journalist Jennie Bristow, an 'a truly open space' of expanding possibilities.

Yet this freedom for an expanding minority of the world's population has been subject to a critique that views it as a potential threat to cultural and environmental diversity. 'Freedom to' is to be balanced against 'freedom from', and freedom is to be exercised 'responsibly'.

Most recently the expanding possibilities for leisure travel have been questioned by the growth of a terrorism that targets not politics but freedom itself. In the face of this, some have sought to champion freedom. Others have cautioned that western freedom to travel perpetuates neocolonial and neoliberal assumptions, and have called for a more circumspect take on individual freedom.

The paper will provide an outline of how the freedom to travel has been viewed over the last 250 years, and offer some reflections on how leisure mobility has been celebrated and problematised over this period.

tourism; freedom; mobilities

Slowing Down for Sustainability: Backpacker Mobilities and the Influence of Pace

Iaquinto, B

Hong Kong SAR, China, bliaq1@gmail.com

Abstract

In this presentation I explore the relations between backpackers, mobility and sustainability practices. Practice-based approaches applied in the study of sustainability have generally avoided an engagement with mobile people, while scholars using practice theory in sustainability-related research have often overlooked the actions of people on holiday. As backpackers are highly mobile but also reside in place for prolonged periods, they can help us to understand what influence fluctuating mobilities have on practices of sustainability. The central claim of this presentation is that pace, as a form of mobility, is responsible for enabling and obstructing sustainability practices. Pace is understood as speed plus rhythm and it is this combination that is particularly well expressed in the intermittent mobilities of backpackers. Pace provided a way to explain and contextualise the relationship between sustainability practices and mobility, as a slow pace of backpacker travel was associated with the performance of more sustainability practices. Therefore, incorporating sustainability into the tourism experience requires more than education programs or changing tourist attitudes. There must be attention paid to the ways tourist mobilities are implicated in the performance of sustainability.

Key words:

Tourism mobilities; sustainability; social practices; practice theory; backpacking; pace

Tourism, Mobility and Participation Rates in the European Union

Coles, T.E. and Hall, C.M.

University of Exeter Business School, Streatham Court, Exeter, EX4 4PU, United Kingdom, t.e.coles@exeter.ac.uk

Abstract

Over the past four decades the rise of travel and tourism has been inexorable, and moving forward further growth is both forecast and desired by policy makers and practitioners around the world. To this end, there have been numerous calls, especially by state and supra-national actors, to reform passport and visa regimes. By focusing the gaze on ever greater mobility, attention is diverted from the fact that many consumers are relatively immobile and others do not travel at all. Recent research in the United States demonstrates that many Americans do not use their full paid leave entitlements while similar work in the United Kingdom points to work cultures as well as school holiday regulations as major impediments. This paper presents an analysis of recent tourism participation rates in member states of the European Union (EU). While contemporary conditions seemingly encourage mobility, of late there has been little systematic attention on the nature and extent of participation and, more importantly, non-participation rates in advanced economies. Utilising secondary data compiled, *inter alia*, by Eurostat and the United Nations World Tourism Organization, notable variations across the EU are identified. Analysis of this nature almost inevitably raises issues of the possible extent and consequences of realising potential and deferred demand. However, a closer examination of the data also raises a series of much wider-ranging future research questions relating to who does not travel and why.

Tourism; mobility; immobility; participation; European Union

Trend and Pattern of International Tourist Arrival in India: A Geospatial Approach

Kumar Rakesh, Prof Bhagat R. B

International Institute for Population Sciences, Mumbai, Department of Migration and Urban Studie, Email Id: rakesh@iips.net

Abstract

Tourism is a vital economic activity. It is a major foreign exchange earner. In 2012- 13, the Indian tourism industry, earned a record of more than USD 17 billion in foreign exchange. According to world travel and tourism council, India will be a tourism hotspot form 2009-2018, having the highest 10- year growth potential. As per the travel and tourism competitiveness report 2009 by the World Economic Forum, India is ranked 11th in the Asia Pacific region. Using a new, global database on international tourism destinations. The database differs from other databases and includes international tourists' arrival of non-resident visitors at national borders, by country of residence; and it contains, for the most important aspects of destinations in context of India. However, using secondary sets of UNWTO unit level data of India tourism. This paper examine analyse the trend and pattern of International tourist arrival in India. While using ARC GIS tool showing the flows of international tourist arrival from different region and country of the world. Which identify the growth of international tourism arrival from the period 2005-2013. Furthermore, also understand the changing pattern of international tourist flows using the method Population Adjusted Travel Index (PTGI). Results suggested that arrival for holidays, leisure and recreation purpose are more compare to business and other purpose. Future more this paper will helpful for policy maker's stakeholder and administrative purpose for development of tourism projects.

Domestic Air Cabotage Within the European Union Countries – Perspectives for Tourism in Peripheral Regions

Pijet-Migoń E

Institute of Tourism, Wrocław School of Banking, ul. Fabryczna 29-31, 53-609 Wrocław, Poland,
edyta.migon@wsb.wroclaw.pl

Abstract

The contemporary development of passenger air transport in the European Union countries occurs under conditions of complete liberalization of aviation market, with respect to all nine air freedoms. Implementation of these freedoms, finalized in 1997, resulted in the appearance of transport phenomena not present before, with resultant consequences for tourism. Among them are full cabotage connections, including domestic connections within a given country, previously allowed only to be offered by carriers registered in this country. Most cabotage connections have been established in southern European countries, i.e. in Italy, France, Spain, Portugal and Greece. Less common they are in Great Britain, Germany, Poland and Romania. Cabotage network is dominated by connections between far-apart airports on the mainland and to island airports, as well as to/from airports not served by other fast means of transport, especially high-speed rail. Regional and satellite airports in the vicinity of large agglomerations are typical destinations, as are areas attractive, or potentially attractive for tourism. Cabotage service fills gaps in domestic networks and is rarely offered between main airports, where competition between carriers is strong. Implementation of cabotage helps to increase transport accessibility of peripheral regions and hence, of those among them which may play a role in the European tourism market such as Greek, Italian and Spanish islands or various parts of the mainland Spanish coast. Cabotage connections supplement or even compete with charter flights, since they allow greater flexibility due to higher frequency of flights and respond to increasing readiness to individual trip planning.

Key words:

air transport; tourism; full cabotage; domestic flights; low cost carriers

Impact of Nonresident on Impulse Buying: An Empirical research on Tourists

Zhifei Li, Shengliang Deng

Hubei University, China. lzf1613@163.com

Abstract

Impulse buying has a large proportion in retail and nowadays more and more consumers have impulse buying at nonresident. But a large amount of research about impulse buying centers in the resident buying, empirical research about nonresident buying not found. Obviously these are two different environments, will customer purchase behavior change? Can the already existing theory models explain these changes? Because of these, this paper puts forward the following research question. What's the impact of nonresident characteristic on impulse buying? This paper adds nonresident variable to the Dholakia's impulse buying model, constructs four measurement dimensions including culture diversity, time pressure, repurchase cost, and purchase pressure via interview and content analysis, and then finds structural equation modeling of the relationship between nonresident variable and impulse buying behavior and tests the model hypotheses. The results show that perceived culture diversity, repurchase cost and purchase pressure have significantly positive correlation with impulse buying intention and behavior, among which the effect of purchase pressure is largest and then culture diversity, which of repurchase cost is comparative least. From the discoveries, we can achieve the following management implements. For remote consumers, based on the perception of increased purchase pressure, it's more important for digging the demand of their families and friends than for mining its own demand; based on the increasing awareness of culture diversity, it's probably more important for introducing the cultural background of merchandise than introducing commodity itself; based on the increasing perception of repurchase cost, selling some commodities originally may be better than selling them everywhere. Finally, the paper points out the research limitations and future research.

Key words:

Nonresident; Impulse buying; Tourist

Is Tourism a Help or Hindrance to Global Awareness and Understanding? Tourism, Cosmopolitanism and Global Citizenship

Jim Butcher

Canterbury Christ Church University, United Kingdom, jim.butcher@canterbury.ac.uk

Abstract

Citizenship has traditionally referred to the formal political and legal relationship of the individual to the state. This has changed drastically in recent decades. Contemporary discussions of cosmopolitanism and global citizenship have effectively reworked citizenship profoundly. According to such formulations, it operates on a global level via global NGOs, ethical trade and an awareness of one's impact upon the world generally.

Because of these changes tourism has become implicated in citizenship. Tourism is held to have the potential to link the individual to global politics, and prompt reflection upon one's place and role in the world. Ethical tourism is a part of the wider category ethical consumption, the latter central to contemporary politics, especially the 'public face of development' (Smith and Yanocopulos, various). It can facilitate social action, with volunteer tourism perhaps the clearest example of this. Some even see tourism as part of an emergent ethical politics (e.g. Stephen Wearing, Freya Higgins-Desboilles).

The exploratory paper look at the rise of tourism's association with global citizenship and understanding, and considers what this tells us about contemporary political and social consciousness.

Key words:

global citizenship; global understanding; ethical tourism; citizenship

Mass Cruise Tourism Creates Culture Shock Situations

Manuela Gutberlet, PhD candidate at RWTH Aachen University/ Germany, Dep. of Geography.
and PR Manager at GUtech, Muscat/Sultanate of Oman; m_gutberlet@hotmail.com

Abstract

Tourism can be both an asset and a hindrance, depending on the scale of tourism, the cultural differences between hosts and guests and the tourists travel motivation.

In the Sultanate of Oman mass tourism has been an agent of change. The country only opened up for tourism in the mid 1980s. A different value system and communication style between European tourists and the Arab / Asian local community contributed to various 'culture shock situations' and an increase in stereotypes and 'stigma' in two tourist destinations. Cultural brokers and other local stakeholders play an important role in mediating between tourists and hosts. As for the cruise tourists, their dress behaviour can be seen as a reflection of the post tourist, who is seeking for his/her own self, an 'existential authenticity' while travelling and being away from home.

The main goal of my research was to analyse the cruise tourists' dress behaviour, while applying the concept of 'mindfulness' and its impacts on the local community and on other tourists (individual and group tourists). Two questionnaire surveys were conducted with German-speaking cruise tourists in 2012 (N=830) and in 2013 (N=235) in two destinations. In addition, a large number of in-depth interviews with various stakeholders were conducted as well as participant observation.

Key words:

Cruise tourists behavior; cross-cultural communication; culture shock; Sultanate of Oman

Tourism and Global Understanding?

Lew A.A.

Northern Arizona University, Flagstaff, Arizona 86011, USA, alan.lew@nau.edu

Abstract

Tourism is one of the major social and economic success stories of humankind. Despite persistent regional and global disturbances, international and domestic tourism continues to grow year after year. Tourism has been a major agent of the economic and cultural globalization trends that have been shrinking our planet at the same rate that tourism has expanded in its scope. In theory, we should know and understand the world today more than at any time in the history of humankind. In reality, however, global ignorance remains a significant challenge. Because 2016 is the International Year of Global Understanding, it is vital that tourism scholars address the important questions of: How has tourism shaped our understanding of global others? What are tourism's successes in fostering global awareness? Why has tourism not achieved the full potential toward these goals? What are the prospects for a better tourism for the future of our shared planet?

Key words:

Globalization; global understanding; mass tourism; alternative tourism; geographic knowledge

Tourism in Times of Crisis: Perils, Prizes and Prospects, the Case of Greece

Author: Terkenli, Theano S.

University of the Aegean, Lesvos 81100, Greece, t.terkenli@aegean.gr

Abstract

Contexts and circumstances of various sorts of crises present both opportunities and setbacks to the tourism industry, often highly unexpected and volatile, other times beyond control and economic profit. In all cases, however, they represent and open up new eras and areas of global awareness and understanding. This paper critically assesses two such realms of perils and possibilities, for the case of Greece. Resting on data from statistical sources and stakeholders' in-depth interviews, it proceeds to a swot analysis of such prospects and perils, as regards a) the credit-economic crisis of the past 7-8 years and its socio-political, cultural and environmental consequences in the country and b) the refugee crisis that has hit Greece, along its eastern borders, during the past year. Towards this goal, on-site research has been undertaken a) in the city of Athens, with a reference to national tourism trends and b) on the island of Lesvos, one of the country's main hot spots and ports of refugee entry.

As regards the former area of investigation, the grave socio-economic impacts of crisis in Greece have been accompanied by surprising and unprecedented possibilities in the tourism industry, whereas in the latter area of investigation, the refugee crisis has opened up fascinating but volatile and risk-laden new realities for local tourism development. In both of these examples, central both to the drivers giving impetus to tourism growth and to its impacts have been new kinds of relationships of (mis)understandings, developing between the two sides—locals and tourists.

Key words:

crises; threats; profits; prospects; Greece

A Case Study of Digital System Assisting the Sustainable Development of World Heritage: Digital Mount Tai

Kun Zhou

China University Of Geosciences, China, Zhoukunny@163.Com

Abstract

To realize the sustainable development of world heritage has being a research hotspot of heritage. Digitization and information technology provide effective modes and methods when they were exerted in the relevant research field at the beginning of the 21st century. “digital mount tai” is the key project of mount tai to build domestic first-class digital scenic spot and the demonstration project that digital system is employed to assist heritage protection and heritage management. This paper discusses construction mode of the project and expounds the content of “a portal, two centers, two bases, three platforms and multiple application systems” .In the view of sustainable development, the effects that digital system is used in the heritage site include: 1) providing dynamic monitoring; 2) affording visual scheduling command; 3) building integrated management platform of heritage site; 4) displaying virtual tourism information; 5) enhancing the work level of planning, construction and land resources.

Key words:

digital system; sustainable development; world heritage; mount tai

Are Landforms Differently Attractive?

Smrekar A

ZRC SAZU, Anton Melik Geographical Institute, Ljubljana, 1000, Slovenia, ales.smrekar@zrc-sazu.si

Abstract

This presentation determines which landforms attract people the most and whether one can speak of collective patterns in the aesthetic evaluation. Even though many studies of this type have been conducted in cultural landscapes, where there have been instances of land development, some have also been carried out in landscapes that were only slightly reshaped, such as in semi-natural and close-to-natural landscapes. The research based on photographs was carried out in two areas in Slovenia: in Dolina Triglavskih jezer (the Triglav Lakes Alpine valley) within the protected Triglav National Park where there are almost no anthropogenic “disturbances” due to extremely limited human activity, and in the unprotected Istria on the Mediterranean coast, where the coastal area is highly affected by tourism and urban sprawl, while in the interior, extensive rural landscape prevails. This survey evaluated the landforms in the protected area of Triglav National Park using various cases and proved that people are the most attracted to water features and vegetation-covered landscape. In Istria as well, people are the most attracted to water features and, perhaps surprisingly, also to entirely anthropogenic landscape elements, such as a motorway viaduct. It can be concluded that collective patterns exist in connection with the perception of the beauty of the natural environment. In professional circles, the aesthetic importance of landforms is often an unjustly and intentionally ignored criterion in defining the importance of landforms. This has especially been the case over the past decades due to the increasing objectification of science, research, and perception.

Key words:

geography; aesthetics; landscape; online survey; photography; Triglav National Park; Istria; Slovenia

Changing Land Use and Environmental Degradation in Varkala As a First Proposed Geopark in South Asia

Anand, Subhash

Department of Geography, University of Delhi, Delhi – 110007, India, sanandpv@yahoo.co.in

Abstract

South Asia is having huge rich geographical diversity which can provide many geoparks but so far no geopark has been developed in this region. Government of India is in process to declare Varkala beach as a first national geopark of country. Varkala beach is well-known tourist destination located in Thiruvananthapuram district of Kerala, which is a fast developing tourism destination, attracting many tourists of national and international origin. Varkala has a great potential for backwaters, beaches, medical, and pilgrim tourists. This paper aims to study land use change, its environmental implications and development of geopark in Varkala. The change in population, growth of non-agricultural activities and socio economic development trigger landuse/ landcover change and has led to alteration of the cliff landscape, degradation of the natural environment and destruction of coastal ecosystem. The data for the spatial and temporal change was taken from Landsat Satellite Imagery of February 2000 and 2014. Field survey was also conducted among the visitors, hotels and local community to assess the status of the infrastructure, environmental problems and their opinion in the study area. The maximum land use is under perennial crops with settlements and built up area. Because of increased tourism activities, the land use pattern is changing very fast and leading into environmental pollution, land degradation, overcrowding etc. The augmented construction on the cliff is responsible for gradual slumping of the cliff. Development of geopark based on sustainable land use becomes relevant in this scenario for proper management of natural cliff.

Key words:

Geoheritage; geotourism; landuse; degradation; geopark; development; varkala

Development of Landscape Resources in Busan National Geopark by Using Spatial Analysis

Suh, J.W.¹, Sung, H. H.²

¹ Ewha Womans University, Republic of Korea, skwldnjs57@gmail.com

² Ewha Womans University, Republic of Korea

Abstract

For sustainable development of Geopark, it is important to diversify landscape resources in Geopark. Landscape resources of Geopark, which are view points, are categorized based on geology, geomorphology, ecology, history and culture. Busan National Geopark consists of 12 Geosites and 121 landscape resources. They place too much emphasis on geology and geomorphology, which account for 75% of landscape resources. Therefore, this study aims to diversify landscape resources in Busan National Geopark. To improve this situation, firstly it was analysed by 5 categories and visualize the distribution of the landscape resources in Busan National Geopark. Second, we collect and analyse survey data through overlaying the landscape resources in aspect of geoheritage, geomorphology, ecology, designated cultural properties, geo-tagging (Google Panoramio) data. Third, hotspots were detected and field survey is taken to validate hotspots. In conclusion, this study allows for diversifying the landscape resources in Busan National Geopark through the hotspot analysis and validation processes. Ultimately this study contributes to extend to develop Geo-tourism and Geo-education.

Key words:

Busan National Geopark; landscape resource diversity; spatial analysis

ESD (Education for Sustainable Development) and Geoparks

Kohmoto D

Nara University of Education, Nara, 630-8528, Japan, daichizu@gmail.com

Abstract

Geoparks have a marked affinity for ESD (Education for Sustainable Development) since education and sustainable development are highlighted in the concepts of geoparks, and both have strong associations with UNESCO. However, research on what are the relationships between ESD and geoparks remains blank. In this paper, the author examines possibilities of our society led by multiplying ESD and geoparks. Firstly, the description contents of the Global Action Programme (GAP) on ESD are considered about cases of geoparks. GAP is intended to make a substantial contribution to the post-2015 agenda, and the follow up to the United Nations Decade of Education for Sustainable Development (2005-2014). Secondly, the members of the ASPnet (UNESCO Associated Schools Project Network) in geoparks of Japan are calculated. Thirdly, learning contents for geoparks are examined from the viewpoints of Earth Sciences and community development. From the former, nature of familiar territory as the first stage, and understanding of the mechanism of Earth activity as the second stage have been found. From the latter, relationships between our life and nature as the first stage, and development of social skills for reaching an understanding with other stakeholders as the second stage have been found. Additionally, international understanding and cooperation through geopark would be the third stage. The results illustrate that geoparks could be places for inspiring learners to act for realizing sustainable society if we transform organizational operations of relevant actors and maximize learning contents given by Earth Sciences and community development.

Key words:

ESD; geopark; sustainable society; Earth Sciences; community development; UNESCO

Interpretation of Geoheritage Using a Communication Channel Model

Chen Anze, Fang Ren

Chinese Academy of Geological Sciences, Beijing, P. R. China, 100081;

Institute of Geomechanics, Chinese Academy of Geological Sciences, Beijing, P. R. China, 100083, 546615019@qq.com

Abstract

This study presents an interpretation system model of geoheritage to facilitate the understanding of geoscience knowledge by the common lay person. Interpretation system construction is crucial to geoparks and is a shared value. The improvement of the effectiveness of geoheritage interpretation is still under exploration. Therefore, the interpretation systems of two global geoparks in China are outlined and compared with the interpretation system in Zion National Park in the United States. From lessons and experiences, this paper suggests utilizing geotourism as a complete contextual communication system, in which a geopark (source) delivers information about its unique cultural and natural values to target tourists (receivers) through tourism activities (channels). The communication effect of geotourism is monitored by feedback from tourists through the post-travel surveys or activities. We expect that this model will provide a better interpretation of geoheritage with a new perspective.

Key words:

Geotourism; Geopark; Geoheritage; interpretation system; communication channels

Progress and Achievements of Geoheritage Survey in China

Dong. Y, Chen. Z.H, Cao. X.J

China Institute of Geo-Environment Monitoring, Beijing, 100081, P. R. China, 13701351480@139.com

Abstract

Geoheritages are precious wealth of human beings which are formed by the inner and outer-momentum geological function. Conservation and scientific utilization of geoheritage has become the consensus of mankind. Since 2008, China Geological Survey Bureau of the Ministry of Land and Resources has deployed systematically a national important geological heritage investigation and established the system of technical methods. As of the end of 2015, the geological survey work has been completed 56% of the land area. By the end of 2017, the first round of the national geological survey work will be completed. The timely application and transformation of the main achievements of the survey, played a very important role and brought benefit in geological scientific research, management of geological heritages protection and local economic development.

Research on Establishing Approach of National Park Category System: a Case Study on Nature Reserve in China

Zhou Rui A, Zhong Linsheng B, Liu Jiaming C

Institute of Geographic Sciences and Natural Resources Research, CAS, Beijing 100101, P. R. China, Catherine-rui@hotmail.com

Abstract

It is inevitable that the administrative managements are disordered and the function-positioning are improper since the categories of protected areas in China are abundant with overlapped protected objective. Therefore, the measure of straightening out protected area category system is significant to coordinate relationship between protection and development. National park is a branch under the protected area system that undertakes dual tasks in natural ecological resources protection and utilization. Based on literature review, this article teases the connotation and functions of national park worldwide and states that national park under IUCN protected area category system is more complete and accurate generalization for global single national parks. Hence the basic criteria of designating any protected area to be national park are concluded according to definition of national park under IUCN protected area category system. The basic criteria should consist of area suitability, nature resource representative, the human influence degree and function comprehensiveness. Following the establishing steps, this article uses nature reserves in China as cases to filter candidates of national parks in China. Firstly, global “national park” should be no less than 1,000hm², so nature reserves in China which do not match this bottom line of area suitability criteria are excluded from candidate list. Secondly, nature reserves at national level in China have been designated to be National Representative for its unique nature resources and ecosystem. So, national nature reserves are selected to enter into national park candidate list. Then, human influence degree in every national nature reserve is evaluated by virtue of human footprint index dataset which indicates a degree of human activities influence to every 100hm² terrestrial area. Therefore, a total of 55 nature reserves in China at national levels with areas are not less than 1,000hm² are finally determined to be candidate national park items. In the end, an approach of “nested” other 5 categories of protected areas are proposed in order to meet the final criteria of function comprehensiveness.

Key words:

protected area; national park category system; nature reserve; IUCN protected area category system; human footprint index

Study of Geo-Historical Perspectives: Gandeshwari Rivulet Zone: Bankura, West Bengal, India

Sinha. M

Assistant Professor, Geography, Jogamaya Devi College, Kolkata, West Bengal, India, malavikasinha@yahoo.co.in

Abstract

The river is an open system. As an open system river gets input from climatic system (precipitation) and geomorphic system (path). The surface runoff is the connector of its upper to the lower catchment area and also it connects the recent geo-formation with the azoic or proterozoic era. The two basic principles of Hotton; the 'present is the Key of past' and 'climate leaves imprints of land form' are reveal that the analysis of present earth's geological and climatic situations provide an idea about its evolutionary history. The geomorphic imprints are related to climatic and land form evolution and all are scatter over the earth's surfaces. The historical perspective of human's evolution is also related the climatic evolution. The rivulet zone of Gandeshwari lies in edge of Gondwana shear zone with Proterozoic formation. But here the most of the land form is not older than Pleistocene. This zone was the habitat zone of Proto Australoid people and the living anthropological remnants of the proto Australoid people are still observed. The geomorphic imprints with archaeological sites of early hominoids of Gandeshwari rivulet zone is a document site from Acheulean culture, in West Bengal

Key Words:

Proterozoic Formation; Proto Australoid People; Acheulean Culture; Palaeolithic tools

Utilization Perspectives of Degraded Landscapes in the Area of the Novohrad–NÓGrÁD Geopark

Gergely Horváth, Mária Szabó, Gábor Csüllög, Béla Munkácsy, László Tamás, Edina Budai

Eötvös Loránd University, 1117 Budapest, Hungary, horvger@caesar.elte.hu

Abstract

The Novohrad-Nógrád geopark which was established in 2011 as result of a Hungarian-Slovakian cross-border cooperation contains several abandoned mining or industrial regions with strongly degraded landscapes. Although the geoheritage, especially the geological values of the mining regions is often great, offering possibilities e.g. for establishing study trails or other thematic routes, however, these landscape-constituent elements result in considerable landscape conflicts. Important task to solve these landscape conflicts and to turn them into potential, in addition, to involve these degraded landscapes into the aims of the geopark project and into the geotourism. The transformation of these degraded landscapes needs landscape reclamation of which implementation could be joined to use of renewable energies, as well; there are already international good examples to be followed. Local renewable energy production of these degraded regions greatly contributes to the development of the infrastructure of the Geopark. For carrying out these ideas, also categories of the mining landscape elements were worked out, taking into consideration among others the localization, the linkage to the settlements, the condition, the scenery, the distance from paved and main roads, the usability etc. As result of the investigations, recommendations will be drawn up for the local authorities of the settlements lying in the Geopark, of which implementation could promote both the regional development of the region and the increasing attractiveness of the Geopark.

Key words:

geopark; landscape degradation; mining; renewable energies

Valuing Landscapes: A Structured Approach to Defining Geomorphic Values for Geo-Conservation

Rutherford, I.D., Grove, J. and Storey, K.

School of Geography, The University of Melbourne, Australia, idruth@unimelb.edu.au

Abstract

Geographers love awe-inspiring landscapes. The growing field of geo-conservation aims to recognise and protect these landscapes. Numerous areas (including World Heritage Areas) have been preserved for their majestic character. But such subjective criteria are a poor basis for a systematic inventory of geomorphic values in a large region. For geomorphic systems we need to be able to value both forms and processes. In completing a review of geo-conservation sites in the large World Heritage Area of Tasmania, Australia, we have made three improvements in identifying (and mapping) geomorphological values. (1) We have developed spatial descriptive units for categorising geomorphic systems (2) We have defined a more effective set of value-classes namely: emotional values, consequential values, and information values. (3) For the class of 'information-values' we define five improved sub-values:

1. Quality of information
 - a. Is it the first studied example of this geomorphic unit?
 - b. Is it well studied?
 - c. Does the unit contain embodied information?
2. Condition
 - a. Is the feature minimally impacted by humans?
 - b. Is it the least impacted example?
3. Rarity
 - a. Is the value endangered?
 - b. Is the site deviant relative to the population?
 - c. Is the unit at a geographical outlier?
4. Reference
 - a. Is it a representative reference?
 - b. Is it an outstanding example?
5. Assemblage. Is the unit part of an assemblage of units or values that together have additional values?

These values provide tools to geo-prospect for new sites and can also be used as basis for management decisions.

Yawata Ironworks as Transnational Geoheritage: Looking behind the Scenes of a late 19th Century Japanese/German Investment Project

Soyez, D.

University of Cologne/Germany, Institute of Geography, Albertus-Magnus-Platz, D-50923 Köln

d.soyez@uni-koeln.de

Abstract

Yawata Iron and Steel Works was the first modern, coke-based integrated iron and steel plant in Japan. Construction of the plant by the renowned German iron, steel and machinery manufacturer Gutehoffnungshütte (GHH) as the primary contractor began in 1897 and was completed in 1901.

Arguably, Yawata represents both the first step toward, and the main symbol of, the country's late 19th/early 20th century industrialization during the so-called Meiji Industrial Revolution. It was recently awarded UNESCO World Cultural Heritage status together with 22 other sites dating from this period. Yawata can be regarded as a true fusion of Japanese-German competence, as exemplified by the pervasive tangible and intangible legacies both in Japan and Germany. These find expression not only in particular sites and buildings in both countries, but also in archival resources, in Germany mainly at Rhineland-Westphalia Economic Archives/RWWA, Cologne, housing the GHH documents. Thus, the Yawata project can serve as a model for demonstrating both the importance of and potential for a new, decidedly transnational perspective on heritage endeavours.

The main objective of the presentation will be a specific look behind the scenes, based on the archive in Cologne, in order to take stock of specific planning problems, blunders and intercultural collisions, i.e. elements of an almost adventurous investment project normally not addressed or even deliberately concealed in heritage valorizations. The main idea behind this is to, hopefully, enrich future interpretation strategies by adding decidedly real life flavours to run-of-the-mill narratives about inventive engineers, diligent workers, creative architects or visionary entrepreneurs, thus adhering to Tilden's well-known dictum that the chief aim of interpretation is not instruction but provocation.

Key words:

Transnational Geoheritage; Yawata Iron and Steel Works

A Quantitative Inference Approach for World Geopark Capability of Lut Desert by Geo-heritages Features

Adel Sepehr

Dept of Desert and Arid Zone Management, Ferdowsi University of Mashhad, Mashhad, Iran. adelsepehr@um.ac.ir

Abstract

In this paper has been studied the capability of Lut desert as a world Geopark based on geo-heritages sites. Lut Desert with area of 100,000 km² approximately is hottest point in the world and 25th world largest desert. To investigate Geopark capability of Lut desert, we applied a quantitative approach based on geoheritage features inference score. In the first was identified the main geomorphology landforms in the Lut desert considering Hydro-Aeolian landforms regarding Mega Yardangs and Kalut, Aeolian features involving desert pavement stones (Hamada), Nebkha, and sand sea (Erg) with highest sand dunes in the world. In other hand was determined the main geomorphic forms in the Playa of lut with huge salty-clay pan areas. To assess capability of these geoheritages for introducing Lut desert as a world geopark, an approach was developed based on utility theory and matrix decision framework. A representative value function was inferred to explain the relative importance of the geoheritages features. The results of this research indicated that Lut desert can be considered as a world geopark to comparison desert evolution and landform chronology in relation to geomorphology events, anthropology and civilization development in similar areas in the world.

Inference approach; Geo-heritages; Geopark; Lut desert; Geoarchaeology

Application of High-Resolution Satellite Remote Sensing in Geoheritage Survey and Monitoring of the Yellow River Delta

Xueping Liu¹, Liping Zhou¹, Ying Dong², Xiaochen Dong¹

¹Laboratory for Earth Surface Processes, College of Urban and Environmental Sciences, Peking University, Beijing 100871, China

²China Institute of Geo-Environment Monitoring, Beijing, 10081, China

Abstract

High-resolution remote sensing image can provide clear details of Earth surface. A combination of remote sensing data and Quaternary information allow us to identify and interpret geoheritage of fluvial landform in Yellow River delta and to monitor the changes in the conservation of the the protected geoheritage. We show that high-resolution satellite remote sensing image has distinct features of river geomorphology in shape, colour and texture, especially for ancient channels and marine sediments, which help to define the types of geoheritage. Using the remote sensing image, we have obtained the information of the surrounding area of the geoheritage environmental conditions including landuse, vegetation coverage and human activities, evaluation of degree of the geoheritage availability. By applying method of dynamic contrast of remote sensing, we can monitor the river migration and collect more detailed features of the geoheritage.

Geoheritage; Fluvial Geomorphology; High-resolution satellite remote sensing; Yellow River delta

Deterioration Hazard of Granite Geomorphologic Landscape: A Case Study of Sanqingshan National Park (SE China)

Xingshan Wang^{1,2,*} Jie Zhang¹

¹School of Geographic and Oceanographic Sciences, Nanjing University, Nanjing, 210093, China, wangxshnju@163.com

²School of Culture Industry and Tourism Management, Sanjiang University, Nanjing, 210012, China

Abstract

The granite geomorphologic landscape is all over the world, which is important physical heritage and tourism attraction, especially in China: many famous religious or tourism mountains are granite geomorphologic landscape. Although being hard material, the granite is still suffering weathering and facing deterioration hazard of all kinds of environmental agencies. Therefore, it is very important to find the main weathering agencies for the sake of the landscape and geo-heritage conservation work.

Previous research of granite weathering mostly focused on the correlation between weathering and physical parameters such as porosity, P-wave velocity, uniaxial compressive strength and so on, which are significant to those building stone. However, as view of tourist, the granite landscape should deserve more attention on the surface deterioration. The authors chose the Sanqingshan National Park as experimental object, measured the surface hardness through Schmidt Hammer, and obtained the chemical weathering degree such as Chemical Index of Alteration (CIA), Weathering Index of Parker (WIP), Weathering Index of Colman (WIC) through XRF experiment. Based on field work and such experiments, we obtained:

- 1.The weathering process of Sanqingshan granite landscape is mainly chemical weathering.
2. The surface hardness of Sanqingshan granite has a certain correlation with the chemical weathering degree: the granite whose CIA are all below 60 or so, have a extremely low surface hardness (below the minimum of the Schmidt hammer); the CIA of granites which are capable for Schmidt measurement are all above 60, but further correlation analysis showed that there is a weak correlation between the CIA and the surface hardness. Such results indicate that, at the primary stage of chemical weathering, the surface hardness of granite is mainly determined by the texture and structure, comparing the chemical components; at the terminal stage of the chemical weathering, the surface hardness of granite decrease sharply, and the granite landscape have high risk of deterioration.
- 3.The main driving agency of Sanqingshan granite weathering is precipitation, other environmental

condition such as sunshine, vegetation have little effect on the weathering process, the granite surfaces with well hydrodynamic conditions have the high risk of deterioration; moreover, the tourist action have a obvious interference to the granite surfaces.

Key words:

granite landscape; chemical weathering; surface hardness; deterioration hazard; Sanqingshan National Park

Geotourism Management in China Learned from the Grand Canyon Experience in the US

Jinjin Wan¹, Run Sha²

¹ School of Management, Nanjing University of Posts and Telecommunications, Nanjing 210023, Jiangsu, China, jinjinwan@njupt.edu.cn

² School of Geography Science, Nanjing Normal University, Nanjing 210023, Jiangsu, China

Abstract

The development of geotourism is presenting a global trend. Under the theoretical background to the geotourism, this paper explores the geotourism structure of the Grand Canyon National Park in the US based on sustainable tourism, and points out the characteristics of geotourism management. The successful experience strategies are learned from the Grand Canyon through field trip method: 1) Plan out tourism product with art experience, and develop vivid interpretation and geoscience education; 2) Improve and optimize tourism infrastructure centering on the visitors; 3) Focus on community tourism resilience planning, and obtain sustainable balance between resource protection and visitor demand; 4) Raise and secure funds of geological heritage management in many ways, and thus promote sustainable development level of geotourism in China.

Key words:

Geotourism; geological heritage management; GeoPark; Grand Canyon

The Geo-Tourism Development of Geopark in Japan-A Case Study of Naeba Mountain Geopark

Kun XIAO, Mollah Hoque TANJINUL, Takaaki NIHEI

The Graduate School of Letters, Hokkaido University, Japan, syoukoncn@yahoo.co.jp

Abstract

Geopark is the place to preserve the value of earth science of natural heritage. The construction of geopark is to preserve the heritage of the earth and education, utilize tourism resources and speed up the regional sustainable development. In Japan, there are 1839 geoparks including 8 Global geoparks. In the geopark activities, the development of the geological tourism is very important. This study takes the Naeba Mountain Geopark in Japan as an example to know about the present situation of the Geo-tourism in order to clarify the purpose of the study of Naeba Mountain Geopark. Using interview of local administrations and tourists as well as data analysis, the authors described the current situations of the Geo-tourism and making future plan along with conclusion that the geo-tourism has great contribution to the local economy however, there have been problems such as the support of government is not enough.

Geopark; geo-tourism; tour; geography; Japan

The Value Assessment of Main Geological Heritage Resources in Fangshan World Geopark of China

kun zhou

China University of Geosciences, China, zhokunny@163.com

Abstract

Based on analytic hierarchy process and linear weight method, this paper constructs the value assessment indicator system to classify and evaluate the main geological heritage resources of Fangshan World Geopark of China. The results indicate that there are abundant and high scientific value geological heritage resources in Fangshan World Geopark of China, with two world-class ones, four nation-class ones and eight province-class ones; the abundance of geological heritage resources in Shidu Geo-Region and Baishi Peak Geo-Region is higher than others; the types of geological heritage resources in Zhoukoudian Geo-Region and Shihua Cave Geo-Region are more characteristic and distinctive; the world geopark is rich in geological tourism resources and relying on the advantages of resources, a China's top base for scientific popularization and research and a international famous scenic spot for geoscience popularization could be built at Fangshan World Geopark of China.

Key words:

geological heritage; value assessment; world geopark

Black Moves: Moments in the History of African American Masculine Mobilities

Cresswell T

Northeastern University, Boston, 02115, USA, t.cresswell@neu.edu

Abstract

This paper explores the mutual constitution of blackness and mobility in the context of the United States. Using insights gained from the inter-disciplinary field of mobility studies it argues that mobilities have played a key role in the definition of blackness (particularly black masculinity) at the same time as blackness has been mapped on to particular forms of mobility. The paper is constructed through a series of suggestive vignettes moving backwards through time that illustrate continuities in the way forms of movement, narratives of mobility and mobile practices have intersected with representations of African American male bodies. Examples include endzone celebrations in American Football, stop and frisk procedures in New York City, the medical pathologization of runaway slaves, and the Middle Passage of the slave trade.

Key words:

Mobilities; race; blackness; African Americans; the United States; embodied mobilities; the Middle Passage

Borders, Mobility and Migration Choices. The role of Thresholds

Van der Velde, M.

Nijmegen Centre for Border Research, Department of Geography, Planning and Environment

Nijmegen School of Management, Radboud University, Nijmegen, the Netherlands, M.vanderVelde@ru.nl

Abstract

The crossing of national state borders is one of the most-discussed issues of contemporary times and it poses many challenges for many. Choosing to move - or not - across international borders is a complex decision, involving both cognitive and emotional processes. This paper tests puts three crucial thresholds that need to be crossed before mobility occurs to the fore. These concern the individual's mindset about migrating, the choice of destination and perception of crossing borders to that location and the specific routes and spatial trajectories available to get there.

The threshold approach, with its focus on processes affecting whether, when and where to move, aims to understand the decision-making process in all its dimensions, in the hope that this will lead to a better understanding of the ways migrants conceive, perceive and undertake their transnational journeys. This paper examines the three constitutive parts discerned in the cross-border mobility decision-making process: people, borders and trajectories and their interrelationships. It hopes to demonstrate that the relation between the three is not fixed but flexible and that decision-making contains aspects of belonging, instability, security and volatility affecting their mobility or immobility.

Key words:

Borders; Migration; Mobility; Threshold Approach; Decision Making

Climate Change and Causes of Migration in Coastal Bangladesh – Empirical Insights

Braun, B.

University of Cologne, Cologne, Germany, boris.braun@uni-koeln.de

Abstract

The idea that global climate change is contributing to migration in vulnerable regions such as coastal Bangladesh has generated considerable academic debate but only limited systematic evidence. In general, the existing evidence shows that climate change is generating rising sea-levels, more intense and destructive storms, greater rainfall extremes (both droughts and flooding) and higher temperatures. All of these are creating greater vulnerability for at risk populations. But is this creating greater migration? This paper presents empirical evidence based on data from national statistics and household surveys in rural areas of coastal Bangladesh. It is based on extensive field work in Bangladesh including a questionnaire survey of almost 1,200 households in selected coastal communities. This work has been conducted by an international team within the framework of the Belmont Forum funded Band-Aid research programme. Our findings suggest that migration is a complex process which is not adequately described by deterministic models and simplistic concepts such as climate or environmental migration. Rather, results point toward a new and broader understanding of climate- and disaster-induced mobility that recognises the significant barriers to migration for vulnerable households as well as their substantial adaptive capacity.

Key words:

Migration; climate change; environmental change; riverbank erosion; flooding; Bangladesh

Drought and Migration: Case of Gendered Response in Baoshan of Yunnan

yahui zou, Banerjee Soumyadeep

Yunnan Academy of Social Sciences, China, zou-yahui@163.com

Abstract

Yunnan Province in Southwest China suffered from a record-breaking, persistent meteorological drought with an estimated return period of greater than 80 years from autumn 2009 through 2012. Rural population was confronted with decreased water availability for farming. Therefore, out-migration from agriculture to other industries became one of the most important recommended solution for combating drought promoted by governments at various level. This paper, adopting a gender sensitive perspective, found that men and women have different perceptions and response about this policy and are affected by this policy in different ways. The study focuses on 3 different locations in Baoshan Prefecture to explore the gender differentiated perception of drought and out-migration in Yunnan, and discusses the gender-differentiated impacts of out-migration and men and women's responses to out-migration. The paper suggests that government-supported should response to women's response directly to meet their priority needs, and encourage women's active contribution and participation in local village public domain/affairs.

Key words:

droought; migration; gendered response

Migration Experience and Cultural Impacts: A Study in the Island of Majuli

Sahay A

Department of Geography, University of Allahabad, Allahabad-211006, India, avijitsahay@gmail.com

Abstract

Majuli, a riverine island in Assam is culturally dominated by neo-Vaishnavism. While in the rest of Assam, neo-Vaishnavism got diluted with new philosophical currents, Majuli preserved it in its pristine form. However, in 1950, Assam was struck with a powerful earthquake and River Brahmaputra started eroding land in Majuli, leading to almost one-third to two-third area of the island being lost to the river. During this time, population of the island has more than doubled, causing a large number of people to move out of the island, either as agriculturalists to nearby districts, or else to work in the industrial centres across the country. However, the youth does not always immigrate, and in many cases, return to the island. A long term trend is discernible in which families moving out to short distances to settle as agriculturalists migrate permanently, whereas youth going to far off urban areas return after an year or two. Thus, while the short distance migrants reinforce the neo-Vaishnavite culture in the rest of Assam; the long distance migrants return to Majuli with elements of foreign culture. Majuli as an island has always been in isolation, but the changing balance between land and people has resulted in contact with the outer world which is influencing the island as well as rest of Assam. The present paper studies the cultural changes being introduced in Majuli by returning islanders as well as the elements of culture being reinforced in places where Majulians have migrated.

Key words:

Erosion; Migration; Cultural Change; Island; Majuli

Mobility in an aging society: An investigation of elderly travel behavior and satisfaction in the old city of Beijing

Yue Wang, Pengjun Zhao

Department of Urban and Regional Planning, College of Urban and Environmental Sciences, Peking University, Beijing 100871, P.R. China, pengjun.zhao@pku.edu.cn

Abstract

The rapid increase in the older population in China has been concerned since 1990s and can pose a significant challenge to transportation. Chinese older population aged 65 and over has increased from 98.79 million to 138.15 million, with the percent of total population from 7.95% to 10.1% during the period between 2004 and 2014. Mobility is a critical element of one's quality of life especially for the older citizens. It is imperative to investigate the mobility characteristics and satisfaction of older adults and explore influencing factors.

Although some studies have examined elderly travel behaviour, the influencing factors have not fully explored and less studies investigated their subjective satisfactions. This study would meet the gap by investigating the trips, distances, time, mode choices of day travel characteristics for older adults, compared with young adults. We also assess the elderly stated satisfactions with mobility. The main factors influencing the elderly mobility are discussed, such as the built environment, transportation, economics and self-perference. The results would enhance our understanding of the characteristics of mobility of China's elderly, and contribute to the policies designed to improve mobility in an ageing society.

Key words:

mobility; aging society; travel behaviour; elderly

Motivational Profiles of Young People to Go to Live/Work Abroad

Pumares P, Navas MS, González-Martín B, Rojas AJ

University of Almería, 04120 Almería, Spain, European Union, arojas@ual.es

Abstract

Youth mobility is a raising issue in Europe. The European Union (EU) is encouraging mobility to improve labor market adjustment and to contribute to an European identity. Despite the free mobility for EU citizens it doesn't reach the expectations. Thus, it is important to understand the motivations that encourage people to move. This study focuses on the motives of young people to move to live or to work abroad. A comprehensive representation of youth mobility requires understanding not only who migrates but also who is sedentary. The aim of this work is to analyze the differential motivational profiles of young people in the case they decide to migrate. The sample for this study is composed of a sample of university students and young unemployed people. They were interrogated about nine motives to move or not to move abroad responding to a questionnaire. This questionnaire was framed in the H2020 European project YMobility. In order to identify the motivational profiles, a cluster analysis was performed with the scores of each motive. After determining the optimum solution of clusters, the differences in some socio-demographic and other related variables were analyzed by motivational profiles.

Key words:

Youth mobility, migration motives, motivational profiles

Population Mobility on Small Tourist Islands. The Case of the Canary Islands

José-León García Rodríguez

Departamento de Geografía e Historia. Universidad de La Laguna

jleongarcia@ull.es

Abstract

The Canary Islands have 2.1 million inhabitants and cover a total area of 7,493 km². The seven islands are of varying size, with unequal resource endowment. With 12 million visitors in 2015, the main source of income is tourism, accounting for 31.4% of regional GDP. The islands' airports handled 35.8 million passengers in 2015, of which 5.5 million corresponded to interisland travel; the seaports handled 5.6 million. These figures demonstrate the high mobility of the island population.

But the heterogeneous population dynamics relate to the different island demographics and economies, and to the importance of tourism and services on each island. Tenerife and Gran Canaria, with 85% of the population and the greatest economic and services potential in the region, are the islands with the greatest population mobility and immigration. The islands of La Palma, La Gomera and El Hierro, with very little tourism development, have lower population mobility and their population is decreasing. The arid islands of Lanzarote and Fuerteventura were sparsely populated in the past. Now, however, they have the highest relative population mobility and the highest population growth rates in the archipelago due to the introduction of seawater desalination, which enabled tourism to expand. Consequently, the development of tourism is the main factor behind the complex patterns of population mobility in the Canary Islands.

Key words:

resource scarcity; tourism economy; population mobility

Quantitative and Qualitative Features of Post-Communist Romanian Emigration.

Case Study: Moldovan Region

Dimitriu R.I., Tudora D., Dimitriu A.

University "Al. I. Cuza", Iași, 700506, Romania, dimitriuradu@yahoo.com

Abstract

After the collapse of the communist regime, the Romanian society has experienced numerous social, political and economic changes. One of them refers to regaining the right of free movement, which has triggered significant migratory flows mainly oriented towards Western Europe.

However, the quantitative and qualitative knowledge of this phenomenon (which is very typical of present-day Romania) is poor, the three post-communist population censuses providing but very general and (anyway) inaccurate data.

In order to remove this informational lack we focused our attention on Moldavia (a historical province lying in North-East Romania) within which, by means of the directed survey method, we collected a sample of 24,987 people who have gone abroad the country in order to work after 1989. In our study we examined the destinations of immigrants from Moldova, as well as various aspects of population dynamics of these movements. Structural aspects of the population involved haven't been neglected: the structure by age and sex, structure depending on marital status, and professional and confessional structure. Moreover, where this was possible they were studied including changes that have suffered these structures over the period.

Key words:

International migrations; migration dynamics; demographic structures of immigrants

Reforming Agricultural Guest-Worker Visas: The U.S. and E.U. Compared

Glatzer, M.

La Salle University, Philadelphia, U.S.A., glatzer@lasalle.edu

Abstract

Every year, tens of thousands of workers enter the United States and the European Union on temporary visas to perform low-wage work on farms. However, guest-worker visas for agricultural labor in the rich democracies are often associated with worker abuse and exploitation. In the words of a member of the US Congress, some of these programs, such as the H-2A and H-2B visa categories in the United States, have produced conditions “close to slavery”. Violations of minimum wage laws, wage theft, overcharging of housing, violations of housing standards, unsafe working conditions, lack of access to medical care, and excessive fees paid to labor recruiters and middlemen are frequent occurrences. Similar problems bedevil temporary immigrant farm labor in Europe. This paper examines the failure of these guest-worker programs to ensure decent working conditions, analyzes proposals put forward to remedy these issues, and evaluates the politics and trajectories of reform in the United States and the European Union. Using interviews with advocates for immigrant farm labor, it examines the variety of proposals presented as potential solutions. The legislative history of recent reform attempts in the US Congress and the European Parliament, as well as executive action by the European Commission and U.S. Presidential Administrations, is used to process-trace the dynamics and differential success of reform of low-wage temporary work visas for agricultural work on both sides of the Atlantic.

Key words:

Guest-worker visas, Low-wage work, Agriculture, Temporary work visas, Circular Migration

Rural-Urban Migration and Household Livelihood in the Agona West Municipality,

Ghana

Prof. Tanle, A., Dr. Ogunleye-Adetona, C. I., Miss Arthor, G.

Geography and Regional Planning, University of Cape Coast, Ghana, adeogunleye2005@yahoo.com

Abstract

Rural-urban migration a multidimensional phenomenon, is becoming part of the daily reality in Ghana and many other developing countries. For instance the impact of migration on households whose member(s) migrated is relatively not very clear especially how this impact differs for households with different socio-economic status. A study was then undertaken to examine the impact of rural-urban migration on rural migrant's households' social-economic status (livelihood) in Agona West Municipality, Ghana. 150 respondents were randomly selected and interviewed to obtain information on the motives of migration and the impact of remittances on household livelihoods. Eight male and female heads of households were purposively selected from each village for the focus group discussion. Frequencies, percentages, diagrams and tables were used to explain the data obtained. The study identified two types of households; the poor and very poor households, and the better-off households. Also it was observed that the poorest migrant households mostly females, were often forced to migrate because of their poor living conditions and low educational attainment, the better-off migrant households with higher educational attainment often migrate deliberately in order to accumulate more wealth. The better-off are therefore positively impacted; better access to health-care, more education opportunities, and agriculture than the poor migrant households. It is therefore recommended that government policy on poverty and employment especially for rural areas need to be revisited for better employment opportunities in the rural for the youth and adults and thereby curb the drift to urban areas.

Key words:

Migrant Households; Poor Households; Better-off households; remittances; Socio-Economic Status; household livelihoods

The Challenge of Diversity: Refugee Allocation and Integration in Post-Socialist Rural Settings

Glorius, B.

Chemnitz University of Technology, Chemnitz, Germany, birgit.glorius@phil.tu-chemnitz.de

Abstract

Migration has severely changed the population structure and social fabric of many regions in Europe. Especially in recent years, many urban but also peripheral, rural regions in Europe experienced increasing population diversity due to the inflow of European free movers, third country migrants and refugees. Contrary to urban agglomerations, rural communities often have few experiences with diversity. In Germany, the huge inflows of refugees since 2013 and their redistribution among federal states and counties confronted many rural municipalities with questions of integration and diversity for the first time. Dealing with those questions we can observe a new East-West divide, with the post-socialist part of Germany appearing as especially hostile, xenophobic and even dangerous for foreigners. My paper explores the perceptions and practices of refugee reception in a post-socialist rural part of Germany. I will show that the recent refugee allocation is not only perceived as an external shock, but also as a form of betrayal of the local population that partly still suffers from devaluation due to the political and economic transformation since 1990. Using selected case studies, the problem of social acceptance and possibilities to overcome xenophobia are discussed. In the outlook, the paper will generalize its findings and unfold the interfaces between immigration, integration, social resistance and social innovation in a regionalized perspective. The paper draws on statistical material and case studies which the author carried out in East Germany.

Diversity; integration; post-socialist transformation; refugees; rural regions

The Gandharbas living on the margins; Travelling in and from Nepal

Morimoto, Izumi

Faculty of International Studies, Meiji Gakuin University, Yokohama, Japan, izumim@k.meijigakuin.ac.jp

Abstract

Transnational migration, particularly from global south, has become one of the essential issues at the time of globalization. Nepal is no exception to this movement. Since the 1990s, the number of Nepalese going abroad has been increasing. The Gandharbas, recognized as the musical caste, and at the same time as the untouchable caste, in Nepalese Hindu society, and marginalized in and excluded from the society, had travelled around in Nepal to sing songs, and gotten some foods and money in return. Recently, some Gandharbas started to go abroad to work same as other Nepalese. In this study, the two Gandharbas, who have migrated to Ireland as workers, are focused on and analysed how they have survived through these situations as untouchables in Nepal and then as migrant workers in Ireland. Even though they are marginalized in Ireland, they could purchase their own houses in Kathmandu for their families. After getting Irish green cards, they don't work if they can't find good jobs, because they can get jobseekers' insurances there. And more they sometimes provide food and accommodation to other Nepalese who have economic and social problems in Ireland. Under such circumstances that they had never imagined in Nepal, they transformed their identities from as the untouchable caste in Nepal, to successful Nepalese migrant in Ireland. The changes of life worlds seem occurred in local scale, but we have to consider these changes as some aspects of the same phenomenon, ongoing reality on the global changes.

Key words:

Nepal; the Gandharbas; travel; migrant; marginalization; exclusion; identity

Translocal Life and Integration of Highly-Skilled Migrants in Germany

Pfaffenbach, C.

Department of Geography, RWTH Aachen University, Templergraben 55, D-52062 Aachen, Germany,

pfaffenbach@geo.rwth-aachen.de

Abstract

This paper addresses the living situations of highly-skilled migrants in Germany, taking managers and persons working in the arts in western German cities as examples. With reference to integration concepts as well as approaches to transnational migration and translocality, the results of qualitative guideline-based interviews conducted with these groups are presented. The focus is on the highly-skilled migrants' professional work conditions, their translocal mobility practices, as well as their shaping of everyday practices and networks in their German places of residence. The depicted networks and translocal practices of highly-skilled migrants reveal existing integration options and aspirations. Both, options and aspirations, are limited by the temporality of their stays, their heavy workloads, their often limited knowledge of the German language, their focus on international networks and only little interest for social contacts on the part of the host society.

Key words:

highly-skilled migrants, translocality, transnational migration, integration, Germany

Where, When, How Often and Using What Routes? Everydayness and Time-Space Mobility of Ukrainian Labour Migrants in Prague (Czechia)

Drbohlav, D., Čermáková, D., Štych, P.

Department of Social Geography and Regional Development, Faculty of Science, Charles University in Prague, Prague, Czechia, drbohlav@natur.cuni.cz

Abstract

The contribution deals with an in-depth survey of everyday life of Ukrainian labour migrants in Prague, a capital of Czechia. The analysis is based on data which was gained via a diary method (the survey was carried out for half a year - in 2011 and 2012 when altogether 19 migrants were willing and able to take part in the diary survey mapping in detail their daily behavior). The research task was to ascertain what are daily “time-space models” of migrants’ behaviour through the city. Of course, time-space patterns are accompanied with description and explanation of migrants’ economic, social and cultural backgrounds and activities which trigger why and how the given migrants are on the move. Two concepts were used: time-space geography (tied mainly to Hägerstrand’s Lund school) and sociology of everydayness (see e.g. Bennett, Watson 2002). This study – analyzing in detail migrants’ time/spatial patterns inside the city, is, in fact, really unique. On one side, there have so far been studies on “time-space” patterns in cities and, on the other side, migrants’ living style in cities, but there are non combining these two topics together.

Key words:

Ukrainian labour migrants; Prague; Czechia; “time-space” behaviour; dairy method

Gender, Migration, Remittances and Development in Uganda

John .A. Mushomi

Makerere University, Department of Population Studies, Uganda, jmushomi@gmail.com

Abstract

Understanding the intricacies of gender, migration remittances and development can result in programs and policies that enhance the benefits and decrease the economic and social costs for female migrants, who make up half of the global migrant population. In this chapter the importance gender as important predictors of remittances use for development by households is underscored. While International migration tend to favor males in Uganda, in this chapter it is noted that households with female senders had increased odds of using remittances for development purposes at household level.

²Fogo Natural Park (Cape Verde)

Abstract

One year after the volcanic eruption of 2014-2015 in Fogo Island (Cape Verde), the spatial mobility of inhabitants affected by this natural event requires an analysis and a deeper understanding. In this poster it is presented the most characteristic data of the social and cultural behavior of migrants in the context of migration studies, a fruitful interdisciplinary research field. The sample studied represents a new interpretation of mobility linked to natural hazards such as volcanic eruptions. Within this framework of analysis, human behavior and attachment to the place of origin are analyzed as a challenge to the limits of the volcanic risk areas and the intrinsic spatial relationship between nature and population mobility, a mobility that exceeds the natural disasters. The balance of migration, according to the processes of volcanic eruption, provides a good example of the importance of social and cultural behavior of the inhabitants of volcanic islands.

Statistical information of the return of the inhabitants to Cha das Caldeiras the analysis of the damage caused by the eruptive event, changes in the location of settlements and economic activities, aerial photographs, satellite images, photo gallery and maps comparing the before and after Caldeira and, in particular, the information obtained through individual interviews to affected people, are a powerful witness to the social, cultural and economic resilience of human mobility in the context of natural hazards.

Key words:

spatial mobility; resilience; natural hazards; volcanic risk; Fogo Island

Exploring the Efficiency of Location-based Social Media in Modeling Activity Patterns—a Case Study of Beijing, China

Xujiao Wang, Yihong Yuan

Texas State University, San Marcos, 78666, United States, x_w9@txstate.edu

Abstract

In this big data era, location-based social media (LBSM) are increasing being used to replace traditional survey methods in modeling activity patterns. In order to evaluate the efficiency of LBSM data quality and temporal resolution, we are focusing on 3 indicators in this research. First, individual's activity patterns will approach the steady point based on analyzing a large LBSM sample size, through the steady indicator we will find out the balance point between the data efficiency and the sample size. Second, using a sample of Weibo (a popular social media in China) users' data of 7 months mainly focused on the geotagged data of individuals in Beijing area, we calculate the radius of gyration indicator for each user, interpreted as the characteristic distance travelled by the user when observed up to the time. Then analyze user's activity trajectories regularity ellipse which records one's attending frequency at the locations, and each user's activity trajectory regularity ellipse is different due to their activity patterns diversity. Third, because of the random nature of human mobility, we calculate the entropy of their regularity to get a degree of predictable value for the regular pattern of an individual. We expect this inherent similarity in individual activity patterns could explain and impact some phenomenon driven by human mobility in the field of temporal resolution, data quantity and other complements.

Key words:

data quality; human mobility; individual activity patterns; spatial-temporal location-based social media

Media Representation: A Study of Crime News Reporting in Delhi

Tripathi V.

Department of Geography, Delhi School of Economics, University of Delhi, Delhi - 110021, India,
vivektripathi21@gmail.com.

Abstract

Information about crime and violence is primarily derived through the media. This paper examines the structure and pattern of crime news and tries to determine the extent at which reported news by media differs from actual crime reporting conducted by government agencies. Four months crime news reports published by Time of India Newspaper, from June, 2013 to September, 2013, have been examined through content analysis method. After analysis it has been found that media crime reports are presenting skewed crime data and they over-hype certain types of crime, particularly, crime against women. There has been huge difference found between the data generated through crime reporting in Times of India newspaper and the National Crime Record Bureau, a governmental data portal. Adoption of selective news negatively influences the perception of people. It results in increased fear among people. Media must adhere to objectivity and present the reality among people instead of prevailing false fear of crime. The practice of moulding crime news according to the incident and person involved is highly dangerous for the welfare of the people. This paper provides a clear picture of actual crime in Delhi and the selective approach of News Media that falsely damages the image of city as crime capital of India. This study positively fills the gap to the limited research on News Media in context of India.

Media Effect; Media Representation; Public Perception; Crime and Violence; Crime and Media; Mass Media; News Reporting; Crime reporting.

Mobility and Translocal Livelihoods in Bangladesh

Islam, M M¹, Sadeque, F B²

¹Sylhet Agricultural University, Sylhet 3100, Bangladesh, mahmud.cmf@sau.ac.bd

²Pranthik, Sylhet 3100, Bangladesh

Abstract

Human mobility has garnered increasing attention in both policy and academic debates, particularly in the context of climate change. Based on secondary literature and qualitative fieldwork, this research investigates the migration trajectories in Bangladesh through translocality lens. The findings indicated that though ongoing environmental change act as driver for mass migration but it can only explain parts of peoples' motivation to migrate. A complex array of economic, societal and cultural issue is interplaying in making the migration trajectories. In many instance, the decision to migrate is shaped by and shaping rural–urban networks across space that organize the behavior of households. Consequently, migrant demonstrated active orientations towards their place of origin that builds translocal households by coordinating their livelihoods activities over geographical distances. Finally, the study concluded that the exchange process of different resources within divided migrant households is crucial for building resilience against crises they constantly face.

The National Identity of the Korean Chinese in South Korea: A Geographical Analysis of Their Social Network

Yinhe Li, Youngmin Lee, Shangyi Zhou.

Institute of Korean Peninsula Studies in Yanbian University, Yanji, 133002, P. R. China, yinheli@ybu.edu.cn

Abstract

Many studies show that national identity changes when people enter another country. It is because they are involved in new social situations. This is a foregone conclusion. What people want to know is what impact national identity and what are the mechanisms that contribute to changing identities. One's national identity is influenced by many factors. To understand this complex issue, scholars need to investigate the mechanism behind those changes and deconstructing it. The Korean Chinese in South Korea are interviewed in this study. A general analytical framework was designed for this case study. It considers geographical characteristics of social networks as independent variables and the home country identity as the dependent variable. The major objective is to investigate changes in a Chinese identity to a Korean Chinese identity in South Korea. We conclude that the Korean Chinese in South Korea are gradually tightening their economic relationships and ties with China. The networks of their family and kinship has still include both China and South Korea, as they have since the early of 1990's when the first tide of Chinese entered South Korea. The international influence of China improved when more Korean Chinese began to also enter other countries in the past decades. All of these developments enhance the Chinese identity of the Korean Chinese in South Korea. A geographical perspective aids in analysing the changing national identity. The identity of the immigration country and emigration country is to be compared in the future.

Key words:

Korean Chinese in South Korea; identity of emigration country; social network; geographical characteristics

Mapping the Spatial Evolution of Urban Innovation Structure at the Zip-Code

Region Scale: A Two-City Comparison of Beijing and Shanghai

Duan Dezhong, Du Debin, Liu Chengliang

Institute for Innovation and Strategic Studies, East China Normal University, Shanghai, 200062, P. R. China,

dezhong_tuan@163.com

Abstract

Based on Zip code geodatabase, the evaluation system of urban innovation was established in the perspective of innovation output, and the spatial evolutionary mode, which is concerning the structure of innovation space of Shanghai and Beijing from 1991 to 2014, was discussed. During the 25 years, the growth of spatial structure of innovation of Shanghai and Beijing demonstrated a lot of common features: with the increase of urban space units participated in innovation year by year, although the overall gap of regional innovation output has narrowed, the trend of spatial agglomeration has strengthened. The growth of spatial structure of innovation of Shanghai and Beijing demonstrated the differences among common features during the 25 years as well: in the trend of the suburbanization of innovation resources, the spatial structure of innovation of Shanghai indicated the driver has evolved from the single-core driver to the multi-core resonance evolution. Radiation effect using traffic arteries as spatial diffusion corridors was prominent. The spatial structure of innovation of Beijing was single-core oriented structure all the way.

Acculturation and School Life Satisfaction of Elementary Students of North Korean Refugees in Daegu and Gyeongbuk Region, South Korea

Soon-Ho Park

Daegu National University of Education, shpark@dnue.ac.kr

Abstract

The number of North Korean refugees entering South Korea have been increased from 148 in 1999 to 2,941 in 2009. There are 24,671 North Korean refugees in South Korea in 2014. About 8.9% of 24,671 North Korean refugees in South Korea are in elementary, middle and high school. About 51.7% are elementary students. This study attempted to analyze the relationship between school life satisfaction and acculturation of elementary students of North Korean refugees in Daegu and Gyeongbuk region. The proportion of assimilation was slightly higher than that of integration. However, 42 percent of students belonging to separation and marginalization passively accepted south Korean culture, so that they would have a difficult time in adjusting to new culture. Students getting older and being used to school life strongly inclined to accept south Korean culture; while, students born in north Korea tended to resist acceptance of south Korean culture. Most students were satisfied with school life. The satisfaction level was high in the relationship with teachers and school environment; while, the satisfaction level in learning activity was relatively low. In the relationship between school satisfaction and types of acculturation, students actively accepting new culture were relatively high satisfied with their school life. accepting new culture were relatively highly satisfied with their school life. A standardized short-term education oriented program for north Korean adolescents refugees living in south Korea should be shifted into the long-term support policy reflected in class and attribute in terms of acculturation.

Key words:

north Korean elementary students refugees living in south Korea, acculturation, school life satisfaction

Addressing Social Issues in Chinese Overseas Investment: A Conceptual Framework Integrating Social Impact and Risk Assessment

Luke Long, Kai Shang

MWH China, Shanghai, 201103, P.R. China, Luke.Long@mwhglobal.com

Abstract

Since the adoption of China's "Going Global" Strategy, Chinese overseas investment by Chinese enterprises is becoming increasingly influential globally. Such investment has brought considerable positive outcomes to China and the recipient countries in Asia, Africa and Latin America. However, the benefits are oftentimes undermined by inadequate social safeguards and poor social performance. There is a need to better manage social conflicts and assure sustainable development in the recipient country's community, but how best to fulfill this need remains to be answered. Our international and China experiences have shown us that social assessment is the cornerstone of implementing social safeguards and carrying out the assessment at the preparation stage of a project is the best time to address social issues. This paper consolidates the lesson-learned from internationally practiced Social Impact Assessment (SIA) and China initiated Social Stability Risk Assessment (SSRA), to profile an innovative approach to address the social issues and challenges in Chinese overseas investment. Five sections are included. Section one summarizes the issues and challenges faced by Chinese overseas investment. Section two discusses the concepts and common features of a SIA and SSRA. Section three examines the limitations within SIA and SSRA individually and explores the imperative needs to combine both together in practice. Section four develops an integrated social impact and risk assessment (SIRA) framework to identify, evaluate and address social issues, impacts and risks related to Chinese overseas development projects. The last section proposes policy recommendations for Chinese enterprises and financing institutes to better manage overseas investments.

Key words:

Chinese overseas investment; social safeguards; integrated assessment; social assessment

An Assessment of the Effectiveness of the Bui Dam Project Resettlement Scheme

Richard Koranteng

Ghana Dams Dialogue- Volta Basin Development Foundation, Ghana, rtwumus@yahoo.com

Abstract

The Bui Hydro Electric Project was financed and constructed by the Chinese in Ghana. Findings indicated that the affected people have been sufficiently consulted at all levels of their resettlement. In particular the Ghana Dams Dialogue which served as a liaison entity between the Government and the communities came up for praise for its usefulness. Many tangible policies were put in place to mitigate the socio-cultural negative effects on the people. There were however issues with loss of identity and disrespect for some traditional authorities. The Bui Power Authority also rigorously followed national and international laws and protocols in the design and implementation of the resettlement scheme. There had been a great appreciation of the compensation regarding infrastructural development but much more would have to be done to satisfy livelihood empowerment requirements. Candid efforts be made to restore the lost identities of those who felt so and more dialogue be encouraged among communities living together. To keep faith with the people, all unfulfilled compensations promised be redeemed immediately by the appropriate Government agency. Capacity building for the resettled people should be seriously looked into by appropriate institutions. Irrigation schemes should be made available for the people to cultivate.

Key words:

Participation; Multi-Stakeholder Platform; Cultural Harmony and Integration; Livelihood Empowerment

Exploring Socio-cultural Effects of Forced Resettlement in the Bui Dam Project Area of Ghana

Adjarkey, D

La Trobe University, Melbourne, Australia, adjarkey.d@students.latrobe.edu.au

Abstract

The Bui dam in Ghana is a state-directed project that was funded by the Chinese Government, through the Export-Import Bank of China, and built by China's Sinohydro Corporation. The aim of the dam was to generate hydroelectric power to enhance economic development, however, it also caused the displacement of 1216 people who required resettlement. While there are studies exploring the livelihood implications of this process, the socio-cultural impacts are not well understood. This presentation will explore the spiritual landscapes, built environment, ancient settlements, and memorable spaces that the resettled villages lost under the floodwaters of the Bui dam. The data will be drawn from a community-based visual recording of everyday behavior and the cultural resources of the affected villages, which I undertook for my master's thesis between 2009 and 2011. The presentation will also share initiatives by both Ghanaian project authorities and village leaders to exhume and relocate the ancestral remains and shrines of deities to the resettlement communities in 2012. These are the few attempts made by various project stakeholders to address the cultural losses that the resettled persons would have suffered because of the Bui dam forced resettlement project. The paper highlights the importance of increasing local voices in resettlement projects.

Key words

Bui Dam, Socio-cultural Impact, Forced Resettlement

Hands-off in Practice? Chinese Engagement in African Dam-induced Displacement and Resettlement

XIAO HAN

University of Melbourne, Australia, hanx1@student.unimelb.edu.au

Abstract

China has raised its dam construction industry via the built-up of numbers of world-class large dams in the past semi-century. As a result, it has also gained comprehensive experience to address dam-induced displacement and resettlement issues. In the nation's going-out wave over the last decade, Chinese dam construction enterprises accompanied with Chinese financial institutions have entered Africa among the so called Chinese influx to "export" large dams. Although the "China in Africa" topic has been debated widely, little has been explored on the ground about Chinese actors' engagement in African development-forced displacement and resettlement, either directly or indirectly. This paper thus attempts to understand the roles of Chinese actors in the displacement and resettlement induced by African large hydropower development. Specific attention will be paid to: how do Chinese actors involved in African dam-induced displacement and resettlement? how could China's domestic resettlement experience be delivered? The recent completed Bui hydroelectric project in Ghana, contracted with Chinese builder and financier, will be employed to illustrate with first hand data.

Key words:

Development-forced Displacement and Resettlement; China's dam construction industry; financial institutions; Ghana

Managing Social Risks for Chinese Outbound Development Projects, Adapting to Local Socioeconomic Context

Jianliang Xiao, Piers Touzel

Hohai University, Nanjing, 210098, P. R. China, elisa.xiaojl@gmail.com

Abstract

China's domestic practice on development-forced displacement and resettlement are increasingly aligned with international expectations. In China, where government plays a leading role in land acquisition and resettlement, project developers are responsible mostly for the costs associated with land acquisition and resettlement. The "Social Safeguard" components of the land acquisition and resettlement process (such as livelihood restoration) are the responsibility of the government agencies implementing the resettlement. While China has resettled more people than any other country to accommodate industrial and infrastructure projects, the institutional knowledge relating to land acquisition and resettlement rests largely with the government rather than the project proponents. Against this backdrop, Chinese developers investing in emerging markets are challenged by the need to be much more "hands-on" in planning for and implementing resettlement programmes, where host government agencies lack the institutional knowledge that Chinese companies have come to rely on back home. Such challenges are compounded by operating in a very different socio-economic and regulatory context. This paper explores the social performance of Chinese outbound projects and proposes measures to mitigate these risks through tripartite engagement with affected communities, government agencies and project partners.

Key words:

Social Safeguard; Outbound Project; Resettlement; Social Risks; Adapting

Resettling the Displaced Via Government Migration Schemes: Considering Indonesia's Transmigration Program

Singer J, Rampisela DA

Kyoto University, Kyoto, Japan, singer.jane.6e@kyoto-u.ac.jp

Abstract

Many dam-displaced populations in Indonesia have been resettled through inclusion in the transmigration program, a government-sponsored internal migration scheme that has moved more than 7 million indigent farmers from Java, Bali and Madura to the outlying islands over the past 50 years. The researchers examine transmigration as a displacement policy instrument with case studies of the Wonogiri dam in central Java and the BiliBili dam in Sulawesi. In the case of the Wonogiri dam, the original participants in resettlement in the 1970s tended to be poorly compensated or landless farmers, as more financially abled residents chose to remain in central Java. However, ongoing interviews and surveys of Wonogiri farmers resettled in West Sumatra and Jambi provinces suggest that a shift from reliance on food crops to tree crops such as rubber and oil palm have enabled them to record higher average income than households remaining in Java. For Bili-Bili displacees as well, when presented with options under a "cash for land" system, poor and landless farmers tended to choose transmigration to remote areas. After initial adversity the resettlers, who had received large land allotments, realized increased earnings from cash crops when compared with pre-displacement conditions. The authors suggest that distant resettlement can be one means of relieving the problem of poor land availability for displaced populations in densely populated areas, but it raises such issues as coerced participation, cultural or ethnic incompatibility with host populations and adverse environmental impacts.

Key words:

Dam-forced displacement; resettlement; livelihood strategies; internal migration; resource-based development

Sustainable Infrastructure Projects? New Developments in Managing Social Risk in Investment Lending

Gransow, B., Price, S.

Freie Universität Berlin, Germany, bgransow@zedat.fu-berlin.de;

Australian National University, Canberra

Abstract

Recent announcements of new international financing initiatives, especially China's new multilateral development bank (MDB) the Asian Infrastructure Investment Bank (AIIB), have sparked widespread interest in the governance and safeguard standards that might apply to projects which are financed by emerging economies. Drawing upon analysis of the recently released AIIB Environmental and Social Framework (ESF) and the previous consultation process, this paper explores the AIIB's planning assumptions, social safeguards and intended modes of operating, including its stated objective of 'knowledge management.' (AIIB website). This paper addresses the question: what kind of knowledge may be considered relevant in social safeguard application to new AIIB-financed project investments? In what ways could knowledge be utilised to inform planning decisions that will inevitably distinguish AIIB as a new MDB in Asia, and inextricably mark its character? The paper addresses these questions by drawing, selectively, upon recent developments in China in social impact assessment and upon China's recent record of overseas investments.

Key words:

Social risk analysis and management, sustainable infrastructure projects, AIIB

The Asian Infrastructure Investment Bank: Understanding its Social and Environmental Framework

Brooke Wilmsen, Susanna Price

La Trobe University, Australia, b.wilmsen@latrobe.edu.au

Abstract

In 1999, China formally launched its “going out” policy and for the last decade its efforts to invest abroad have intensified. China is now the world’s third largest outbound investor, backing large infrastructure constructions across Asia, Africa, Latin America, Europe and the Middle East. Many of its investments, such as large dams, mines, transportation corridors and port constructions displace large numbers of people. As such, China’s social responsibilities feature high on the agendas of activists, NGOs, CBOs, academics and practitioners in the sector. This is a shift from the many decades where such scrutiny was concentrated on the activities of the major international development banks. However, in 2015, China established a new international development bank, the Asian Infrastructure Investment Bank (AIIB). This new player in the global development architecture includes 57 member states from around the world. China holds the largest voting share at over 25 per cent and therefore maintains power of veto. Not only will China’s investment in large infrastructure projects be further intensified through the AIIB, but such investments will also be more visible as will their social and environmental impacts. In its bilateral dealings, China’s position is to default to the borrower’s domestic policies on land acquisition and resettlement, however, under the auspice of AIIB it is committed to an environmental and social framework. Late last year a draft was circulated for comment. How that framework compares to the latest operational procedures of other leading development banks in the region, the World Bank and Asian Development Bank, will be explored in this paper.

Key words:

development safeguards; land acquisition

The Benefit-Sharing Policy and Practice in China: Past, Present and Future

DUAN Yuefang

China Three Gorges University, Yichang 443002, P.R. China, peter_yf@aliyun.com

Abstract

In an attempt to deal with the complicated involuntary resettlement issue caused by the construction of water resources development projects properly China has established the benefit-sharing policy to allow the displaced populations to share the benefits of water resources development since the middle of 1980s. This policy has been evolved as one very important pillar of Chinese resettlement policies with the transformation and development of Chinese economy over 30 years. Evidence has shown that this policy has played an indispensable role in restoring and improving the resettlers' livelihoods. But there is still room for this policy to be further improved in terms of the policy application coverage, the payment standard for supporting the resettlers and the types of benefit-sharing. This paper intends to analyze the evolution process of the benefit-sharing policy and conduct a preliminary evaluation of the effect of the current benefit-sharing policy based on the fieldwork finished in Shangrao City, Jiangxi Province as well as make some recommendations for the further policy improvement.

Key words:

Water resources development; Involuntary resettlement; Benefit-sharing policy; Sustainable resettlement

“Win-win approach”: Innovation in reservoir resettlement patterns in China

Chen Shaojun, Chen Yuhang

National Research Center for Resettlement, Hohai University

Abstract

Since the foundation of new China, China's reservoir resettlement and compensation policies have evolved for over 60 years. From 1949 to 1978, reservoir resettlement was conducted under administrative orders by means of political mobilization under the planned economy system. Since 1979, with China's reform and opening up, the Chinese government began to pay attention to reservoir resettlement and compensation, and proposed a development-oriented resettlement policy, a change from the past concept of paying more attention to construction and little attention to resettlement. In 1991, the Regulations on Compensation and Resettlement for the Construction of Large and Medium Water Resources and Hydropower Projects were promulgated formally, indicating that China's reservoir resettlement and compensation work became legalized and normalized gradually. In the 21st century, China's reservoir resettlement and compensation policies and practices have been innovating to protect the rights and interests of migrants, and realize the sustainable development of water resources and hydropower projects.

This paper explores “win-win approaches” to reservoir resettlement and compensation based on real examples, and analyzes elements, features, conditions and effects of various approaches to provide a useful reference for other water resources and hydropower projects. A “win-win approach” to reservoir resettlement and compensation is a pattern in which the migrants, developer, local government and other stakeholders share the benefits of the project jointly. Such approaches mainly include: 1) Equity participation: For a hydropower project with stable income, migrants may become shareholders with construction land approved according to law to share benefits; 2) Urbanization: The local government brings migrants into the urban employment system, offers free training, and establishes a social security system in conjunction with China's new-type urbanization strategy; and 3) Resettlement on reserved land: When collectively owned land of migrants is acquired, a certain percentage (10-15%) of the land is reserved as construction land to be developed and utilized by the migrants or collective in a unified manner to receive long-term income.

Academic Achievement of Immigrant Children. Individual-Level Sources of Success: the Self, Parents, and Friends

Paula A. Tufiş, Monica Şerban, Mădălina E. Manea

Department of Sociology and Social Work, University of Bucharest, Bucharest, Romania, paula.tufis@sas.unibuc.ro

Abstract

Previous studies have shown that immigrant children's academic achievement differs both across origin and destination countries, and that there are important predictors of achievement at multiple levels of the analysis: individual, school, community, and country levels. In our analysis, we focus on discussing individual level effects but we also assume that there are important macro-level effects that have to be taken into consideration. We account for these latter effects by using a cross-classified hierarchical model by origin and destination countries. We use the PISA 2012 data on mathematics achievements of 15-year-old students to explore how various factors influence achievement and how much variance in achievement there is at the individual level, between immigrant students in different destination countries, and between students from different origin countries. We draw on ideas from research on the academic achievements of children, in general: that the way parents interact with schools is an important factor that can enhance or hinder children's academic success (the role of parental cultural capital), that the child's peers may be an important resource in motivating children to do well in school (the role of the child's social capital) and that both cognitive and non-cognitive traits of children may influence their success in school (the role of the child herself). We explore whether these factors, which have been shown in previous studies to be important vehicles of academic achievement for students in general, among other proven predictors (such as parental socio-economic status), operate in the same way for immigrant children.

Key words:

Academic achievements of immigrant children; cross-classified hierarchical model; socio-economic status; cultural capital; social capital

EU countries youth Mobility: Policies to Facilitate their Repatriation. The case of Italy

Montanari A.

Sapienza Rome University, Department of European, American and Intercultural Studies, Rome, Italy,

armando.montanari@uniroma1.it

Abstract

Youth mobility within EU countries is now a significant phenomenon. This is possible for the right to free mobility within the EU which is guaranteed to all citizens. The boost to the mobility of young people is caused mainly by cultural globalization and economic phenomena, and forms of information that easily cross national boundaries. Certainly young people move also for prospects of better economic conditions or even better chance to assert their career aspirations. The press and the political authorities have considered the phenomenon especially from a quantitative point of view. It is so widespread a kind of convergence baseless alarmism that leads to the impoverishment of the EU southern countries. It seems that young leave a number larger of those who then decide to return. The Italian Government in the last six years, in the wake of political forces and of the press, has implemented policies to encourage the return of young expatriates. Return policies put in place have made particularly reference to tax breaks for those who after being abroad for a few years have decided to return home. The contribution will highlight the actual size, characteristics and behaviour of youth mobility departing from Italy on the basis of the preliminary results of the YMOBILITY European project that is being carried out as part of the EU Horizon 2020 program.

Youth mobility; European Union; Italy; repatriation policy; policy effectiveness

Harmonizing Youth Migration Stocks and Flows Data in the Eu: A New Approach

Sechi G., Krisjane Z., Berzins M.

Department of Human Geography, University of Latvia, Riga (Latvia),guidosechi78@gmail.com

Abstract

Comparative analysis of migration trends in EU countries is hampered by substantial differences in terms of criteria and definitions, depending on the cultural, political, legal, geopolitical and historical context of each country, which make it difficult to ensure the consistency of patterns and figures.

The proposed study is aimed at defining a new approach for the integration and comparison of national data, by taking into account regional, gender, and education differences, and temporal evolution of migration patterns and definitions, on the basis of secondary national data about young migrants' stocks and flows, related to 9 EU countries. A mixed quantitative-qualitative methodology will be adopted, consisting of descriptive and inferential statistical analysis and metadata review respectively. Typologies of youth mobility and their main characteristics will be identified and described for the selected countries, as well as patterns of migration flows between and among such countries.

Key words:

Secondary data analysis; mixed methodology; EU internal migration; youth migration

International youth migration: challenges for Latvia

Krisjane Z., Apsite-Berina E., Burgmanis G., Berzins M., Sechi G.

Department of Human Geography, Faculty of Geography and Earth Sciences, University of Latvia, Riga, Latvia,
zaiga.krisjane@lu.lv

Abstract

Migration in recent years are characterised with diversity of migration forms, groups involved, contexts of sending and receiving countries. Group of young migrants takes part in these current processes.

The paper examines trends of international youth migration and its effects on home countries. Since the EU enlargement in 2004 the share and numbers of youth among out migrants are steadily increased particularly during the peak of recession period of 2009-2012.

In order to research this group successfully we have used innovative research tool - web-based survey in locally popular social networking website *draugiem.lv*. Survey was posted to all registered Latvian users who geographically according to their *IP* address were located in the UK, Ireland, Germany, Sweden and Norway. The data used in this study consists of responses of two survey waves in 2012 – 2565 and in 2014- 2702 respondents. The results display following findings:

- Change of destination – more search for new opportunities and new destinations to fulfil the expectations;
- Change of motivations -from unemployment to better prospects in labour market and need to pay housing mortgage payments;
- Change of pull factors – from higher income and new experiences to better work conditions and career growth.

Emigration of youth, in turn, causes long term consequences of depopulation in Latvia. These circumstances are challenging for many shrinking regions in finding ways for further development, attracting young return migrants and utilise their human capital.

Key words:

International migration; youth migration; Latvia

Italian youth mobility in the last two decades: an overview in eight selected countries

Gallo G¹ and Staniscia B²

¹ISTAT-Italian National Institute of Statistics, Rome, Italy, barbara.staniscia@uniroma1.it

²Sapienza University of Rome, Rome, Italy

Abstract

International mobility of young persons from European Mediterranean countries has become an important theme in the scientific debate. The issue has a big echo in national media and press, as well, since youth outflows – not adequately compensated by return flows or new inflows – can undermine the economic and social sustainability of development paths in the countries of origin. The 2007-2008 financial and economic crisis has deeply contributed in intensifying those outflows and in reducing the return flows.

This paper will focus on the international mobility of young Italians in the last two decades. After having tackled the problem of existing data sources and their comparability, spatial analysis will be concentrated on 8 EU destination countries presenting different socio-economic characteristics: UK, Germany and Sweden (characterized by high mobility, high income, and high attractive capacity); Latvia, Romania and Slovakia (characterized by high out-mobility, medium-low income, and low attractive capacity); Ireland and Spain (characterized by high mobility, medium-high income, and an attractive capacity temporally and spatially discontinuous). Spatial analysis will consider the most representative places of origin in Italy, at the scale of labour market areas.

Our study will provide a taxonomy of international outflows of young Italians that will consider destination countries, places of origin, gender, civil status and stage of youth. Those results could be used by scientists and policy makers dealing with the challenge of maximizing the advantages of mobility for individuals and minimizing their costs in terms of social and economic sustainability.

Key words

International mobility; youth mobility; international migration; youth migration; Italy

Motivations and Barriers of International Youth Mobility in Europe: A Comparative Study

Williams, A., Li, G. and Janta, H.

University of Surrey, UK, g.li@surrey.ac.uk

Abstract

The scale and nature of youth mobility have changed dramatically in recent decades. Youth mobility provides a strategy for negotiating a number of critical life course transitions. By enhancing lifelong skills and competences, youth mobility shapes the transitions from education to work, and from unemployment to employment. It is a means of enhancing individual employability, employment and careers, which have become increasingly important as a consequence of the latest global economic crisis.

While the returns to human capital are undoubtedly a major driver of youth migration, motivations are diverse, and also include lifestyle aspirations, stimulus-seeking, personality characteristics, previous mobility history and social networking. Less often considered are the barriers to migration – in terms of economic costs, cultural and linguistic obstacles and immigration control regimes – all of which determine who does and does not migrate, and who does and does not intend to migrate. Although there has been considerable research on youth mobility, there is a lack of the comparative research which is required to understand the motivations and barriers of youth mobility in different national and institutional contexts.

Focusing on young people aged 16-35 in nine European countries, this research aims to provide a comprehensive examination of a broad range of motivations and barriers of youth mobility, and identify and compare the key determinants of who does, versus who does not, migrate as a life course-enhancing strategy. The empirical analysis is based on a large online panel survey. Regression analysis will be employed to provide statistical evidence. (This research is part of the “YMOBILITY” project funded by the European Commission.)

The Current Migration of High-skilled Young Adults in Spain: between the Economic Crisis and the Globalization of Labor Market

Juan M. Parreño-Castellano, J.M., Domínguez-Mujica, J., Díaz-Hernández, R.

Department of Geography, University of Las Palmas de Gran Canaria, Spain, juan.parreno@ulpgc.es

Abstract

The economic crisis started in 2008 has implied a sharp change in the international migrations in Spain. The situation has gone from the arrival of labor migrants of different origins to the return of a part of foreign people and the emigration of Spaniards. The recent Spanish emigration abroad is characterized by the departure of high-skilled young workers due to the Spanish labor market does not offer the proper employment opportunities for this group.

The aim of this paper is to show the current situation of these migratory flows. In particular, we focus on the analysis of the quantity of migrants, the origins and host countries, the level of qualification, the occupation, the situation in the host countries and the future expectations. In consequence, we have used several official statistic sources, some surveys conducted between young emigrants and qualified information coming from the emigrants and Spanish organizations located abroad.

The study of these migratory flows allows us to glimpse to certain extent this process is the result of the gap between the progress in education and the characteristics of labor market in Spain, the economic crisis, the politics of austerity implemented by the government or the globalization of labor market. We think that all these factors converge to explain the current situation in Spain.

Key words:

emigration; high-skilled young adults; economic crisis; globalization; Spain

What makes international students stay in the study host country after graduation?

A statistical analysis of longitudinal register data of international students in

Switzerland

Lombard, A.

Geographical Institute of the University of Neuchâtel, Switzerland, annique.lombard@unine.ch

Abstract

International students are very mobile individuals and potential highly skilled workers for the host countries labour market. Upon graduation, international graduates have various options for their future professional career, further formation/education, research or an entry into the labour market – and consequently, leaving the host country or staying there. On these options and the final decision, various factors may have an impact. Some factors have been identified in a literature review so far (such as study and labour market conditions, social ties in host country and abroad, leisure opportunities and living conditions, and others). Options may also be restricted due to limited resources, immigration and labour market policies. The aim of the study is to analyse whether these and additional factors have an impact on the stay rate of international students in Switzerland. Therefore, individual pathways of international students are analysed with a longitudinal approach. The national statistical data originates from the Swiss student register that is linked with the population register. This combination covers a broad range of variables (such as progress in studies, change of permit, marriage, child birth, entry into labour market and socio-demographic characteristics). The graduation cohorts from 2012 to 2015 are analysed retrospectively from the time of entry in Switzerland until the latest available data from 2015.

Key words:

International student mobility; statistical analysis; return rate; labour market integration

Youth on the move: an overview of recent trends in Latvia

Berzins M., Krisjane Z.

Department of Human Geography, University of Latvia, Riga, Latvia, maris.berzins@lu.lv

Abstract

Youth migration is a relatively new but increasingly noticeable phenomenon in migration studies. The most significant life course events of the individuals usually move through numerous changes in the place of residence. Thus, youth migration as an age-related phenomenon shapes a series of key life course transitions – from education to work, from unemployment to employment, from youth to adulthood and family formation. There has been considerable number of previous studies on many of these aspects of youth mobility. However, existing research has been fragmented by focusing on particular groups (e.g. students, highly skilled workers) of youth migration. Moreover, relevant studies in Latvia are almost inexistent, despite the fact that many urban and rural areas are facing a significant drop in fertility rates and an overall ageing of the population. The proposed study analyses recent trends in youth (15 to 35 years of age) migration. The research question that we address in this study is whether there are distinctive compositional variations in migration behaviour, depending different flows. The focus of the study is both on internal and international youth migration taking place in the 12 month before the 2011 census. We are using individual level data from the recently released 2011 census round. Using multivariate methods, we analyse different flows of youth migration based on their compositional characteristics.

Key words:

Youth mobility; internal migration; migration behaviour; life course transition; Latvia

Crisis, migration and Return: New Mobility of Young Spaniards and its Consequences

Pumares P, Navas MS, González-Martín B, Rojas AJ

University of Almería, 04120 Almería, Spain, European Union, arojas@ual.es

Abstract

The deep economic crisis and its uneven impact on the different European countries have produced a dramatic shift in the map of migration flows. Young well-educated people from Southern European countries and Ireland, recent immigration countries and former emigration countries in the past, have been impelled to move to other European countries in order to find a job or to fulfill their career expectations. The short-term consequence is a certain relief of the pressure in origin labor markets, but also a profound feeling of deception in young people, especially in those with university degrees that may deter their return intentions. This process tends to increase the concentration of human capital in fewer areas. The consequences for countries of origin may vary depending on the duration of the process, whether these people return or not, the concrete region they return to, and if their experience is acknowledged and used in origin, so that it can have spread effects. We will approach these issues through the testimony of 30 young Spaniards returnees to the regions of Madrid and Andalucía. These interviews were framed in the H2020 European project YMobility. They were interrogated about the motivations and obstacles to return to Spain, the competences acquired, if their experience abroad was useful for their career in Spain and in which way this knowledge is having an impact in the current labor environment (work culture, international networks...). Affective factors, life style, confidence in the country and transferability of human capital will also be considered.

Key words:

Youth mobility; return; human capital; brain drain; brain gain

Charting the Waterlogging Risk Rating Map of Beijing: Take Low-Lying Areas on Traffic Roads of Chang'an Avenue, Second and Third Ring Road for Example

Li Zhenfa, Qiao Luming, Zhang Dongyu, Wang Jing-Ai

School of Geography, Beijing Normal University, Beijing, 100875, P. R. China, lizhenfa@mail.bnu.edu.cn

Abstract

The rainstorm waterlogging is one of the most typical natural disasters that endangers city safety, and it has caused great concern of all parties. This study takes low-lying areas on traffic road of Chang'an Avenue, Second and Third Ring Road as the research object, combines hazards risks, stability of fostering environment, fragility of exposures, uses Analytic Hierarchy Process (AHP) to calculate waterlogging risk rate and generates the waterlogging risk rating map under different scenarios. With data of precipitation in long time series, ground elevation, traffic flow and other aspects, our main findings are as follows: ① Under the same precipitation return period, the risk level of the low-lying areas gradually increases with the antecedent soil moisture condition changing from ACM1 to ACM3. Under the same antecedent soil moisture condition, the risk level of the low-lying areas increases with the precipitation return period increasing. ② Jianguomen Bridge to Zuoanmen Bridge in east of Second Ring Road and northeast of Third Ring Road are the high risk areas of the research. Rapid assessment of city waterlogging risk can provide scientific instruction for waterlogging disaster warning and risk prevention.

Cyclone Warning Systems in Coastal Districts of Andhra Pradesh: A Case Study of Nellore District, India

Dr. N. Nagabhushanam, Dr. D. Chandrasekhar Reddy.

Retd., Prof. of Geography, S.V. University, Tirupati, 517502, India, nnbgeo@yahoo.com

Abstract

Among all the coastal districts of Andhra Pradesh, the Southernmost is the Nellore district. It is very prominent with a lengthy coastline of 165 kilometres lying adjacent to Bay of Bengal. The district was exposed to repeated and more number of cyclonic storms of severe intensity accompanied by storm surges, caused unmeasurable devastation of people, livestock, settlements, crops, soils, properties etc. This loss can be prevented by the application of timely available efficient Cyclone Warning Systems (CWS), creating proper awareness among the people about disasters and their likely impact and adopting appropriate advance measures for disaster reduction. Since, a sound early warning system is a prerequisite for effective disaster management, the state of art of forecasting and warning by Indian Meteorological Department (IMD) in mitigating the intensity of disasters in various parts of the country is briefly discussed and the cyclone warning process in coastal Andhra Pradesh, the mode of dissemination of warnings and cyclone warning centres established in the district and their functionaries are discussed in detail in the present paper.

Exploring the Effects of Increasing Urbanization on Flooding: The Case Study of Xiang River Basin, Southeast China

Linlin Cheng^{1,2}, Juan Du^{1,2}, Yumeng Yang^{1,2}

1. Key Laboratory of Environmental Change and Natural Disaster, Ministry of Education of China, Beijing Normal University, Beijing 100875, PR China, chengll@mail.bnu.edu.cn;

2. Academy of Disaster Reduction and Emergency Management, Ministry of Civil Affairs & Ministry of Education, Beijing 100875, PR China

Abstract

Land use changes in space and time tremendously affect the hydrological, ecological and environmental processes in rapid urbanization basin. The increase in impervious areas reduces basin lag time and may lead to higher flood peaks. The present study examined the effects of land use changes associated with urbanization on basin flood peaks and flood volumes of the 55 sub-basins of Xiang River in Hunan Province, China, by using the HEC-HMS hydrological model. The model was calibrated and validated using observed daily streamflow data and flood events records. Land use changes before and after rapid urbanization in the basin for the year 1980 and 2010 were analyzed. The analysis revealed that the lower basin experienced a rapid urbanized process and there was an obvious increase in the built-up area of Changsha-Zhuzhou-Xiangtan economic zone from 1980 to 2010. The simulation results of HEC-HMS model for 1980 and 2010 land use scenarios indicated that flood peaks and flood volume have increased within the lower Xiang River basin, especially in the Changsha-Zhuzhou-Xiangtan economic zone. And the frequency of small floods increased in post-urbanization than that in pre-urbanization period in Xiang River basin. The phenomenon implied the positive relationship between ongoing urban expansion and increased flood risk. The results of the study can provide useful information for rational land use planning and urban flood risk management.

Flood Disaster Risk Analysis in Shanghai

Jiahong WEN¹, Shiqiang DU¹, Hui XU¹, Jianping YAN²

¹Department of Geography, Shanghai Normal University, Shanghai 200234, jhwen@shnu.edu.cn

²United Nations Development Programme, New York, NY 10017

Abstract

Located on the Yangtze River Delta alluvial plain, Shanghai is low-lying and surrounded by waters, and Huangpu River and Suzhou Creek pass through the city. Such a geographical environment makes Shanghai prone to floods (waterlogging, coastal floods, riverine floods). The future climate change and rapid urbanization will makes Shanghai become one of the cities with rapid increasing flood risk. The urban areas was 3 km² in 1840, 86 km² in 1949, and reached up to 2968 km² in 2009. Over 260 rivers, with a length about 470 km disappeared in center district of Shanghai during the past 140 years. The total river drainage capacity reduced by 80%. The population increased from 5 million in 1950 to 25 million in 2015, with a density of 3900 people per square kilometer. Rapid urbanization results in: (1) More people, properties and infrastructures exposed to floods; (2) dramatic increase in impervious surfaces and reduction of river drainage capacity.; (3) more intensive “Rain Island Effect”, and thus more urban torrential rainstorms. The maximum 1-hour precipitation has increased significantly since 1980. Shanghai has been subject to land subsidence since the 1920's. The maximum subsidence over the last century is up to 3 m. The annual maximum high tide has an increasing trend, and sea level rise and land subsidence increases the risk of urban floods. More work for identification, analysis and evaluation of flood risk in Shanghai, especially for the black swan events are urgently needed.

flood disaster; risk analysis; urbanization; climate change, Shanghai

Flood Hazard Resilience and Vulnerability of Bulgarian Mountain Regions

Nikolova, M.

Bulgarian Academy of Sciences, National Institute of Geophysics, Geodesy and Geography, Sofia 1680, Bulgaria,
mn@bas.bg

Abstract

Climate change and related changes in intensity and frequency of climate extremes pose serious challenges to prevention and management of natural hazards in mountain territories. Flood hazard management needs specific approaches in mountain regions, which should be in accordance with both their vulnerability to climate change impact and their resilience in respect of existing land management practices. An integrated regional approach for assessment of mountain's vulnerability to flood hazard and resilience of mountain communities to it is proposed. Discussed are issues related to EU policy for flood risk management, geographical specificities of mountain regions, observed and projected extremes according to the regional climate change projections for different time horizons and potential flood risk. Indicators based Flood Vulnerability Index is calculated for Bulgarian mountain territory. In conclusion are outlined priority areas in which to pursue regional policy for flood risk management under conditions of climate change in mountain regions of the country.

Flood Risk Assessment in the SIDS: The First Steps Towards a Generic GIS-Based Tool

H. Glas, P. De Maeyer, G. Deruyter

Ghent University, Ghent, Belgium, hanne.glas@ugent.be

Abstract

Natural hazards cause devastating economic losses worldwide. The SIDS (Small Island Developing States) are characterised by a high vulnerability and a low resilience to these hazards, due to their geographic, political and economic fragile situation. Flooding is one of the most common hazards in these regions, triggered by heavy rainfall, hurricanes and tropical storms. The limited resources and funds available must be allocated as efficiently as possible. Therefore, an oriented approach on minimizing the consequences of flooding is necessary. A flood risk assessment calculates the expected damage cost from inundations and indicates the high risk areas. This research aims to develop such a flood risk tool, applicable for all SIDS. A first assessment was carried out in Annotto Bay, Jamaica, where a flood damage map was created showing the building, road and crop damages from an inundation in 2001. Since data availability is a major issue in developing countries, determining a basic set of indispensable input data, necessary to achieve an accurate result, is a main focus in this research. Furthermore, the use of satellite imagery as an added value in order to achieve a higher accuracy is investigated. The methods that were used in the Annotto Bay case study will be tested in other countries in the SIDS, in order to derive a generic, user-friendly flood risk tool that is applicable for all low-lying, densely populated, coastal areas.

Key words:

Flooding; natural hazards; SIDS; risk assessment; vulnerability; damage calculations

Hazard Zoning of Flash Flood in Wushan County under the Climate Change

Lin Xiaosong, Zhou Qianyou, Yu Qing

School of Architecture and Urban Planning, Chongqing JiaoTong University, Chongqing,
400074, P.R.China, linxiaosong@cqjtu.edu.cn

Abstract

Flash flood is a serious threat to people's life and property security. In recent years, a series of flash flood disaster led to a series number of casualties and property losses, which seriously hampered the sustainable development of the socio-economic in mountain areas. China is a mountainous country, and mountainous area counts for 2/3 of the total land area. Complicated geological and topographical conditions, climates with severe storms, dense population and human activities have led to frequent mountain floods and thus caused huge casualty and property losses. With Wushan County in Chongqing as a research scope, in accordance with the characteristics of the formation of flash flood disasters in mountain areas, this paper establishes a flash flood hazard zoning index system based on the micro landforms, topography and slope position, surface runoff accumulation and vegetation coverage, and under the ArcGIS platform support, get the index data of study area by the appropriate methods, calculates the flash flood hazard comprehensive index of every grid cell by using the flash flood hazard zoning model, after that get the results of synthetic regionalization in Wushan County. The results of flash flood disasters research can provide a decision-making basis to Wushan County for preventing and mitigating the flash flood disasters, meanwhile also can provide reference to urban planning in Wushan County.

Key words:

flash flood; hazard zoning; Wushan County

Hazard-formative Environment Compartments of Typhoon Disaster Chains Based on GIS Spatial Analysis - A Case Study of Guangdong Province, China

Zhang A Y, Chai M, Yu H, Wang J A

School of Geography, Beijing Normal University, Beijing, 100875, P.R. China, andy_zhanganyu@163.com

Abstract

Hazard-formative environment compartments are the basis for integrated disaster risk study. In this paper, we compartmentalized three basic units, namely coastal areas, inland plains and inland mountainous areas, by analysing coastline, DEM, and slope data of Guangdong Province with GIS technology. These three basic units respectively correspond to three typhoon disaster chains, which are typhoon – storm surge – flood, typhoon – rainstorm – flood and typhoon – rainstorm – landslide/debris flow. On the basis of the three units, drainage density data was used to precisely compartmentalize the areas where storm surge, flood and landslide/debris flow disasters more likely take place. The compartment results indicated that area of the hazard-formative environment of three typhoon disaster chains are 13,561 km², 99924 km² and 111751 km² respectively. To test the result, we collected 72 damage cases of typhoon in Guangdong Province during the years from 2010 to 2015 on news records and spatialized as verification points to make cross-validation. The validation result indicated that the overall accuracy reached 83.3% and the kappa coefficient is 0.705. We believe this result will provide significant reference for the further research on vulnerability and risk studies of typhoon disaster chain.

Key words:

typhoon – storm surge – flood disaster chain; typhoon – rainstorm – flood disaster chain; typhoon – rainstorm – landslide/debris flow disaster chain; hazard-formative environments compartments; Guangdong Province

Improvement to the flooding risk assessment of storm surges by residual interpolation in the coastal areas of Guangdong, China

Xianwei Wang and Xina Wang

School of Geography and Planning, Sun Yat-sen University, Guangzhou, China, xianweiw@vip.qq.com

Abstract

The coastal areas of Guangdong Province, China are susceptible to tropical cyclones and storm surges. The projected global warming, coastal subsidence and sea level rise together will bring about great flooding risk to these areas. Previous studies on flooding risk assessment directly interpolate the extremely total storm tide height at limited standard tide gauge stations into elevation grids covering the large study areas and normally have great uncertainties due to the spatial heterogeneity of storm tidal heights. This study develops a residual interpolation to estimate the extreme storm tide height based on the long-term observations of extreme storm tidal heights at the standard tide gauge stations and the astronomical tidal features of numerous additional tide stations in the Guangdong Province, China. The extreme storm tide height consists of the diurnal and semidiurnal astronomical tide and the storm surge. Over ten standard tide gauge stations with long-term observations of tidal heights are applied to compute the extreme storm tidal heights, the astronomic tidal heights and the storm surge heights at seven return periods (T) from 2, 10, 20, 50, 100, 200 and 500 years. The residuals between T years and 2 years computed from the long-term observations at standard tide gauge stations are interpolated into numerous additional tide stations and form the extremely total storm tide heights, which are further interpolated into elevation grids for inundation modeling. A static inundation model is used for flooding analysis. The residual interpolations can better capture the spatial variability of the storm tide than the traditionally total tide height interpolation. Accordingly, the flooding risk uncertainty is greatly reduced by the residual interpolation based on the astronomical tidal features of numerous additional gauges, thus offering better supports for coastal development planning and flooding hazards risk management.

Flooding risk; Storm tides; Storm surges; Residual interpolation; Guangdong Province

Research on Flood Risk in Medium and Small Basin during Urbanization: A case study on the East and West Streams Watershed in Xiamen

Jie Xiang, Youpeng Xu*, Jie Yang, Liu Yang, Yu Xu

Geographic and Oceanographic Sciences, Nanjing University, Jiangsu Nanjing 210023, China, xiangjie0429@163.com

Abstract

With the rapid development of economy and the accelerating urbanization process in recent years, the disaster caused by frequent floods has become one of the major natural disasters in southeast coastal urbanization cities, which has threatened the safety of life and property. Therefore, it's urgent to implement the flood risk research in small basin under the background of urbanization. In this paper the East and West Streams Watershed in Xiamen were taken as study area. Based on the spatial analysis of GIS and the two-dimensional hydrodynamic model named MIKE21, this paper combined the rainstorm flood frequency analysis with plain flood submerging simulation, to proceed the flood risk analysis, to simulate the submerged conditions of the study area under strong flood, to evaluate the flood risk degrees in this area, and finally to create dynamic flood hazard mapping of the East and West Streams Watershed in Xiamen. The research supports to the flood control and disaster mitigation in study watershed. Meanwhile, it provides helpful references to the flood hazard analysis for the small watershed of southeast coastal areas.

Key Words:

Flood Risk Analysis; Two-dimensional Hydrodynamic Model; Submerging Simulation; Flood Hazard Mapping; The East and West Streams Watershed in Xiamen

Risk Assessment of Flood Hazard in the Nepal Himalaya: Case Studies of Seti River, Pokhara and Tamakoshi River, Dolakha

Thapa B, Watanabe T, Kobayashi Y

Hokkaido University, Sapporo, Japan, bhabana99@gmail.com

Abstract

The Seti River suddenly flooded rural areas in the Pokhara on 5 May, 2012. The flood killed 32 people and left 40 missing. Meanwhile, Nepal's 2015 earthquakes killed over 9,000 people and injured more than 23,000. The aftershocks might cause a glacial lake outburst flood from the Tsho Rolpa (one of the most dangerous glacial lakes in Nepal). The main objectives of this study are to map flood hazard risk; and to analyze community profiles and to assess communities' vulnerability in Seti River, Pokhara and Tamakoshi River, Dolakha to mitigate future flood hazards to be caused by the similar events recently occurred. The first study area is the Seti River basin with the altitudinal range from 812 m to 1,511 m, which covers from Jamire Bari to Ramghat Kaski districts. The second study area is the Tamakoshi River basin with the altitudinal range from 2,216 m to 4,595 m, covering from Tsho Rolpa (glacial lake) to Kunaure ghat. This study first conducted a flood inundation mapping, and then conducted social surveys. The flood inundation map was prepared by the existing topographic maps, by the detailed topographical survey at 1 m contour level, and by calculation using software HEC-RAS and ArcGIS. This study adopted a number of different approaches of social survey such as interviews, focus group discussion, questionnaire survey, and field observations. We interviewed 163 households in the Seti River basin and 300 households in the Tamakoshi River basin.

Key words:

Flood hazard; inundation mapping; risk assessment; questionnaire survey

The Applicability of Remote Sensing Precipitation Data for flood events detection in Xiang River Basin, China

Yumeng Yang, Juan Du, Linlin Cheng

Key Laboratory of Environmental Change and Natural Disaster, Ministry of Education of China, Beijing Normal University, Beijing 100875, PR China; juan.du@bnu.edu.cn

Academy of Disaster Reduction and Emergency Management, Ministry of Civil Affairs & Ministry of Education, Beijing 100875, PR China. juan.du@bnu.edu.cn

Abstract

Flood, as one of the most globally hazardous natural disaster, causes huge loss and casualties every year. A well understanding of the extreme stream flow is significant to identify the potential floods thus achieves the goals of disaster monitoring and risk management. The remote sensing precipitation data with high spatial-temporal resolution have been proved to be potential alternatives to the gauged data, which are sparse or even unavailable in some places. There are 756 national meteorological stations in China, the precipitation data of which are available to the research. But only 14 out of the stations are located in the Xiang River Basin, with an area of about 90,000 km². Obviously the scarce precipitation gauge data can hardly satisfy the need of the flood discharge simulation of the basin.

The preliminary work of this study is to evaluate the usefulness of satellite-based data to flood monitoring by forcing the HEC-HMS hydrological model with the TRMM 3B42 V7 precipitation data, and to find whether the simulated discharge can denote the rare special flood events in Xiang River basin, a sub-basin of Yangtze River basin. Results indicate that the TRMM precipitation data can be successfully used in detecting the rare flood events in spite of some biases of the time and magnitude of the flood peak comparing with the historical records. Further study will focus on estimating the success rates of TRMM precipitation data to flood events detection considering the whole time series (1999-2012) and different spatial distributions, in order to verify the applicability of the TRMM precipitation data as the hydrological input forcing data in simulating the hydro-process in scarce gauged area.

precipitation; TRMM; flood events detection; HEC-HMS model

The May 5, 2012 Seti River, Nepal, Outburst Flood Disaster—Physical and Socioeconomic Causes

Jeffrey Kargel, Gregory Leonard, and Dhananjay Regmi

University of Arizona, United States, jeffreyskargel@hotmail.com

Abstract

On May 5, 2012, a hyperconcentrated slurry flood slammed into tourists, gravel workers, and small villages along the Seti River, north of Pokhara, taking 72 lives. Clues to the mysterious disaster are lack of rainfall, youtube videos of the disaster, and video capture of an immense dust cloud high within the Sabche Cirque nestled among Annapurna peaks. Two weeks later the first author made an overflight and found an ice-rock landslide sourced near Annapurna III. The landslide's initial impact generated a small earthquake. Satellite data revealed the disaster pathway and pre-event conditioning. In the weeks or months before the disaster a rockfall had taken place in the Seti Gorge and blocked the Seti River. Furthermore, satellite thermal imagery indicated that the lower snowfields and glaciers were likely undergoing spring melting. Collapse of cornice ice most likely initiated the mass movement. The ice avalanche mobilized rock debris and wet lower snowfields and icefields, and maybe ingested small supraglacial ponds and meltwater stored somewhere, apparently including a rockfall dammed lake within the Seti Gorge. 6300 m of descent of the rock-ice-water mass generated further heat, which melted much entrained ice/snow mass. A sediment-laden avalanche wind plastered mud across the Sabche Cirque; the impoundment in the gorge pastured mud onto the gorge walls. The event was a classic sturzstrom according to German/Swiss literature. A climate change attribution is tenuous, but plausible considering the role of spring thaw. Increasing human exposure is a bigger factor in the deadly toll.

Nepal; Seti River; Outburst flood; disaster; glacier; Himalaya; climate; hazard

Tropical Cyclone Hazard Mapping Using Geospatial Techniques: Application to a Coastal Upazila in Bangladesh

Hoque M.A^{1, 2}, Phinn S¹, Roelfsema C¹, Childs I³

¹Remote Sensing Research Centre, School of Geography, Planning and Environmental Management, The University of Queensland, Brisbane, QLD 4072, Australia, m.hoque2@uq.edu.au

² Department of Geography and Environment, Jagannath University, Dhaka-1100, Bangladesh

³Queensland Centre for Population Research, School of Geography, Planning and Environmental Management, The University of Queensland, Brisbane, QLD 4072, Australia

Abstract

Tropical cyclones are one of the most dangerous and devastating natural disasters, regularly affecting coastal areas around the world. The intensity and extent of damage due to tropical cyclones are very high. An appropriate mapping approach is essential for producing detail hazard assessments to plan for and reduce the impacts of cyclones on people, property and environment. This study developed and tested a hazard mapping approach for tropical cyclone impacts in Sarankhola Upazila, a 151 km² local government area, located in coastal Bangladesh. The study integrated remote sensing, field data and multi-criteria evaluation at local scales. Four criteria associated with cyclone hazard impacts were assessed: storm surge height, cyclone wind speed, cyclone frequency and precipitation intensity. Thematic raster map layers quantifying the level of hazard were prepared using Analytical Hierarchy Process (AHP) approach. A weighted overlay technique was used for overlaying standardized maps for each of the four input hazard criteria with their weights to produce the final hazard map. Our results indicated that 15% of the study area was located in the very high hazard zone, mostly close to the coastal river, with 25 % area as high hazard zone and around 18 % area was at moderate hazard zone. The area was classified as low and very low hazard zone accounts the 16% and 26% respectively. This approach provided very promising result and it was verified by field survey. Our findings indicate this approach has potential to assess the cyclone hazard in the affected countries for the purposes of disaster planning and management.

Use of Remote Sensing for Verification of a Two-Dimensional Hydrodynamic Model for Flooded Areas

Sazonov A.A., Agafonova S.A., Frolova N.L., Gelfan A.N., Kireeva M.B., Krylenko I.N., Mikhaylyukova P.G.

Lomonosov Moscow State University, Faculty of Geography, 119991, Leninskie Gory, GSP-1, Moscow, Russian Federation; sazonov.lesha@gmail.com

Abstract

There are more than 700 cities and towns, thousands of villages and settlements, and more than seven million hectares of agricultural land of the Russian territory are exposed to a risk of flooding. Results of flood modeling for three cities located in different parts of Russia: Veliky Ustyug at Northern Dvina river (Europe); Yakutsk at the Lena river (Siberia) and Blagoveschensk at the Amur river (Far East) are presented. The two-dimensional hydrodynamic model of flow in channels and on floodplain STREAM_2D on the basis of the numerical solution of two-dimensional Saint-Venant equations was used for the simulations. One of the major challenges in mathematical modeling is the verification of the model. This is usually made using data on water levels from hydrological stations: the smaller the difference of the actual level and the simulated one, the better the quality of the model used. Alternative sources of verification, e.g. remote sensing, should be used where data is unavailable. Flooded areas obtained from hydrological modeling and satellite images interpretation have been compared. Satellite images made by optical and radar sensors: SPOT-5/HRG, Resurs-F, Radarsat-2 were used. Flooded areas were calculated using unsupervised classification for satellite images. Verification of the model through a comparison of simulated inundated areas with outlines of flooded zones from satellite images for known hydrologic situations demonstrate close correspondence (relative errors of 7-10% in terms of the area for peaks of the analysed floods). This study was supported by the Russian Science Foundation, project no. 14-17-00155.

² Center for Hydrogeology and Environmental Geology Survey, CGS, Baoding 071051, China;

³ The Center for Excellence in Tibetan Plateau Earth Sciences, CAS, Beijing, 100101, China

Abstract

Under rainfall or earthquake conditions, karst accumulation bodies on the slopes were easily triggered and transform into landslides which may lead to major disasters. Huluqiao landslide, occurred in Longtoushan mountain before Ludian 8·03 earthquake, went through obvious deformation process, did not cause any casualties of residents or passing vehicles due to the success of early warning. Based on field investigation and lab analysis, this landslide was identified as a progressive failure type according to the characteristic of its slope deformation vs. failure time curve. Steep slope, loose structure and low intensity of the accumulation horizon provided favorable environment for landslide formation. Long duration rainfall with high intensity caused the rock and soil particles to flow and rupture inside the sliding area at micro scale. At the same time, the flow and micro rupture play imperative roles in the macro deformation and failure of slope. The rainfall infiltrated into landslide along the surface of the accumulation mass, formed conflux transfixion at the interface between the soil and rock where backwater was formed. The backwater reduced the soil strength and introduced dynamic uplift force in the landslide. Meanwhile, with the rainfall filled in the cracks and the weak structural planes, the dynamic expanding force was induced and the tension crack was enlarged. As a results, the deformation of the accumulation mass was intensified. Revealing the mechanism of such landslide provided support to the slope stability assessment at regions with similar geological condition and laid the guideline for early warning of such landslides.

Application of Debris Flow Hazards Emergency Assessment Method

Yan Yan, Peng Cui

Institute of Mountain Hazards and Environment / Key Laboratory of Mountain Hazards and Earth Surface Processes,
CAS, Chengdu, 610041, China, pengcui@imde.ac.cn

University of Chinese Academy of Science, Beijing 100049, China

Abstract

Emergency assessment is extremely useful in urban hazard reduction and post-hazard reconstruction at hazard prone region. It is also imperative to the development of sustainable society at mountainous countries. In this paper, we have developed a debris flow emergency hazard assessment method and its application. This method was based on the analysis of the unmanned aerial vehicle aerial photography data. From the aerial photographs, the information on sediment thickness and diameter of the large particles in debris flow deposition zone were extracted and analysed. This information allowed us to retrieve flow path, and dynamic parameters of debris flow including velocity, impact force, and momentum of debris flow. The availability of these debris flow parameter can be used to derive a quantitative analysis of destructive degree due to debris flow in its deposition area, as well as to carry out the rapid assessment of hazard. This proposed method could carry out dynamic inversion for specific location over the whole area, and make a quantitative analysis of the damage within the debris flow deposition zone after the hazards. The application of this method will be very instrumental for the post hazards relief and reconstruction operation. As a case study, the method is applied to the quantitative analysis of a specific debris flow event in Wenchuan earthquake area.

Landslides Susceptibility in A Traditional Nigerian City: A Remote Sensing Approach

Oluwafemi O.A, Nyofa S.H.

Centre for Geodesy and Geodynamics, Toro, Bauchi State, Nigeria, walefemi007@yahoo.com

Abstract

As a result of dearth of relevant information about Landslide Susceptibility in Nigeria, the monitoring and assessment appears intractable. Hence, the study developed a Remote Sensing approach to map landslides susceptibility, landuse and landcover analysis in Jos South LGA, Plateau State, Nigeria. Field Observation, SPOT 5 2009 and 2012, ASTER DEM 2009, Geological Map 2006, Topographical Map 1966 was used to map Landslide Susceptibility and Landuse /Landcover Analysis in the study area. Geospatial Analytical Operations employed using ArcGIS 10.3 and Erdas Imagine 2013 include Spatial Modeling, Vectorization, Pre-lineament Extraction Image Processing among others. Result showed that 72.38 % of the study area is underlain by granitic rocks. The landuse/cover types delineated for the study area include flood plain (29.27 %), farmland (23.96 %), sparsely vegetated land (15.43 %), built up area (13.65 %), vegetated outcrop (8.48 per cent), light vegetation (5.37 %), thick vegetation (2.39 %), water body (0.58 %), plantation (0.50 %) and mining pond (0.37 %). Landslide Susceptibility Analysis also revealed that 87 % of the study area is relatively at low to very low risk of landslide event. While only 13 % of the study area is at high to very high risk of landslide event. The study revealed that the susceptibility of landslide event is very low in the study area. However, possible landslide event in the hot spots could be pronounced and could destabilize the natural and man-made environmental systems of the study area.

Catastrophic landslides shape new mountain environment (the Caucasus, Georgia)

Gracheva R., Shorkunov I.

Institute of Geography of RAS, Moscow, 119017, Russia, gracheva04@list.ru

Abstract

Being a part of global process of the earth surface denudation, transportation and irrecoverable mass wasting by catastrophic landslides is of vital importance for mountain environment and population causing change of watercourses, a dramatic reduction of biodiversity and population outflow. Subsequent environmental evolution in damaged regions is not always predictable. That is especially important when landslide excavates and brings to the surface rock material that is not typical for the area.

Landslide hazard is extremely high in Georgia. Local population often adapts stabilized great slumps for agricultural needs because they contain a great volume of dispersed mineral matter. The latter is highly important in the mountain region with limited land and strongly eroded soils. 25 years ago, in the densely populated forested region of Adjara (Minor Caucasus) catastrophic landslides excavated alkaline material changing properties of geochemical landscape. Over the past years calcicole plants became dominant replacing endemic species, and *species* homogeneity resulted in homogenous environment; local waters which before were of low mineral content, in new environment are much more mineralized.

Adaptation of “alkaline landslide” for human needs requires special remediation measures. Composition of landslide body has to be tested for revealing the probability of including it in land use. (Researches were supported by Russian Scientific Foundation, Project 14-27-00133)

Debris Flow Modeling for Susceptibility Mapping at Regional Scale in Himalayan Region, INDIA

Dr Anand Malik

Associate Professor, Geography, SSN College (University of Delhi), New Delhi, anandmalik1111@gmail.com

Abstract

The first assessment of debris flows susceptibility at regional scale was performed in Kullu Manali region of North Himalaya in India where 500 landslides were reported in two days (Times of India, March 11, 2011). The complexity of phenomena and variability of local controlling factors limit the use of process based models for first assessment. The GIS based approaches associating an automatic detection of the source areas and assessment of the debris flow spreading may provide a substantial basis for a preliminary susceptibility assessment at regional level. The discrimination of source areas is based on an index approach, which includes three topographic parameters (slope, contributing areas, and curvature) and hydrological settings. The debris flow run out was estimated using a process and GIS based model Flow_R (IGAR, University of Lausanne), which is based on combined probabilistic and energetic algorithms for the assessment of the spreading of the flow and maximum run out distances; where the first results for different test areas have shown that run out distances can be modeled reliably and can be useful to determine which areas need to be prioritized for detailed studies.

Abstract

Landslides, generally in slope, the rock, soil or debris down the slope, under the influence of gravity is moving in the direction of the slope. Each year, many people lose their lives due to landslides and excess material damage is seen. Among the causes of landslides, such as excessive rains, earthquakes, volcanic activity and anthropogenic influences or a combination of these effects can be shown. According to USGS, due to landslides, \$ 2 billion in property damage occurs each year only in the United States.

Our study area which is located in Erzurum Plain is on Kiremitlik hill in the Eastern Anatolia. The ski jumping ramps and runways were built on Kiremitlik hill with \$ 67 million budget in 2011 for the 25th Winter Universiade. Two landslides were occurred on slope of jumping ramps and runways in firstly 7 July 2014 and triggered again 15 July 2015. In the first landslide, ski jumping complex and facilities where the towers are, are completely unusable. The natural and antropogenic cause of this landslide has been tried to present by this study. It was utilized in previous studies, reports and satellite images in this study. There's an ongoing lawsuit case relating to the region and therefore are factors that restrict the field of research to be closed to visitors.

Kiremitlik Hill which is an anticline structure, is limited to the north and south with the faults. In addition, this anticline is fragmented with active faults. Pliocene geological formation which was named Gelinkaya Formation (tuffs and basalt blocks) being overlain by Quaternary alluvium constitutes Kiremitlik Hill. Erzurum Ski Jumping Towers and Runways Landslide occurred in slipping into suitable geological structure and erroneous engineering applications result. Prior to the construction of the area by examining satellite images have also been proved to be an old landslide area. Where the loose material and buildings built on the northeast slope in motion taking no precautions have triggered this landslide. Loads should be removed and left in its natural state on this slope. Otherwise, it is inevitable for new landslides to happen again and again.

Frequency Difference of Debris Flows Controlled By Fault in Alpine Region, Moxi Basin, Southwestern China

Yongbo Tie¹, Jin-tao Jiang^{1,2,3} Zhi Song¹

¹Chengdu Center of China Geological Survey, Chengdu 610081;

² China University of Geosciences Beijing, Beijing 100083, China;

³Chinese Academy of Geological Sciences, Beijing 100037, China. tyongbo@cgs.cn

Abstract

Debris flow is one types of remarkable geomorphological hazard in mountain area. The primary objective of this study was to understand the relationship between active fault and debris flow frequency (high-frequency debris flow (HDF) and low-frequency debris flow (LDF)) in Moxi basin. The study area Moxi basin is a typical high mountain environment dominated by tectonic uplifting and glacier movement processes, where debris flow frequency show a distinct difference and many debris flow fans occupy the valley bottom. Based on the field surveying, literatures studying and the interview to residents for historical events of HDFs and LDFs in study area. This paper using geographic information systems (GIS) techniques, outlining their relation with fault, and analyzing possible effects in their frequency difference. Results show that the spatial distribution, topographic characteristics of debris flow gully, return period and numbers of debris flow is mainly controlled by the Xianshuihe fault because of the tectonic uplift. The frequency difference between HDFs and LDFs is mainly controlled by the glacier distribution, because of the glacier deposits act as the loose source for the initiation of debris flows.

Landslides and Vulnerability in East District of Sikkim

Singh, A.¹ and Ranjan, R.K.²

¹ Research Scholar, Department of Geography, Sikkim University, Gangtok, India-737102
amritasingh.geo@gmail.com

² Assistant Professor, Department of Geology, Sikkim University, Gangtok, India-737102
rkranjan@cus.ac.in

Abstract

Sikkim is among the India's most vulnerable regions both to natural and human-made disasters. Landslides in Sikkim have been constant sources of destruction of property and loss of lives. Number of landslides in Sikkim has increased in recent years. The lithological variation as well as structural deformation in form of various large and small scale structural features mainly thrust, faults, small and large scale folds are geological controlling factor of the landslides in Sikkim. In addition, high rainfall, steep topographical slope, and high weathering rate are other major contributory factors. Loss of vegetative cover, and slope modification for construction of various erections like roads & tunnels etc. is among the anthropogenic factors.

It has been found that East district of Sikkim is more vulnerable as compared to other districts in the state. Population density in this district is highest and so the amount of property damage and other losses will also be higher. It has also been found that vulnerability varies in terms of rural and urban settlement. It has been noticed that urban area is more vulnerable also because of its developmental activities and huge and haphazard infrastructural development in the study area, owing people more prone to the disasters which takes the form of hazard for the settlements and creates havoc for them and can give it a worse shape in near future.

Lithology and Geologic Structure Associated with Recent Landslides in Nepal

Alina Karki, Jeffrey S. Kargel, Dhanjay Regmi

Nepal Society for Ecological Restoration, Nepal jeffreyskargel@hotmail.com

Abstract

The M7.8 Gorkha earthquake on April 25, 2015, and subsequent aftershocks—up to M7.3—produced thousands of landslides. Kargel et al. (2016) mapped their distribution and found that there were several important geologic controls in addition to seismicity—on their occurrence. The first-order geologic units of Nepal seem to have a strong bearing on where landslides occur. However, until now no detailed lithologic study of the recent earthquake- and meteorologically induced landslides and their adjoining rocks has been undertaken. Here we focus on the lithology of the landslides and make note of significant rock structures, such as faults, which might have played a role in localizing the quake-caused landslides. In addition to earthquake induced landslides, we examine also some landslides affected by anomalous extreme rainfall, and others by road and aqueduct construction for a small hydroelectric power plant. In general, we found that (1) weak lithologies, especially of highly weathered low-grade metamorphic rocks such as phyllite, and (2) closely adjoining rocks of distinctive lithologic contrast both favored landslide activity. An expected increase in regional precipitation and especially an increase in extreme rainfall and snowmelt events in eastern Nepal might increase the frequency and magnitude of weather-related landslides. Glacier thinning and retreat and consequent debuttressing of moraines and hanging glaciers may aggravate collapse of those. Overall, however, the natural Earth system and demographic/land use change mandates that whatever happens with climate change, destructive landslides of many types will always be commonplace in the Himalaya. Geologic susceptibility factors must be better understood.

Monitoring hydrological processes in loess and its effect on slope instability using electrical resistivity tomography - a case study in the Heifangtai Terrace, Northwest of China

Xingmin Meng, Ph.D.; Runqiang Zeng; Fanyu Zhang, Ph.D.; Siyuan Wang; Yi Zhang; Guan Chen; Zhijie Cui

College of Earth and Environmental Science, Lanzhou University, 730000, P. R. China

Abstract

Loess has long been considered as a homogeneous and porous material in engineering geological perspective. It is commonly believed that water penetrates through loess pores into ground and causes mass movements. A few researchers have doubted about this, however, the hydrological processes in loess and the effect on slope failures have not been fully investigated. This study selects the loess terrace, Heifangtai of the forth terrace of the Yellow River, at the northwestern China. 2D and 3D time-series electrical resistivity tomography (ERT) approach was employed to monitor the movement of ground water before and after irrigation & rainfall and the evolution of a sinkhole in the toe of the landslide deposits. In addition, laboratory tests were carried out and integrated the other researchers' results on the undisturbed loess samples to examine the variations of their physical properties. It has been observed that (1) The depth of infiltration into the thick unsaturated loess is less than 5 m from the implication of the 2D ERT results in TL profile. (2) The electrical resistivity decreased with the water infiltration through the sinkholes, which can increase soil water content in loess, induce soil liquefaction and eventually result in land sliding. (3) The landslide deposits block the drainage pipes of the groundwater, which makes water concentration in the toe of the landslide. As a result, the groundwater and the rainfall trigger the failure of sinkholes or tracks, which may induce new slope failure in the old landslide sites, and this process is sustained.

hydrological process; loess landslide; sinkhole; electrical resistivity tomography (ERT); Heifangtai Terrace

Natural Hazards in Mountainous Regions in Relation to Abundant Sediment Supply and Resultant Depositional Landforms

Oguchi T., Kohmoto, D.

Center for Spatial Information Science, The University of Tokyo, Kashiwa 277-8568, Japan oguchi@csis.u-tokyo.ac.jp

Abstract

Countries and regions like Japan, Taiwan China, and northern India in and around the Ganges Plain are characterized by large population sizes, steep mountainous terrain, and frequent storms. Large sediment supply from the steep mountains due to landslides and gullying often results in sediment deposition in piedmont areas to form alluvial fans and in coastal areas to form alluvial plains. The amount of sediment supply varies according to various factors such as topography, geology, rainfall, and human interference. In addition, long-term geomorphic responses to the Pleistocene-Holocene climatic change affect contemporary sediment supply. Types of depositional landforms such as dissected and non-dissected reflect past changes in sediment supply. These types also indicate the possibility of sediment disasters, which are useful for appropriate land-use planning. However, attention to landform types is often insufficient during land development including the construction of residential areas. This situation may result in serious sediment disasters such as the debris-flow hazard on coalescing alluvial fans in Hiroshima, August 2014, which killed 76 people. The impacts of abundant sediment yields on natural hazards are sometimes complex. For example, large sediment supply from a river mouth may lead to the formation of offshore sand bars along the nearby coast. Then the area between the bars and land may be filled with fine sediments to form flat coastal plains. Although such plains are useful for various human activities, they are prone to inundation and liquefaction due to earthquakes. Knowledge about landforms and sediment yields is highly important to prevent natural disasters.

sediment disaster; mountain; alluvial fan; coastal plain; landform type; residential area

North Tehran Faults and Seismic Hazard Assessment in Tehran City

Karami parivash

Ph .D student of Kharazmi University of Tehran .IRAN. karamiparivsh@yahoo.com

Abstract

Modern cities in different parts of world for various reasons, including the type site selection, poor physical development, non-compliance with the required standards and are constantly exposed to risks of natural disasters. One of the hazards that many cities to threaten the world , including our country, earthquakes Iran is one of the most earthquake-prone countries in the world in relation to this natural phenomenon damages the cities have seen. Tehran metropolis of the first countries not only as an exception, is not due to structural density, dense population, lack of standards, poor physical development and is faced with a serious threat in the study area (north of Tehran) is a large tectonic forms among which we can mention the major and minor faults. Considering the importance the study area and residential areas and resident population in the area, identify faults and their effects on environmental hazards is of great importance. Activity of each of the faults in the area could have a dramatic earthquake and caused damages and casualties. In this study, we tried to identify these forms and how their performance on risks, providing solutions to help during the earthquake, the amount of damages to be reduced.

Properties of Snowpack Profile And Driving Factors of Snow Avalanche in the Tianshan Mountains

Hao Jian-Sheng^{1,2}, Bai Lei^{1,2}, Osamu Abe³, Li Lan-Hai¹

¹State Key Laboratory of Desert and Oasis Ecology, Xinjiang Institute of Ecology and Geography, Chinese Academy of Sciences, Urumqi 830011, China, lilh@ms.xjb.ac.cn

²University of Chinese Academy of Sciences, Beijing 100049, China

³Snow and Ice Research Group, National Research Institute for Earth Science and Disaster Prevention, Tokamachi, Shinjo 966-0991, Japan

Abstract

The national road 218 connects the southern and northern parts of Xinjiang. Snow avalanche often happened in the section across the Tianshan mountains in spring. This paper tried to analyze the physical properties of snowpack profile before the snow avalanche and identify the triggering factors for snow avalanche. The results showed that the most occurring frequency of snow avalanche happened within about 7 sites/km where is characterized by the slope of the hillside with 30°-43° trenches. Avalanche mainly occurs from January as dry avalanches, to late February and early March as wet avalanches, due to the different properties of the snowpack. The main factors triggering snow avalanche are extreme snowfall event and significant rise of temperatures in a given time period. Based on the observed data before the one week of the massive avalanche on 26 February 2016, the change of physical properties of snow profile before one week of the massive avalanche happened can be observed: 1) Daily mean air temperature increased at a rate of 0.7°C/d; 2) The temperature within the snowpack rapidly increases, and the temperature of 0°C quickly moved up from the bottom to the top of the snow and reached to 30cm up to the ground; 3) The average density of snowpack increased at a rate of 7.4kg/m³·d; 4) The depth hoar hardness decreases and thickness rapidly increases to 83.1% of the total snowpack depth with a increasing rate of 4.2%/d. These findings help assisting the management and forecasting of avalanches to mitigate the damage from avalanche disasters.

Quantitative Morphology of Bedrock Fault Surfaces and Identification of Paleo-earthquakes

He Honglin¹, Wei Zhanyu¹, Alexander Densmore²

¹ Key Lab. of Active Tectonics and Volcano, Institute of Geology, China Earthquake Administration, Beijing 100029

² Department of Geography and Institute of Hazard, Risk and Resilience, Durham University, Durham DH1 3LE, UK

Abstract

The quantitative analysis of morphologic characteristics of bedrock fault surfaces is a useful approach to study faulting history and identify paleo-earthquakes. It is an effective complement to trenching techniques, especially to identify paleo-earthquakes in a bedrock area where trenching technique cannot be applied. We calculate the 2D fractal dimension of three bedrock fault surfaces on the Huoshan piedmont fault in the Shanxi Graben, China using the isotropic empirical variogram. The fractal dimension varies systematically with height above the base of the fault surface exposures, indicating a clear segmentation of the fault surface morphology. We interpret this segmentation as being due to different exposure duration of several parallel fault surface bands, caused by periodical earthquakes, and discontinuous weathering. We take the average of fractal dimensions of each band as a characteristic value to describe its surface morphology, which can be used to estimate the exposure duration of the fault surface band and then the occurrence time of the earthquake that exposed the band. Combined with previous trenching results, we fit an empirical relationship between the exposure duration and the morphological characteristic value on the fault: $D=0.314 \times \log_{10}(17707 \times T)$. The average width of those fault surface bands can also be regarded as an approximate vertical coseismic displacement of characteristic earthquake similar to the Hongdong M8 earthquake of 1303. Based on the segmentation of quantitative morphology of the three fault surfaces on the Huoshan piedmont fault, we identify three earthquake events. The coseismic vertical displacement of the characteristic earthquake on the Huoshan piedmont fault is estimated to be 3-4 m, the average width of these fault surface bands. Gaps with a width of 0.1-0.3 m between two adjacent bands, in which the fractal value increases gradually with fault surface height, are inferred to be caused by weathering between two earthquakes or interseismic slip on the fault.

Regional Scale Landslide Risk Assessment in Data Scarce Area- a Case Study on West Kameng District, Arunachal Pradesh, India

Ghosh K and Bandyopadhyay S

Department of Geography, University of Calcutta, Kolkata-700019, India, ghoshk.geo@gmail.com

Abstract

The present research is intended to present an integrated approach involving uses of geospatial technologies for landslide risk assessment in data scarce region of Eastern Himalaya. Successful Landslide management plan and policy depends on in-depth knowledge about the hazard and associated risk. Thus, Landslide hazard and risk assessment is carried out as an integral part of landslide hazard management in West Kameng District, Arunachal Pradesh. The landslide hazard map is prepared by using weight-rating based method. To analyze landslide manifestation in the present study area different causative factor are analysed. The present research revealed that geological structure and road have more influence than other considered factors on the occurrences of landslide in the present study area. The hazard zonation map shows that the very high and high hazard zone covers about 18% in comparison to low and very low hazard zone which covers about 50.07 % of the total district. The final landslide risk scouring map of the District is generated by integrating hazard scouring and resource damage potential scouring (fuzzy membership values) maps. The values of landslide risk matrixes are varying within the range of 0.04 to 1.00. The risk scouring map has been reclassified into very high, high, moderate, low and very low risk zones. The final risk assessment map shows that only 15.43% (845.54 km²) of the district is under very high to high risk zone. The major part (3126.47 km i.e. 57.06%) of the district is under very low and low risk zone.

² Institute of Mountain Hazards and Environment, Chinese Academy of Sciences and Ministry of Water Conservancy, Chengdu 610041, China

Abstract

The upper reaches of Min River is an area with topographic uplift and economic trough, which is not only with superposition of unfavorable conditions and difficult factors but also prone to geological disasters of collapse, landslide and debris flow. The mountain settlement is the basic social economic unit and the basic social organization unit in the upper reaches of Min River. Road is the main channel and arterial of mountain settlement, and also the short board and bottleneck of economic and social development because of the threat of slope disaster in the upper reaches of Min River. Firstly, the level of road network accessibility was studied by analyzing the index such as road density, connectivity of road network, inner accessibility of townships and connection to trunk road. Then, taking the side slope of road as the evaluation unit, the possibility of slope disaster is evaluated based on analyzing the combination of environmental factors such as the degree of slope, lithology, slope structure and aspect of slope. Moreover, the possibility of the highway slope disaster is analysed based on the spatial relationship between the slope and the road. Finally, the road network fragility under the duress of slope disaster was studied through the analysis of the impact of road network accessibility when a certain section of road was destroyed by slope disaster. The results will provide some theoretical basis and practical guidance for economic sustainable development of settlement, disaster prevention and mitigation, road layout and road network optimization in the upper reaches of Min River or other similar areas with road slope disaster.

The Research of GLOFs (Glacial Lake Outburst Floods) in Cordillera Blanca, PeruVilímek V¹, Emmer A^{1,2}, Klimeš J³¹ Department of Physical Geography, Faculty of Science, Charles University in Prague, Czech Republic, vilimek@natur.cuni.cz² Department of the Human Dimensions of Global Change, Global Change Research Institute, Czech Academy of Sciences; Brno, Czech Republic³ Institute of Rock Structure and Mechanics, Czech Academy of Sciences; Prague, Czech Republic**Abstract**

High mountain areas are considered as regions of exceptional risk for human population and activities. These areas are also very sensitive during global climate changes. Our research of Glacial Lake Outburst Floods (GLOFs) consists from several steps hold in last 10 years and is mainly dedicated to the Cordillera Blanca in Peru. Apart of different case studies dealing with hazardous GLOF events we tried to solve also some more general topics to contribute to the research of GLOFs in general: inventory of lakes in Cordillera Blanca, new methodology for hazard evaluation and establishing of GLOFs database. We also tried to sum all different factors which influence the GLOFs hazard evaluation. Due to the fact that slope movements are the main triggering factor for GLOFs in Cordillera Blanca we tried to go more detailed into this phenomena as well. Because of several regional differences we decided to establish the worldwide GLOFs Database to get more detailed dataset for future comparison. The research of GLOFs is an example of topic which needs a complex approach across geosciences.

The Response of Debris Flow to Mountain Vertical Differentiation in Upper Min River

Mingtao Ding¹*, Xiating Lv¹, Cheng Miao¹, Sergey A. Sokratov²

¹ School of Environment and Resource, Southwest University of Science and Technology, Mianyang 621010, China, mingtaoding@163.com

² Laboratory of snow avalanches and debris flows, Faculty of Geography, Lomonosov Moscow State University, Moscow, Russia

Abstract

The generation, formation, and development of debris flows are closely related to the vertical climate, vegetation, and soil condition of a given mountainous area. Taking the Upper Reaches of Min River as the study region, this paper selects a total of 12 indices from the 2 aspects of heat and moisture: mean annual temperature, dry seasonal temperature, wet seasonal temperature, mean temperature of the hottest month, mean temperature of the coldest month, $\geq 0^{\circ}\text{C}$ accumulated temperature, $\geq 10^{\circ}\text{C}$ accumulated temperature, solar radiation, annual precipitation, dry seasonal precipitation, wet seasonal precipitation, and dryness. The analysis and discussion of the mountain vertical zonality shows that the elevation has a conspicuous negative correlation with the following 7 indices: mean annual temperature, dry seasonal temperature, wet seasonal temperature, mean temperature of the hottest month, mean temperature of the coldest month, $\geq 0^{\circ}\text{C}$ accumulated temperature, and $\geq 10^{\circ}\text{C}$ accumulated temperature; and a positive correlation with solar radiation, annual precipitation, dry seasonal precipitation, and wet seasonal precipitation. Vertically, the study region has been divided into 7 zones: the subtropical ~ evergreen broadleaved forest ~ yellow soil zone, the warm temperate ~ deciduous broadleaved forest ~ cinnamon soil zone, the temperate ~ mixed coniferous and broadleaved forest ~ brown soil zone, the cold temperate ~ spruce forest ~ cryo-brown soil zone, the subpolar ~ alpine meadow ~ mat cryo-sod soil zone, the polar ~ scree vegetation ~ alpine frozen desert soil zone, and the tundra ~ permanent snow zone. The debris flow gullies have been found to concentrate on 4 of the zones from the subtropical ~ evergreen broadleaved forest ~ yellow soil zone to the cold temperate ~ spruce forest ~ cryo-brown soil zone. The deposition and circulation areas are mainly distributed along arid valleys of the subtropical and temperate zones, while the formation and confluence areas within one or two base zones. The study results of this paper will expand the cognition of debris flow development laws, provide boundary reference for debris flows and mountain vertical differentiation, and enrich the scientific basis of prevention and reduction of debris flow hazards.

A Geographical Study of the Evacuation from Welfare Facilities for the Aged in the Case of a Tsunami Disaster

Matsuo, T. and Hashimoto, Y.

Hokkaido University, Sapporo, Japan, t_matsuo@eis.hokudai.ac.jp

Abstract

This study aimed to clarify the problem of the tsunami evacuation for the elderly welfare facilities in the heavy snow region. The study area is Kushiro City, which is located in the eastern part of Hokkaido. In this study, the following procedure was used. First, by using GIS and the tsunami inundation simulation data, this study clarified where welfare facilities were located in the hazard zone. Next, by the interview and questionnaire survey to the directors of welfare facilities, it investigated the factors which delay tsunami evacuation. In addition, it examined the problems with the point of view in the snow season. The result is as follows. The 18 facilities was located in the tsunami hazard zone in Kushiro City. In tsunami evacuation, there were mainly four subjects. First, it was difficult for elderly people to evacuate on foot. Second, equipment of the refuge place was not well-equipped. Third, the cooperation with the area and administration was insufficient. Finally, there are too few personnel at night. Furthermore, the condition aggravation of the elderly people in refuge place was a problem in winter. Since a road surface froze, it turned out that a walk and movement with a wheelchair become difficult.

Welfare facilities for the aged; Tsunami evacuation; snow area; Aged people; Kushiro

Assessments and Suggestions for the Urban Construction and Industrial Development Based on the Cause Analysis on Water Related Hazards (Taking China as an Example)

Ni L., Huang S.

China Architecture Design Group, Beijing, 100044, P. R. China, huangsw@cadg.cn

Abstract

Water issues have been emerged along with the fast urbanization and industrialization since 1979. Presently, China is undergoing a new round. The issue how to conduct an integral and overall assessment for water related hazards has become hot.

Like the on-going sponge city construction in China, various places adopt intervention on water body to tackle the problem. Also, new risks may be triggered while overcoming difficulties on water, due to the complex influence to water arising from construction. The water disasters such as the July 21 water logging in Beijing arising from extraordinary rainstorm ever took place frequently. Therefore, a comprehensive cognition for the issue is needed by introducing new perspectives.

The text, based on the analysis for the water body intervention, obtains relevant experiences of time dimension, assessment indicators and spatial scale through analysis for the different results of two duration of short and long term, as well as from the two spatial scales of urban area and drainage basin.

The cases concerning drainage basin mainly include the human intervention for the Yellow River basin etc. The cases from urban local areas mainly include the Fushou gutter in Ganzhou of Jiangxi etc. The influences involved with drainage basin are mainly made by industrial development. As for such influences regarding urban, they mainly come from engineering construction. It is hoped to learn experience from nature, guide urbanization decisions, reduce risks and achieve applicable feedbacks from the practice like the sponge city construction of Ganzhou.

CO₂ Emissions from the Summer 2010 Forest Fires in Russia

Guo M

School of Geographical Science, Northeast Normal University, Changchun 130024, P.R., China, guom521@nenu.edu.cn

Abstract

We used forest fires in Russia in the summer of 2010 as a case study, and we used GOSAT (Greenhouse gases Observing SATellite) data to evaluate CO₂ emissions for the study case. Based on MODIS (Moderate Resolution Imaging Spectroradiometer) AOD (Aerosol Optical Depth) daily mean values and daily maximum value trends, we determined that the forest fires occurred from July 20 to August 20. We calculated the CO₂ concentration changes during the period of the forest fires and found that the forest fire smoke rose to a height of approximately 850 hPa (1.56 km). Using GOSAT L4B data, we determined that there were 412.54 Tg of CO₂ emissions from the 2010 Russian forest fires. We also calculated the CO₂ emissions using the Biomass Burning Model (BBM) for the same study site. With regard to the missing BBM parameters, we used the values measured at Daxingan Mountain because of the similar vegetation species compositions in the two regions and obtained a CO₂ emission result of 26.06 Tg. Our result was similar with that calculated from CO emissions of former research by using emission ratio. This paper proposes a new way to evaluate CO₂ emissions from forest fires using remote sensing data, although there are many limitations that must be overcome in the future.

Key words:Forest fire; CO₂ emissions; GOSAT data; BBM

Community Resilience against Natural Hazards: Case Studies from the Pacific Islands

Weber, E.

The University of the South Pacific, Suva, Fiji Islands, weber_e@usp.ac.fj

Abstract

Disaster Risk Reduction policies have made good progress on national and regional levels in the Pacific Island Region. However, in most countries the connection between the national level and community levels has been insufficiently addressed. The integration of local level disaster risk reduction and climate change adaptation into development planning is essential. Here additional efforts are required to reduce disaster risk and enhance effective recovery following major disasters.

The paper synthesizes lessons learnt on community resilience in Pacific Island Countries. It discusses case studies of several disaster events from a grass-root level perspective. We find that local-level institutions and networks, both formal and informal, play an important role in people's agency and interaction. The paper also considers how hazards add to other challenges people are facing, such as poverty and tenure insecurity. It highlights the importance of social capital for disaster risk and disaster recovery and rehabilitation.

Our findings suggest that in assessing community resilience and devising disaster risk reduction strategies particular attention needs to be given to local land tenure systems, ethnic differentiation, remittances, and safety networks.

In conclusion, the paper calls for integrated approaches that link national and local level interventions and that take into consideration that people's capacities to face the various aspects of climate change and natural hazards may become overstretched when they have to deal with too many and/or too severe challenges at the same time.

Disaster risk; climate change; Pacific Islands; community resilience; social capital

Construction of Elderly Vulnerability Assessment Index System in Urban Community

Ran Xu

Beijing Normal University, Beijing, 100875, China, xurans1@163.com

Abstracts

Outbreaks of disaster vulnerable urban population worldwide. Add also, the elderly will suffer more losses. Yet previous vulnerability study mostly focuses on certain systems such as financial system and eco-system and leans much on statistical analysis thus field investigation defaults. Based on questionnaire survey and field work data, this paper conducts a vulnerability assessment on the aged in 39 communities located in Beitaipingzhuang subdistrict in Beijing, combining AHP methods and Delphi method to confirm the weight of index. The result shows that due to massive old residents living in this area, the overall vulnerability is considerably high. Moreover, the completion time, function and characteristic of those communities have major influence on its vulnerability. Notably, college and university nearby reduces its vulnerability significantly. Meanwhile, disaster prevention education and organization of those activities are needed to be improved.

Do Spatial Heat Vulnerability Assessment Studies Influence Policy?

Wolf T, Chuang W-C, McGregor GR

Department of Geography, King's College London, London, UK, tanja.wolf@kcl.ac.uk

Abstract

Human vulnerability to heat varies at a range of spatial scales, especially within cities where there can be noticeable intra-urban differences in heat risk factors. Mapping and visualizing intra-urban heat vulnerability offers opportunities for presenting information to assist support decision-making. For example the visualization of the spatial variation of heat vulnerability has the potential to enable local governments to identify hot spots of vulnerability and allocate resources and increase assistance to people in areas of greatest need. Recently there has been a proliferation of heat vulnerability mapping studies, all of which, to varying degrees, justify the process of vulnerability mapping in a policy context. However, to date, there has not been a systematic review of the extent to which the results of vulnerability mapping studies have been applied in decision-making. Accordingly a comprehensive review was undertaken of 37 recently published papers that use geospatial techniques for assessing human vulnerability to heat. In addition, an anonymous survey of the lead authors of the 37 papers was conducted in order to establish the level of interaction between the researchers as science information producers and local authorities as information users. Both paper review and author survey results show that heat vulnerability mapping has been used in an attempt to communicate policy recommendations, raise awareness and induce institutional networking and learning, but has not as yet had a substantive influence on policymaking or preventive action.

heat waves; heat risk; vulnerability mapping; climate risk management; policy

Drought Adaptation Capacity Assessment of Agricultural System---Take Xingtai District in North China as An Example

Yanrui Shang, Jiafei Chen, Qinghua Hu, Jingwen Ma

School of Resources and Environmental Science, Hebei Normal University, Shijiazhuang, 050024, P. R. China,

shangyanrui@126.com

Abstract

Drought is the biggest challenge for agricultural In North China. With temperate monsoon climate, high water consumption crop structure and intensive land-use, agricultural drought occurs almost every year. Irrigation by over-exploitation of both surface and groundwater is popular. This in return drives the hydro-ecological environment drying up and amplifying drought intensity. For sustainable development, systematic adapting to drought is the best way. This paper take Xingtai district in North China as an example, analyzed the impacting factors of agricultural drought, including each zone's physical environment, natural resources combination, social-economic conditions and restricts, management of farm households respectively in its western mountainous and hilly zone, the medium piedmont plain zone and eastern lowland. An index system and model for agricultural drought adaptive capacity assessment was established on the villages and town level. Using GIS, we assessed the adaptive capacity, classified its degree and made a set of maps. The result shows that on growing season and yearly time scale, Xingtai's agricultural drought adaptive capacity in the medium piedmont plain zone is relatively high, in eastern lowland zone is medium and in the western mountainous and hilly zone is low. But on the decades time scale and from the view of sustainable ecology, the eastern lowland zone is the most vulnerable and low adaptive capacity due to its severe drying of hydrological-ecological feedback caused by long term sustaining overdraw of groundwater. Furthermore, we put forward adaptation strategies on spatial scale of farm household, villages and towns, county.

Global Agricultural Drought Vulnerability and its Spatial Characteristics

Jianjun Wu, Guangpo Geng

Academy of Disaster Reduction and Emergency Management, Beijing Normal University, Beijing, 100875, P. R. China,
jjwu@bnu.edu.cn**Abstract**

Agricultural drought vulnerability is an important component of agricultural drought risk. By quantifying agricultural drought vulnerability as well as identifying the spatial characteristics, it would be helpful to prevent and alleviate drought impact reasonably. In this paper, we chose the global agricultural region as the study area, and selected six main crops (rice, maize, wheat, barley, sorghum and soybean) as the hazard bearing body, for the first time to assess agricultural drought vulnerability at the global scale and to reveal the spatial characteristics. The results indicated that area percentages of high and very high agricultural drought vulnerability zones were 25.37% and 7.26% of the total agricultural area in the world. Moreover, those zones mostly were distributed in northern and southern Great Plains, eastern Pampas Steppe, most of Iberian Peninsula, western Turan Plain, western Iranian Plateau and Deccan Plateau, most of Loess Plateau, southeast and west coastal area of Australia. Meanwhile, approximately 40% area in high and very high vulnerability zones were located in semi-humid and humid regions, and only 15% population in this study were located in high and very high vulnerability zones.

Land Use and Land Cover Change Detection and Its impact on Hydrological Hazards and Sustainable Development: a Case Study of Alaknanda River Basin, Uttarakhand, India

Prasad, Abhay Shankar ¹; Pandey, B. W. ¹; Negi, V. S. ² and Bandooni, S. K. ²

¹Department of Geography, Delhi School of Economics, University of Delhi, Delhi, India, abhaydse@hotmail.com

²Department of Geography, Shaheed Bhagat Singh (Eve) College, University of Delhi, India.

Abstract

Anthropogenic activities are continuously disturbing the natural system and its impact on hydrological behavior of river. The important factor causing flood and also accelerate several hydrological hazards during monsoon periods in Alaknanda river are heavy rainfall, cloud burst, GLOF, landslides, Slope failure, deforestation, drainage congestion due to urbanization. Natural hazards have had significant impacts on life, livelihood and property in areas with high population density and land use intensity. The escalation of risks and vulnerability has come about through population growth and land use intensification in the areas, both of which have encroached upon hazard zones and in some case, such as road construction on slopes, have exacerbated the hazard of slope failure. These hydrological hazards are mainly responsible for several socio-economic consequences (cultivated land degradation, infrastructure loss, human casualties, loss of transmission lines, and so on). Factors causing these changes have been attempted to be understood through the use of GIS and LANDSAT TM. Geospatial technique is used to find out the land use/cover change detection for three time periods (1976, 1999, and 2015). Toposheet (Survey of India) and secondary data has been taken for to carry the analysis work. Preliminary studies conducted on this subject indicate that human interference, unscientific developmental activities, agriculture extension and road construction are some of the activities which are creating the hydrological imbalances in the Alaknanda River Basin. This paper has identified the Vulnerability issues and suggest to adaptation method for sustainable development strategy for the development in the Alaknanda river basin, Uttarakhand, India.

Abstract

Landslides are one of the most wide spread geological hazards that threaten the human life worldwide especially on the mountain region of the world. Despite the growing scientific and technological development it has been difficult to reduce the impact of natural disaster. Hence if the affected communities are involved in the process of disaster risk assessment and reduction, the impact of disaster can be minimized to a great extent and therefore developing a suitable community based disaster management technique is required. This paper presents a preliminary finding on community engagement in land slide risk assessment and strengthen the capacity of communities to cope up with the disaster in Kandey and surrounding villages of Uttarakhand. The land slide near the Kandey village is very old (according to villagers it is more than 70 years old) and still active mostly in the monsoon season which poses threats to the villagers and may affect the villagers in coming years. For data collection secondary data and PRA tools have been used widely. This study is conducted in two stages, emphasis was placed on collection of disaster experience and skills development of locals in the identifying and characterizing of various hazards in villages with special emphasis on landslide and landslide contributory factor and preparedness for coping with disaster. In the first stage hazards, vulnerability and capacity have been assessed to find the landslide and associated hazards risk involving the local community. In the second stage emergency preparedness and management plan has been drafted out incorporated with the local communities. For emergency preparedness the perception of local communities are generated in a simplified map which includes emergency escape route, shelter during the time of disaster hit. In the last step for managing the land slide risk reduction community training, community education, resources inventories are being practiced. Finally the study provides the example of the utility of community based disaster management approach for solution towards the effective mitigation of land slide and associated hazards especially in developing countries.

Measuring Social Vulnerability to Natural Hazards in Beijing: from the Perspective of Spatial Heterogeneity

Jianyi Huang

BUU, China, jianyi@buu.edu.cn

Abstract

Presently, the cities of China are facing serious disasters with rapid urbanization. How to reduce urban social vulnerability, promote stable and healthy development of urbanization has become a critical issue of urban research field. As the urban spatial non-equilibrium of urban activities and development distribution, urban social vulnerability shows significant spatial heterogeneity, and affected by social, economic, cultural, institutional, built environment and other factors. To carry out the comprehensive urban social vulnerability, and reveal its spatial heterogeneity, has important academic contributions to disaster and risk management research. Based on the analysis of the latest research progress of urban social vulnerability, there are some challenges facing the vulnerability assessment: namely, without the consideration of the effects of urban multiple disasters and the multidimensional characteristic of the social vulnerability, and the collection, integration, and synthesis of large quantities of heterogeneous data to provide reliable estimations. This situation has led to the neglect of all significant interactions between the considered indicators, despite their being essential to urban social vulnerability analysis. From the perspective of spatial heterogeneity, and Beijing are carried out for empirical research. This article attempts to take a new method to reveals the heterogeneity of urban social vulnerability by using spatial clustering method for the selected core factors of the urban social vulnerability. Using the Hazards-of-Place Model of Vulnerability, the social vulnerability hotspots city and its main influencing factors are explored, under the disturbance of multiple disaster scenarios. The result will reveal the hotspots and key factors of urban social vulnerability by focusing on the locally convergent specific characteristics and processes reinforcing (or reducing) social vulnerability.

Regional Feature Analysis of Natural disaster chains in Northeast China

Ran Wang¹, Shujuan Cui¹, Jingai Wang^{1,2}

¹ School of Geography, Beijing Normal University, Beijing 100875, China, wangr0225@163.com;

² Laboratory of Regional Geography, Beijing Normal University, Beijing 100875, China.

Abstract

Although Northwest China are sparsely populated, but disasters such as rainstorms, drought, earthquakes, cold waves happen frequently, and secondary disasters caused by them constitute disaster chains, resulting in loss of population, economy and so on, especially the debris flow of Zhouqu in 2010 make people concern about disaster problem in this area. Based on the disaster system theory, according to disaster database of China provincial newspapers from 1949 to 2013, this paper builds a classification system of nature disaster chains in Northwest China, and analyses their distribution features by the form of case. The results show that Northwest natural disaster chains can be divided into 4 types, including rainstorm disaster chains, cold wave disaster chains, earthquake disaster chains and drought disaster chains, with a total of 64 sub types. Rainstorm disaster chains are the most occurrence times of natural disaster chains (41.8%), among them, rainstorm-flood and waterlogging disaster chains (73.3%) mainly occur in the plain area of Northern Xinjiang and central Shanxi, rainstorm-geology disaster chains (18.9%) mainly occur in the mountain area of Southern Shanxi central southern Gansu, Northeast Qinghai and Southern Ningxia; cold wave disaster chains are the second most occurrence times (25.8%), they mainly occur in Northern Xinjiang, central north Gansu and Northern Qinghai; earthquake disaster chains (20.4%) mainly occur in Tian Mountain region, Gansu Corridor, Ningxia region and Qinghai region; and drought disaster chains (12%) mainly occur in western and northern Xinjiang, central Gansu, central north Shanxi and Ningxia.

Abstract

In recent years, the research on vulnerability of hazard bearing body, especially the elderly is becoming more and more important in disaster risk management. This article build an index system to evaluate the vulnerability of natural disasters of the elderly, including 5 dimensions: Physical, Mental, Household, Community, and Awareness. Then the impact factors can be analyzed based on the demographic characteristics, including Age, Gender, Career, Education level and Location. A questionnaire is designed to get the research data ,people aged 60 and above are chosen as the research objects and Beijing is chosen as the study area, for its various kinds of natural disasters and topography characteristics and serious aging problem. This article expect to put forward a scientific and whole method to analyze the main affect factors of vulnerability of the elderly to natural disasters, and to make contributions to the disaster prevention and reduction.

Risk and Resilience in Urban Area Under the Land Use Change

Shigeko Haruyama

Mie university, 1577 Kurimachiyaccho, Tsu city, Mie pref., Japan, haruyama@bio.mie-u.ac.jp

Abstract

Flooding damage has been drastically reduced and life loss has decreased, however, Asia Monsoon area is still now troublesome of flood risk in complex phenomena related with human and nature dimension. The strengthening of community based activities for fighting flood should be increased for lifesaving under the natural disaster and new emerging disaster risks. The coastal and fluvial plains in Asia Monsoon area are greatly suffered from flood disasters because of its location, potentiality of rainfall and low relief plain with density population related with sea level change. Regarding to reduction of damages by huge scale flood, the comprehensive measures should be needed including hazard management, resilience of the local society to flood, disaster exposure management and damage management. Suitable disaster science education for understanding factors of natural disaster mechanism, and sustainable and suitable land use planning on site for avoidance and reduction of disaster damages, appropriate watershed management harmonized with nature without threaten of disaster risk increasing, visible local planning between inhabitants and government planner. In this study, the author will explain the specific case study of the Shonai River Basin in Japan.

Social Disparities in the Distribution of Air Pollution Risks: Comparing Perceptions and Exposure in Houston, Texas

Chakraborty J, Collins T W, Grineski S E, and Maldonado A

Department of Sociology and Anthropology, University of Texas at El Paso, El Paso, Texas, USA, jchakraborty@utep.edu

Abstract

While numerous empirical studies have found racial/ethnic minorities and people of lower socioeconomic status (SES) to be disproportionately exposed to environmental hazards, prior research has rarely examined whether individuals facing greater health risks from pollution exposure also exhibit higher awareness or perceptions of such risks. Risk perception studies in the U.S. suggest that racial/ethnic minorities demonstrate higher levels of environmental concern than Whites, but perceived risk levels of local residents have rarely been compared directly to the environmental exposure they experience. Our paper addresses this limitation by comparing perceived health risks from air pollution to health risks from exposure to industrial and vehicular air pollutants in the Greater Houston metropolitan area (Texas, USA)—a racially diverse urban area containing one of the world’s largest petrochemical complexes. We seek to determine if personal health risk perceptions of air pollution are statistically related to exposure from industrial and transportation sources of air pollution; and how this relationship varies across specific categories of race/ethnicity, after controlling for contextual factors such as age, gender, SES, and previous experience with air pollution. We integrate primary household-level survey data with estimates of cancer risk from exposure to industrial releases and on-road mobile sources of hazardous air pollutants obtained from the U.S. Environmental Protection Agency. Statistical analyses are based on descriptive comparisons and spatial autoregressive models that account for geographic clustering of surveyed households. Our findings underscore the need to incorporate risk perception in future empirical analyses on social inequalities in the distribution of environmental hazards.

The Geographic and Demographic Determinants of Mortality in the Great East

Japan Disaster

Abe, T.

Tohoku University, Sendai, Japan, takashi.abe.p1@dc.tohoku.ac.jp

Abstract

Many papers point out large regional difference in the human damage caused by the Great East Japan Disaster, however, not enough have been revealed about the demographic determinants to the human damage at micro geographic level. Analysis at finer geographical scale is necessary to exploit the knowledge from the painful experience to future mitigation and town planning. We compared the age and sex profile of death and missing people in Yamada Town in Iwate Prefecture to that of the Population Census 2010 Small Area Statistics. As a result death and missing rate in advanced age groups was considerably higher than that in younger age groups. the geographical distribution of the death and missing people is considered to be influenced by the elderly ratio, household composition and the damage of housing of a small area. We analyzed the relationship among the rate of death and missing, the elderly ratio and the flood rate. Multiple linear regression analysis revealed that elderly ratio and flood rate can explain about 50% of the geographical variation in death and missing rate among small areas. The standardized partial regression coefficients of elderly ratio and flood rate were 0.3112 and 0.5857, respectively, thus the flood rate had been better explanatory variable.

The Population in China's Earthquake-Prone Areas has Increased by Over 32 Million Along with Rapid Urbanization

Huang Q, He C, Dou Y

State Key laboratory of Earth Surface Processes and Resource Ecology, Beijing Normal University, Beijing, 100874, P.R. China

Abstract

Accurate assessments of the population exposed to seismic hazard are crucial in seismic risk mapping. Recent rapid urbanization in China has resulted in substantial changes in the size and structure of the population exposed to seismic hazard. Using the latest population census data and seismic maps, this work investigated spatiotemporal changes in the exposure of the population in the most seismically hazardous areas (MSHAs) in China from 1990 to 2010. In the context of rapid urbanization and massive rural-to-urban migration, nearly one-tenth of the Chinese population in 2010 lived in MSHAs. From 1990 to 2010, the MSHA population increased by 32.53 million at a significantly higher rate of change (33.6%) than the national average rate (17.7%). The elderly population in MSHAs increased by 81.4%, which is much higher than the group's national growth rate of 58.9%. Greater attention should be paid to the demographic changes in earthquake-prone areas in China.

The Use of Remote Sensing Data for Vegetative Drought Monitoring of Mountain Ecosystem (Armenia)

Muradyan V,

The Center for Ecological-Noosphere Studies National Academy of Sciences of RA, Yerevan, Armenia,

muradyan.asx@gmail.com

Abstract

Drought is a natural phenomenon that has been recurring at a regional scale throughout history. In fact, the monitoring and assessment of drought conditions in a region is usually performed through drought indices. There are several drought indices based on ground (conventional) and/or remotely sensed data. A number of drought indices have been developed based on NOAA-AVHRR, SPOT, LANDSAT data exploiting the remote sensing potential at different temporal scales. Being a mountainous country, Armenia has undergone different kinds of natural disasters, such as droughts.

As a modeling area were selected Syunik marz and Sevan region. The impact of drought on vegetation, referred to as vegetative drought, is commonly monitored at a regional scale using satellite based vegetation indices such as the Normalized Difference Vegetation Index (NDVI), The Vegetation Condition Index (VCI), Vegetation Health Index (VHI), Drought Index (DI). Vegetation conditions can be characterized by the deviation of the current NDVI Values from their corresponding temporal mean NDVI values, usually calculated over a long period such as one or more decades.

Deciphering satellite images through NDVI enabled us to indicate the monitoring and assessment of drought of the mountainous ecosystem of Lake Sevan basin and Syunik region in a period 1973 to 2014. For the last 40 years the study area has displayed were detected changes of drought duration and periodicity and also drought-sensitive areas increased. The results of this study will used for the development of a regional drought monitoring system.

Remote sensing data; NDVI; VCI; vegetative drought; monitoring; mountain ecosystem

Understanding Community Resilience to Tropical Cyclones in the Mahanadi Delta, India

Fanchiotti, M

University of Southampton, Southampton, UK, m.fanchiotti@soton.ac.uk

UNESCO, Paris, France

Abstract

Disasters of natural origin cause many fatalities and significant losses every year and exposure to these hazards is growing worldwide as urbanisation driven by greater economic productivity is leading to higher concentrations of population in areas at risk and global warming is posing serious threats to communities. In light of this, the concept of disaster resilience has gained momentum in recent decades and the need to invest in resilience building for disaster risk reduction has been recognised as a global priority in the Sendai Framework for Disaster Risk Reduction 2015-2030; however, there is still little understanding of the nature of resilience and more research is needed to empirically investigate the concept and to develop effective tools for its measurement and operationalisation, especially in developing countries. This research is aimed at investigating community resilience to tropical cyclones in the Mahanadi delta, India, with the ultimate scope of contributing to understanding what disaster resilience looks like in the case study area and of developing a tool for its assessment over space and time. This study builds on available literature to provide a conceptual framework for the measurement of resilience to tropical cyclones in the study site through the identification of key drivers of resilience and their indicators. A data-driven and bottom-up approach with direct stakeholder engagement in the selection of indicators is being used and a model is being developed to capture the interactions between drivers of resilience. The model is meant to facilitate knowledge transferability and aid decision making by providing decision support tools to comparatively evaluate resilience. This study is part of the 'Deltas, Vulnerability & Climate Change: Migration & Adaptation' (DECCMA) project, under the Collaborative Adaptation Research Initiative in Africa and Asia (CARIAS).

10Be Exposure Age Reveals a 12 Ka Seismic Triggered Rock Avalanche in the Tibet-Bhutan Himalaya

Peng Xu, Liu Gengnian, Chen Yixin, Liu Beibei, Liu Junnan

College of Urban and Environmental Sciences, Peking University, Beijing 100871, China, px910928@163.com

Abstract

The geological record of prehistoric rock avalanches provides invaluable data for assessing the hazard posed by these rare but destructive mass movements. Here we investigate a previously unrecorded rock avalanche deposit that resulted from a major mountain slope failure on the NW face of Mount Chomo Lhari in Linxila area of the Tibet-Bhutan Himalaya. This research provides detailed mapping of landslide, related Quaternary phenomenon, surface exposure dating of rock avalanche deposits, and reliable analysis on the trigger of failure. Cosmogenic ^{10}Be exposure ages of 6 deposited boulders revealed a Younger Dryas age of 11.99 ± 2.54 ka for the Linxila rock avalanche. Proxy records for this region of the Himalaya imply a similar cold and dry climatic regime to the present day at this time, suggesting that degradation of permafrost and precipitation were unlikely trigger for this rock avalanche. Given the close relationship with the Yadong fault, we can conclude that the most likely trigger for this collapse was seismic activity which was related to the Yadong fault.

Key words:

Rock avalanche, Cosmogenic dating, Yadong fault, the Tibet-Bhutan Himalaya

A Study of the “11.2” Landslide-Debris Flow Characteristics of Chuxiong, Yunnan Province

Huang Jiangcheng, Ou Guoqiang, Liu Jinfeng, Pan Huali, Li Xu

Yunnan Key Laboratory for International Rivers and Transboundary Eco-Security, Yunnan University, Kunming, 650091, P. R. China, explor99@163.com

Abstract

Landslide-debris flow has always been a difficult problem of mountainous disaster prevention because of its characteristics of wide multi-point coverage, strong concealment, sudden outbreak and short duration. With the combined effect of warm moist flow from the Bay of Bengal and surface cold air, Yi Autonomous Prefecture of Chuxiong, Yunnan suffered a rare autumn continuous heavy rainfall during October 24th to November 2nd, 2008, which triggered “11.02” catastrophic natural disaster. Landslide-debris flow occurred in Dazhulin Village of Shuangbai County, causing the great damage of the village and 39 deaths. Through on-site investigation, fine terrain measurement, diachronic precipitation data and analytical test of provenance and accumulation samples, this paper reveals the forming reasons and move process of the debris flow, and makes a further analysis of forming mechanism of the disaster. The study results can provide scientific reference for the prevention of the widespread mountainous landslide-debris flow in China.

Agricultural Accidents in a Segment of Lower Ganga Plain

Dr. B. R. K. Sinha

Professor of Geography, Faculty of Science, Banaras Hindu University, sinha_brk@yahoo.co.in

Abstract

Agricultural accident, a part of occupational hazards, is an unexpected event or unfortunate mishappening that occurs during hours of work in agricultural activities. This may be in the form of cut, pain, sprain, wound, fracture, bruise, squeezed and crushed injury, etc. that arises mainly by means of agricultural tools/implements/machines, chemicals and others. The major means of accidental injuries in agriculture are ploughshare and leveling bar, sickle, spade, hoe, fodder cutting machine, pumping set, electric motor, thresher, power tiller, tractor, spray machine, vehicle, bullock cart, irrigation tools, etc. Accident may be slight, serious, more or less harmful or damaging and varies in space and time. It leads either to temporary or permanent, partial or total disability of the suffered parts of human body. This seizes a week or more of worker's working period and affects almost the whole family. Sometimes it may cause loss of life too.

Objectives of this study are to: i) examine variation in the pattern of accidents caused by several means during work operations and cropping seasons; ii) demonstrate variation in the pattern of loss of mandays, loss of earning, suffering period, medical cost and gross monetary loss and its household level effect, and; iii) put forth appropriate suggestions to prevent agricultural accidents for well-being of the people.

The analysis of entire work is based on the primary data collected through questionnaire from households of sample villages of a District from Lower Ganga Plain in eastern India.

Occupational Hazards; Agricultural Activities; Agricultural Tools; Work Operations; Cropping Seasons.

Analysis of Climatic Hazards of Iran

Farajzadeh Manuchehr

Tarbiat Modares University, Tehran, Iran, farajzam@modares.ac.ir

Abstract

Iran located in mid latitude and has different climate type's form intermediate and humid to very arid climates. Each of climates has different climatic hazards in relation to climate types. In this paper the main climate hazards analyzed based on weather station data for 40 years from 1955 to 2004 using statistical calculations and all captured results mapped by GIS in order to spatial and temporal analysis. The results indicated different geographic rejoin on country have all climatic hazard including UV radiation, heat and cold waves, drought, heavy rainfall, storms and son on, but frequency of hazards is very different in various climatic types. The spatial analysis of climatic hazards show in the north of Iran with humid climate we have heavy rainfall, heat and cold wave; while in the south of Iran with arid climate we have high frequency of drought and UV radiation associated with wind storms. Temporal analysis indicated in all climate types of Iran, in the recent years climatic hazards have increase trends. Climatic hazards susceptibility of country says we must have necessary design making in relation to decrease and mitigation approaches in different rejoin of country.

Analysis of Flood Risk Using Spatial Technology in the Southern Coastal Zone of Sri Lanka

Wickramasooriya, A. K.

Department of Geography, University of Peradeniya, Peradeniya, 21000, Sri Lanka, awickramasooriya@gmail.com

Abstract

Flood is one of the common natural hazard experience in Sri Lanka. This is more significant in and around Southern coastal zone. In each year, there are many People and properties in this region affected by floods. Geomorphological setting and the distribution of the drainage pattern in the area influence to create floods. It has been observed that many historical floods were recorded in this area during South West monsoon period from May to July. However, few sever past floods were experienced in this region due to sudden change in climatic conditions closer to bay of Bengal. Due to complex nature of factors control floods, it is difficult to manage floods. However, by introducing flood risk maps and monitoring rainfall data, it is possible to minimize the damage create by floods. Main objective of this research is to introduce flood risk map for the Southern coastal zone of Sri Lanka using spatial technology i.e Geographical Information systems and aerial photo interpretation. Also google earth imaginaries are used to locate possible areas affected by floods. First main factors influence on floods were identified and prepared thematic maps using ArcGis software. Different factors influence to create floods in different manner. Therefore, different weightages were assigned for these thematic layers. Also influence to create floods varies when conditions within a factor vary. Therefore, different ranks were introduced to represent different conditions. By weighted overlay analysis flood hazard map was prepared. Finally, flood risk map was introduced by considering human settlements, infrastructure facilities, etc.

Analysis of Relations Between Natural Disaster Resilience and Regional Socioeconomic Characteristics

Park, S. Y., Jeon, E. Y. & Byun, B. S.

Ph.D. in Urban and Regional Planning, Graduate School, Inha University, richstar515@gmail.com ;

Doctoral Program in Science of Public Administration, Graduate School, Inha University,

Graduate School Office, Inha University 100 Inha-Ro, Nam-Gu, Incheon 22212, Korea

Abstract

As climate change incurs abnormal climate, which makes prediction and advance countermeasures difficult to implement, and especially in vulnerable environments, it tends to link with complicated and enormous natural disasters. As a result, both urbanization and climate change, which have contributed to create vulnerable surroundings, could expand the scope of damage when a natural disaster occurs, and also require high expenses and efforts to recover from the disaster. Not only physically vulnerable regions, but also vulnerabilities in populations, society, and economy tend to increase damage by any disaster caused by climate change, and also required considerable efforts to restore. In such context, issues such as climate change, vulnerable populations or environmental justice have been emerging recently. Thus, this study analyzed the impact of regional socioeconomic characteristics to the natural disaster resilience. In other words, it is necessary to study how much efforts would be required to overcome natural disaster, if socioeconomic vulnerability is high. The major purpose of this paper is to analyze the relationship of diverse socioeconomic factors in a region with natural disaster resilience by extracting regions with high natural disaster resilience and those with low resilience at first. For the analysis, we used ArcGIS software program to check the pattern of cost incurrence caused by restoration of natural disasters across the nation, and analyzed influence relations through regression analysis by using regional socioeconomic indicators.

Natural Disaster Resilience; Socioeconomic Vulnerability; Environmental Justice

Analysis of the Peak Flow Dynamics Based on Information Technologies and Algorithms of the Automatic Hydrograph Separation

Kireeva M., Rets E., Ezerova N., Frolova N., Efremova N., Sazonov A.

Lomonosov Moscow State University, Moscow, Russia, kireeva_mb@mail.ru

Abstract

Evaluation of occasional flood runoff is a complex and multifactorial problem. The main difficulty is extremely hard selection of each flood wave. Given the climate variability and the general trend of a climate warming, a growing number of flood waves on the rivers of European Russia is observed. Therefore, the main goal of the study is the development of approaches for automatic hydrograph separation within all hydrological seasons. To analyze the role of peak-flow component in the annual runoff special soft – GrWat was created. The code was written both on Fortran and R-studio software. Algorithm based on the hydrograph separation schemes, carried out by B. Kudelin. Given the characteristics of each particular river, the program, firstly, correctly separates the groundwater and surface component. Then, according to the dates the spring flood and peak flow are calculated. The mathematical description of the individual characteristics of river flow variations set the 12 calibrated parameters. For the separation of rainwater after the main melt water wave the block of the recession curves have been incorporated into the program. For the analysis of the peaks in the summer-autumn and winter period spatial distribution of the air temperature and precipitation (Daily NOAA-CIRES 20th Century Reanalysis V2) was involved. It helps to determine flow-effective precipitation and to derive individual peaks and flood periods. (The study was supported by the Russian Foundation for Basic Research (grant No. 16-35-60080)).

Automatic hydrograph separation; hydrological software; flood wave; peak flow

Analysis of Vulnerability of Dam Failure in Nigeria Using GIS Technology

Salamatu, L. A^{1,*}, Hauwa, .M.A¹, Mahmud,U¹, Oluwafemi ,O.A¹, Adepoju, K.²,

¹ Centre for Geodesy and Geodynamic (CGG), Toro, Bauchi State, Nigeria.

²Obafemi Awolowo University, Ile-Ife Osun state., sally401ng@yahoo.com

Abstract

Dam has become a widely distributed and devastating disaster that has caused significant damages both economically and socially in Nigeria. Dam failure has caused more harm than good, Dam failure are caused by flood event, geological/foundation weakness (earthquake), storms and other human activity. Flooding originated from different levels of human environmental system which can lead to Dam failure. Flood event in Nigeria have pushed rivers over their banks and submerged hundreds of kilometers of urban and rural lands. Flash flood are common features in Nigeria during the raining season. This study therefore aims at creating a database and mapping of vulnerable area to dam failure using geospatial techniques. SRTM DEM was developed with ARCGIS 9.3 to identify vulnerable areas in both Towns/Villages as well as LGAs, the DEM was reclassified to highly vulnerable, moderately vulnerable and low vulnerable, using interval of less than 50m, 100m, 200m elevation from Dam 500m Buffer and River 300m Buffer. The study shows that 17 LGAs in Nigeria are vulnerable to dam failure after the buffering analysis was carried out and a total of 33 states are vulnerable to event of Dam failure.

Analysis on Susceptibility of Flood Disaster's Disaster-Pregnant Environment in Honghu Basin

Wu L, Xu Y P, Yang Q

Nanjing University, Nanjing, 210023, P. R. China, wuleiresearch@163.com

Abstract

The rainstorm, which began July 5 and continued to July 26 2010, dumped more than 580mm, in some part the cumulative precipitation was over 700mm, and the heavy rainfall has caused a serious flood disaster. MNDWI (Modified Normalized Difference Water Index, MNDWI) was applied to extract water body based on the remote sensing image before and after the flood disaster, then spatial overlay analysis was used to extract the flood inundation area. On this basis spatial analysis methods and certainty factor analysis method were applied to analyze the sensitivity analysis of disaster-pregnant environment, such as terrain factor, vegetation coverage, water network, water projects and facilities and road, etc. The research result shows that elevation between 30m and 60m, slope and relief amplitude are less than 30m are conducive to the occurrence of floods; vegetation coverage value is more than 0.75 is prone to floods; the closer distance from water network, the greater chance of flood disaster; the farther distance from road, the greater chance of flood disaster.

Key words:

flood disaster; disaster-pregnant environment; certainty factor; susceptibility analysis

Analyzing Changes to a River Network and Its Storage Capacity Under Rapid Urbanization during the Past 50 Years in the Yangtze River Delta, China

Liu Yang, Youpeng Xu*, Yu Xu, Jie Xiang, Jie Yang

School of Geographic and Oceanographic Science, Nanjing University, Nanjing 210093, China, palapalayl2006@126.com

Abstract

Rapid urbanization has significantly impacted many river networks and their water storage capacity. The Yangtze River Delta region has undergone rapid and profound urbanization in the last 50 years. In this study, the urbanization expansion strength model was used to evaluate the urban expansion in the Yangtze River Delta from 1991 to 2009. Changes in the river network structure from the 1960s to 2010s in five representative sub-basins of the Yangtze River Delta were analyzed using remotely sensed images and topographic maps. Changes in the river storage capacity and flood control capacity under rapid urbanization over the past 50 years were then investigated. Grey relation analysis is used to analyze the impacts of storage-flood control capacity on river network systems. The results indicated that: 1) the sub-basins around Shanghai and Taihu Lake had the highest intensity of urban expansion; 2) the number of river networks were reduced, so did the complexity of river network spatial structure. The average drainage density, water surface ratio, river area-length ratio and fractal dimension of the five representative sub-basins were 3.02 km/km², 9.31%, 44.15, and 1.48, respectively. The attenuation rates during the 1960s to 2010s of drainage density, water surface ratio, river area length ratio (excluding one basin), and fractal dimension were 15.2%, 10.8%, 2.2% and 5.1%, respectively; 3) the storage-flood control capacity of the Yangtze River Delta region both showed a decreasing trend during the past 50 years due to the reduction of the general rivers; 4) the water surface ratio and drainage density had a great influence on the storage capacity and flood control capacity in the Yangtze River Delta.

Key words:

Urbanization; River network structure; Storage capacity and flood control capacity; Grey relational degree; Yangtze River Delta

Assessment and Mapping of Sinkhole Susceptibility in Gypsum Karst Terrains (Study Area: Yek-Mahe Sub Basin, Southwest of Iran)

Saffari Amir ¹, Mohammadi Zakieh ²

¹Associate Professor, Department of Geographical Sci, Kharazmi University, Tehran, Iran. saffari@khu.ac.ir

² Ph.D. Student in Geomorphology, Kharazmi University, Tehran, Iran. mohammadi.zakieh@gmail.com

Abstract

Sinkholes are very critical hazards in gypsum karst terrains and can damage manmade structures and cause groundwater pollution. Preparation of sinkholes susceptibility maps will help to successful planning in karst terrains. The aim of this research was a sinkhole susceptibility map in gypsum karst area of Yek-mahe sub basin, southwest of Iran. The map of sinkhole distribution was prepared by a geomorphological approach based on direct observations during field and the visual interpretation of satellite images (7338 sinkholes are recognized in 31.9 km²). The sinkholes effected factors maps, include geological (lithology, structures), hydrological (drainage systems), and topographical (slope, elevation) were produced using field observations, remote sensing data, and GIS techniques. The susceptibility map was constructed using the linear regression technique. The values obtained were visualized by four susceptibility levels (low, moderate, high and very high). The sinkhole susceptibility map shows that more than 86 percent of the surface studied area are located in the very high and high susceptibility levels. The validation of the susceptibility map was checked by considering 3532 sinkholes, which not had been used in modelling. It seems that the results obtained in this paper can be used as a basic phase of sinkholes hazard assessment in regional planning in gypsum karst terrains of Iran.

Key words:

Gypsum karst terrains; Sinkhole susceptibility map; linear regression method; Iran.

Application of UAV Remote Sensing in Urban Atmospheric Environment Disaster

Liu HuiLin, Ma JinJi, Wu Hao

AnHui Normal University, WuHu, 241002, P. R. China, liuhl@aust.edu.cn

Abstract

In the process of rapid development of urban construction, emergency air pollution disasters occur frequently, causing huge environmental damage and economic losses. Unmanned aerial vehicle (UAV) remote sensing, as a new method of environmental monitoring, has broad application prospects. In this paper, based on the two key aspects in the emergency monitoring of air pollution events: "Measurement of atmospheric environmental parameters" and "Post disaster decision support information extraction", we analyze the working principle of the UAV remote sensing platform, research and design the data collection scheme for UAV environmental emergency monitoring, the sensing data post-processing technology, and discuss the existing problems. This work provides a reference and scientific basis for the application of remote sensing in the urban atmospheric environmental disasters.

Assessment of Tourist Risk Perception of Mountainous Rainstorm Hazard: Take Huayang Ancient Town Resort In Qinling Mountains of China as an Example

Xiaofeng Wang, Sha Wang, Xianchao Huang

College of Tourism and Environment Science, Shaanxi Normal University, Xi'an, Shaanxi 710119, China,

wangxf@snnu.edu.cn

Abstract

In recent years, mountainous rainstorm disasters occurring frequently have a serious impact on regional sustainable development. There is a great significance for tourism safety and hazard risk prevention and mitigation to evaluate tourist risk perception of rainstorm hazard in the course of travel in mountainous ecological resort based on multi-discipline crossing. Taking Huayang Ancient Town resort in Qinling Mountains of China as study area, tourists in this area as study objects, through field questionnaire survey, using methods of AHP, Likert Scale and Exponential Model, index system of tourist risk perception of rainstorm hazard has been set up; weights of questionnaire index have been assigned; tourist risk perception exponent has been calculated quantitatively; Types and differences of tourist rainstorm hazard risk perception have been evaluated; At last, study results have been verified through related methods of bounded rational. The research results show that: in the face of rainstorm hazard risk, there are individual differences from tourists' perception; although tourists have positive attitudes to hazard risk mitigation, but their hazard risk mitigation knowledge is not enough, and their behavior tendencies to hazard risk mitigation need to be improved urgently, their comprehensive ability is poor.

mountainous rainstorm hazard; risk perception; tourists; index system of assessment; Huayang Ancient Town Resort in Qinling Mountains

China's Population Exposure Change Analysis Under Rainstorm Disaster

Weixia Y, Yao J, Yaoyao W, Jing'ai W (Corresponding author)

Beijing Normal University, Beijing, 100875, P. R. China, jwang@bnu.edu.cn

Abstract

Rainstorm and flood is one of the worst natural disasters which occurs frequently in China. Under the background of globalization and global change, frequent occurring of heavy precipitation, more people gathering will increase the impact of rainstorm disaster risk on population in the future. The research was based on 6 times' Chinese census data and day precipitation data from 1951—2010. Through analysing the spatial relationship of rainstorm and population (6 decades), population exposure change under rainstorms were studied. The results showed that: from 1950s-2000s (1)High volume rain region and high populated region were overlapped in space: they were mainly in the Yangtze River basin, south-eastern Rivers Basin, the Pearl River Basin;(2) High proportion heavy rain region and high population density region were overlapped in space: they were mainly in the North China Plain, the Yangtze River Basin, Sichuan Basin, southeast coastal areas; (3)"high rain - high population density levels" regions increased in the number: area with rainstorm grade ≥ 6 ($\geq 2500\text{mm} / \text{decade}$) and population density levels ≥ 6 ($\geq 200 \text{ people} / \text{km}^2$) was increased from $315,000 \text{ km}^2$ to $608,000 \text{ km}^2$.(4) The population exposed to high level heavy rain was in an increase. Population under rainstorm was increased from 560 million to 1.29 billion; population under rainstorm grade ≥ 6 was increased from 220 million to 540 million. In the nearly 60 years, China's population exposure under rainstorm increased significantly. The study set up a foundation for population vulnerability and risk assessment under heavy rain disasters.

Coal Mining and Rural Livelihood in Korba Coalfield, India: An Empirical Analysis Based on Livelihood Approach

Pushpendra Singh¹, Dr. Falguni Pattanaik²

¹PhD Research Scholar, Indian Institute of Technology Roorkee, India , pushpendra_singh@live.com;

² Assistant Professor, Indian Institute of Technology Roorkee, India

Abstract

India has the fourth largest coal reserve in the world with 9 per cent global share of coal. This coal reserve is distributed in different parts of the country; Chhattisgarh has second largest coal reserve (87 BnT) and contributes 18% national production. This fact clearly indicate that economy of the district is mainly coal-based. The inhabiting tribes and marginalized community of this area are backward and has experienced with both the positive and negative consequences of mining activities. The present study aims to estimate the differences in the household living environment, health and education across mining affected and non-mining affected villages. Also, the study tries to analyse the nature and extent of occupational diversification and its association with migration in the mining affected villages and the role of government. The proposed study will collect primary data from proximate to mine village and non-mining affected and secondary data 70th round (2014) of the National Sample Survey (NSS) and Annual Health Report, Government of India (2014). The result reveals that the distribution of the five capitals (namely, natural, human, social, physical and financial capital) are affected on local people and people are leaving under risk due to high coal mining and land acquisition. The present study sought to highlight the occupational diversification and its association with migration in Korba Coalfield also illustrated that the human wellbeing and Natural Hazards risk coverage.

Contamination and Health Risks of Arsenic and Heavy Metals at Different Land Use Types in Tianjin Qilihai Ancient Lagoon Wetland, China

XIANG Lixiong¹

¹School of Geography & Environmental, Jiangxi Normal University, Nanchang 330022, P.R. China, xianglx2015@163.com

Abstract

A total of 36 surface soil profiles sampled from wetlands in Tianjin Qilihai Ancient Lagoon Wetland (TJQW). In this study, we investigated topsoil (0–20 cm) sampled at different land use types to provide information on the concentration levels of heavy metals in a coastal wetland in China. Total concentrations of arsenic (As), cadmium (Cd), copper (Cu), lead (Pb), chromium (Cr) and zinc (Zn) were determined using inductively coupled plasma atomic absorption spectrometry (ICP-AES) to investigate the level of pollution in the sampling spots. The results demonstrated that the levels of Cd, Cu in all surface soil followed the order: the human intensive soil (HIS) > the wetland soil (WS) > the farmland soil (FS) > the vegetable community soil (VCS). As, Cd and Cu were the highest levels in human intensive area, while the level of Pb and Zn were the highest levels in farmland area. The average concentrations of Cu, Cr, Cd, Pb, Zn and As in the surface soil were 38.74, 83.52, 0.19, 34.27, 121.7 and 18.77 mg kg⁻¹, respectively. The contamination indices of As were high pollution level in the FS and HIS, Cd for moderate pollution level in WS and FS while high pollution level in HIS. The comprehensive contamination index values demonstrated that As was the content variation of maximum in four land use types, Cd pollution to a high level. Geoaccumulation index showed that As and Cd characterized by moderate pollution, other land use types of heavy metal pollution in human intensive area. This study provides a sound information that land use types can play a significant role in heavy metal contamination.

Coseismic Landslips and Associated Newmark Displacements in the Bhote Koshi Watershed of Central Nepal by the 25 April 2015 Gorkha Earthquake

Megh Raj Dhital¹, Moti Lal Rijal¹, Samjwal Ratna Bajracharya²

¹Central Department of Geology, Tribhuvan University, Kirtipur, Kathmandu, Nepal, mrdhital@gmail.com

²International Centre for Integrated Mountain Development, Dhapakhel, Lalitpur, Nepal

Abstract

The Mw 7.8 Gorkha earthquake of 25 April 2015 and its many large aftershocks generated about 2000 landslips in central Nepal. We have assessed the relationship between shaking and coseismic failures in the most severely-affected region of Bhote Koshi watershed. The study revealed that the distribution of slides is strongly controlled by their position in the landscape. Many slides were found to originate at a high crest or a peak. A comparison of Newmark displacement with landslide distribution shows that the slides are not positioned in the area with a maximum displacement. The slopes that had the highest internal relief suffered the most from the seismically-triggered failures. Similarly, the old and large failures, which are confined mainly to the river valleys, were rather insensitive to earthquake shaking. Back analysis of seismic hazard in the area affected by the Gorkha earthquake revealed that Newmark displacements are not the only factors to be considered during shaking, but the secondary effects can also play a decisive role in triggering shallow falls and slides on rock slopes. The investigation indicates that ground vibrations were significantly higher at the top of the slope and along crests than those at their respective bases. This process could be attributed to the resonance of shear waves comparable with the dimensions of the mountain.

flood disaster; risk analysis; urbanization; climate change; Shanghai

Crop Drought Risk Assessment Based on Vulnerability Surfaces——a Case Study of Global Maize

Hao Guo, Xingming Zhang, Fang Lian, Yuan Gao, Jing'ai Wang

Beijing Normal University, Beijing, 100875, P. R. China, jwang@bnu.edu.cn

Abstract

The intensity and frequency of drought had constantly strengthened under the background of climate change mainly characterized by global warming. The largest agricultural losses were caused by drought compared with other natural disasters. It is significant to reinforce the research of crop drought risk and reduce agricultural drought risk. Based on the EPIC model, this paper adopted the methods of irrigation scenarios to fit vulnerability surfaces of “Loss- Disaster intensity-Environment (L-D-E)” by constructing a database suitable for risk assessment on large regional scale, and completed the quantitative drought risk assessment of global maize. Global maize drought risk was quantitatively assessed according to the optimal vulnerability surface. The results showed that R square of optimal vulnerability surface is 0.9934 with coarse fragment content as the environmental indicator. The yield loss rate of expected annual risk is 19.18% on average. The yield loss rate of drought risk with different return periods (10a, 20a, 50a, 100a) is 29.18%, 32.76%, 36.89% and 38.26% respectively. From a global perspective, Central Asia, Iberian Peninsula, Eastern Africa, Midwest America, Chile and Brazil are the areas with high maize drought risk. The drought risk assessment based on vulnerability surfaces considers the impacts of environmental changes on drought risk, better reflects spatial heterogeneity of crop vulnerability and applies in large-scale risk assessment research.

Debris Flow Series In Kerala Western Ghats, India

S Sreekumar, Arish Aslam

Associate professor, Department of Geology and Environmental Science, Christ College, Irinjalakuda, Kerala, India, sreeavani1961@gmail.com

Abstract

Many factors such as hill slope, relative relief, attitude of joints, shear strength of slope materials, type of vegetation and landuse practices make a hill slope vulnerable to debris flow. During the monsoon period, slope failures are a common natural disaster in the Western Ghats in the southern part of Indian peninsula. Its ferocity depends upon the material properties and thickness of the loose unconsolidated overburden formed by the weathering process. The triggering factor for the debris flow is found to be continuous heavy rainfall for a couple of days. The paper examines the influence of shift in rainfall pattern and its variation on debris flow events. The failure surface is identified and located from the field and its interaction with material properties and hill slope is critically examined. Highly weathered rock samples were collected from the failed areas for the determination of material property such as friction angle. Geometrical method is used for understanding the role of joints in the slope instability.

Key words:

Debris flow; Western Ghats; Rainfall Pattern; Discontinuities; Friction Angle.

Detecting Fire Disturbance and Monitoring Post-Fire Vegetation Recovery in Greater Khingan Mountain

Guo X.Y., Zhang H. Y., Zhao J. J.

School of Geographical Sciences, Northeast Normal University, Changchun, P. R. China, 130024,

guoxy914@nenu.edu.cn

Abstract

The Greater Khingan Mountain is a typical fire-prone ecosystem in which many species have a recognized ability to regenerate after fire. There was a severe fire occurred during May and June, 1987 in this region. In the present study, the spatial characteristics of fire disturbance were detected by disturbance index (DI), which was developed by EVI2 and LST derived LTDR dataset at $0.05 \times 0.05^\circ$ spatial resolution. The difference DI (dDI) between post-fire and pre-fire was used to identify the burnt pixels. Our results show that there are 436 burnt pixels in Mohe (70%) and Tahe (30%) county of Helongjiang Province. According to standard deviation of dDI, the magnitude disturbed by the fire was classified into three levels: slight, moderate and severe. Therefore, percentage of burnt pixels for slight, moderate and severe level is 50%, 32% and 18%, respectively. Annual post-fire vegetation recovery trajectories were analyzed by EVI2, NDV and NPP time series for all burnt pixels. The three indicators show a similar trend with fast increasing during 1987 and 1990, which means vegetation exhibit a better recovery in post-fire period in burnt area. In addition, EVI2 and NDVI time series exhibit clear differences among various disturbed magnitudes in 1987, and then the differences peter out as times goes on. Instead, the differences for various magnitudes in NPP time series are obvious except the year of fire occurred (1987). The study provides a unique sight to understand the vegetation responds to fire disturbances in Greater Khingan Mountain.

Distribution of Debris Flows Along the Sichuan-Tibet Highway from Kangding to Qamdo

Yang Jia

Institute of Mountain Hazards and Environment, China, 8394186@163.com

Abstract

The intense tectonic activities and complex geomorphology have made the Tibetan Plateau the highly potential area of mountain hazards, which often pose a serious threat to traffic lines. For example, benefiting from the road reconstruction and disaster mitigation countermeasures, the annual interrupted traffic time of the National Highway G318 from Sichuan to Tibet has been shortened from more than 3 months to several days at present.

Spatial distributions of debris flow were analyzed through satellite image interpretation and field investigation along Sichuan-Tibet highway from Kangding to Qamdu. In addition, there exist high correlations between debris flows and other factors including topography, lithology, seismic factor and climatic conditions as follow:

- (a) debris-flow gullies are concentrated at an altitude of 3000–3500 m with slope ranging from 10° to 25°,
- (b) gradient of most debris-flow gullies (84%) are in the range of 10%-40%,
- (c) the viscosity of debris flows is decided by lithology, and 93 percent of the viscous debris flows are distributed in the soft rock region,
- (d) the activity frequency of debris flows is positively correlated with the distribution of precipitation, which gradually decreases from West to East line,
- (e) 74 percent of the debris flows gullies are distributed in the region with 0.15 to 0.25 g peak ground acceleration, except the debris flows gullies around Kangding city where GPA exceeds 2.5g.

Sichuan-Tibet highway; Distribution of debris flows

Ecological Sensitivity Analysis in Key Ecological Function Areas: Taking Wanan, Jiangxi Province as a Case

LI Y, Ma D G

Jiangxi Normal University, Nanchang, 330022, P. R. China, dgm7799@163.com

Abstract

Ecological sensitivity analysis in Key ecological function areas is an important basis and foundation of such regional ecological protection and construction and appropriate development of space. In this study, using the 12 initial natural environment information on terrain data, vegetation, soil, and ecological environment, etc, applying to Analytic Hierarchy Process (AHP) and entropy method, with the support of GIS space technology to evaluate ecological sensitivity of Wanan County. We can draw spatial distribution of comprehensive sensitivity of ecological environment, the ecological environment Sensitivity will eventually be integrated 5 grade : non-sensitive , slight sensitive, moderate sensitive, highly sensitive and extremely sensitive. The results showed ,(1) Wanan was moderate ecological sensitivity of the area, in which the smallest moderate regions 44.18%; slight and non-sensitive sensitive area being about 28.58%, in which the percentages were 5.46% and 23.12% respectively. Highly sensitive areas accounted for 17.3% of the total area, and the extremely sensitive area was large, accounting for 9.94%. (2)The area below the slight sensitive is adapted to concentrate the socio-economic factors; (3)high sensitive areas had ecological environment problems easily, such as Soil Erosion and Species diversity decreased, and they are the key area of ecological environment recovery and protection.

Key ecological function areas; ecological sensitivity; Analytic Hierarchy Process

Extreme Precipitation on the Territory Mountain Crimea

Todorova O.I., Ovcharuk V.A.

Hydrometeorological Institute, Odessa State Environmental University, Odessa, Lvovskaya str.15, 65016, Ukraine,
lenochka.todorova@mail.ru

Abstract

In Crimea, 80-85% of annual precipitation falls as rain. In watersheds of the Crimean mountain rivers rains cause floods that destroy bridges, wash away roads, erode the fertile soil layer. Most often heavy rains and downpours occur within one day and only in winter are possible within a few days.

The analysis showed that on the territory in question is most frequently observed maximal quantity rainfall is 71-90 mm (27.3%), for the formation of flood warm season is characteristic rainfall is in the range 31-70 mm (total probability - is 40, 9%).

The distribution of rainfall of 1% probability of exceedance also has a different character depending on the exposure of the slope.

To the north-western slope of the maximum rainfall of 1% probability of exceedance it is characteristic for warm period. The opposite pattern is observed for the southern coast of Crimea; on it is dominated by peaks in the cold season. For station Simferopol is located in the north-eastern slope of the Crimean Mountains is sufficiently homogeneous distribution, and the maximum rainfall of 1% probability is typical for July. For the steppe part of the territory is characterized by displacement the maximum in the earlier period - June.

Thus, the formation of the catastrophic floods of different origin on the territory of Crimea is possible throughout the year, for this reason the maximum flow calculations should be carried out on the cold and the warm season, and as designed to choose the bigger of the two maximum discharges.

Flood Inundation Mapping in Greater Dhaka District Using Satellite Data and Geomorphological Land Classification Map

Marju Ben Sayed¹, Shigeko Haruyama²

¹Department of Environment Science and Technology, Mie University, Tsu, Japan

²Department of Environment Science and Technology, Mie University, Tsu, Japan, 514d203@m.mie-u.ac.jp

Abstract

Floods are a common feature in rapidly urbanizing Dhaka and its adjoining areas. In this paper, flood hazard assessment in Greater Dhaka of Bangladesh was examined using an integrated approach of GIS and remote sensing. The objective of the study is to examine the Assessment the flood risk based on the satellite data and geomorphological land classification map under the land use change. Elevation heights, land cover classification, geomorphic land forms and drainage network data generated from remote sensing and GIS approach. For each geomorphological unit, geological characteristics, geologic process and probability of inundation is investigated based on field survey. Among the various units, especially river channel, flood plain, marshy land and former river course are the most vulnerable to flood inundation. The map showed that 70% of greater Dhaka district were within moderate to very high hazard zone, especially fringe areas. It is projected that these areas will be fully urbanized by the year 2020. Only a little portion (8%) was found to be the least vulnerable. It is anticipated that proposed land use policies can contribute to effective flood forecasting, relief and emergency management for future flood event. Based on this study, comprehensive flood hazard management strategies for land use planning decision were proposed for the efficient management of future flood disasters.

Flood Risk from Extreme Water Level Driven by Sea-Level-Rise Under the RCP Scenarios

Aiqing Feng^{1,2}, Shaohong Wu¹

¹Key Laboratory of Land Surface Pattern and Simulation, Institute of Geographical Sciences and Natural Resources Research, Chinese Academy of Sciences, Beijing 100101, China;

²University of Chinese Academy of Sciences, Beijing 100049, China; aiqingfeng2011@163.com

Abstract

High water levels always lead to coastal flood and sea-level rise induced by global climate change exacerbate this flood risk. This paper explores the flood risk triggered by extreme water levels, which are joint occurrence of storm surge and high tides with sea-level rising. With Rongcheng City as a case, once encountered extreme events and without any adaptation, 52.32-64.37% of low-elevation coastal zone was expected to be flooded with 63.98-79.51% of gross domestic production (GDP) and 55.41-76.10% of population more than exposed to high tide. Under global mean sea-level rise, the exposed area, GDP, population and flooding depth will be increased, respectively. Results indicated that inundated area would be increased by 3.39-10.35% in 2050 and greater as much as 5.13-17.87% in 2100. The effected GDP and population would be amplified by 4.18-10.04% and 5.98-12.89% in 2050, while even added up to 5.64-18.49% and 8.70-25.33% in 2100. Our results emphasize that, in the absence of adaptation, sea-level rise induced by climate change makes the flood risk of extreme water levels worse and is likely to affect coastal human habitability and sustainable development.

flood risk; climate change; sea-level rise; potential flood damage

Floods Occurred by a Collapse of an Earthquake-Induced Dam, Gongar, Dolakha, Nepal in April 2015

Watanabe T, Paudel L, Kobayashi Y, Thapa B, Khanal NR, Ghimire M, Regmi D

Hokkaido University, Sapporo, 060-0810, Japan, teiwata@mac.com

Abstract

This study detailed the occurrence of a series of floods caused by a collapse of an earthquake-induced temporary dam developed in the upper tributary of the Tamakoshi River, Nepal in 2015. The village of Gongar (1280 m) is situated at the confluence of the Tamakoshi River and the Gonagar Khola, a tributary draining from the west. This study conducted field surveys in and around the village between November 2015 and February 2016; namely, interview survey with the local residents and collection of videos taken by the residents. Further, this study took photographs by a drone in February 2016. A fresh landslide scar exists on the south-facing slope in the upper basin of the Gongar Khola (3600–4400 m). One of the Google Earth images on 4th December 2014 clearly shows a small scar on the same slope. Another Google Earth image on 6th May 2015 shows much larger fresh scar and fresh deposits along the Gongar Khola. The fresh scar was formed when a large landslide occurred on 26th April 2015, which was identified by the interview survey and by the videos taken by technicians of the hydropower station in Gongar. The videos show debris cloud started in the upper basin and reached Gongar in 30 seconds. From 15th to 25th June, a series of floods occurred from the dammed lake, three of which were recorded by local smart phones in Gongar. One pedestrian bridge and many containers of the hydropower station were washed away on 23rd and 25th, respectively.

Fractal Dimension for Earthquake in Sichuan and Chongqing Based on GIS

Xu Gang, Gan Fenfang

School of Geographical Sciences, Southwest University, Chongqing 400715, China, xuliumin@swu.edu.cn

Abstract

Based on the fractal theory and research methods applied in current seismic studies, this paper takes "Sichuan Earthquake Record", "Sichuan Tectonic Unit Map" and "Sichuan Province Geological Map" as basic data, taking GIS as technical support platform, adopting grid method, capacity dimension, information dimension and G.R etc. as formulas to calculate dimension value of earthquake space, time and energy for each tectonic unit in Sichuan and Chongqing. And using these formula to calculate fault dimension value for each tectonic unit in Sichuan and Chongqing. Then reveal earthquake seismic fractal mechanism from the different research perspective. The main contents and conclusions of this paper include:

(1) Systematically discussed spatial fractal characteristics of tectonic unit in Sichuan and Chongqing area. Seismic spatial distributions of tectonic units within a certain space scale have significant fractal characteristics. Seismic spatial distributions of fractal dimension values of secondary tectonic units is clearer than that of first tectonic units. Seismic spatial distribution fractal dimension value is negatively correlated with average distance between most two adjacent earthquake points. There is no corresponding relationship between seismic spatial distribution fractal dimension value and times of earthquake happened in tectonic unit, while it shows a positive correlation between seismic spatial distribution fractal dimension value and spatial distribution density. Generally speaking, seismic spatial distribution fractal dimension value interrelated with complexity of tectonic units and strength and weakness of crustal movement. Its information dimension is quantitative indicator for strength and weakness of tectonic units activities.

(2) Systematically discussed the temporal fractal characteristic of tectonic unit, and of time series before and after the earthquake as well in Sichuan and Chongqing areas. Seismic time distribution structure of tectonic units within a certain time scale have significant fractal characteristics. Seismic time fractal dimension value reflects in-homogeneity of time of earthquake happened. There are some corresponding relationship between seismic time distribution fractal dimension value and time of earthquake happened. The greater the proportion earthquake point occupied (Surface wave magnitude ≥ 5) is, the smaller the information dimension value of time distribution of earthquake point becomes. Seismic time series fractal characteristics of Sichuan-Chongqing region existed within a certain range of time scales objectively. Fluctuations in seismic time series

fractal dimension can reflect the strength of seismic activity. Before the earthquake, dimensional seismic time sequence information may appear abnormal rise, abnormal decline and transition variation.

(3) Systematically discuss energetic fractal characteristics of tectonic unit in Sichuan and Chongqing area. Seismic energy distributed structure of tectonic units has a scale in-variance fractal characteristic. Energetic fractal dimension values can quantitatively reflect the strength and weakness of the regional tectonic movement. Seismic energetic distributed fractal dimension value is negatively correlated with ratio of earthquake quantity ($\text{Surface wave magnitude} \geq 6$) to earthquake quantity ($4 \leq \text{Surface wave magnitude} < 6$). The smaller the proportion of big earthquake happened in tectonic units is, the greater energy fractal dimension value of earthquake point becomes.

(4) Systematically discussed the fractal characteristic of fault lines of tectonic units, and the relationships between earthquakes and fault lines in Sichuan and Chongqing areas. Fault spatial distributed structure of tectonic units has significant fractal characteristics within a certain time scale. The fractal analysis indicates that a more complex spatial distributed structure of fault and stronger tectonic activity and a better development tectonics followed a bigger fault capacity fractal dimension. There is no corresponding relationship between fractal dimension value of fault spatial distribution and quantity of fault in first -level tectonic units, while it is significantly correlated with quantity of fault when this number is under 0.05 in the secondary tectonic units. Certain corresponding relationship exists in spatial distribution between earthquake point and fault. Earthquake points mainly distribute around deep fault zone. Moreover, there is a certain corresponding relationship seismic spatial fractal dimension and fault fractal dimension. A higher seismic spatial fractal dimension value follows a higher fault fractal dimension value.

spatial and temporal distribution of earthquake; fractal dimension; fault; grid method; Sichuan and Chongqing areas

Geohazard Map of Collapse Sinkholes in the Sahel of Doukkala-Abda (Morocco)

EL Bchari F. , Boumaggard E.H

Polydisciplinary Faculty, Cadi Ayyad University, Safi, Morocco, boumaggard@gmail.com

Abstract

This paper reports the methodology developed to draw up a geohazard map of cover-collapse sinkhole occurrences in the Doukkala-Abda area. In this area, a Mesocenozoic cover, mainly consisting of gypsum, marls, limestone, sand and clay. The thickness of this cover ranges from a few meters to more than 100 m. The surficial morphology of the area show karstic structures as sinkhole.

The karstification which is a shape of specific erosion / precipitation because of the dissolution of the carbonated formations generates, in Doukkala-Abda, karstic galleries. These last are often at the origin of the dangerous downfalls in the region. These karsts are of shapes and variable sizes, their distribution depend on several parameters (nature and thickness of the rock, cracks, circulation of waters...) they are more frequent on the coastline that behind country.

Recent works suggested that the collapses are set off from reactivated paleokarsts. The paleokarsts studied in the area proved to be the result of a particular weathering of the limestone.

In order to draw up the geohazard map geological data (lithology and tectonics), hydrogeological (hydrographic network), climate (precipitation), geomorphological (slope, aspect elevation), and anthropogenic (road network and land use) factors will used. These data and a digital elevation model of the area were integrated into a geographical information system (GIS) to produce a coherent 3-D description of the study area.

Goharroud River Flood Zone Determination within Rasht Using GIS and HEC-RAS Hydraulic Model

Parviz Rezaei (Ph.D.) Associate Professor of Climatology,

Department of Geography, Rasht Branch, Islamic Azad University, Rasht, Iran, Rezaei@iaurasht.ac.ir

Abstract

Drainage of surface runoff is one of the management problems in Rasht metropolis. Rising of river water due to flood, blocked drainage channels, and river low slope in northern regions are the main factors of flooding in streets. The terrain geometry simulation was implemented with high accuracy and speed by the use of geographical information system. For this purpose, the geometry and marginal lands across Goharroud River were simulated by using HECGeoRAS rider and river's plan. Also, the discharge with different return periods were estimated. At the next step, the river hydraulic behavior was simulated by the use of geometry information and river marginal lands. Finally, the flood zone was delineated by GIS. This research is done in a part of Goharroud River in Rasht city. This area located between Lakan Shahr up to Siahroud with 15 kilometer length. The maps provided by 50 years return period show that the overflow in a 500m range in a northern region is called Siah Estalkh located after river passage from Shohadae Gomnam Blvd. According to the type of land use, flooding is divided into low, medium, and high risk zone.

Grassland Fire Spatiotemporal Pattern Evolution During 2000-2014 In China-Mongolia Border Regions

Narisu, B Yulong, Yinshan, Lina

College of Inner Mongolia normal university geography science, Hohhot, 010020, China,

1052026082@qq.com

Abstract

Grassland fire is one of the serious natural disasters suffered both in China and Mongolia. In view of the grassland fire occurred in 3 banner of East Ujimqin banner in China and adjacent Mongolia as research area, by using GIS spatial analysis method and MCD45A burned products data, the spatiotemporal patterns of grassland fire on the study area in 2000-2014 were examined, The effects of vegetation, climate and human disturbance on the grassland fire were also analyzed. The results are as followings: In total burned area is $8.09 \times 10^3 \text{ km}^2$, $76.8 \times 10^2 \text{ km}^2$ area in Mongolia, 95% of the total area is located in the territory of Mongolia in recent 15a, highest frequency reached 7 times in Khalkhgol of Mongolia. Inter annual variability of burned area in 2000-2014 is indicated that, burned area was firstly reduced and then growth trend, the 2008 reached the least value. Negative correlation between rate of fire and precipitation, and with NDVI has been positive correlation. It was found that Inner Mongolia had much higher human population and livestock density than Mongolia, but lower burned area ratio, suggesting that human disturbance was the major factor inducing the different patterns of grassland fire between Inner Mongolia and Mongolia.

Hazard Distribution Assessment of Debris Flow Alluvial Fan based on Remote Sensing in Xiaojiao Valley

Li Yanji^{1,2,3}, Hu Kaiheng^{1,2*}

¹Key Laboratory of Mountain Hazards and Earth Surface Processes, Chinese Academy of Sciences, Chengdu Sichuan, 610041, P. R. China;

² Institute of Mountain Hazards and Environment, Chinese Academy of Sciences & Ministry of Water Conservancy, Chengdu Sichuan, 610041, P. R. China;

³ University of Chinese Academy of Sciences, Beijing, 100049, P. R. China

Abstract

Debris-flow alluvial fans in mountainous areas are good places for dwelling and industrial development while are posed a threat by serious debris-flow hazards. The debris flow hazard assessment and mapping are of great significance for the reasonable land use in mountainous. As a new technology developing fast in recent years, remote sensing could provide plenty of information about terrain and ground surface mulch of mountainous. In this paper, a new model of assessing hazard distribution on the alluvial fans is applied, which considers fan's morphological characteristics and debris-flow occurrence frequency. And then, the NDVI and LAI were interpreted from TM remote sensing images from 1988 to 2015 by ENVI software in Xiaojiang river basin, southwestern China. Combining model assessment and vegetation coverage, grade assessment result of debris-flow alluvial fans as low-risk, middle-risk and high-risk. By field survey, most of low-risk and parts of middle-risk debris-flow alluvial fans could be used for agricultural production and industrial development in Xiaojiang river basin.

Heat Waves in Romania. Regional Features and Changes

Croitoru A-E

Babes-Bolyai University, Faculty of Geography, Cluj-Napoca, 400006, Romania, roitoru@geografie.ubbcluj.ro

Abstract

Climate changes, including changes in extreme weather events, have currently become one of the major social, economic and environmental threats. The main aim of this study is to present the spatio-temporal features and changes that occurred in heat waves in Romania over a period of 53 years: 1961-2013. The identification of heat waves was made considering the maximum daily temperature data series recorded in 22 weather stations based on the 95th percentile threshold, and a minimum duration of three consecutive days. Four parameters of the heat waves were considered for further analysis: heat waves number, heat waves day frequency, heat waves mean duration, and heat waves maximum duration. The main results are: the most and the longest heat waves are specific to the Southern and Western regions of Romania, while the less and the shortest ones were recorded in the Southeast part of the country; in terms of trends, most of the slopes calculated are positive and the great majority of weather stations recorded increasing trends to all heat waves parameters (77-95 %); more than 70 % of the slopes were found statistically significant.

heat waves, trend, 95th percentile threshold, Mann-Kendall and Sen's slope, Romania

Impact of Rockfalls and Screes on Human Activity

Govorushko S.M.

Pacific Geographical Institute, Far Eastern Federal University, Vladivostok, Russia, sgovor@tig.dvo.ru

Abstract

Rockfalls and screes cause problems for the following kinds of human activity and structures: (1) residential construction; (2) transport (motor, rail, pipeline); (3) transmission facilities; (4) agriculture; (5) hydropower engineering.

Impact on residential construction resulted in the destruction of settlements located at the foot of a mountain. Such example is a rockfall off Rossberg in the Alps on 2 September 1806 when total of 953 people, 126 occupied houses, 85 barns, and other buildings were wiped out.

The effects on transport include blockage of highways and railways by the deposit layer, damage to roadbeds, and destruction of engineering structures, which result in traffic disturbances. Sometimes, wreckage of transport vehicles due to immediate impact of rockfalls has been noted. In March 1981, part of a passenger train was buried at a distance of 182 kilometres from Belgrade as a result of a rockfall. Sixteen people were killed, and 35 were injured. Quite often, rockfalls and screes damage pipelines and transmission facilities.

The impact on agriculture consists of destruction of arable and grazing lands as a result of their being buried underneath rock fragments. When a rockfall occurred in 1881 near Elm (Switzerland) the event destroyed 90 hectares of arable land. The influence on hydropower engineering is in decreasing the capacity of reservoirs, which results in reductions in electricity production. One indirect influence of rockfalls on human activity is related to the falling of blocks into water bodies, which results in the formation of waves.

Key words:

Rockfalls, screes, residential construction, transport, transmission facilities, arable lands, hydropower engineering

Inhabitants' Awareness of Prevention and Preparation towards Hazards in the Settlements along the Tamakoshi River, Dolakha, Nepal

Kobayashi Y, Thapa B, Watanabe T, Paudel L, Khanal N, Ghimire M, Regmi D

Hokkaido University, Sapporo, 060-0810, Japan, ykobayashi48@icloud.com

Abstract

An earthquake with magnitude of 7.8 hit Nepal on 25th April. This study focused on the settlements along the Tamakoshi River, an upper basin of which has one of the most dangerous glacial lakes, called Tsho Rolpa. The objectives of this study are: (1) to identify damages by the earthquakes; (2) to make an accurate terrain model; and (3) to predict the inundated areas by a future glacial lake outburst flood (GLOF) from Tsho Rolpa. Questionnaire surveys about the damages by the earthquakes were conducted. A drone (UAV) was used to take photographs of the major settlements. To predict the inundated areas, a HEC-RAS model was used. In Singati, the largest settlement in the upper area, 66 households were interviewed in total, among which 57 were completely destroyed. The questionnaire survey shows that almost all inhabitants do not understand a hazard map, and that the preparation for next hazard is not also conducted well. In Singati there are three river terraces, and 110 houses are distributed on the lowest and the middle terraces. The result obtained by the HEC-RAS model suggests that the area approximately 20 m higher than the riverbed would be inundated when Tsho Rolpa is bursts, and 60 houses would be flooded. In spite of this prediction, some houses already have started re-construction on the lowest terrace. To prevent and mitigate further damages, education on hazards and discussion on escape routes to a safe site will be important.

Key words:

Kosi Flood Disaster and its Impact on Women: A Case Study of Kheriya Village, India

Kumari, SUMITA

Banaras Hindu University, Varanasi, 221005, India, sumitasingh.bhu@gmail.com

Abstract

The Kosi River is known for frequently changing its course and severe flood. Kheriya village is situated at confluence of Ganga and Kosi River and worst affected by Kosi flood. Women are more adversely affected by flood because of their vulnerable physical, economic, social, political and psychological status. Being an agrarian and caste based society, majority of population belonging to the 'lower caste' have to migrate for livelihood. Women are economically more vulnerable, because they can't migrate like their male counterparts due to social limitations and face high risk of flood.

The aim of the paper is to analyze the Kosi flood (2008) induced vulnerabilities among women in Kheriya village in Katihar district of Bihar. The study employed both quantitative and qualitative methods. This study is based on individual interview of 50 women and Focus Group Discussion. Quantitative household questionnaires and qualitative key informant interviews are used to collect the data. The paper reveals that poor and disadvantaged women are more vulnerable to disasters than men due to the conditions that predispose them to severe disaster impacts. Women also suffer from domestic violence and are subjected to harassment when taking shelter or refuge at community centers. These particular vulnerabilities and problems interrupt women's mitigation efforts and adaptation capacities in disaster risk reduction.

Flood; Vulnerability; mitigation; disaster risk reduction

Landslide Susceptibility Assessment by the Statistical Index Method and the Analytic Hierarchy Process technique

Zhang, G.F.^{1,2}, Zheng, Z.¹, Cai Y.X.

¹ School of Earth Science and Geological Engineering, Sun Yat-sen University, Guangzhou, 510275.
zhgfang@mail.sysu.edu.cn

² Guangdong Key Laboratory of Mineral Resources & Geological Processes, Guangzhou, 510275

Abstract

This study aims to present a landslide susceptibility assessment enable integration of expert knowledge and existing landslide inventory to optimize the processing chain for LS assessment. At first, the Statistical Index Method (SIM) was used to develop relationships between landslide-controlling factors and the distribution of landslides. Eight landslide causing factors were considered including Elevation, slope, aspect, lithology, land cover, distance to a fault, distance to a road, distance to a river and precipitation. SIM was used to determine the weighted value (S_i) for classes of every landslide causing factor. Then, the Analytic Hierarchy Process (AHP) was utilized to determine the weighted value (W_i) for every factor, and then the landslide susceptibility index (LSI) value for every pixels was gained by the summation of the product of S_i by W_i . Based on the derived LSI value, the study area was grouped into five susceptibility classes: very low susceptibility, low susceptibility, moderate susceptibility, high susceptibility and very high susceptibility. The high and very high susceptibility classes mainly distributes in the settlement and sparse forest area with layered moderate hard to hard mixture of clastic rocks and massive moderate hard to hard mixture at the elevation of 0-200 m, implying that the slope failure in Huizhou affected by human activity seriously. There is a satisfactory agreement between the susceptibility map and the actual landslide data. The landslide densities and the ROC (receiver operating characteristic) curves suggest the model is suitable and acceptable for study area.

Key words:

landslide susceptibility assessment; Statistical Index Method; Analytic Hierarchy Process

Monitoring of Hydro Geological Conditions around Nuclear Power Station in Permafrost Areas in Russia

Egorov Y., Khlebosolova O.

The Russian State Geological Prospecting University, Moscow, Russia, egorovyaroslav2012@yandex.ru

Abstract

If a nuclear power station is situated in permafrost areas, so called “talik” - an unfrozen layer of rocks – may be developed under the station or/and around it. Monitoring of the talik-zone (and other hydro geological phenomenon) is an important part of the safety measures. The purpose of the research was modeling of talik-zone changes in permafrost areas after nuclear power station seized to function. The monitoring system includes observing a temperature and borders of the talik-zone, waters and rock composition (chemical and radiochemical), etc. through boreholes.

Key words:

permafrost areas; talik-zone; nuclear generating station; monitoring system

Moraine-Dammed Lake Distribution and Outburst Flood Disaster Risk in the Chinese Himalaya

Wang Shijin

State Key Laboratory of Cryospheric Sciences, Cold and Arid Region Environment and Engineering Research Institute, CAS, Lanzhou 730000, China, wangshijin@lzb.ac.cn

Abstract

To improve understanding of glacial lake outburst flood (GLOF) disaster risk, we have analyzed synthetically the spatial distribution and evolution of moraine-dammed lakes and potentially dangerous glacial lakes (PDGLs) in the Chinese Himalayas, established a county-based assessment system of GLOF disaster risk combining PDGLs outburst hazard, regional exposure, vulnerability of exposed elements and adaptation capability (risk management) using the Analytic Hierarchy Process, finally, evaluated synthetically the county-based GLOF disaster risk using the Weighted Comprehensive Method. The remote-sensing data results show that there are 329 moraine-dammed lakes (larger than 0.02 km²), with a total area of 125.43 km², in the Chinese Himalaya in the 2010s, of which 116 lakes with a total area of 49.49 km² are identified as PDGLs. The zones at very high and high risk of GLOF disaster are mainly concentrated at Nyalam, Tingri, Dinggyê, Lhozhag, Kangmar and Zhongba, in the mid-eastern Himalaya, whereas low- and very low-risk zones are located in the eastern Himalaya. On the county scale, Lhozhag and Lhunze have the highest hazard degrees of hazard and exposure, respectively, while Zhongba and Zando have the highest degree of vulnerability and lowest adaptation capacity. The regionalization results for GLOF disaster risk degrees in the study are consistent with the distribution of history disaster sites across the Chinese Himalaya.

Multi-Level Analysis of Vulnerability to Flooding in Lagos Metropolis, Nigeria

Fashae, OA¹, Olusola, AO²

¹Department of Geography, University of Ibadan, Ibadan, Nigeria, toyinafashae@yahoo.com

²Department of Geography, Osun State University, Osogbo, Nigeria

Abstract

Flooding has become a common hazard in Nigeria especially in the low-lying coastal areas of Lagos in recent times where many communities had suffered losses. Lagos is a rapidly developing coastal megacities and is at risk of flooding and majority of her population are particularly vulnerable to its impact. This study is a post-flood disaster assessment of some communities in five Local Government Areas (LGA) of Lagos metropolis in 2011. We adopted the integrated vulnerability assessment approach using indicators of exposure, susceptibility and adaptive qualities. A total of 1065 affected respondents were interviewed coupled with geoinformation techniques such as Geographical Information Systems (GIS) for generating the flood extent and vulnerability maps. All vulnerability indicators were subjected to descriptive analysis and correlation analysis of some selected indicators at 0.05 significant level. The results revealed that Ajewole/Ajejunle/ Ikorodu LGA are the most vulnerable being very close to the lagoon and with an elevation <13m while Apata/Shomolu LGA is the least with an elevation of >30m. About 70% of the affected buildings/population are within the 50m and 100m flood extent. Hence, the multi-level risk using distance and risk (hazard x vulnerability x amount) indices show different levels in vulnerability exposures from high-moderate-low. The study established the need to enhance geoinformation techniques with other flood mitigation techniques by risk managers/government so as to ensure a sustainable flood mitigation strategies that will assist in appropriate planning of developmental works.

Potential GLOF Hazards and Initiatives taken to Minimize its Impacts on Downstream Communities and Infrastructures in Nepal Himalaya

Regmi D, Kargel JS, Leonard G, Haritashya Uk

The Himalayan Research Center, Kathmandu, Nepal, dj.regmi@gmail.com

Abstract

With the increasing temperature in recent years the glacier lakes are developing as a great threat to the infrastructure and the communities living downstream. There are more than 2000 Glacier lakes in Nepal and out of them some are really dangerous such as Tso Rolpa, Imja, Barun and Thulagi Glacier Lake. The objective of this study is to 1) to present the research results of the glacier lakes study that has been carried out in Nepal Himalaya in the past; 2) to present recent research results Bathymetric studies of the lakes; 3) to talk about the possible infrastructure damages specially millions dollar Hydropower's that are under threat of GLOFS; 4) to talk about the on-going Imja lake lowering project which represent the highest altitude lake, that is attempted to lower down the existing water level by three meters to keep safe the tourism, community and the infrastructures of the Everest region of Nepal.

Research results show that lakes are growing very fast and threat is increasing day-by-day, downstream areas of some dangerous glacier lakes, required immediate attention before the disaster happens. Initiation taken by Nepal government to mitigate the risk by lowering lake by 3m is a good step ahead in this direction.

Quantitative Assessment on Regional Risk of Debris-Flows, Case Study: Southwest China

Guangxu Liu, Erfu Dai, Xinchuang Xu, Wenxiang Wu, Aicun Xiang
Gannan Normal University, Ganzhou, 341000, P. R. China, lg760411@126.com

Abstract

This paper presented a comprehensive risk analysis model with an integrated hazard zoning and intensity-frequency analysis to investigate the population risk loss of debris flows quantitatively in county units, with the purpose to increase our understanding of debris-flow risk. Results show that the hazardous places mainly spread in mountains around the Sichuan Basin, the border area between Sichuan and Yunnan provinces, the eastern and southern part of Yunnan province and the eastern part of Guizhou province. The extremely-high vulnerable zones are characterized by a fragility rate of 3.89 persons per 10,000, which are distributed in 80 counties including some from the west and southwest of Sichuan Province, Zhaotong in Yunnan Province, and Bijie in Guizhou province. The risk loss increases gradually from the southeast to the central, reaches the highest (more than 100 persons/yr) on the Jiangyou-Zhaotong-Baoshan Line, then gradually reduces to its lowest in the northwest. Accounting for scales of the disasters, the extremely-large scales are the major factor of casualty. Appropriate risk management and mitigation solutions should be determined comprehensively based on debris hazard levels together with fragility rates in vulnerable zones in these hazardous places.

debris flows; risk loss; similarity-based method; Southwest China

Rainfall Aggressiveness in Relation to Morphological and Hydrological Processes in the Margin of the Eastern Himalaya

Prokop P¹, Walanus A²

¹ Institute of Geography and Spatial Organization, Polish Academy of Sciences, Department of Geoenvironmental Research, Jana 22, 31-018 Krakow, Poland, pawel@zg.pan.krakow.pl

² AGH University of Science and Technology, Department of Geoinformatics and Applied Computer Science, Krakow, Poland

Abstract

The study area is located in the Darjeeling and Bhutan Himalaya just north of the gap between the Deccan Plateau and the Meghalaya Plateau. The multiscale interaction of monsoonal circulation with the local topography cause that area experiences the highest annual rainfall (3,000-5,000 mm) and most frequent heavy rains (up to 800 mm/day) along the whole Himalayan margin.

Four precipitation concentration indices, predisposition of a site to produce overland flow as well as rainfall thresholds between 1 and 3 days for triggering shallow landslides were calculated on the basis of daily rainfall for period 1981-2010. The results show that the precipitation concentration values are lowest in the Himalayan foothills where annual total precipitation is highest. The margin of Himalaya and narrow belt along foothills have highest predisposition to produce of overland flow. The probability of shallow landslides triggering increases from 0.2-1.4% for one day rainfall threshold of 144 mm to 2.3-7.1% for 3 days rainfall threshold of 181 mm. The spatial differentiation of the probability increases together with the number of days of the rainfall threshold. It is significantly higher in the Bhutan Himalaya in comparison to the Darjeeling Himalaya.

Reconstruction Processes of the Radioactive Contamination Area in Fukushima, JAPAN

Seto M., and Takagi A.

Fukushima University, Fukushima, JAPAN, msyk_seto@nifty.com

Abstract

Kawauchi village was damaged by the 2011 Off the Pacific Coast of Tohoku earthquake. The most serious damage was nuclear hazard. This village evacuated in 16, March, 2011. The refuge continued until January, 2012. In Kawauchi village, the administration functions were returned earlier than municipalities around, and temporary storage sites for contaminated materials were secured early. This is because it is used as a model case of reconstruction from a disaster in this article. Now decontamination of the land is nearly completed and introduction of a system of real-time monitoring of temporary storage of the contaminated materials is in the progress. Hence, the overall countermeasures against radioactive materials are well under way. There are also various signs of reconstruction such as setting up of major convenience stores, planning of commercial facilities and plants, etc. However, although currently residents' returning to the village is under way, the number of fixed domicile residents seems to reach a ceiling. Moreover, recovery of the coastline areas is not promoted and most part of basis of residents' living is still missing.

Relationships between the Loess Slide Size, Slope Relative Height and Slope Gradient Within Different Slip Surfaces

Qiu, H

College of Urban and Environmental Science, Northwest University, Xi'an 710127, China, 13991345616@163.com

Abstract

Based on intensive landslide surveys and interpretation of remote sensing image, we established a landslide inventory. According to slip surface we grouped the loess slides into 3 classes, they are landslide in loess, red clay contact landslide and bedrock contact landslide. Results indicated that the overwhelming majority of loess slides in the Yan'an region were small and the size of individual landslides varied largely. Although the landslide size span multiple orders of magnitude there was an obvious power law relationship and self-similar behaviour among loess slide length, area and volume. In addition, intermediate slope relative height and slope gradient was more prone to landslides, and the frequency of landslides was low at high and low slope relative height and slope gradient. However, there were different distribution rules for the loess slide number and area. Further analysis revealed that the landslide size became larger with slope relative height increasing and there were obvious linear or power law relationship between landslide size and slope relative height. On the contrary, the landslide size gradually decreased with slope gradient increasing at the certain significance level. In future, we will further study the relationship between loess slide size and other causative factors and apply the study results to improve the approach of regional landslide susceptibility assessment.

Research on the Driving Force of Soil Salinization and Ecological Risk Assessment in the Yellow River Delta

Cao Jianrong, Liu yanjun, Zhang baohua

College of Environment and Planning, Liaocheng University, Liaocheng, 252059, P. R. China, caojianrong@lcu.edu.cn

Abstract

Saline soil is a series of soil influenced by salinity-alkali components, which are composed of saline soil, alkaline soil and other soil in varying degrees of salinity and alkalinity, including coastal saline soil and inland saline soil. The formation of soil salinization is closely related to the topography, climate, soil parent material, groundwater, and human activities while the secondary soil salinization may occur when regional water and salt migrates in unsuitable conditions. It is of great significance to study the distribution, migration and risk assessment of salt & water. Six indicators, i.e. the elevation, groundwater level, groundwater salinity, the condition of irrigation and drainage, soil organic matter and population density, were selected as the main factors, which were analyzed by cluster analysis methods. By introducing the soil salinization ecological evaluation models, taking into consideration the reality of the Yellow River Delta, choosing the above seven elements as the evaluation factors, regarding NDVI index as the ecological endpoint, and taking advantage of ArcGIS and Matlab programming, we established the ecological risk assessment model suited for soil salinization of the Yellow River Delta and then did the evaluation. The findings showed that, first, the elevation and the groundwater level were the main controlling factors, and both were internal factors in controlling soil salinization; however, human activity factors, such as population density and drainage irrigation district were the external factors for the development of soil salinization. Secondly, the great and severe risk areas were mainly located in the southeast and northwest coastal areas and the small parts of the northeast district. Such risk areas were influenced seriously by marine and accounted for more than 58% of the total area.

Key words:

Soil salinization; Driving forces; Ecological Risk Assessment; YRD

Research on Time and Space Symmetry in Earthquake Disaster

Junping Yan, Pengtao Wang

College of Tourism and Environment, Shaanxi Normal University, Beijing, 100101, P. R. China, igc2016@igsnnr.ac.cn

Abstract

An earthquake trend judgment, falling into the research scope of scholars, usually has the medium-term or long-term earthquake trend as its focus, and describes macroscopic earthquake possibilities in 1-2 years or about 10 years. With its nature between an earthquake risk and earthquake prediction, an earthquake trend judgment is a judgment involving three earthquake elements, and aims at providing prediction data for earthquake functional departments and forewarning signal for people in the study area. Therefore, this book is designed as a work on earthquake trend judgments, instead of prediction, and let alone forecasts. Symmetry is the key to understanding the secrets of nature. The author thinks that only part of natural disasters at some places and in some periods (active periods) have certain symmetry; namely all natural disasters do not have space-time symmetry. Consequently, it is necessary to discriminate different cases and find symmetry regularities through in-depth study. In this book, only space-time regularities of earthquakes will be discussed. This book systematically introduces a space-time symmetry method for studying major earthquakes, investigates the space-time symmetry laws of earthquakes within the typical scope of the circum-Pacific seismic belt and the Eurasian seismic belt (Mediterranean-Himalayan seismic belt) by this method, discusses the space-time window period of earthquake occurrence, and preliminarily forecasts the occurrence trends of major earthquakes in these regions. And many forecast cases of earthquake trends have been verified by disaster facts. In addition, more details can be found in the book "Research on Time and Space Symmetry in Earthquake Disaster".

Key words:

time and space symmetry; earthquake disaster; trend judgment;

Resilience to Green Famine: Dimensions, Magnitude and Ethno-Culture Disparity in the Green Famine Belt

Guyu F. and Muluneh W.

Addis Ababa University, Addis Ababa, Ethiopia, guyuferede9@gmail.com

Abstract

Up-to-date, theories about famines in Ethiopia have focused mainly on drought. In contrast, theories meant to explaining and understanding the 'green famine' are either inadequate or absent. The 'green famine belt' has been generally overlooked by the government, humanitarian agents and researchers. The overall purpose of this study was to increase insights into the vulnerability context and establish theories about the 'green famine' and people's resilience to it based on cross-sectional study of households in a case study district. The study revealed that the impact of 'green famine' and hunger, amidst of flourishing green vegetation and ample rainfall, was as severe as that of the conventional famines. Cultural-institutional, socio-economic, and climate-induced shocks other than drought, biophysical and demographic factors were found to have triggered 'green famine'. Aspiration to change, social safety net, cultural bond and practices, income and food access, stability, access to basic services, asset possession, and adaptive capacity were observed locally relevant dimensions of household resilience to 'green famine' shocks/stresses. The study also established and proposed a theory and approach (ethno-culture approach being the base of its framework) that may be universally applied to explain and understand 'green famine'. The famine (food insecurity) that has had prevailed in most parts of Ethiopia was largely due to drought though observations show this cannot be an explanation to the 'green famine' of the green belt. Hence, policies of intervention should take into account those factors which are in operation in this regard.

Key words:

Green-famine; shock/stress; theory; resilience; ethno-culture; green famine belt.

Rock Fall Hazard and Risk Assessment Along Araniko Highway, Central Nepal Himalaya

Amar Deep Regmi, Cui Peng, Megh Raj Dhital

Institute of Mountain Hazard and Environment, Chinese Academy of Sciences, Nepal,

amardeep_regmi@yahoo.com

Abstract

Rock falls are frequent along the steep slopes of highway cuts in mountainous areas like Nepal. Araniko Highway is a major highway connecting Nepal and China that has suffered from several instability problems. Recent earthquake activity in Nepal has generated many landslides, including rock falls along the highway, mostly between Lamosangu and Liping. These landslides have deposited huge piles of debris along the highway, as well as in the hill slope above, which has increased future risk of rock fall. Here, we have tried to analyze the distribution of rock falls along the highway, their mode of failure and the associated hazard and risk. The analysis show that most of the rock falls are concentrated along steep rock cliffs and are of wedge and plane failure type. For the rock fall hazard and risk assessment of the highway, we have slightly modified the original Rock fall Hazard and Risk Assessment (RHRA) method to fit the condition of the Araniko Highway. The developed hazard and risk map effectively indicates various levels of rock fall hazard and risk along the highway. Thus, based on the level of hazard and risk, the maintenance and inspection work can be carried out. In addition, the study reveals that this system can be effectively used to prioritize the severity of potential rock falls along other highways with similar geological and morphological settings.

Spatial and Temporal Pattern Discovery for Fire in China Using Statistical Probability Distribution

Bin Li, Fang Chen, Lijuan Li

The Institute of Remote Sensing and Digital Earth, Beijing, 100101, P. R. China, libin01@radi.ac.cn

Abstract

Revealing the spatial and temporal pattern of fire across the whole China is very important for both the government and the researchers. Especially in the case that the straw burning which is closely related with the PM_{2.5} and PM₁₀ has become the concern of the whole country in recent years, indicating the possible big anthropogenic impacts on the environment. This study investigates the probability distribution of fire hotspots and burn area in China. The long term MODIS based hotspots and burn area dataset for eight climatic zones are collected. The fire hotspots products are generally produced from MODIS 4- and 11-micrometer radiances, while the burn area data are derived from both the Terra and Aqua MODIS daily surface reflectance. The trends, the Probability Density Functions (PDFs) and the four higher moment statistics – mean, variance, skewness and the kurtosis for each of the climatic zone have been calculated. Great spatial heterogeneity in the statistical characteristics has been detected. The uncertainty and the possible reasons are discussed.

Key words:

Spatial and temporal pattern; the Probability Density Function; spatial heterogeneity

Spatial Characteristics Analysis and Potential Risk Evaluation of Heavy Metals in Jiaojia and Jincheng Mining Areas of Shandong Province, China

Wang Fei, Wu Quan-Yuan, Lv Jian-Shu, Dong Yu-Long, Cao Wen-Tao, Kang Ri-Fei, Cao Jian-Fei
Shandong Normal University, College of Geography and Environment, Jinan 250014, China, wqy6420582@163.com

Abstract

In order to reveal the influences that anthropogenic factors, especially mining activity, made to soil environment quality, thirty five topsoil samples were collected from JiaoJia and Jincheng mining area, Shandong province, China and determined the contents of Cu, Pb, Zn and Cr. Spatial variation structure, concentration distribution, contamination probability and risk areas were analyzed via spatial statistic analysis with respect to these heavy metals. Results showed that the average concentration of Cu、Pb、Zn and Cr was 17.52mg/kg, 27.31mg/kg, 50.7mg/kg and 37.39mg/kg respectively. Semivariance analysis demonstrated that Cu and Zn were fit for exponential model, and Pb and Cr were fit for gaussian model; in addition, nugget coefficients of all calibrations were all above 0.75, which illustrated the variation characteristic of four heavy metals were considerably apparent. Cu、Pb、Zn and Cr in the topsoil were distributed in island duing to the effects of local factors. The result of hotspot analysis and indicator kriging interpolation collectively revealed that Jincheng town, the boundary zone of Xinzhuang town and Canzhuang town were the common high risk areas in terms of the four heavy metals, while the south part of study area was relatively the safe zone. Pb had a bigger probability exceeding threshold than others, and the middle or high contamination risk areas of Pb distributed widely as well.

Key words:

Soil heavy metals; Spatial variability; Hotspot analysis; Indicator kriging; Pollution risk area

Spatial Characteristics of Physical Environment for Human Settlements in Jinsha River Watershed (Yunnan Section), China

Xia, J.S.

School of Resource, Environment and Earth Sciences, Yunnan University, Kunming, Yunnan 650091, P. R. China,

xiajsh@ynu.edu.cn

Abstract

In recent years, earthquake, landslide, debris flow, collapse, drought, high and low temperature and other disasters occur frequently in Yunnan Jinsha River watershed, causing deterioration of physical environments for human settlements in some areas of the watershed. Therefore, it is important to identify the spatial distribution of physical environments for human settlements to support population distribution planning. This study includes 10 factors (topography, landform, vegetation, elevation, fault, rock, soil, earthquake intensity, temperature, and precipitation) as indicators for the assessment of human settlement suitability based on AHP (analytic hierarchy process) and Gray Correlation methods. GIS functions such as 3D trend analysis, 3D perspective view and spatial variation law were used to help understand the spatial distribution of human settlements and the causal factors. The study concluded that the middle section of the watershed has the best quality of living environment, while the quality of living environment deteriorates in the downstream and upstream sections, and the upstream watershed has the worst living environment. This study reveals different spatial units of the watershed suitable for human habitation from the viewpoint of physical environment, and provides recommendations for urban planning and siting, land use planning, and disaster mitigation in the watershed.

Jinsha watershed; human settlements; GIS; AHP (analytic hierarchy process)

Spatiotemporal Analysis of Typhoon Disaster Chains in Southeast China

Mingyue Zhao, Jian Peng, Jitao Wang, Yanglin Wang

Laboratory for Earth Surface Processes, Ministry of Education, College of Urban and Environmental Sciences, Peking University, Beijing, 100871, P. R. China, zhaomy647@pku.edu.cn

Abstract

Under the background of global climate change, frequently occurring extreme events has been causing intensified natural disaster risk. Typhoon is one of the most frequently and extensive worldwide meteorological disaster, and usually caused winds, storms, and storm surges. China is one of the countries influenced frequently by typhoon events, and the agriculture, population and economy are threatened dramatically as its high population density and intensive economy in southeast coast. In this study, we used tropical cyclone data and meteorological data from 1949 to 2014, applied disaster risk theory and spatial analysis, analyzed the typhoon's spatial distribution influencing southeast China in the north-western Pacific and the south China sea region. Mapping the spatial distribution of typhoon-wind, typhoon-storm, and typhoon-storm surges, and finally zoning the typhoon disaster in the southeast China and obtained the frequency of typhoon disasters. The results showed that: 1), typhoon formation and landing in the north-western Pacific and the south China sea region had significant differences between years, the values peaks of formation and landing occurred in 1960-1969, with 412 and 102 respectively; 2), there are two regions affected most by typhoon——Beibu Gulf regions, along with Guangdong Coast, and the Taiwan Strait. 3), the typhoon disaster chains indeed exist, typhoon-wind, typhoon-storm, and typhoon-storm surges affected differences in different regions.

Key words:

tropical cyclone; typhoon chains; spatiotemporal analysis; typhoon-wind; typhoon-storm; typhoon-storm surges

Study on Early-warning of Typical Regional Coastal Zone Carrying Capacity in the Beibu gulf, Guangxi, Southern China

Xinxian Huang, Baoqing Hu, Yuchu Xie

Guangxi Teachers Education University, Key Laboratory of Environment Change and Resources Use in Beibu Gulf, Guangxi
Key Laboratory of Earth Surface Processes and Intelligent Simulation, Guangxi Nanning, 530001, 541371396@qq.com

Abstract

Coastal zone, where terrene, ocean and atmosphere interact on each other, is the richest region on the earth. Integrated coastal carrying capacity (ICCC) is one of the important bases for coastal and marine major function oriented zoning. It not only reflects the supporting capacity of the coastal environment, resources and ecosystem to human activities, but also could warn the state of environment and resource and make ecosystem staying healthy. Nevertheless, as a marine-terrestrial interlaced zone, the coastal vulnerability is inevitable. Under the background of the strategy of “the Belt and Road Initiative of China” and “the 13th Five-Year Plan”, it has become increasingly emergently in discussion of the carrying capacity, especially in the Guangxi Beibu Gulf. In this study, taking the Guangxi Beibu Gulf coastal zone as a case area, we constructed of early warning index system of ICCC based on the model of the “driving force-pressure-state-impact-response”(DPSIR). And then, we quantitatively assess the coastal carrying capacity and early warning from 2010 to 2014. The result shows that: the ICCC decreased and its alarm is not serious in the Beibu Gulf coastal zone. In space, it exhibited a pattern of high in the East and South, low in the west and North. Based on the contribution rate analysis of secondary indicator carrying capacity, the key driving forces of ICCC are the rate of the pollutants, energy consumption, regional economic development, and the environmental pressure respectively. (Foundation: National Natural Science Foundation of China(41361022), the scientific and technological development projects of Guangxi zhuang autonomous region(2014DD29090), the Natural Science Foundation of Guangxi (2014GXNSFDA11803))

Abstract

In order to improve the soil sodium chloride monitoring accuracy, research the high spectral estimation method of soil sodium chloride content in the north of Weifang. using Spectral measurement technology. Taking the typical area of salt water intrusion in Wei-fang city as the research area, 41 soil samples were collected in the field, and the physical and chemical properties were measured. The mathematical transformation of the measured hyperspectral reflectance, and the soil sample sodium chloride content analysis, and the use of partial least squares regression analysis method to establish the soil sodium chloride monitoring model. The research results show that: the first derivate reflectance, the second derivate reflectance soil sodium chloride content monitoring model of the determination coefficient are higher than 0.8, the modeling accuracy is higher. After the test, the reflectance of the second derivate reflectance is the best spectral index for predicting the content of soil sodium chloride, the modeling coefficient is 0.859, the total root mean square error is 0.274.

The Distribution of Educational Infrastructure on The Vulnerable and Areas of of Potential Disaster in Metropolitan Bandung Area

Nandi, Maryani, E, Jupri, Malik, Y.

Department of Geography Education, Universitas Pendidikan Indonesia, Bandung 40154, nandi@upi.edu

Abstract

This study aims to identify the inventory and distribution of educational infrastructure in areas that have the potential and vulnerable of disaster in Metropolitan Bandung Area. The information obtained provided early warnings in the form of distribution of disaster-prone spots in the educational infrastructure. The research method uses descriptive-analytic survey and geographic information systems (GIS). The use of GIS-based modelling was intended to create and produce a spatial distribution map of the region. The population of the research was the whole area of Metropolitan Bandung Area. The population of the educational infrastructure consists of the location of schools and colleges in Metropolitan Bandung Area, from kindergarten to the university. The results showed that the location of educational infrastructure in the affected areas are spread. The reason for this is because the location of the educational infrastructure (schools) were in many affected areas. For example, the areas with potential earthquake are mostly located in West Bandung (Lembang District) and Bandung Regency, especially in Pangalengan District. Meanwhile, the Bandung and Cimahi Municipality are dominated by flood and fire. There are also some scattered areas of potential landslides in West Bandung regency, Bandung and Sumedang Regency. The infrastructures should not be located in an area that has a severe impact with high potential of disaster because it will cause losses and a bottleneck in the learning process in schools. The existing location can use disaster friendly construction concepts and they will become schools or education infrastructures that are prepared for any kinds of disaster.

Key words:

Disaster; Educational Infrastructure; Distribution; Bandung Metropolitan Area

The Impact of Climate Changes on the Coastline of the State of Kuwait

Ahmed Hassan

P h D, physical geography, Ain-Shams University, Cairo, Egypt, ameh812000@gmail.com

Abstract

Climate change is one of the most serious problems facing the coasts of the world in general and the State of Kuwait in particular. Where 90% of the population of the State of Kuwait live in the coastal region, and most of the urban areas are concentrated on the coastal zone of Kuwait. Thus, tracking sea-level changes during the Holocene era is one of the methods to adapt the environment in order to avoid the risks that probably exposed the coastal area because of the changes of the sea level.

The preliminary field study monitored the many references throughout to the function changes the sea level along the coast of Kuwait, Such as marine terraces, Coastal ridge, coral reefs and Coastal sabkhas.

This paper consists of three elements:

1. Monitor the most important human activities in the coastal zone in Kuwait.
2. Work of imaginary model of the sea-level changes (+ 1) meters.
3. Determine the impact of the sea level in the coastline.

The aim of this paper is to follow and assess the impact of climate changes on the coastline of the state of Kuwait.

The study uses several methods such as; 1- comparing maps of the old space image with the new one . 2- The field study to collect evidence and monitor climate changes down the bottom of the Gulf and on the beaches. 3-The researcher will make coring to tracking the sea-level changes in different soil depths.

The Livelihood Vulnerability of Rural Households In earthquake-Stricken Areas: A Case Study Of Ning'er, Yunnan Province

Benyong Wei, Guiwu Su

Institute of Geology, China Earthquake Administration, Beijing, 100029, P. R. China, bywei1982@163.com

Abstract

Earthquakes happen suddenly and are immensely destructive. They not only destroy entire societal production and infrastructure systems but also seriously interfere with daily life and reduce opportunities to earn income in earthquake-affected areas. In this paper, using the Ning'er Ms 6.4 earthquake in 2007 as an example, we analyzed the livelihood vulnerability of rural households in Ning'er County, Yunnan, based on data from questionnaires and on-site interviews. The results showed that on the whole, local rural household livelihoods are relatively vulnerable in the earthquake-affected area of Ning'er. The main reason for the high level of vulnerability of rural households is the lack of single or multiple incomes. Due to the shortage of household income, the capacity of rural households to manage the aftermath of an earthquake is low. Improving the income allocation and transformation level and expanding methods of earning income is an effective way for rural households to decrease livelihood vulnerability in earthquake-prone areas. Some suggestions are given for local rural households to enhance their livelihood income levels in the event of earthquakes.

Key words:

vulnerability; earthquake; livelihood; rural household; Yunnan

The research on flood disaster risk zoning in Chaonan district of Shantou

Wanghang,qinfun

Henan University ,Kaifeng,457000,P. R. china,wanghang20001@163.com

Abstract

The investigation found that the studying area has complex topography landforms, which influenced by the high density of town constructions, with various artificial slopes that lead to serious soil loss. Over the years, when the annual flood season or typhoon comes, this area is always damaged by certain degrees of flood with the secondary disasters. Therefore, this region is the area with frequent geological disasters in Guangdong Province.

Depending on the typical nature of this region, the article is based on the theory of regional disaster system and the general consideration of natural environmental factors and human-economic activities, we used AHP method to determine the evaluating index, and then constructed the evaluating model. GIS and spatial statistical methods are used to analyze the risk of disaster-inducing factors, the sensitivity of subsequent environment and the vulnerability of hazard-affected bodies in Chaozhou district of Shantou. Then, we got the flood disaster zoning map and the risk tables of every village in Chaonan County. The results show that the towns of Chendian, Leiling and Jingdu are the biggest risk coefficient. The shape of the risk area is distributed by block and strip, which is influenced by river and terrain factors greatly. Meanwhile, moderate risk area is distributed in the secondary risk area that affected by population. According to social practice, the result satisfied the disaster area. Moreover, risking factors table could also be seen as the basis of risk management for villages.

Variability of Geotechnical Parameters of Slope Covers and Its Influence on Landslide's Vulnerability – Case Study from Polish Flysch Carpathians

Bucała A., Zydrón T., Gruchot A., Demczuk P.

Institute of Geography and Spatial Organization PAS, Department of Geoenviromental Research, Kraków, Poland,

abucala@zg.pan.krakow.pl

Abstract

Rainfall-induced shallow landslides are common phenomena in the world. Observations of past events reveals that especially prone to landsliding are pastures and meadows. Our research were concentrated on determinations of geotechnical parameters of soil cover located within meadows in two mountainous of catchments in the Gorce (Jaszczce and Jamne, Polish Flysch Carpathians). The test were done in the context of analysis of slope stability failures, that were caused by heavy rains in July 1997 and 2008.

Site investigations included making a few open pits in order to collect soil samples, determination of soil density and estimation of hydraulic parameters of the soil. The laboratory tests included determination of a grain-size distribution, soil consistency limits, permeability coefficients and shear strength parameters, which were determined using direct shear and triaxial tests. In order to determine slope stability conditions in both catchments, was used SINMAP model.

Our research revealed that slope covers from analyzed catchments are in general coarse-grained, medium permeable and low-cohesive soils, which geotechnical parameters are not very diversified. However, shear strength tests revealed that higher values of internal friction angle and lower values of cohesion were obtained from traxial tests. Slope stability analysis confirmed that the Jamne and Jaszczce catchments are prone to shallow failures caused by intense rainfalls, mainly due to high slope inclinations, low cohesion and medium permeability of slope cover soils. The other significant factor controlling instability processes in the area is process of the saturation of the slope covers.

Catastrophe Experience, Risk Perception, and the Transformation of Social Space in Post-Disaster Communities

Lo, Alex Y¹, Cheung, Lewis TO²

¹The Kadoorie Institute, University of Hong Kong, Hong Kong, China, alexloyh@hku.hk

²Department of Social Sciences, The Hong Kong Institute of Education, Tai Po, Hong Kong, China

Abstract

This presentation explores the relationships between catastrophe experience and risk perception, social interaction, and household economic resilience to future catastrophes. Our main argument recognizes the geographical context in which social capital is formed and reproduced. Social relationships and norms adjust to the social landscape, which can be transformed by the spatial consequences of natural catastrophes. We argue that sources of household resilience may be derived from the spatial transformation of social practices, and not necessarily from catastrophe experience and risk perception directly. Case studies in Mainland China, Hong Kong and Australia will be presented, which are primarily based on household surveys and in-depth interviews with local residents and victims of catastrophic earthquakes and flooding. The findings challenge the assumption that catastrophe experience and risk perception are related to residents' intention to prepare for future catastrophes. Nonetheless, the relationship may be mediated by social relationships and social norms. Catastrophe experience and risk perception can be construed as a geographical contextual factor. Increased proximity between residents facilitates neighbourly interaction and risk communication across a neighbourhood. We will discuss the non-linear, dynamic relationships between the variables examined and the grounding of social capital in space.

Global Disaster Risk Reduction Knowledge Service System in IKCEST

Wang Juanle

Institute of Geographic Sciences and Nature Resources Research, Chinese Academy of Sciences, Beijing, 100101, P. R. China, wangjl@igsnr.ac.cn

Abstract

More and more hazard and disaster events occurred frequently recently not only in regional scale and global scale. UNESCO has paid more attention on disaster risk reduction for long term. catering to the UNESCO need of building a data and knowledge platform, a Global Disaster Risk Reduction Knowledge Services System was initiated supported by International Knowledge Centre for Engineering, Science and Technology (IKCEST) in Chinese Academy of Engineering. The service mission is mainly aimed to establishing global disaster metadata standard or best practice and global disaster meta-databases; setting up natural disaster warning and relief mechanism by regions in China and its neighboring regions. The paper introduces the general architecture, common and specific functions of the Global Disaster Risk Reduction Knowledge Service System. Earthquake disaster relief in Nepal and drought monitoring in Mongolia Plateau is discussed as typical cases.

Key words:

Influence of Climate Change on Environmental Hazards and Human Well-Being in the Urban Areas -Warsaw Case Study

Marek Degórski, Bożena Degórska

Institute Geography and Spatial Organization, Polish Academy of Sciences, Poland, m.degor@twarda.pan.pl

Abstract

During relatively rapid changes of climate, urbanized areas are particularly vulnerable to increasing frequency of heat waves and intensification of torrential rainfalls. Such areas are characterized by the high density of population, specific spatial structure, with a large share of built-up areas and decreasing share of biologically active compounds. This results in an enlargement of the areas under impact of urban heat island, which as a consequence of a synergy effect with aging residents, triggers the lowering of the quality of human life and even increased mortality risk in terms of inflow of hot air waves. Aim of this presentation is to show on the example of Warsaw, how changes in land use structure during next 50 years may worsen the quality of life of residents, increase the risk of floods or increase the risk of elderly people and children mortality due to heat waves. Moreover, the demographic standing of Polish cities will be shown in terms of the structure of inhabitants age. Particular attention will be driven to the issues of changes in land cover, the functioning of ecological corridors and wedges aerating the city, with urban sprawl as a result of strong sub-urbanization processes. Negative consequences of climate changes will be presented along with proposals of adaptations of the environmental system to their courses.

Key words:

climate change; land use changes; urban sprawl; green infrastructure; urban heat island

A Hybrid Approach to Assessing Urban Flood Vulnerability Using Expert Opinions and Participatory Planning

Cho S. Chang H

School of Urban Studies and Planning, Department of Geography, Portland State University, Portland, 97201, USA,

changh@pdx.edu

Abstract

Urban flood risk management has mainly been focused on reducing physical vulnerability in the city. Such a narrow focus inadequately addresses equitable, effective, and efficient solutions to urban flooding problems, failing to investigate city's internal and systemic capacity to deal with diverse population characteristics. The concept of social vulnerability, which represents comprehensive a priori conditions of urban communities and neighborhoods, thus becomes critical for sustainable urban communities. It is necessary to assess urban flood vulnerability based on a broader understanding on social capital and social relations that are closely linked to the common good and the exercise of authority. From this point of view, this research conducts surveys on university researchers and urban practitioners to investigate how the perceptions of each group differ by their sociodemographic and academic backgrounds and work experience. Under the assumption that urban population may be disproportionately affected by climate change within the city, this research also attempts to explore various ways of characterizing flood vulnerability and how physical and social vulnerability are interrelated each other over space. Moreover, this research explores the possibility of developing an index approach for assessing flood vulnerability as the practice of consensus building and joint fact-finding, and its potential as social learning tools.

Key words:

Urban floods; vulnerability; social vulnerability; physical vulnerability; survey; participatory planning; index approach; consensus building

Problems in Geographic Emergency Visualization and a Rapid Solve Method by Template Technology

Zheng Shulei, Chen Yufen, Liu Jianzhong, Cai Zhongxiang, Zhang Jing

Zhengzhou Institute of Surveying and Mapping, Zhengzhou, 450052, P.R.China, z_score2@163.com

Abstract

Nowadays, natural dangers and manmade emergency cases such as traffic jam and air pollution have ascended sharply. During geographic emergency preparedness, warning, response and recovery process, map played important roles for its good abilities in visualization, localization, query and analysis. But there are still problems weakened its visualizing effect at present.

This contribution deals with problems in geographic emergency visualization and situations rapid creation. After conception and functions introduced, problems which troubled user cognition and personalized information transmission were analysed. To solve problems above, multidimensional conditions consist of different user and equipment and task were researched firstly. Then some design rules were brought up, mainly including foremost rapid mapping, personalized visualization for specific environment condition, templates combination and repeat use to simplify process, attention to indication of colours. In the following part, a new method of emergency thematic map by template technology was demonstrated.

Templates making and rapid combining methods for base-map, thematic symbol, colour and other elements were all referred to basing on questionnaire analysis results. Especially, qualitative eye tracking trace and hot-map on emergency thematic map pictures in eye movement tracking experiments validated their effectiveness. Also quantitative parameter statistical analysis of Time to First Fixation and Fixation Count supported the template method. More sufficient preparation ensures successful selection for similar emergency cases. More personalized mapping process lessens the cognition of map user. More simple decision-making process advanced rapid mapping as soon as emergencies burst out. We believe the significant method has a bright and broad future. (Project supported by the National Nature Science Foundation of China (NSFC, No.41501507, 41301125& 41171353) and the National High Technology Research and Development Program("863"Program) of China(No. 2012AA12A404).)

Key words:

geographic emergency visualization; thematic map template design; rapid mapping technology; eye movement experiment

Multi-Hazard Risks and Challenges for Society in High Mountain Regions – The Barsem Debris Flow Disaster, Pamir (Tajikistan)

Keiler M, Zimmermann M, Fuchs S

University of Bern, Institute of Geography, Bern, Switzerland, margreth.keiler@giub.unibe.ch

Abstract

Changes in high-mountain environments are responsible for new and challenging multi-hazard conditions and materialize in particular through cases such as the Barsem disaster (Pamir) in July 2015. At least 14 major debris flows occurred in the Barsem Valley within four days during a period of exceptional meteorological conditions. The flows transported large volumes of debris on the fan where the village Barsem with about 1,500 inhabitants is located.

As a result, 80 homes were completely destroyed, and one person went lost. Moreover, the debris dammed the Gunt River, forming a lake of two kilometers length and endangering the local power supply. The lake interrupted the Pamir Highway and the potential lake outburst threatened the downstream communities along the valley as well as Khorog, the capital of the Gorno Badakhshan Autonomous Oblast. The damage was caused directly by the debris flows deposits and by subsequent flooding as a consequence of dammed Gunt River.

This contribution will provide a first analysis of the processes sequences, process-process interactions but also on emerging multi-hazard risk situations and the local and regional risk management strategies. In this context interactions of environmental and social components on different scales will be analysed based on a coupled human-landscape system approach. An additional focus will be on the challenges of resilience-building for the communities and society in this regions under changes in the high-mountain environment.

Key words:

Process chains; multi-hazards; coupled human landscape systems; dynamic systems; high mountains; Pamir; communities at risk

A Calendar Visualization of Fine Particulate Matter Time-Series in Beijing during 2014

Jianzheng Liu, Jie Li, Weifeng Li

Department of Urban Planning and Design, Faculty of Architecture, The University of Hong Kong, China,

jzliu@connect.hku.hk

Abstract

The overly high fine particulate matter (PM_{2.5}) concentration in Beijing has become a new symbol of Beijing in addition to its figure as capital city in China. “Capital of Smog” used to denote London 60 years ago now falls upon the city of Beijing, posing a critical challenges to the sustainable development of Beijing that leads to major public health concerns. In order to formulate mitigation measures and policies, knowledge on PM_{2.5} variation pattern should be obtained. While previous studies are limited either due to data availability, or because of problematic priori assumptions that PM_{2.5} concentration follows subjective seasonal or monthly or weekly patterns, our study aims to let data show itself rather than imposing an arbitrary periodic pattern upon the data. To achieve this, we conduct a time-series cluster analysis on a full-year PM_{2.5} data in Beijing at the year of 2014, and provides an innovative calendar visualization of PM_{2.5} measurements throughout the year. Intuitive insights from the cluster analysis on temporal variation of PM_{2.5} concentration show that no weekly patterns are found, and seasonal pattern does exist but doesn’t follow a strict temporal division. Our findings contradict the result of previous studies and offer a different perspective which can help with policy formulation regarding PM_{2.5} mitigation.

Air Pollution and Its Impact on Human Health

Myagmarsuren Dash, Otgonbayar Erdenetsogt

University of the Humanities, Mongolia, dmiigaa@yahoo.com

Abstract

Due to uncontrolled expansion of city and population growth, air quality issue had been on fire for the last decade in Ulaanbaatar city. The research study aimed to monitor Ulaanbaatar air quality changes, air pollution measurement research study was conducted at the “Environmental monitoring laboratory” University of the Humanities. The number of sampling of precipitation and soil was prepared. The laboratory experiment result shows that of the research, sources of burning organic fuel have been increased heavily in Ulaanbaatar city, which emits NO_2 and SO_2 into the atmosphere, NO_2 and SO_2 react to hydrogen ion in the atmosphere and forms SO_4^{2-} and NO_3 . The amount of the ion has increased in the snow – water. Snow-water is considered as mild type, but its solidity has increased to 2.2-4.6 mg eqv/l for the last years. The soil water sample is 11.46-12.2 mg eqv/l, very hard. The amount of NO_3 in snow-water and soil water is low, and the amount of NO_2 in the atmosphere is 2 to 3 times more. According to the average amount of total pollutants, it is higher in the samples from the air quality points in Bayanzurkh district. As a result of the research, it is shown that the air quality index will be increasing for the last years and it has a clear impacts on human health.

Key words:

air pollution; NO_2 and SO_2 into the atmosphere; soil water

An Exploration of Longitudinal Impacts of Built Environments on Childhood Obesity

Jia P

Department of Epidemiology and Environmental Health, University at Buffalo, Buffalo, NY 14214, USA,

jiapengff@hotmail.com

Abstract

Although numerous efforts have been made to associate built environments with the prevalence of childhood overweight and obesity, most studies are cross-sectional which disallows them to conclude with a strong association between them. To conclude with significant impacts of built environments on children's weight status, I examined if changes in built environment factors over time would impact children's Body Mass Index (BMI) z-score and weight status. Children's individual records were extracted from two waves of the Early Childhood Longitudinal Study – Kindergarten class (ECLS-K) data (2000 and 2007). The street intersection density, housing unit density, population density, and average speed limit at the census tract level were used as main predictor variables in this study, with children's individual factors including age, gender, race, parents' highest education, and annual household income controlled for. There were a total of 9,438 children followed up from 2000-2007. Overall, children living in the census tracts with a higher street intersection density in 2000 have experienced a slower increase in BMI z-score during 2000-2007, which is significant for those children living in the suburb. Also, children living in the census tracts with lower speed limit on average showed a smaller BMI z-score increase, which implied that children living in those tracts may have more physical activity to prevent them from overweight and obesity. The built environments were found having significant impacts on children's weight status. This is the first study to observe this association based on a national representative dataset, which enables us to approach their causality.

Key words:

Built environment; obesity; overweight; street intersection density

Arsenic and Contamination of Drinking-water and an Approach for its Mitigation in parts of Ballia District UP India: A Public-health Perspective

Kumar A

Research Scholar, Department of Geography, Faculty of Science, Banaras Hindu University India

kabhijolly89@gmail.com

Abstract

Arsenic contamination of groundwater is common on the Gangetic plain, which stretches from Pakistan, across northern India, and into Bangladesh, where the Ganges flows into the sea. The arsenic, along with lead and chromium and other heavy metals, has been deposited in Sediments carried by the rivers flowing out of the Himalayas. Although the sediments date back tens of millions of years, arsenic contamination is a recent development: it has become a serious health problem only since the advent of tube well technology. Medical symptoms of slow arsenic poisoning range from skin lesions to cancer of internal organs. The contamination is spotty. Arsenic above permissible limit in ground water of phreatic younger alluvium of Ganga and Ghaghara rivers along meandering course and shallow aquifer, has reported as the main source of arsenic contamination. Due to excess of Arsenic in ground water people are reported to be suffering from diseases like skin cancer, ulcer and pigmentation in skin and hardening in palm skin. This situation warrants immediate measures to be taken up for planning and implementation of various management programs for mitigation of arsenic.

Assessing Urban Environmental Impacts on Human Health in Kolkata Metropolitan City, India: A Case Study

Haque Senaul, Singh R. B.

Department of Geography, University of Delhi, Delhi, India, 110007, senaulhaque68@gmail.com

Abstract

The environmental conditions of big cities in less developed countries are most of the cases not found to be in a healthy situation and the case of Kolkata Metropolitan City in this regard is not an exceptional one. The biggest problem that a megacity faces from environmental point of view is deteriorating air quality and paucity of sufficient water for drinking and sanitation purposes. In Kolkata, it has found that the concentration of pollutants (NO_2 and RPM) in the ambient air have gone much beyond the prescribed national standards and recorded as critically and highly polluted in all the total 17 monitoring locations. The availability and accessibility of purified supply of piped water is equally a pressing problem in Kolkata and lack of that people extract underground water which found to be contaminated with heavy metals like arsenic and mercury. Covering questions on environment and health, people's awareness and avoiding nature to pollution; a survey has been conducted at dispensaries run by Kolkata Municipal Corporation (KMC). Three dispensaries have been selected based on spatial concentration of pollutants (one each from critical, high and low polluted areas) and only those patients were interviewed who are having either respiratory and water borne diseases. The data thus generated have revealed that people with respiratory ailments (*Acute Respiratory Infection*) are more frequent and these are among the children than those of the water borne diseases. An attempt has been made to address some suitable measures in bringing sustainable urban development in Kolkata.

Key words:

urban environment; air quality; water quality; health; sustainability, Kolkata.

Biogeography of Transmitting Vectors of Leishmaniasis in Area of Sugarcane

Expansion and Forest Remnants, in Brazil

Casagrande B, Matsumoto P S S, Guimarães R B.

Universidade Estadual Paulista "Julio de Mesquita Filho" campus de Presidente Prudente, Brasil, (UNESP).

flebalta2012@gmail.com

Abstract

The objective of this study is to evaluate the similarity, dominance and diversity of sandfly communities in area of sugarcane expansion and in the remaining forest. This work was carried out through night capture of sand flies using Shannon traps and CDC. Data were analyzed by PAST and Dives software, in order to calculate the similarity (Sorensen index), dominance (Simpson index) and diversity Shannon-Wiener. In forest remnants were found four different species of sandflies, and 190 specimens of *Nyssomyia neivai*, 128 *Pintomyia pessoai*, four *Evandromyia carmelinoi* and 2 *Nyssomyia whitmani*. In the areas of sugarcane expansion we found 5 different species of sand flies, and 1620 specimens of *Nyssomyia neiva*, 12 *Nyssomyia whitmani*, 4 *Evandromyia Lenti*, 1 *Psathyromyia aragaoi* and 1 *Brumptomyia brumpti*. By considering these data, it was found that the index of similarity between the sand flies communities on the sugarcane expansion and in the remaining forest was 0.44, the dominance index was 0.50 and diversity with a significant difference was 0.015. Certainly, identifying the characteristics of the species, can help control and minimization of leishmaniasis.

Key words:

leishmaniasis, Phlebotomine sand flies, sugarcane expansion and Biogeography.

Cancer Villages in China: A Study Based on Media Reports

GONG Sheng-sheng, ZHANG Tao, et al.

College of Urban and Environmental Science, CCNU, Wuhan, 430079, P. R. China, shshgong@mail.ccnu.edu.cn

Abstract

A Cancer Village is the village whose cancer morbidity or mortality is remarkably higher than the national averages. The first Cancer Village in China was reported in 1954, and 351 Cancer Villages were reported by 2011; The number of Cancer Villages increased slowly before 1988, but rapidly since then, 186 amongst Cancer Villages (53%) were reported in 2000-2009. The spatial distribution of Cancer Villages was significantly different between zones, the number of Cancer Villages in the eastern zone was more than in the central zone, and in turn more than in the western zone; The mainland of China could be divided into four-level regions: rather dense areas, relatively denser areas, sparse areas and blank areas. In the last thirty years, the gravity centers of Cancer Villages in China moved continuously from west to east, and 60 % of them located within a 3 km distance from rivers, and 81% within a 5 km distance. Of all Cancer Villages, 95.16 % were caused by chemical factors, 1.99 % by virus factors, and 1.14 % by physical factors, it is obvious that water pollution was the chief cause of Cancer Villages.

Key words:

Cancer Village; distributional change; carcinogenic factor; Pollution; period 1980-2015 China

Characteristics and Health Effects of Air Pollutants in ShenzhenFengying Zhang^{1,2}, Wuyi Wang², Thomas Krafft³¹China National Environmental Monitoring Centre, Beijing 100012, China²Institute of Geographic Sciences and Natural Resources Research, Chinese Academy of Sciences, Beijing 100101, China³CAPHRI School of Public Health and Primary Care, Maastricht University, the Netherlands**Abstract**

During 2013, daily average levels were 10.9 $\mu\text{g}/\text{m}^3$ for SO_2 , 39.6 $\mu\text{g}/\text{m}^3$ for NO_2 and 1207.2 $\mu\text{g}/\text{m}^3$ for CO. Daily AQI ranged from 24 to 179. There were 39 days had air pollution. According to the China National Ambient Air Quality Standard (GB3095-2012) and Technical Regulation on Ambient Air Quality Index (on trial) (HJ 633-2012), NO_2 was the third main air pollutants in Shenzhen, which had 61 days as primary pollutants and 3 days as non-attainment pollutant. There were no polluted days for SO_2 and CO. Monthly/hourly average AQI and concentrations of NO_2 and SO_2 in center city area were higher than tourist area. Annual AQI and NO_2 concentration showed higher value in west parts of Shenzhen. SO_2 level showed higher value in eastern Shenzhen; lowest CO concentration appeared at Luohu District. Relative risks (RRs) in the all-cause mortality number would increase with SO_2 or NO_2 level increase. When SO_2 or NO_2 concentration changes, female were more sensitive than male, and people elder than 65 years seemed to be affected more easily than younger people.

Key words:

Patterns; air pollutants; all-cause mortality; Shenzhen

Diversity in the Geography of Natural Focal Diseases in the European part of Russia

Pestina P.V., Malkhazova S.M.

Faculty of geography, Lomonosov Moscow State University, Moscow, 119991, Russia, polina.pst@yandex.ru

Abstract

At present medical geography pays considerable attention to the study of regularities of influence of natural and social conditions of concrete territories on the health of the population. It is possible to insist that even potentially effective prophylactic arrangements will not be successful if they don't take into account data on spatial differences in spreading of diseases. The aim of this investigation is to determine diversity in the geography of natural focal diseases in the European part of Russia on the basis of the special database. There was analyzed spreading of 7 diseases, the parasitic systems of which are members of natural ecosystems. Offered approaches to the study of spatial differentiation of territory can be used for the analysis of diversity in health level of population for different diseases and characteristics of the environment.

Key words:

natural focal diseases, diversity, spatial analysis of epidemiological data

Dynamic Variation Relationship between Climate Change and lung function of Chinese Adolescent Students

HE Jinwei^{1,2}, GE Miao²

¹Yan'an University, Yan'an 716000, P. R. China, hotred_714@163.com

²Shaanxi Normal University, Xi'an 710062, P. R. China, gemiao@snnu.edu.cn

Abstract

To evaluate the effect of climate change to human health, vital capacity of Chinese adolescent students aged 7 to 19 years age old in cities from 1985 to 2005 was collected. At the same time, five climate indexes were derived from China Meteorological Data Sharing Service System, including annual mean air temperature, annual precipitation amount, annual mean relative humidity, annual mean wind speed, annual sunshine duration. Time series of five climate indexes and Spatio-Temporal Variation of vital capacity were analyzed, and explored the relationship between them. The annual average temperature increased significantly, while the annual average relative humidity, annual average wind speed and sunshine hours have drop trend. The increase of precipitation was not obvious. Adolescent students' vital capacity substantially decreased year by year. Successive growth rate of vital capacity was higher in north, while lower in south. Climate change is more likely affect higher aged students' vital capacity. There are significant negative correlations between vital capacity and annual mean air temperature, annual precipitation amount, annual mean relative humidity, while positive correlation with annual mean wind speed, annual sunshine duration.

Key words:

Adolescent; Vital Capacity; Climate Change

Environment Exposure of Heavy Metal Lead to Children, P. R. China: An Investigation from Systematic Literature

Xiaoping LI, Ting WU, Yanan ZHAO, Dongmei LIU

Shaanxi Normal University, Xi'an, 710062, P.R.China, lixiaoping@snnu.edu.cn

Abstract

Lead (Pb) is a kind of toxic metal, widely distributing in the environment. It has seriously effects on the children's abilities of mentality and behavior. This paper presents a systematic analysis from the lead dataset in urban soils ($n=11365$) and children Blood Lead (BL) ($n=50038$) in 35 Chinese cities collected from 2000-2014. We combine SPSS software, ArcGis techniques and assessment model to evaluate the spatiotemporal complexity of lead in soil and in children's blood variables with an aim to understand their relationship and its spatiotemporal changes. Thematic analysis results that the soil lead (SL) with the mean of $50.82 \text{ mg}\cdot\text{kg}^{-1}$ and mean of $66.39 \mu\text{g}\cdot\text{L}^{-1}$ in children blood. The studies identify an empirical curvilinear association between children's BL and SL dataset in tracts: $\text{BL}=21.06+11.92\times\ln(\text{SL}+0.17)$ $R^2=0.2838$ (28.38%). The relatively low R^2 value shows the contribution of SL to children's blood lead is about 30%. The spatiotemporal maps of BL and SL are observed that the distributions of them in eastern China are higher than others, smaller observed in the middle areas of China, and the southern areas are higher than those of north. However, the extram are observed in bigger cities or industrial urban. Extrapolating from the results, it is not neglected the environment exposure of lead to children in China even though lead in gasoline was phased out after the year of 2000. These results reinforce the proposal that prevention of childhood Pb exposure must include SL remediation as demonstrated by a chinese pilot project and aproactive chinese government program.

Keywords:

Environment exposure; lead; blood lead (BL); soil lead (SL); children's health

Health Outcomes of Tourism of Chinese Tourists: A Study Based on Tourists' Travel Blogs

XIE, S.Y., YE, D.

Central China Normal University, Wuhan, 430079, P. R. China, xieshuangyu@mail.ccnu.edu.cn

Abstract

It is widely believed and empirically proved that to be healthy or to relax from hard work or urban life is one of the motivations driving tourists to go travelling. However, whether tourists can really benefit in health wellbeing from tourism has been neglected in tourism literature, except that Muso et al. (2004) investigated the health consequences of visiting Sagarmatha National Park, and Coghlan (2015) explored tourism experiences that enhance participant mental health. Therefore, this study aims to investigate the health outcomes of tourism in China. It will collect the travel blogs tourists write during or after their travel in recent two or three years and implement word frequency analysis and content analysis to get their comments on their tourism experience, especially on their emotion and their feeling about their body and health. After exploring the overall health outcome of all tourists, it will analyze the difference of the health outcome among different tourists in terms of gender, age, educational attainment, motivation, type of destination, season of travel, type of travel, and so on, by using the method of analysis of variance.

Key words:

Health outcome of tourism; travel blogs; Chinese tourists

Integrated Approach to Dengue Vulnerability in Delhi: From Illness to Wellness

Approach

Mohapatra, SUBHAKANTA and Kumar, GIRISH

Department of Geography, School of Sciences, Indira Gandhi National Open University (IGNOU), New Delhi, India,

subhakanta@ignou.ac.in

Abstract

Dengue fever has emerged as one of the major health challenges in Delhi. Objectives of the study are to examine spatio-temporal distribution and analyze the degree of vulnerability to Dengue fever. The study looks dengue from health ecology perspective by combining disease ecology and political ecology of health. Data related to dengue fever and meteorological parameters were obtained from Municipal Corporation and Indian Meteorological Department respectively to show the seasonal variations and relationship among temperature, rainfall, humidity and the dengue fever cases. GIS mappings were used for analyzing incidence and spread of disease. 3 to 5 percent cases from each vulnerable cluster were selected as sample by using stratified random sampling technique. Qualitative methods were used for understanding the adaptive behaviour and negotiating processes. Out of 12 zones, maximum dengue incidences were reported from South, East and North Zone which mostly occurred during September and October. Zone wise analysis (2003-2015) revealed variations in cases. Ward level analysis revealed no specific pattern as cases were reported from both affluent colonies and slums and urban villages. The findings of the study give emphasis on processes i.e. move from Illness to Wellness approaches rather than outcomes. Rainwater storage is being promoted as an adaptation option to increase availability of freshwater; however unhealthy storage practices increases mosquito breeding. For effective control of the disease there are requirements to improve environmental sanitation along with improvement of storage practices and facilities to eliminate vector breeding, storm water disposal, health services and to increase public awareness.

Key words:

Spatio-temporal analysis and mapping; vulnerability; health ecology, adaptive behaviour; negotiating processes; wellness approach

Latest Trends in Public Health in Russia

Shartova N.V., Malkhazova S.M.

Faculty of geography, Lomonosov Moscow State University, Moscow, 119991, Russia, shartova@yandex.ru

Abstract

Public health is one of the main criteria for the sustainable development of regions. It is characterized by health and demographic indicators as morbidity, mortality, life expectancy, disability, temporary disability; its status is an indicator of the quality of the environment. The research presents the characteristics of the rate of public health in the regions of Russia (in 2002-2012). Changes in rate of public health have been identified in comparison with data of years 1990-2001. For comparative assessment of public health in Russia by its regions, an integrated parameter was used, specifically, the index of Public Health (IPH) which combines coefficients of infant mortality and life expectancy for men and women. Five groups of regions with different rates of public health have been determined and analyzed. Linked analysis between mortality rate and some environmental and socio-economic factors for 168 towns has been performed with a view to a possible interpretation of current public health.

Legacy Impacts of Historical Anthropogenic Mercury Releases on Modern and Future Global Source-Receptor Relationships

Chen L., Zhang W., Wang X. J.

Ministry of Education Laboratory of Earth Surface Process, College of Urban and Environmental Sciences, Peking University, Beijing, 100871, P. R. China, chl@pku.edu.cn

Abstract

Growing concerns about the risk associated with increasing Mercury (Hg) levels in the environment have resulted in a focus on the relationships between intercontinental emitted and accumulated Hg. We use a global biogeochemical Hg model with eight continental regions and a global ocean to evaluate the legacy impacts of historical anthropogenic releases on global Hg source-receptor relationships. Two inventories including anthropogenic emissions to air from 2000BC to present and riverine discharges to ocean from 1850 to present are used to drive the model. Results indicate that historical anthropogenic releases from Asia account for 8% of soil Hg in North America, which is smaller than the proportion (~17%) from previous studies. Human activities contribute more to the global ocean than continents (84% and 59%, respectively). The largest anthropogenic contributors to the oceanic Hg reservoir are North America (26%), Asia (16%), Europe (14%) and South America (14%). Although anthropogenic releases from Asia have exceeded North America since the 1970s, source contributions to the global ocean and combined continents from Asia have not exceeded North America by far. Future projections indicate that if Hg emissions are not effectively controlled, Asia will exceed North America as the dominant contributor to the global ocean in 2019 and this has a long-term adverse impact on the future environment. Accounting for the legacy impacts, sufficient efforts should be made to accelerate and better coordinate the implementation of Hg control policies, such as the Minamata Convention.

Abstract

The circulation of rice from contaminated areas could escalate exposure risk from a local problem to a national issue and affect a wider population beyond the region of origin, as confirmed by the “Poison Rice Incident” in May, 2013, in Guangzhou, China. In this study, we established a food chain model based on the equivalence method to identify major sources of methylmercury (MeHg), estimate the levels of MeHg, and quantify exposure to MeHg via rice and aquatic food consumption. Different kinds of organism samples from the Haihe River were also collected to verify the calculated values. The MeHg intake in pregnant women was 1529.1 ng/day from aquatic food chain and was as high as 2804.0 ng/day from rice, although the intake varied among scenarios. The maximum possible MeHg concentration in blood of the pregnant women was 5.21 µg/L, higher than the threshold value of MeHg recommended by the USEPA (4.4 µg/L), indicating that pregnant women could face risk from MeHg exposure. We also assessed the risk of MeHg exposure in pregnant women and their breastfed infants using a new index ($HQ_{\text{Equivalent}}$). In four scenarios, the $HQ_{\text{Equivalent}}$ indices ranged from 0.42 to 1.18 for pregnant women and from 0.29 to 0.83 for breastfed infants.

PMs and Mortality of A City with Relative Good Air Quality in South China

Fengying Zhang¹, Yong Ni¹, Wuyi Wang², Haijiang Luo¹

¹ China National Environmental Monitoring Center, Beijing, 100012, P. R. China, zhangfy@cnemc.cn.

² Institute of Geographic Sciences and Natural Resources Research, Chinese Academy of Sciences, Beijing 100101, China

Abstract

Most studies on associations with air pollution and human health in China have focused on the heavily polluted areas or mega-cities, and studies on cities with comparatively good air quality are still rare. Only a few studies have attempted to analyse particulate matter for Shenzhen in the Pearl River Delta. So far no systematic investigation of PMs spatiotemporal patterns in Shenzhen has been undertaken and understanding of pollution exposure in urban agglomerations with comparatively low pollution is still limited.

The results show that annual average PM₁₀ and PM_{2.5} concentrations were 61.3 and 39.6 µg/m³ in 2013. About 8.8% days had heavy PM_{2.5} pollution and PM_{2.5} was the main air pollutant. Daily PM_{2.5}/PM₁₀ ratios were high. Hourly PM_{2.5} concentrations in the tourist area were lower than downtown. PM₁₀ and PM_{2.5} concentrations were higher in western parts of Shenzhen than in eastern parts. Excess risks in the number of all-cause mortality with a 10 µg/m³ increase of PM were 0.61% for PM₁₀, and 0.69% for PM_{2.5}. The largest ERs of PM₁₀ and PM_{2.5} were in 2-day cumulative measures for the all-cause mortality, 2-day lag for females and the young (0–65 years), and L02 for males and the elder (> 65 years). PM_{2.5} had higher risks on human's all-cause mortality than PM₁₀. Effects of high PM pollution on mortality were stronger in the elder and male.

Population Health Index – A Multidimensional Tool to Analyze Health Inequalities at Different Geographical Levels

Santana A, Bana e Costa C, Oliveira M

Centre of Studies on Geography and Spatial Planning (CEGOT), University of Coimbra, Portugal,
paulasantana.eurohealthy@gmail.com

Abstract

The increase of health inequalities across Europe has been recognized as a key issue in the European policy agenda. At the core of the EURO-HEALTHY project (which stands for "Shaping EUROpean policies to promote HEALTH equity") is the construction of a Population Health Index (PHI) that will be used to assess population health in multiple dimensions at the NUTS 2 regional level and in ten representative metropolitan areas. The EURO-HEALTHY PHI is intended to be the starting point for the evaluation and selection of policies with the highest potential to reduce health inequalities across European regions.

The construction of the PHI was informed by scientific evidence on the relationship between multiple determinants and health outcomes, and it adopted a multi-criteria decision analysis (MCDA) methodology. Specifically, the MACBETH approach was combined with interdisciplinary and participatory processes to capture the views of stakeholders and experts. After outlining this socio-technical approach, this communication will discuss how the PHI can be the starting point for: i) assessing how alternative policy options for health policy development may reduce health inequalities, through the use of MCDA resource allocation models, conflict analyses, analysis of policy feasibility and scenario analyses; ii) performing space-time analysis of geographical patterns and comparing population health across regions through a WebGIS platform.

Generically, the PHI will allow for monitoring, foreseeing and discussing the impact of multilevel policies on overall health and well-being at European, national and regional levels. The methods in use will contribute to enhancing the literature in the area, with the results advancing the understanding of regional, national and European policy-makers regarding the major health problems affecting their regions, and to illuminating priority areas for policy intervention. (This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 643398)

Progress of Medical Geography & Health Geography in China

Yang Linsheng¹, Li Hairong¹, Cheng Yang², Wei Binggan¹, Wang Wuyi¹, Leng Shuying³

¹Institute of Geographical Sciences and Natural Resource Research, Chinese Academy of Science, China, yangls@igsnr.ac.cn

²Beijing Normal University, China

³National Natural Science Foundation of China. Beijing, 100101, P. R. China

Abstract

A total of 20,891 articles published in SCI/SSCI journals (WEB OF SCIENCES) and the papers published by Chinese scholars since the end of 1990s were analyzed through literature metrological analysis. The results show that medical & health geography has been rapidly developed both in the world and in China. The publications in SCI journals published by Chinese scholars and the citation frequency of these publications have greatly increased. In the developed countries, researchers pay more attention to health care accessibility/health equity and their relationships with space, place, neighborhoods, landscapes, area, economy, culture, population aging and other social determinants, as well as the health impacts of global environmental change and the environmental quality degradation at a large scale. In China, researchers concern more about health risks of local environment pollution (either heavy metals or POPs in air, soil or water) and the prevalence of diseases at a local scale. As China is the largest developing country with rapid development, researchers in medical & health geography in China should focus on health related challenges occurred in both the developing and developed stages.

Research on Geographical Distribution in Pulse Reference Values of Healthy Chinese Children

Yang Shao-fang¹, GE Miao^{1*}, WANG Chong-Xia², HE Jin-Wei¹, ZHANG Ming-xin³

¹College of Tourism and Environment, Shaanxi Normal University, Xi'an 710119, China

³College of Resources and Environment, Ningxia University, Yinchuan 750000, China

Abstract

Objective: This paper aims at supplying a scientific basis for standardizing the normal reference value of values Chinese children aged 6-12 years. **Methods:** The pulse reference values of 126468 healthy boys and 156793 girls were collected from 69 units from 30 provinces (cities) in China. The variance, correlation and stepwise regression analysis were used to find the correlation between nine geographical factors besides age and the pulse reference value. Then distribution maps in pulse reference values of children were drew. **Results:** there was significant relationship between geographical factors besides age and the pulse reference value. The geographical distribution in pulse reference values of healthy boys and girls both were gradually decreasing from west to east, inland to the north coast. Age increased each year, the Chinese boys' reference pulse decreased by 0.98 ~ 11.36, while the girls' reference pulse decreased by 0.89 ~ 10.32. The girls' pulse reference value was 2.16 numbers one minute higher than boys' in same age and environment. **Conclusion:** The important factors that influenced pulse reference values of Chinese healthy children were altitude, annual sunshine duration and age. There was greater difference of functional status of cardiovascular system between boys and girls with age. However, the geographical distribution in predict pulse reference values of healthy boys and girls was roughly similar.

Spatiotemporal Differentiation of Ground-Level Fine Particulate Matter (PM_{2.5})

Pollution in China

LI Mingsheng

China National Environmental Monitoring Center, Beijing 100012, P. R. China, lims@cnemc.cn

Abstract

PM_{2.5} is the primary pollutant which affecting air quality in China. The statistical method and GIS technology were used to analyze the ground-level PM_{2.5} observation data in 2015 from 338 routine monitoring sites in urban air quality monitoring network. The results were also compared to PM₁₀ which can be summarized as follows. ① The daily mean PM_{2.5} concentration obviously accorded with lognormal distribution showing main distribution range of 15-60 $\mu\text{g}/\text{m}^3$. 17.5% of the days' mean PM_{2.5} concentration failed to meet the prefectural level this year, and only 22.5% of the cities' yearly evaluation results at or above prefectural level according with currently in effect ambient air quality standards. The pollution level was far more serious than European and American developed countries. ② The PM_{2.5} pollution was relatively light in summer, finally spring, early autumn compared to heavy pollution in winter. ③ Daily PM_{2.5} concentration variation followed indistinctive bimodal curve with minimum value around 16:00 and maximum value around 10:00. The pollution level was relatively high in the small hours of the day. ④ The PM_{2.5} pollution was serious in Beijing-Tianjin-Hebei region and its surrounding area, as well as Hubei, Hunan, and Anhui province in the central China area. The light polluted area was contagious distributed in southeast coast and Yunnan, Tibet in southwest China. ⑤ The spatial distribution of PM_{2.5} pollution was significantly correlated with wind speed, air relative humidity, and land cover. Generally, the serious polluted area has been linked to slow annual mean wind speed, high air relative humidity, and high proportion of crop land and urban and build up land. ⑥ The correlation coefficient between PM_{2.5} and PM₁₀ was 0.86. However, the PM_{2.5} pollution was more serious than PM₁₀. Pollution days with PM_{2.5} as the primary pollutant accounted for 70.7% of the total pollution days, outclassing that of PM₁₀. ⑦ The average value of PM_{2.5} and PM₁₀ concentration ratio was 0.591, which has spatial pattern of gradually increasing from northwest to southeast, and south region higher than north region. The high ratio value of PM_{2.5}/PM₁₀ centralized in south of Yangtze River to Tibetan Plateau (except Yunnan-Guizhou Plateau). ⑧ Monthly PM_{2.5}/PM₁₀ ratio was basically stable in the range of 0.55-0.6, excluding higher in January, February, and lower in May. Diurnal PM_{2.5}/PM₁₀ ratio variation presented sinusoidal distribution, with peak value around early in the morning, following downward trend until reached peak-valley value toward evening, after then increased.

Spatiotemporal Variation of Vehicular Traffic Emissions and Its Impact on Urban Health: An Empirical Case Study of Kolkata Megacity

Roy Chowdhury, Dr. Indrajit

Assistant Professor, Post Graduate Department of Geography, Prabhu Jagatbandhu College, Howrah, India,

ndrjt.roychowdhury@gmail.com

Abstract

Kolkata Megacity experiences high emissions rate of vehicular pollutants from the vehicles which are plying on the major arterial as well as through major traffic intersection points. 65 percent of the vehicles are diesel run and these are very toxic and carcinogenic in nature. Bharat Stage – IV compliant vehicles have higher toxicity than the petrol counterpart. Petrol fuel emits high percentage of carbon monoxide and hydrocarbon and it is approximately 24 to 30 $\mu\text{g}/\text{m}^3$ per day (WBPCB, Annual Report 2014 – 2015) compared to diesel fuel where the rate is nearly 18 to 21 $\mu\text{g}/\text{m}^3$ per day. To assess the status of automobile pollution load, twenty traffic intersection points has been selected from different quadrants of Kolkata in order to estimate the automobile pollution status. Study reveals large and small buses are the principle sources of NO_x, CO, HC, Pb, CO₂, SPM and RPM in the city. The average age of the passenger cars is about 10 years but over one quarter of the large diesel trucks are over 30 years. As an effect these pollutants create various respiratory diseases has cropped up like Bronchial Asthma, Chronic Bronchitis, Breathing problem followed by other diseases like Eye irritation, High pressure found among the respondents in Kolkata because of high rate of exhausts from the on-road running vehicles. This paper explored the study of traffic air pollutants and its impact on urban health followed by various long term strategies to control automobile air pollution for improvement of the quality of life.

⁵London School of Hygiene & Tropical Medicine, UK

Abstract

Objective: To identify the effectiveness of the interventions relating to air quality control on health and health equality in Europe. **Method:** Systematic review. Three databases, Web of sciences, PubMed, and Trials Register of Promoting Health Interventions (TROPHI), were searched for scientific literatures investigating the effectiveness strategies on air pollution control and health quality and health equality from 1995 to 2015. **Results:** A total of 17 scientific papers are included. Four groups of strategy types, namely, general regulations, traffic related emission control interventions, energy emission control interventions and greenhouse gas emission control interventions from climate change mitigation strategy where air pollutants emission cut as a co-benefit are identified. All of the strategies gained laudable or modest air quality improvement and health quality improvement. The studies regarding the impact on health equality are very limited, 3 out of 17, and no consistent and systematic result is found that those strategies could gap the health inequality caused by air pollution. **Conclusions:** particulate matter, particularly fine particulate matter, and nitro dioxide are the main air pollution concerns in Europe recently. Health benefits were gained either as main goal or as co-benefit from all of the strategies, but no consistent impact on health equality from the strategies was found. The strategy types on air pollution in Europe and the health impact assessment methodology are also discussed in this review.

Study on Air Pollution and Mortality in Chaoyang District, Beijing

Bai Yu

China National Environmental Monitoring Centre, China

Abstract

In this paper, the association between concentration of ambient air pollutants and daily number of mortality in an urban area of Beijing was studied. Different age groups, gender groups were taken into consideration. The results showed that, for all the groups, the average daily number of mortality showed an increasing trend from June to January of next year, and a decreased trend from February to June. When the concentration of air pollutants increased, the health risk also increased. In multi-pollutants models, the pollutants had a decreasing order NO_2 , PM_{10} , SO_2 for the different gender groups when the concentration of pollutants increasing, and had a decreasing order NO_2 , PM_{10} , SO_2 for different age groups when the levels of pollutants increasing. The lag effects of air pollutants and seasonal differences were also found. The results of our study could serve to strengthen the local evidence base for air pollution-related health effects that is imminently needed for better air quality management, and also add valuable information from Beijing.

The Spatial-Temporal Distribution and Environmental Mechanism of Plagues in the Ming Dynasty

ZHANG T, GONG SS

Central China Normal University, Wuhan, 430079, P. R. China, ztccnu@qq.com

Abstract

The plague is one of the climax natural disasters which is company with the human beginning to end. Based on the historical materials of plagues, climate changes and natural disasters in the Ming Dynasty, we study on the spatial-temporal distribution of plagues and the environmental mechanism, using spatial analysis and mathematical statistics methods.

In the temporal distribution, the Chongzhen dynasty is the most serious, the spring and summer are the high incidence seasons of plagues, the general trend is on the rise, the number of plague counties adds 9.5 every ten years, and there exist two scales of the fluctuation cycles which are 100 years and 50 years. In the spatial distribution, the plagues decrease from the northeast to the southwest in the whole, there are totally 1009 counties exist plagues, the hot spots of plagues mainly locate in the three regions in the northeast, the cold spots of plagues mainly locate in the three regions in the southwest.

The environmental mechanisms of plagues can be interpreted to be the environmental elements which influence the plagues, the influence extent and the action mechanisms. There are five main natural environmental elements which influence the plagues of the Ming Dynasty, including the cold and warm changes of climate, floods, droughts, locusts and earthquakes. The influence extent of the five environmental elements can be ordered by "droughts (74.1%) > locusts (46.4%) > floods (33.1%) > earthquakes (29%) > cold and warm changes of climate (23%)" from high to low.

The Spatio-temporal Characteristics of Children's Outdoor Activities in Large Cities: A Case Study of Shanghai

Baoxin ZHAI, Wei ZHU

College Of Architecture and Urban Planning, Tongji University, Shanghai, China, 20092, 1431634@tongji.edu.cn

Abstract

With the increasing severity of children's health problems (especially obesity), children's outdoor activities are receiving more and more attentions. Especially in large cities, factors such as high population density, limited supply of the activity spaces, traffic and community safety all affect children's outdoor activities. This paper presents a case study of Shanghai to recognize the spatio-temporal characteristics of the health, outdoor activities, and their relationships of the children and adolescents between 6-18 years old. The data were collected through an internet questionnaire survey which received 403 valid responses from children's parents. Using descriptive statistics, statistical testing, spatial analysis and other methods, two aspects of analysis are conducted: First, it analyzes the statuses and spatial distributions of the self-rated health and BMI of the children, describes the intensity, frequency, periodicity of the children's outdoor activities, and tests the relationship between the children's health and outdoor activities. The results show that 23% of the children are obese, more than 74% of the children's activities do not meet the requirements of the World Health Organization, and there is a significant correlation between the children's health and vigorous activity. Second, it analyzes the spatial and temporal distributions of the children's outdoor activity, activity time and place, and tests their relationships. The results show that the children's activity times and spaces closely vary with age. Activity place and vigorous activity are also significantly related: sidewalks, street space, nearby schools are the main places where high intensity activities occur.

Trends of Air Pollution and Impacts on Human Health in Mumbai, India

Grover, A, Singh, R.B.

Department of Geography, Delhi School of Economics, University of Delhi, Delhi-110007, India,
aakriti.grover@gmail.com, rbsgeo@hotmail.com

Abstract

Air pollution is critical environmental problem worldwide. An analysis of the changing air quality of financial capital of India, Mumbai, is presented in the paper. The ambient air quality data (1990–2011) of four pollutants-Sulphur Oxide (SO₂), Nitrogen Oxide (NO₂), Suspended Particulate Matter (SPM) and Respirable Suspended Particulate Matter (RSPM) is studied for three stations: Parel, Bandra-Worli and Kalbadevi.

The annual average data for SO₂ reveals that lowest (4 µg/m³) is recorded in 2011 that were high with 61.5 µg/m³ 1990. The NO₂ decreased in Parel while increased in Kalbadevi and Bandra-Worli (1990-2011). Nearly 41 µg/m³ NO₂ concentrations were recorded in Bandra-Worli. The average from 1990 to 2011 reflects that while SO₂ and RSPM are highest for Parel; NO₂ and SPM in Kalbadevi.

The month wise trend reveals that all pollutants except SO₂ observe a dip in monsoon season. The overall trend however shows that the pollutants have decreased substantially in all the stations post 1999-2000 but again tend to increase post 2003.

Primary survey of 75 respondents was conducted using random sampling method to analyze people's perception on air quality and rise in respiratory illness.

air quality; seasonal trend; pollutants; human health; Mumbai; India

Which Indicators Are Considered Relevant for the Evaluation of the European Population's Health?

Santana A, Freitas A, Costa C, Stefanik I, Bana e Costa J

Centre of Studies on Geography and Spatial Planning (CEGOT), University of Coimbra, Portugal,

paulasantana.eurohealthy@gmail.com

Abstract

The process of selecting indicators plays a crucial role in constructing the Population Health Index (PHI), a tool designed to consider multiple aspects and simultaneously deliver an aggregate score on the population's health in different regions. The PHI will be applied to evaluate the population's health across European regions and be used to foresee and discuss the impact of policies on health equity.

This presentation reports on the approach, methods and outcomes regarding the selection of indicators and related dimensions and areas of concern considered relevant for the evaluation of the European population's health. In order to gather the views from a broad spectrum of experts and stakeholders representing transdisciplinary backgrounds and to assure the selection of a wide range of indicators from diverse health-related areas of concern, an innovatively designed Delphi process was built and a web-platform established for implementing and monitoring that process. The panel consisted of 81 participants, of which 51 were Consortium experts and 30 stakeholders. The level of consensus was assessed through the analysis of the level of agreement or disagreement on a 5-level Likert scale determined for each indicator from a list of 130 (previously identified in the literature) and by making frequency distributions of the responses. After an enchaind two-round Delphi process, a consensus was reached on the relevance of 80 indicators. The selected indicators are related with the following areas of concern in terms of the population's health: i) Economic and Social Environment; ii) Demographic Change; iii) Lifestyles and Health Behaviours; iv) Physical Environment; v) Built Environment; vi) Healthcare Services and vii) Health Outcomes. (This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 643398)

Distribution of Polycyclic aromatic hydrocarbon and Its Health Risk of Surface Dusts from Parks of Kaifeng, China

DUAN Haijing¹, CAI Xiaoqiang², RUAN Xinling¹, TONG Zhiqi¹, LI Yimeng¹, MA Jianhua^{1*}

¹Institute of Natural Resources and Environment, Henan University, Kaifeng 475000, China

²Kaifeng Environmental Monitoring Station, Kaifeng 475000, China)

Abstract

Fifty-three surface dust samples were collected from four parks (Longting Park (PL), Tieta Park (PT), Qingmingshanghe Park (PQ), Xiangguosi Park (PX)) located in Kaifeng City, China. The concentrations of sixteen priority polycyclic aromatic hydrocarbons (PAHs) in dusts were determined by GC-MS. The status, source and health risk of dust PAHs were discussed. Results showed that the Σ PAHs concentrations in the surface dust ranged from 332.20 to 7535.10 $\mu\text{g}\cdot\text{kg}^{-1}$ with the mean being 1320.10 $\mu\text{g}\cdot\text{kg}^{-1}$. Dominant PAH compounds were 4 rings and 5 rings PAHs (Such as Phe, Ant, Flu, Pyr, BaA, BbF, BaP). The Maliszewska-Kordybach from the 4 Parks indicates that Σ PAHs of dust in PX, PL and PT polluted seriously, PQ polluted moderately. The hazard health risk for children exposed to urban dust PAHs was thought to be greater than that of adults, dermal contact appeared to be the predominant exposure route. The average CR decreased in the order of $\text{PX} > \text{PT} > \text{PL} > \text{PQ}$. The average CR of Σ PAHs in the PX was higher than 10^{-6} . Source apportionment indicated that the PAHs originated mainly from burning, mainly oil burning.

Key words:

park; surface dust; PAHs; health risk; Kaifeng city

Spatial and Temporal Variations of Evapotranspiration and Its Influencing Factors in Loess Plateau in Shaanxi-Gansu-Ningxia Region

Pengtao Wang, Junping Yan

College of Tourism and Environment, Shaanxi Normal University, Xian, 710119, P. R. China, wnpengtao@126.com

Abstract

Based on MODIS-ET data, spatial-temporal variation patterns of evapotranspiration of Loess Plateau in Shaanxi-Gansu-Ningxia Region during 2000—2012 was analyzed. Meanwhile, the influencing factors of the ET's variations in Loess Plateau in Shaanxi-Gansu-Ningxia Region were analyzed by statistics observation data of the meteorological stations and calculating correlation coefficients of ET to climate elements. The results showed that:(1) The average of ET of Loess Plateau in Shaanxi-Gansu-Ningxia Region increased rapidly In 2000-2002 and peaked in 2003(378.6mm).(2)The spatial distribution pattern of annual ET was apparently various. ET increased gradually from the northwest to the southeast, and ET of Southern-most forest regions were higher than that of other parts of Loess Plateau in Shaanxi-Gansu-Ningxia Region.(3) Different land use/cover types had different contribution to the ET distribution in Shaanxi-Gansu-Ningxia Region. The highest contribution rates were made by grasslands and croplands, closely followed by closed shrublands and open shrublands, while the contribution evergreen needle leaf forest and woody savannas contributed less for ET distribution.(4) The influencing factors of ET were as the following : ET in its main part was positively correlated with forceful factor of ET change, wind speed affect the ET of the region most. The thermodynamical factor mainly negatively correlated with ET changes. The air temperature was negative correlated with ET in most areas whereas sunshine hours in less regions had negative correspondence with ET than air temperature. Besides, it can be found that moisture condition like precipitation and relative humidity all had strong positive effect on the ET.

Temporal and Spatial Distribution Characteristics of Air Quality Index in Shandong Province, China

Xu Haichao, Li Zijun, Lin Jinkuo, Li Qian, Su Ning, Dong Xiaoyan

Shandong Normal University, Jinan, 250014, P. R. China, sdxhc@139.com

Abstract

Based on the daily monitoring data of air quality index (AQI) of 17 cities in Shandong province from November 1, 2013 to October 31, 2015, and combined with geographical location and each season's climatic characteristics of every city, to analyze the spatial and temporal distribution characteristics of air pollution in Shandong province from the macroscopic angle. The results showed that the air quality has obvious regional differences in Shandong province, which the air quality is generally good in the eastern coastal areas and relatively serious in the inland cities, and the AQI are gradually increasing from the southeast to the northwest in coastal cities. The change of AQI has obvious seasonal characteristics in Shandong province, winter air pollution is most serious and summer is the lightest. Although the frequency of air pollution in the spring is higher than the autumn, the pollution degree in autumn is more serious than the spring. The air quality in the peninsula region is the best, followed by southern region, and worst in central and northwest region of Shandong province.

Key words:

air quality index (AQI); spatial distribution; seasonal characteristics; Shandong Province

The Concentrations and Sources of PAHs and PCBs in Oil Field and Estuary Soils from the Yellow River Delta, China

Cao Jianrong, Liu Yanjun, Zhang baohua, Liu Ziting

College of Environment and Planning, Liaocheng University, Liaocheng, 252059, P. R. China, caojianrong@lcu.edu.cn

Abstract

A study was conducted to assess the occurrence of organic pollutants i.e. polycyclic aromatic hydrocarbons (PAHs) and polychlorinated biphenyls (PCBs) in the soil samples of two different sub-regions (Oil Field versus Estuary) from the Yellow River Delta, China. Total concentrations of PAHs and PCBs in soil were in the range of 157.8-481.7 and 5.6-56.6 $\mu\text{g kg}^{-1}(\text{dw})$, respectively. The average concentrations of PAHs in Oil soil samples and in Estuary soil samples were 274.0 and 244.4 $\mu\text{g kg}^{-1}$, and the contribution of low molecular weight (two- and three-ring) PAHs was more larger in the Oil soil samples than that in the Estuary soil samples. Both PAHs and PCBs contaminations in Estuary Area were weaker than that in Oil Area. Using diagnostic ratios analysis, the main source of PAHs was attributed to petroleum input which caused by the fuel oil or light refined petroleum products in the Gudong Oilfield. The average concentrations of PCBs in the Oil soil samples and Estuary soil samples were 24.2 $\mu\text{g kg}^{-1}$ and 10.8 $\mu\text{g kg}^{-1}$, respectively. The low-chlorine congeners (3-4 chlorine atoms) PCBs in Oil soil samples were more abundant than that in Estuary soil samples. Congeners analysis of PCBs and the correlation index between PCBs and PAHs were employed, which showed that the emission of PCBs in YRD were influenced by both Gudong Oilfield and other industrial sources.

The Determination of Sources of Allergenic Airborne Pollen in Beijing Using Backward Trajectory Analysis

Qin Xiaoxin, Li Yiyin

College of Urban and Environmental Sciences, Peking University, Beijing, 100871, P. R. China, lyy@urban.pku.edu.cn

Abstract

Trends in airway allergic disease caused by airborne pollen have shown a substantial increase in prevalence all over the world. To understand the atmospheric dispersion of pollen in Beijing, we used Burkard 7-day spore-recording trap to monitor daily pollen concentrations in 3 different locations. We used HYSPLIT model of backward trajectory analysis to explore the relationship between air-mass movements and the peak values of pollen concentrations during the pollen season. The results of HYSPLIT model showed that peaks of pollen concentrations occurred in different time. While *Humulus* and *Artemisia* belonging to strongest allergenic taxon have accounted for more than 80 %. Comparing the curves of daily pollen concentrations, 4 peak dates were chosen in the same period, including 23rd, 24th and 28th April and 2nd September. 128 trajectories were identified from April to September in 2015, and clustered into 9 types of air-mass movements distinguished by direction and distance. The main source included north-northeast, east-northeast and slower northeast movement featured by 49 % frequency in total; the second largest group contained local north and north air-mass movements with the total frequency of 23 % ; the third group comprised west-northwest, faster northwest and north-northwest movements, which has occupied 17 %; the frequency of southwest movement was 12 %. The 48-h back trajectories of peak dates during autumn pollen season in each monitoring site indicated the sources from northeast were closely associated with the highest daily pollen concentrations in Beijing.

Key words:

Abstract

Haze pollution has become a severe environmental problem for people's daily life as well as their health in China, related research has the extremely profound significance. Based on the remote sensing data retrieval by the NASA from 1998 to 2012, takes advantage of GIS spatial statistical analysis, being the first time systematically analyzed the spatiotemporal distribution features and regularity of PM2.5 concentrations for long time series in china, further selectively exploring causes and driving factors of PM2.5 concentration change. The results show that (1) PM2.5 concentrations presents the trend of firstly rapid increase and subsequent stability from 2000 to 2011 in china and 2007 is an inflection point of the change of PM2.5 concentrations. (2) PM2.5 pollution presents the trend that the north is higher than the south, the east is higher than the western, and high concentration value concentrated distributes the four heavy pollution areas of Huanghuaihai Plain, the Yangtze river delta plain, Sichuan basin and the Taklamakan desert. (3) The main area of PM2.5 pollutions obviously showed eastward trend between 2000 and 2006. The center of gravity of high value area of pollution concentration obviously showed the eastward trend since 2007. (4) Spatial autocorrelation analysis show that PM2.5 annual average concentration emerge strong local spatial positive autocorrelation. high-value zone of PM2.5 continuously distribute North China, and low-value zone concentrations intensively distributes southeast coast and islands. (5) Geography detectors method testifies that straw burning, population density, residents of car ownership are main anthropogenic driving factors of PM2.5 concentration change.

Ministry of Education, China, Nanning, Guangxi, 530001, P. R. China, gxzhm@foxmail.com

Guangxi Key Laboratory of Earth Surface Processes and Intelligent Simulation (Guangxi Teachers Education University),

Nanning, Guangxi, 530001, P. R. China

Abstract

The marine environment is the carrier of the marine economy development. To study the relationship between them is conducive to explore the marine environment's carrying capacity and economic development potential. Based on the data of Guangxi's marine economy and environment which during 2010~2014, to analysis the development of them deeply, and based on the mathematical method of the environment kuznets curve and harmonious coefficient, to discuss the relationship between them. The results show that the marine economy in Guangxi has developed rapidly in recent five years. The growth rate of 2010~2014 was 28%, 19%, 15.9%, 18.1%, 9.1%. The proportion of GDP in Guangxi increased from 5.7% to 5.9%. The developmental pattern need further optimize its industrial structure, because it is too extensive. The marine environment is in good condition, seawater quality is up to standard and ecosystem maintains stability. The relationship between the marine environment and the economic development is overall coordination, but the rapid development of economy brings some pressure on the environment. Therefore, this paper suggests that optimizing regional development planning, promoting industrial structure adjustment, transformation and upgrading, making the marine ecological red line clearly and realizing the socialization of environmental responsibility.

Abstract

Theoretical bionics allow us to construct mathematical models of living biological systems, studying internal and external processes, multi variation relationships. This helps to predict the development of micro- and macro- level processes in living biological systems. The intensive activity of the person was accompanied by an increase the anthropogenic pressure on urbanized areas, which affects the environment and changes in global climate. The functional relationship living and inanimate nature is being changed. Comparison of mathematical models allow us to identify critical functional linkages in the system "plant-soil-environment", the borders of sensitivity of biological systems, trigger points of regulation of plant metabolism in optimal conditions and as well as growing anthropogenic pressure. We investigated the relationship of coniferous trees (the trees of genus *Pinus*), soil and environment in optimal conditions, when changing climatic conditions and toxic air parameters of the two of the Chinese cities; including Beijing and Huh-Hot. These cities are belong to the industrial centers and it considered that, they are contemned zone of air pollution. According to the statical and dynamic indicators of living nature (trees metabolism, soil) and inanimate nature (environmental conditions) are described by mathematical models as deterministic, discrete and continuous. Living biological systems have different sensitivity indicators of inanimate nature. It was established functional linkages with multi varieties relationships in the living biological systems.

mathematical modeling, natural biological systems, climate, *Pinus*, environment, anthropogenic pressure

Urbanization and its Environmental Health Hazards of Bangalore City, Karnataka - South India

Dr.D.Rajasekaran

Associate Professor of Geography, Govt. Arts College, Bangalore-560 001, India, E-mail: drdrajasekaran@gmail.com

Abstract

Bangalore is the capital of Karnataka and is the primate city of South India - one of the largest growing metropolitan regions of the world. With the Information Technology (IT) and Bio-Technology (BT) boom, Bangalore is one of the fastest growing cities in India and Asia. Bangalore serves as the global example of the potentials and problems facing mega-cities in the developing nations. Due its rapid development in urban area either in demography, migration, transportation, or industrial sector since last two decades, the Bangalore has the highest demography and the only metropolitan city of Karnataka. It has 95 lacks of population as per the 2011 census. Presently 2015 Bangalore has a population of more than One Crore.

Bangalore is among the top 10 polluted cities in the country as found by the Ministry of Environment. The prime cause for pollution is by emissions of motor vehicles. But, there is no mechanism as such to check the increasing vehicular pollution that is affecting the air quality and health of people. Earlier, commuters had to inhale a lot of petrol and diesel exhaust smoke at signals, but now because of increasing LPG-fuel vehicles, they complain of inhaling more gaseous substances, dust from paved roads and soils, building construction dust are leads hazards to health. Therefore, the study reveals to focus on the effects of the Bangalore City's air pollution especially Particulate Matter (PM10) – exceeds recommended standards levels and which lead to various environmental health hazards are analysed and some of the suggestions are dealt in it.

Water Quality Changes in Tavantolgoi-Mining Area, Mongolia

Oyun-Erdene.B, Javzan.Ch

Institute of Geography-Geoecology, Mongolian Academy of Sciences, bayar_oyun70@yahoo.com

Abstract

Tavan Tolgoi coking coal mine is located in the place Tsagaan-Ovoo bag of Tsogttsetsii of South Gobi province at 98 km in the east from Dalanzadgad at 200 km north from the border of China. Although rivers and streams provide over 60 percent of Mongolia's water resources, underground water is an important source of drinking water and other agricultural needs. Studies increasingly show a decline in the availability of water and its quality putting pressures on increasing demands for drinking water. Gobi region is characterized by very limited precipitation and high evaporation rate under influences of air temperature and wind and the process of salinization in the soil. Tavan tolgoi mine water with coal was formed in the Permian age originated from Tyerrigiyeni is defined as very hard water with high content of minerals. Latest studies showed that micro elements in this content and in vaporizing have been rapidly increasing. Chemical composition of shallow wells had increased sulfate ions change in the composition of sulfate and chloride class, sodium group. Nutrient pollution indicators of nitrogenous compounds were relatively high and exceeded some of the heavy metal / Se, Sr / standard. Related to the heavy metals concentration, the 59 percent of the sampled drinking waters were over contaminated in 2013 and then the amount of the unfitted water was increased to the 75 percent in 2015.

A Geographic Analysis on Indigenous Medicinal Practices in Tribal Communities a Study of Chamarajanagara in Karnataka

Dr.Chikkarangaswamy

Faculty, Institute of development studies, university of Mysore, India, dr.crswamyids@gmail.com

Abstract

The Poverty in India is one of the Major issues for the comprehensive development in India. Under the public welfare aspect, the primary agenda in front of the state is on tribal health service to its people in Chamarajanagara District. Tribal community is one of the most very backward in the state. The living condition of tribal people is in very bad. The medicinal practices of tribal people still have not decided to put to use in the main practice of medication as in English medicine practice. In Pre modern period the tribal settlements were completely from the main society. The major tribal group who dwell in forest also has no proper infrastructure in terms of housing, portable water, transportation and communication. In this condition people of this region are living in a miserable condition. The tribal people collect honey, gum traditional medicinal plants and use the technique of using medicinal practices of tribe which is vanishing in the present days is one of the significant aspect to be considered to protect them. Hence a systematic geographic analysis in indecencies Medical practice in tribal communities in Chamarajanagar in Karnataka is required.

A Healthy City Oriented Accessibility Assessment in Singapore: A Perspective from Big Data

Kai CAO

Department of Geography, National University of Singapore, Singapore 117570, geock@nus.edu.sg

Abstract

As stated by WHO, a Healthy City aims to 1) create a health-supportive environment, 2) to achieve a good quality of life, 3) to provide basic sanitation & hygiene needs, 4) to supply access to health care. Apparently, the accessibility to the health care services plays an important role in the concept of a Healthy City. In addition, the access to green space, recreational facilities, physical activities resource, retail centers, public transit stops, walkability etc. have also been proved important to healthy cities. However, most of these analysis are quite qualitative and not systematic enough. In this study, with the support of GIS technology and the transport big data (mass transport card data), we have compared some representative communities in Singapore quantitatively in terms of the accessibility to health care centers (general hospitals, polyclinics etc.), accessibility to green space (parks), accessibility to retail center and walkability. We believe all of these different categories of accessibilities would affect the health of the residents from different communities differently, more in-depth analysis will be carried out in the coming months, and we believe more impressive findings will show up from a spatial and quantitative perspective. This research would also be supportive to other studies pertaining to Healthy Cities.

Abstract

Selenium (Se) is an essential trace element in human life, and insufficient intake of selenium may lead to related diseases like Kashin-Beck Disease (KBD). The major source of Se is through diet. Although KBD is presently controlled in most regions of China, it is still active in the Tibetan Plateau. So in this paper, according the main food dietary intake and the content of Se in samples, we assessed the dietary Se intake of local residents by Monte Carlo method. The results were as follows. The average daily selenium intake of surveyed residents in KBD areas was 12.33 μ g/d, and the pastoral areas was higher Se intake than the other two (the farming areas and the farming pastoral areas). The Se intake of people was decreased with age. In addition, female dietary Se intake (12.59 μ g/d) was higher than the male (11.52 μ g/d). On the whole, over 61% of them are higher than previous selenium intake in KBD prevalence areas (11 μ g/d). But most of residents' dietary selenium intake is still difficult to meet the selenium minimum physiological needs (20 μ g/d). Low-selenium environment continues to be a constraint on the dietary selenium intake of residents in KBD areas. (We gratefully acknowledge funding from the National 12th Five-Year Plan scientific and technological issues (No. 2013BAC04B03), and the National Natural Science Foundation of China (No. 41171081).)

Challenges of the Romanian Health Care System : Avoidable Hospitalizations and Population Accessibility to Quality Medical Services

Liliana DUMITRACHE, Mariana NAE, Gabriel SIMION

University of Bucharest, Bucharest, 10041, Romania, dosaredumitrache@yahoo.com

Abstract

Despite some structural reforms of the Romanian health system, reorganization of hospital sector and reduction of avoidable hospitalizations as well as the disparities in access of the population to health services still remain key issues

Although, through health care reform, it was attempted to correct certain deficiencies, giving more weight to primary health care, organizational malfunctions, lack of GP's in rural areas and weak delivery of primary care services lead to an increased rate of hospital-use, where population access hospitals for simple diagnosis or routine investigations. This explains why almost 25% of the population is hospitalized yearly and also the increased expenditures on hospitals (50% of total health expenditure).

Territorial distribution of hospitals in Romania is consistent with those of the large cities, however, less than 50 hospitals units (from a total of 467) recorded over 80 % of discharges, peoples addressing most to emergency or university hospitals, located in several largest cities, to receive quality care. Many municipal hospitals are poorly equipped, being unable to provide complex medical services so patients are directed towards major hospitals.

The phenomenon increases the healthcare costs and reduces population addressability to health services due to barriers related to mobility (distance, transportation) or affordability (higher individual costs) Also, it contributes to overcrowding hospitals, to overworked physicians and to the depreciation of services delivered within hospitals. Using statistical analysis and GIS, this paper highlights the limits of geographical accessibility of the population to hospital units, as well as the particularities of avoidable hospitalizations in Romania.

Health Care; Hospitals; Avoidable Hospitalization; Accessibility; Disparities; Romania

Climatic, Geopolitical and Commercial Aspects of Paranasal Sinus Tumors in the Tropics

Késmárszky R

BMGE, Budapest, Hungary, kesmarszky@yahoo.fr

Abstract

Migration, climatic changes and commercial activity may help to diffuse pathogens, vectors, some cultural habits, not to forget about those humans who are genetically prone to acquire some diseases. In the tropical areas all these factors can be present leading to challenging diagnostic and therapeutic situations in the head and neck surgical activities. Besides, even without visiting the tropical areas, the “exotic” dangers are omnipresent, tropical plants are commercialised in many countries, even when toxic effects are known.

The author focuses the presentation about the paranasal sinus tumors in migrants arriving to the tropics, analysing their incidence, diagnostic difficulties and criteria. Though being a rare entity, T-cell lymphomas must be considered especially in patients of Asian origin. disfiguring may imitate facial palsy. Due to rapid progression, diagnostic delay is not allowed to be able to introduce an oncological treatment. Besides the genetic and viral theories the above mentioned factors are analysed as well.

Key words:

head & neck; migration; climatic changes; tropics; facial nerve; plant; tumor

Continuum of Care for Maternal Health in Assam- A Relatively Backward State of India

Sk Rayhan, Banerjee Anuradha

Ph.D. Scholar, Jawaharlal Nehru University, New Delhi, India. rayahangog@gmail.com

Abstract

Assam, a state of India recorded the highest Maternal Mortality Ratio of 328 (SRS 2010-1012). Proper implementation of maternal health care services and ensuring universal utilisation could be the standout interventions to prevent maternal morbidity and mortality. Therefore, there is need to understand the levels, continuum of care and gap for the utilisation of maternal health care. Data from the District Level Health Survey (2007-08), covering 9,980 ever-married women aged 15-49 are used for this study. Three separate logistic regression models with predicted probabilities are employed to identify the factors of continuum care of maternal health. Of the sample women, 74.3% received antenatal check-ups (ANC), but only 37% continued and received skill birth attendance (SBA) and finally 26.7% completed the continuum care of maternal health through postnatal care (PNC). There are significant regional variations in receiving ANC and SBA combinedly in Assam. Maternal age, birth order, education, religion, caste, wealth status, exposure to mass media and regional divisions are associated with the receiving of ANC; consistently these factors are also significantly associated with the continuation from having ANC to receiving SBA. Further, having full ANC and urban residence are significantly associated with SBA. Only a few variables e.g. higher maternal age, muslim women, rich, having full ANC, delivery in private hospitals and urban residence are significantly associated with the continuation from having SBA to receiving PNC. From the above findings, it could be recommended that the health delivery system needs to evolve ways to ensure continuity in maternal health care

Continuum of Care for Maternal Health

Experiences of Community Elder Care by Older People Residing at Home in Beijing, China

Jie Yu, Mark W. Rosenberg

Queen's University, Kingston, Canada, yujie129@gmail.com

Abstract

This paper analyzes older people's experiences of different types of care, caring relationships and how these experiences produce and reproduce caring spaces. Care as discussed here includes physical, emotional and financial supports provided by community that assist older people's everyday living. By using qualitative data of 47 interviews with older people, the following research questions are answered. What are older people's perceptions and experiences of different types of service and care? What are the spatial implications? Community services at this stage are under development and access to community services is unequal. For services that were in place, older people found certain problems existed and improvements were needed for future community service development. They tended to compare current experiences to pre-reform experiences. Despite the positive or negative experiences with communities and community care, older people believed that community care is a feasible and effective solution to help them age in place. They hoped that communities would offer more elder care in the future.

Key words:

Aging; care; community; caring space

Geographical Distribution of the Serum Creatinine Reference Values of Healthy

Adults

WEI Dezhi, GE Miao, LIN QianYi, LI MengJiao, LI Peng

Institute of Health Geography, College of Tourism and Environment, Shaanxi Normal University, Xi'an 710062, China, weidezhi@snnu.edu.cn

Abstract

To reveal the relationship between the Serum creatinine reference values of healthy adults and geographic factors, and to provide the scientific foundations for establishing a unified Scr reference value standard. Collecting 29697 Scr reference values of healthy adults measured by 347 medical facilities from 23 provinces, 4 municipalities and 5 autonomous regions. We chose 11 geographical factors, used them and Scr reference values to do the correlation analysis and worked out what factors correlated significantly with Scr reference values. According to the Principal component analysis and Ridge regression analysis, we constructed two models and finally chose the optimal model by comparing each model's fitting degree of predicted results and measured results. At last, we built the distribution map of Scr reference values through Kriging interpolation method. There are 7 geographic factors correlate significantly with Scr reference values, the overall trend is that the Scr values in the south is high, low in the north. If we get the geographic factors data of a certain region, we will be able to predict the Scr values of this region. Putting the geographical factors into medical analysis will benefit the further researches concerning the regional difference of medical reference values.

Serum creatinine; Geographical factors; Principal component analysis; Ridge regression analysis

Health Care Facilities and Health Problems of Workers of Hajua Tea Estate in Assam

Borgohain, P.

Dept. of Geography, Cotton College, Panbazar, Guwahati – 781 001, India

parijat_borgohain@rediffmail.com

Abstract

Tea garden workers of Assam are poor and ignorant due to illiteracy and often live in over- crowded and unhygienic living conditions. Health care including availability of doctors, nurses and other medical facilities in close proximity aids in safeguarding the health of the tea garden workers. The present study examines the health care facilities available at Hajua Tea Estate in Sibsagar District of Assam, India, the vulnerability of the tea garden workers to various health problems and the effects of the health problems upon their occupational and social lives. The study also suggests remedies for mitigating the health problems of the tea workers. The study is based on primary survey conducted with the help of a schedule prepared for the purpose. Queries relevant to the theme under study has been included like income, housing, education, medical facilities, health awareness sources, etc. Both male and female workers of Hajua Tea Estate have been surveyed by Random Sampling Method. Secondary information on the subject has been collected from various sources such as books, journals and the Internet. The data collected has been analysed and appropriate statistical methods and techniques used for interpreting the findings of the study. The results illustrate that many workers suffer from some common health problems due to the nature of their work and poor socio-economic facilities.

³ School of Geography, University of Leeds, Leeds, LS2 9JT, UK

⁴ Institute of Geographic Sciences and Natural Resources Research, The Chinese Academy of Sciences, Beijing, 100101, P.R. China

Abstract

Environmental pollution is a major problem in China, where people are subject to significant health risks. However, surprisingly little is known about how these health risks are distributed socially or spatially, particularly at the urban scale. Such information is needed to better understand health inequalities, and to develop more effective and just, environmental and public health policy. Drawing upon a large-scale survey conducted in Beijing in 2013, this study investigates associations between environmental hazards as perceived by residents, their self-rated health and geographical context. A spatial multilevel logistic model is developed to account for spatial dependence in unobserved contextual influences on health outcomes. Results reveal statistically significant and robust associations between perceived exposure to environmental hazards (traffic related air pollution, noise, and landfills), and self-rated health, using five point Likert scales. Each unit decrease in perceived exposure to traffic related air pollution, noise and landfills is associated with an increase of 15.2%, 17.5% and 9.3% respectively, in the odds of reporting good health, *ceteris paribus*. Furthermore, geographical context is also found an important role in shaping the distribution of self-rated health, controlling for the compositional effects.

Health Literacy in Tribal, Rural Population: A Geographical Analysis

Bhole Dilip G

ASPM's Womens College of Arts, Commerce and Computer Application, Dongar Kathore, Tal. Yawal, Dist. Jalgaon, Maharashtra, India, dgbhole@gmail.com

Abstract

In this age health care is one of the important aspects of human life. World wide mission has been started by World Health Organization (WHO), Government, Semi government and private organization to develop health consciousness in the population. In this study investigator has studied health literacy in tribal and rural areas in Jalgaon district in Maharashtra state in India. The health literacy were studied in to two phases i.e. consciousness about need of nutrition for health, health care. Research work is based on primary and secondary data. Micro level study analyses by statistical methods.

Key words:

Tribal; Rural; Health Literacy; Micro level

Impact of Changing Water Supply and Sanitation System on the Quality of Life of Rural Women: A Study of Purba and Paschim Medinipur Districts in West Bengal, India

Roychowdhury, P.

Assistant Professor, Department of Geography, Krishnagar Government College, Krishnagar-741101, Nadia District, West Bengal, India, parorc@gmail.com

Abstract

Provision of safe drinking water and sanitation, the two crucial components of preventive health care has gained national attention in rural India during the last two decades. Handpumps, tubewells and standposts have been installed and sanitation programme have been intensified in rural India to improve the quality of life of rural folk particularly women. These initiatives have resulted from two arguments; first women are more burdened with domestic water collection and second they have to compromise more with their dignity if household latrine is not available. Given this backdrop, the present paper argues that improved water supply and sanitation system is not always conducive for positive change in the quality of life of rural women.

Studying six villages served by handpumps and standposts as water sources and household latrine located in Purba and Paschim Medinipur districts of West Bengal, India, this paper attempts to evaluate the impact of changing rural water supply and sanitation system on rural women. Observation from these villages reveals that any shift from unsafe (surface water) to safe source (ground water) for domestic water supply partially benefits the rural women. Such shift along with the increased demand of water for improved sanitation system hardly reduces the water collection burden on rural women, particularly in the areas with abandoned surface water. Geographical and socio-economic distances from the safe water source are the key determinants for varying impact of water supply and sanitation on the quality of life of rural women.

health care; quality of life; rural water supply; sanitation system

Intergenerational Differences in Social Support for Community-Living Older People in Beijing, China

Cheng, Y., Xi, J. Rosenberg, M.W.

School of Geography, Beijing Normal University, Beijing, 100875, P. R. China, chengyang@bnu.edu.cn,

Abstract

The combination of the rapid process of social-economic development, urbanization and population aging brings many challenges for care providers and quality of life of community-living older people in Beijing. This research aims to understand the intergenerational differences of social support for older people and the impacts of the community environment on social support in the socio-cultural context of Beijing. To answer the research questions, we collected 30 semi-structured in-depth interviews from older people aged 60 and over in three types of communities in Beijing. The results show that older people aged 60 to 74 received more formal social support and less informal social support compared to their parents' generation. The formal social support they received was not much different but they received less informal social support compared to the older people aged 75 and over living in the same communities. They expected to receive more formal social support when they become the older old as the informal social support from their children was less due to the one child policy. The physical and socio-cultural environment varied among the three types of community and factors such as the age, health status, daily activities and care providers affected older people's perceptions of the living environment of their communities. Both the differences in the community environment and the older people's perceptions have impacts on the social support that they received. The findings help us understand how socio-economic development and urbanization processes affect the daily life and social support of community-living older people from different age groups and also provides knowledge for improving the quality of life and healthy living environment for older people in Beijing.

Key words:

“I’ll Avoid Where the Big Guys Hang Out”: Gender, Exercise Practices, and Mobilities in Gym Environments

Coen, S. E.

Department of Geography and Planning, Queen’s University, Kingston, Ontario, Canada, stephanie.coen@queensu.ca

Abstract

Physical inactivity is one of the most pressing public health challenges of our time, but comparatively little attention has been given to the gendered nature of this health behaviour. Around the world, men and boys are more active than women and girls. When men and women participate in leisure time physical activity, types of activity often differ by gender. What role might an everyday exercise environment, specifically the gym, play in these gendered inequities and differences in physical activity? Geographical research on physical activity has largely focused on obesogenic neighbourhood environments, and not extended to specific sites and facilities where individuals take up physical activities. Drawing from my wider study on men’s and women’s experiences in gym environments, in this paper I report on how gender influences women’s and men’s exercise practices and mobilities in gyms. Methods comprised semi-structured interviews coupled with a drawing activity with 52 men and women aged 25-64 in Kingston, Ontario, Canada. Data were analyzed using thematic coding. Results indicate several themes, including: (im)mobilities and the masculinization of space; gender policing of exercise practices; and agency in navigating gendered gym terrain. Overall, I argue that the socially and spatially embedded gender hierarchies of gym environments help to set the stage for the normalization of gender differences in exercise participation in the gym, and possibly beyond. Thus, while gyms are potentially sites for health promotion, they are also places where gendered inequities in health opportunities emerge. Public health initiatives should work towards depolarizing masculinities and femininities in gyms.

Canada; gender; gyms; health; physical activity

Le système de santé roumain et sa réforme: représentations réelles-virtuelles et interactions dans le cyberspace

Mariana Nae, Liliana Dumitrache

University of Bucharest, Faculty of Geography, Department of Human and Economic Geography, Bucharest, 010041, Romania, mariana.nae@geo.unibuc.ro

Abstract

Face aux dysfonctionnements structurels et institutionnels, le processus de réforme du système de santé roumain s'est avéré difficile, engendrant une nouvelle réalité sociale. Même si les dysfonctionnements du système de santé roumain se sont bien forgés sous une forme ou une autre dans le domaine social, un véritable « champ de force » (Bourdieu, 2012 : 258), dans l'espace virtuel, leurs représentations tiennent plutôt du contexte interprétatif et de l'habitus linguistique. L'objectif de cette présentation est de mieux appréhender les représentations des bénéficiaires du système de santé roumain. Sur la base d'un corpus documentaire formé de 250 articles et de la sélection ultérieure de 150 discours, cet article propose une analyse sémiotique des principaux défis de la réforme du système de santé roumain.

système de santé roumain ; réforme de la santé ; sémiotique ; représentations ; cyberspace .

Migrants Access to Health Care Services: A Review of the Policy Framework at European, Country and Local Level

Ledoux C, Pilot E¹, Krafft T

Maastricht University, Faculty of Health, Medicine and Life Sciences, CAPHRI School for Public Health and Primary Care, Department of Health Ethics and Society, Maastricht, Netherlands, c.ledoux@maastrichtuniversity.nl

Abstract

Objectives: This study aims at identifying the policy framework for non-European migrant's access to healthcare at European (EU), member country, and regional/local (sub-national) level and at performing a descriptive and comparative analysis of the interventions. **Methods:** A literature review was performed for the European level, a content analysis of official policy documents was undertaken for the country level, the selected countries being Ireland, Spain and Portugal, and qualitative interviews for the local level, represented by the city of Lisbon, Portugal. **Results:** At European level, no comprehensive policy fitting the definition was found but relevant policy instruments recommending more inclusive healthcare policies were found. At country level, the main objective is the improvement of the health status of the immigrant population based on equity and equality principles. The main strategies are the adaptation of services through actions targeting patients and providers, such as the implementation of cultural mediators and trainings for health professionals. While policies on the regional/local level were found to be theoretically fairly adapted to the migrant's needs, implementation was lacking. **Discussion:**

Recent policies seem to go in the right direction of improving access to healthcare services for immigrants, still the interventions require some further reflections. Also while the evaluation is positive for some member countries, this is not the case for the entire EU. Inclusive policies are indeed under threat due to the economic and social crisis and due to the respective nationalistic views on integration. The European Union is challenged to take a more proactive leadership and ensure that countries effectively implement inclusive actions to improve migrant's access to health services.

Key words:

Migration; European Union; inclusive healthcare policy; access to health services

Multiple Deprivation and Urban Health Inequality in Ilorin, Nigeria

Raheem U.A (PhD)

Department of Geography and Environmental Management, University of Ilorin, Ilorin-Nigeria,
adebimpeusman@gmail.com

Abstract

Lack of access to essential social and environmental services are important dimensions of deprivation. In Nigeria, the impact of these deprivations on health status has not been sufficiently researched. This study examined the influence of inadequacies in social and environmental services on the differences in health status among residents of Ilorin, Nigeria. Data were obtained through a household survey of the twenty wards across Ilorin. A systematic sampling method was used to select one out of every ten houses in randomly selected streets in each ward while one household was selected through a simple random method in each building. In all, 800 household heads were sampled. The indicators of deprivation in social and environmental services were selected in five domains made up of 18 indicators. The indicators used include household access to safe drinking water, safe faecal disposal, presence of septic facility in households, and geographic access to health and education facilities. Health status was measured using hospital admission ratio, disability days and prevalence of childhood diarrhea among sampled households. Benchmarks were established for each of the indicators using the national averages obtained from secondary sources. The proportion of deprived household was calculated in each ward and a composite Index of Multiple Deprivation (IMD) was obtained by aggregating scores for each domain. A multiple regression analysis was used to determine the relationship between indicators of social and environmental services and household health status. Study finds a positive relationship between deprivation in social and environmental services and admission ratio in households ($r = 0.44$) ($p < 0.05$) as well as disability days lost to illness ($r = 0.27$) ($p < 0.05$). Differences in geographic access to health facilities accounted for 50.9% ($p < 0.05$) of the variation in the use of substandard health care options. Multiple deprivation was concentrated in the inner parts of Ilorin city compared to wards in the suburbia where housing and neighbourhood qualities were better. Public health policies must consider housing characteristics within the city, classify areas according to needs, and determine areas that require positive discrimination in social and environmental services.

Key words :

Multiple deprivation; inequality; Urban Health; Nigeria

Neighbourhood Crime and Children's Cognitive Development - Evidence from the UK Millennium Cohort Study

Feng Z, Dibben C

The Longitudinal Studies Centre- Scotland, School of Geosciences, University of Edinburgh, Drummond Street, Edinburgh, EH7 9XP, zhiqiang.feng@ed.ac.uk

Abstract

This paper investigates the association between neighbourhood level of crime and children's cognitive test scores using the data from the UK Millennium Cohort Study (MCS). The MCS follows around 19000 babies born in 2000-01 over years. Information is collected in face-to-face interviews on a large amount of information about the child, their family, parenting activities and cognitive assessment. We link the crime rate data derived from the Index of Multiple Deprivation (IMD) in England at the super output area level to the residential location of MCS cohort members. The cognitive ability is measured using the British Ability Scales Pattern Construction test, in which children of age 7 constructed a design by putting together flat squares or solid cubes with black and yellow patterns on each side. We use the regression analysis to examine whether neighbourhood level crime rate is related to children's standardised pattern construction test scores. We control a number of variables including birth weight, family income, parenting activities, parents' education. We find that neighbourhood crime rate is associated with reduced cognitive performance measured by pattern construction test scores. In addition we find that children who spent their childhood persistently in a high crime neighbourhood showed the lowest level of cognitive ability, which is indicative of a cumulative effect of neighbourhood crime.

neighbourhood crime; cognitive ability; UK

Out of Pocket Expenditure in Healthcare and Health Equity in India

Yadav, SONALI

Jawaharlal Nehru University, New Delhi, India 110067, sonali.alld@gmail.com

Abstract

Health represents physical and mental well-being of any individual not merely freedom from diseases. Basic healthcare is not only fundamental right of a person but, it is one of the most vital needs by virtue of being human. India has achieved much after independence and enjoyed accelerated economic growth in last two decades but it is also disheartening to know that it has performed hopeless in terms of human development indicators of health. Till date India has high child mortality and maternal mortality rate, which is higher than most of the south Asian countries with similar of a lesser level of economic growth. The nexus of caste, class and gender has made it impossible to achieve universal healthcare to all and health equity is nothing but a myth in “Asian Pharmacy”. India is on the crossroads of healthcare where it accounts for double burden of diseases where many preventable diseases are growing unchecked and chronic illness conditions are more less became permanent. Despite of achieve a lot, and progress of Indian healthcare system, it is not sufficient in delivering services to those who needs it the most and it is challenging to cope up with long persisting inequalities of caste, class and gender. In this pretext, paper aims to analyze the role of public financing and increase privatization of healthcare in India where, a fatal combination of two is responsible for out of pocket expenditure of private household becoming a major cause of poverty and impoverishment.

Key words:

Social indicator; catastrophic payments; out of pocket expenditure; health equity.

Out of Pocket Health Care Expenditure and Accessibility across Geographical Regions in India: A Poverty Nexus, 2004-2014

Pushpendra Singh

Research Scholar, Indian Institute of Technology Roorkee, India, pushpendra_singh@live.com

Abstract

India is a multi-cultural, multi-ethnic and having multi-geographical diversity. While struggling with the unfinished agenda of its communicable diseases, increasing the burden of Communicable and Non-Communicable Diseases are imposing unavoidable costs on Indian, a population that exacerbate poverty and dragged many poor further down by heavy medical expenses in different states, due to accessibility and environmental changes. The present study aims to estimate the extent of the health care expenditure of the individuals who has hospitalized due to various diseases in the different geographical area. Also, the study tries to highlight the burden of the health care expenditure on impoverishment level in India. The unit level data from the 62nd (2004) and 71st round (2014) of the National Sample Survey (NSS) is used in the analyses. The burden of medical expenditure and accessibility on a different level of households in India and Bivariate and multivariate logistic regression analyses were used in analysis. GIS mapping for accessibility of healthcare in the different area. The result reveals that the cost of hospitalization due to noncommunicable diseases is three times higher than the communicable diseases in India. The present study sought to highlight the health care expenditure and its effect on the poverty among the hospitalized across geographical area of India.

Relationship between Deprivation and Accessibility to Health Care Services in Botosani County-Romania

Ursulica Teodora Estera

“Simion Mehedinți” Doctoral School, University of Bucharest, Nicolae Balcescu Avenue, no.1, zip code: 010041, Bucharest, doraursulica@gmail.com

Abstract

The inequalities in distribution of health resources in Romania and particularly in Botosani County, show a different accessibility to health services, depending on the living environment, but also on some financial, educational and social aspects.

Geographic distribution of health care units, social and development status, represent barriers that limit access of certain population groups to health services, especially in rural areas.

This paper focuses on the analysis and interpretation of the population's accessibility to health services in Botosani county, situated in an underdeveloped region, in the period 2000-2013, in order to highlight a relationship between deprivation and accessibility to health care services.

The methodology is based on the analysis and interpretation of secondary data from NIS and from health surveys achieved in three administrative units from both areas of life. These were analyzed, processed and converted into relevant indices (the deprivation index and health care services index) to highlight spatial inequalities in accessibility to health care services.

Using statistical and spatial analysis, this paper highlights the inequalities that arise in providing health care services at territorial level, emphasizing concentration of health resources in urban areas and severe shortage in rural areas.

The high degree of deprivation from Botosani county determine urgent health care needs, which exceed the offer of health care services.

The low degree of coverage by medical staff and medical units overlaps with deprived areas, characterized by high levels of unemployment, low levels of education and poor housing, contributing to the overall expansion of deprivation areas, with precarious population's health status and reduced quality of life.

Key words:

health care services; deprivation; accessibility; inequalities; Botosani county.

Research on Health Inequalities of Older People in China

Mengqi Yang, Mark W. Rosenberg

Department of Geography, Queen's University, Kingston, ON K7L 3N6, Canada, 12my21@queensu.ca

Abstract

Previous studies have shown that inequalities in health status among older people in China remain significant. Inequalities can be attributed to both socioeconomic and other health-related indicators (i.e., the environment, health service resources, etc.). This study, therefore, analyses the associated patterns and magnitude of health inequalities, specifically in terms of the relationship between older people's health and health-related indicators at a micro geographic scale. Data are extracted from the Chinese Longitudinal Healthy Longevity Survey (CLHLS). Considering its wide participation, CLHLS is recognized as an accurate source of health information on older people in China. Employing logistic regression, analysis results address the fact that a range of factors affect individual health. This study demonstrates that measures are needed to improve the Chinese health care system to promote equality and efficiency.

Simulation Study of Prevention and Control Measures for Dengue Outbreak in Guangzhou in 2006

Lingcai Kong, Jinfeng Wang

LREIS, Institute of Geographic Sciences and Natural Resources Research, Chinese Academy of Sciences, Beijing 100101, P. R. China, konglc@lreis.ac.cn

Abstract

Dengue fever is one of the most important vector-borne diseases around the world, modelling of the transmission dynamics of it allows to understand the transmission mechanism, to determine the key influential factors, and to evaluate the impact of intervention measures. However, traditional models usually assume that the human hosts and vectors are well-mixed, which is not in line with reality.

Here, we first develop a compartment model including human and adult mosquitoes, using negative binomial distribution transmission functions, both from vector to hosts and from hosts to vector, to model the heterogeneity of mosquitoes' bites on human beings during dengue virus transmission. By numerical simulations, we explored the impact of heterogeneity on the transmission dynamics. It is shown that the heterogeneous bites can slow down the transmission speed on the population level in comparison with homogeneous models' output. Then, we extend the model to incorporate the immature aquatic mosquitoes, and the impact of climate on the growth and development of mosquitoes and on the transmission of dengue viruses. Finally, we use the extended model to evaluate the effectiveness of intervention measures during the dengue outbreak in Guangzhou in 2006. We also simulate the dengue transmission dynamics in different scenarios, which help us to make strategies in controlling dengue.

This study contribute to a better understanding of the transmission dynamics of dengue virus in that the real dengue outbreak is further different from the output of homogeneous-mixing models.

Key words:

Dengue fever; transmission model; heterogeneous mixing; intervention measures; scenario simulation

Spatial Analysis on Occupational Health of Unorganized Sector Workers in Ambedkarnagar District, India

Dr. Anjum Mahvish, Prof. Khan Nizamuddin

Department of Geography, Aligarh Muslim University, Aligarh, 202002, India, mahvishanjum@gmail.com

Abstract

Health refers as a state of complete physical, mental and social well-being. Health and socio-economic status are interrelated. In developing countries, like India great efforts are directed towards the advancement of cottage industries as these are considered the engine for their economic growth. It is an unorganised sector, mostly run by private establishment. It provides employment for both men and women, mainly those from the lower socio-economic status. People working in unorganised sector are exploited in term of working hours, low and irregular income, unsatisfactory work conditions, no legal protection and exposed to occupational health hazards. Despite growing prosperity and spectacular technological advances, the task of ensuring health and well-being for the world is becoming more difficult and expressive and complicated then even before. The present paper is an attempt to analyse the regional variation in health conditions of workers and its relation with socio-economic status. The entire work is based upon primary sources of data which have collected through field survey. Stratified random sampling has used for selection of data. Total 257 workers have surveyed. For analysis of data Z-score, composite Z-score, percentage, correlation technique is used. The result of present study indicates that socio-economic status and cottage industrial growth has significant impact on health status of workers. Present study would help to solve the problems of workers regarding health status as well as socio-economic conditions in cottage industry sector by adopting suitable policies and strategies.

Key words:

Occupational Health; cottage industry; socio-economic status; workers; well being.

The Influence of Psychological Factors on the Morbidity between the South and the North of Philippines

Chi Zhang^{1,2,3}, Yongjun Luo^{1,3}

¹ Department of Military Medical Geography; College of High Altitude Military Medicine, Third Military Medical University, Chongqing 400038, PR China;

² Battalion 14 of Cadet Brigade; Third Military Medical University, Chongqing 400038, PR China;

³ Key Laboratory of High Altitude Medicine (Ministry of Education); Third Military Medical University, Chongqing. 400038, P.R. China. luoyongjun2011@gmail.com;

Abstract

As a member of Association of Southeast Nation, Philippines locates in the western pacific and enjoys the monsoonal tropical rainforest climate, the high-temperature wet throughout the year. Various study has illustrated that there exists difference of morbidity for many kinds of disease between the south and the north of the country, that may caused by the natural environment or the social and humanistic environment. As we know, the bad weather all the year round may leads to some psychological factors, such as depression. After integrating the factors above, we consider that the psychological factors may play a even more important role in the difference. So it's necessary to discuss the influence of psychological factors on the formation and development of high-risk disease. This paper tends to analyze these problems to provide some reference information for the treatment of these diseases.

Key words:

Philippines; psychological factors

The Limitations of Place Effects: Results of a Mixed Methods Study of Health and Place in Small Town New Zealand

Sarah A. Lovell¹, Andrew Gray²

¹School of Health Sciences, University of Canterbury

²Department of Preventive & Social Medicine, University of Otago

Abstract

Research into 'place effects,' has found that neighbourhoods exert only a modest influence on our beliefs, behaviours and health outcomes that cannot be explained by the demographic composition of the places we live. We draw on a case study examining place effects in small town New Zealand to interrogate Pearce's (2013) assertion that such conceptualisations of place may not adequately capture the assemblage of macro-level social, economic and political processes that determine the outcomes of individuals within a community. One year on from the partial-closure of its meat processing facility in our study town, survey results indicated declines in community capacity relative to three control communities and differences in health status that were more sensitive to the context than the composition of these places. These results are juxtaposed with life-story interviews with six participants affected by the rationalization and decline of this primary industry. Participant narratives describe the implications of globalization on local industry and the composition of place as Main Street shops closed, workers left, and participants lost touch with their neighbours. Triangulating the two data sets, we conclude that methods distinguishing between the composition and context of a community to measure place effects do not adequately capture the extent to which 'compositional' factors such as the resident population and their income levels are determined by local experiences of social and economic change.

Key words:

Place effects; Health; Globalization

Three Modes of Power Operation: Understanding Doctor-Patient Conflicts in China's Hospitals

Zhou P, Grady S

Department of Geography, Michigan State University, 671 Auditorium Road, East Lansing, MI 48824, USA,

zhoupeil@msu.edu

Abstract

Doctor-patient conflicts have been escalating in China over the last twenty years. Since 2002, doctor-patient conflicts in China have increased at a rate of 22.9 incidents per 1,000 population annually. Previous health care intervention research provides limited techniques that doctors can use to build trust with their patients. This paper examines the growing problem of doctor-patient conflicts in contemporary China from a health geographic perspective. In particular, this paper considers the ways in which hospitals, as a type of therapeutic landscape, can have a significant impact on health care provision and doctor-patient conflicts. First, a proposed framework that combines three modes of power-relations and therapeutic landscapes is provided to study doctor-patient conflicts. Second, the paper draws on a case study in a small Chinese city to explore how the spatial and temporal arrangements of space, different modes of discourses, and the internal design within hospitals can build upon, maintain, or ruin a harmonious doctor-patient relationship. The paper concludes that an adaptation of the current hospital internal design can help doctors proceed with therapies smoothly and with fewer conflicts.

Key words:

Doctor-patient conflicts; Therapeutic landscapes; Power-relations; China

Toward A Framework for Classifying the Extensions of the Two-Step Floating Catchment Area (2SFCA) Method: A Critical Review

Zhuolin Tao^{1,2}, Yang Cheng³

¹College of Urban and Environmental Sciences, Peking University, Beijing 100871, China, taozhuolin@pku.edu.cn

²School of Urban Planning and Design, Peking University, Shenzhen 518055, Guangdong, China;

³School of Geography, Beijing Normal University, Beijing 100875, China

Abstract

The two-step floating catchment area (2SFCA) method is an important method in the research on spatial accessibility to public service (especially healthcare) facilities, which has been widely applied. Moreover, various extensions of 2SFCA have been developed. However, there is a lack of an effective framework to explicitly classify various extensions of 2SFCA.

Thus, this study aims to propose a framework for classifying 2SFCA extensions, thus to systematically summarize the major extensions of the 2SFCA method. Based on a summarization of existing literature trying to modify 2SFCA, the proposed framework decomposes the 2SFCA method into four components, i.e. (1)the distance-decay function, (2)the catchment area, (3)the competition between demands or supplies, and (4)the travel modes. All the improvements made by different extensions found in literature can be classified into the four components.

The first category focuses on the distance-decay function, replacing the dichotomous distance-decay form of the original 2SFCA by multilevel discrete form as in the Enhanced 2SFCA, or continuous forms such as the gravity-style, Gaussian-style and Kernel-density-style distance-decay functions.

The second category deals with the delimitation of catchment areas, i.e. the service areas of facilities or the searching scopes of demanders. The original 2SFCA form adopts a buffer-ring (BR) method delineating the catchment areas as concentric circles with certain radii of physical distances or travel times. Some extensions improve the BR method, including the variable catchment sizes 2SFCA, the dynamic catchment sizes 2SFCA and the multi catchment sizes 2SFCA. Moreover, a new nearest-neighbor (NN) method, which delineates the catchment areas by identifying a finite number of nearest facilities for each demand node, has been proposed. The third category strives to improve the accuracy of 2SFCA by accounting for the competition among demand nodes or among supply nodes. The initial extension of this category is the three-step floating catchment area (3SFCA) method, following which other extensions such as the Modified 2SFCA and the Huff-based 2SFCA are

proposed to make a further improvement.

The fourth category extends the travel manner of demanders, including the Multi-mode 2SFCA taking into account various potential transportation modes, and the Commuter-based 2SFCA integrating service visits and commuting behavior.

The advantages and disadvantages, appropriate scenarios and future potential improvements of these extensions are also discussed. The framework proposed in this study can contribute for the choice of method for relevant studies and promote the implement and development of 2SFCA method.

Key words:

two-step floating catchment area method; extensions; review; distance-decay function; catchment area

Urban Rural Differential in Health Seeking Behaviour of Elderly in Siwan District of Bihar (India)

Kumari, MANJU

Centre for the Study of Regional and Development, School of Social Sciences, Jawaharlal Nehru University, New Delhi.
manju.ch0103@gmail.com

Abstract

Country like India has a rapidly growing population of elderly. The elderly generally experience different kind of chronic diseases in their later part of life and they treat the disease according to various factors i.e. economy, awareness, personal beliefs and societal attitude, culture, geographical location, accessibility to health care services, family environment and family support among others. There is a clear delimitation of health care services in rural and urban areas of any country. Urban areas are no doubt in better condition whereas the condition of rural areas largely depends on decentralisation policy of government.

The objective of the study is to find out various factors responsible for differential health seeking behaviour among elderly in Siwan district of Bihar (India). The data has been collected through structured questionnaire. In total, 500 elderly people of Siwan district of Bihar state have been surveyed. Statistical techniques include Cross section with chi-square test, correlation and binary logistic regression for better understanding the said issue.

It is found that people generally refer to the nearest facilities available for treatment. The elderly of urban areas have larger options whereas many rural elderly largely depend on self medication. Chemist shop plays an important role in serving medicine to the elderly. There is a tendency to move to private hospital in urban areas whereas in rural areas government facility is opted. Family environment and educational attainment play crucial role during health seeking. Besides, transportation facilities also determine health seeking behaviour of the elderly people.

Key words:

Rural; Urban; Health seeking behaviour; elderly; family environment;

Evaluation of the Visual Analog Score to Assess Acute Mountain Sickness in a Hypobaric Chamber

Jialin Wu^{1,2,3}, YuChen³, Yongjun Luo^{2,3}

¹Department of Military Medical Geography; College of High Altitude Military Medicine, Third Military Medical University, Chongqing 400038, PR China

²Battalion 8 of Cadet Brigade; Third Military Medical University, Chongqing 400038, PR China

³Key Laboratory of High Altitude Medicine (Ministry of Education); Third Military Medical University, Chongqing. 400038, P.R. China. luoyongjun2011@gmail.com

Abstract

The visual analog score (VAS) is widely used in clinical medicine to evaluate the severity of subjective symptoms, such as measuring pain, nausea, fatigue, and sleep quality. But there are few research is about using VAS to evaluate Acute Mountain Sickness (AMS), not to mention in a hypobaric chambers, which as a laboratory equipment is wildly used in the high altitude medical research. In this paper, we evaluated the degree of AMS using the VAS in a hypobaric chamber in which the equivalent altitude was increased from 300 to 3500 m and compare which the “gold standard” --Lake Louise score. During the five hours of testing, we measured the resting blood oxygen saturation (SaO₂) and heart rate (HR). Using VAS to record the subjects' ratings of their AMS symptom intensity that occurred throughout the phase of increasing altitude at 300 m, 1500 m, 2000 m, 2500 m, 3000 m, and 3500 m. The results showed that patients' SaO₂ and incidence of symptoms had a significant correlation with altitude($P<0.05$). The composite VAS score, which rated the occurrence of four symptoms (headache, dizziness, fatigue, and gastrointestinal discomfort), was significantly correlated with elevation ($P<0.01$). Based on the experimental data, the VAS can be used as an auxiliary diagnostic method of Lake Louise score to evaluate AMS and can show the changing severity of symptoms during the process of increased elevation in a hypobaric chamber, it also reflects a significant correlation with altitude.

Key words:

acute mountain sickness (AMS); visual analog score (VAS); hypobaric chamber.

Exploring of Walkability of Urban Environment - Samples Xuanwu District in Nanjing, China

Shuaiqi Xia¹, Zhen Xu², Jiacheng Liu³,

¹College of Landscape Architecture, Nanjing Forestry University, 274950708@qq.com;

²College of Landscape Architecture, Nanjing Forestry University;

³Harvard University Graduate School of Design

Abstract

21st century witnessed China's aggressive urbanization and urban sprawl, a period when people were living in the forest of reinforcement bars and castle of concrete. What impact it brought to our daily life was the increasing need and dependency for automobile and public transportation. As a result, cities are now planned and designed for the wheels, overlooking the fact the people who don't have cars outnumber those who have, which adversely affects people's living quality. Walking is one of the most significant way people connecting themselves to the nature, thus its accessibility directly mirrors public health and living quality. This paper samples Nanjing city as the research object, a city where human touch and natural resources brewed along the rich history of six dynasties, focusing on Xuanwu District's accessibility and concluding influences environment exerts on public health and living quality.

³Center for Endemic Diseases Control, Tibet Centers for Disease Control and Prevention, Lhasa, 850000, P.R. China

Abstract

Kashin-Beck disease (KBD), which is considered to be relevant to selenium deficiency, is usually evident between the ages of 7-15 years and grows greatly worse with age if no treatment is done. In this study, we chose Luolong County in Changdu where the KBD prevalence is still severe to collect hair samples of children (aged 6-16), investigating their selenium status and possible influencing factors. The selenium concentration in hair samples was determined by inductive coupled plasma mass spectrometry (ICP-MS). The results showed that the average hair selenium concentration of children in Luolong County was 0.290 ± 0.125 (43) $\mu\text{g}\cdot\text{g}^{-1}$, ranging from 0.041 to $0.550 \mu\text{g}\cdot\text{g}^{-1}$. The selenium level was decreased with the severity of local KBD increased. There was a significant difference between students and non-students ($P=0.000$), which was likely due to their different dietary structures. The average hair selenium content of boys (0.317 ± 0.132 (20) $\mu\text{g}\cdot\text{g}^{-1}$) was slightly higher than that of girls (0.267 ± 0.117 (23) $\mu\text{g}\cdot\text{g}^{-1}$) ($P=0.189$). Children aged 11-16 whose hair selenium level (0.273 ± 0.116 (19) $\mu\text{g}\cdot\text{g}^{-1}$) was slightly lower than children aged 6-10 (0.304 ± 0.133 (24) $\mu\text{g}\cdot\text{g}^{-1}$) ($P=0.425$). Although the selenium status of children in Changdu KBD areas is significantly improved when compared with a few decades ago, there are still 44.2% of children staying at low selenium status, most of which are girls. This information obtained is valuable for making more effective selenium supplement strategies to prevent and control selenium deficient diseases.

The Spatial Distribution of Aging Population and Its Correlation with Economic Development in Foshan

Zhong Zhiping, Lin Lin

School of Geography and Planning, Sun Yat-Sen University, Guangzhou 510275, China, 5566zhi@sina.com

Abstract

On the basis of the 2010 census statistics, this paper adopted seven indicators of population aging and, by virtue of hierarchical cluster analysis, obtained five rings of Foshan's spatial distribution of aging: the central circle, the central peripheral circle, the intermediate circle, minor outer circle and outer circle. Their corresponding aging degrees are respectively initial senior stage, initial adult stage, later adult stage, initial senior stage, and middle-later senior stage. The Pearson correlation test between selected aging coefficient and GDP as well as gross industrial production in each district indicates that economic development and the level of aging population in different districts of Foshan demonstrate a negative correlation. The paper thus puts forward that uneven economic development exerts significant impact on population aging, which can be manifested by the migration of young adults.

Abstract

The present paper mainly focuses on the application of Remote Sensing, GIS, GPS, in healthcare such as visual analysis of health management information, health service mapping and geographic analysis of health services and its coverage. The main emphasis has been given to generation of Geospatial Health Management Information System (GHMIS) it will be easier for the governance of health sector and infrastructure in the rural areas. At each level, data would be viewed geospatially which would help to make rational decisions and hence better healthcare. The study area has been chosen as Bemetara District of Chhattisgarh, India. The main objective of the study are to create buffer around the health centers to denote the catchment area; allow for overlay analysis of different pieces of information; calculate distance; permit interactive queries of information in web-GIS. The present study is mainly based on both primary and secondary data.

It has been found that creation of GHMIS design the function of healthcare service and administrative service to monitor health status and service needs according to National Rural Health Mission (NRHM) norms. Identify environmental, socio-economic and other factors like inaccessible areas, geographic and demographic factors. The user can access the data of any level by logging into the central service without having the hassle of visiting every website. It can be act as a single window service station. The range of expectation of health information system will depend on the role of the people involved. "People" comprises of three categories Doers, Users & Viewers.

A Linear Programming Based Spatial Equity Evaluation for Health-Care Facilities Considering Risk of Cancer

ZHANG Wenting¹, WANG Haijun²

¹Huazhong Agricultural University, Wuhan, 430070, P. R. China, wentingzhang@mail.hzau.edu.cn

²Wuhan University, Wuhan, 430072, P.R. China

Abstract

The equity in accessibility of health-care facility is significant to judge the convenience of health-care system. Existing studies have taken the census data as health-care demand, but the impacts of population structure (gender and age) on cancer risk are missed. A trial on equity evaluation for cancer risk with regard to population structure is carried out. First, facing the fact that traditional methods ignored the heterogeneity of health-care supply and demand in space, a linear programming (LP) is employed to distribute the cancer patients into health-care facilities in space. By results of LP, equity in accessibility can be evaluated. Hong Kong with high population density and scarce public health-care resource is selected as case study area. Due to the mountainous terrain, islands and the heterogeneous spatial population distribution, it is necessary to study the equity in accessibility of health-care facility for Hong Kong. The results indicate that the spatial layout of health-care facility in Hong Kong is general reasonable. Population who reside in isolated places or islands suffer in low accessibility and equity, and they occupy a small part of entire population in Hong Kong. The results can be used in urban planning or health-care facility planning.

A Multi-Phase Environmental Exposure Assessment Framework Based on the Dynamics of Human Activities in Geographic Space

Guixing Wei, F. Benjamin Zhan

Texas State University, San Marcos, 78666, United States, g_w38@txstate.edu

Abstract

Environmental exposure assessment is an important step in studies examining the association between exposure and adverse health outcomes. In environmental exposure assessment, it is important to take into account of the dynamics of human activities in geographic space and time, and consider how the dynamics is related to the environmental conditions under consideration. But few existing approach fully accounts for this type of dynamics. In this study, we propose a new multi-phase framework to assess environmental exposure using trajectories of human activities in geographic space and time. This approach consists of four steps: (1) classifying the trajectory data and segmenting the data into different phases, (2) connecting the segmented trajectory data to environmental conditions under consideration, (3) assessing exposure for each individual during each phase based on the segmented trajectory data, and (4) determining the overall exposure for each individual. We demonstrate the usefulness of this proposed framework through an example.

exposure assessment; GIS; health; air pollution

A Spatiotemporal Analysis of Radon Screening Activities in an Urban Environment

Dai D

Georgia State University, Atlanta, United States, ddai@gsu.edu

Abstract

Radon exposure is the second leading cause of lung cancer after smoking and the leading cause of lung cancer among non-smokers. This research evaluates the spatiotemporal pattern in radon screening rate in a urban county in Georgia, United States. We obtained 25 years of radon test data ($n=6,355$) from both the local county government and a commercial radon testing company. Geographic Information Systems (GIS) techniques were used to examine the temporal trend of the radon screening services and its interaction with spatial variation. Results suggest that radon tests were the highest in the early 1990s and then decreased greatly since 2000s. Over the 25 years, there were parts of the county that had significantly lower test rates compared to the rest of the area. Further studies will need to examine knowledge about radon and awareness of screening service availability.

Spatiotemporal analysis; GIS; radon; radiation; exposure; health geography; lung cancer

Community-based Models for Visceral Leishmaniasis Supported by Remote Sensing and World View II in the Western São Paulo State, SP, Brazil

Fonseca ES¹, Martins MS², Guimarães RB¹, Malone JB²

¹Health Geography Laboratory, School of Sciences and Technology, São Paulo State University, Rua Roberto Simonsen, 305, Presidente Prudente, São Paulo, Brazil, elivelton.fonseca@gmail.com

²Pathobiological Sciences Department, Veterinary Medicine School, Louisiana State University, Baton Rouge LA, USA.

Abstract

Background: Geospatial risk assessment models for neglected tropical diseases (NTD) have been usually reported at regional scale. New satellite data systems (Worldview-2) now make it possible to map and model community risk surfaces for multiple NTD at habitat and household scales. **Goal:** The goal was to estimate and stratify the risk areas for Visceral Leishmaniasis at the community-based level in Teodoro Sampaio, west of São Paulo state, Brazil. **Methods:** Models were developed in the Maxent, using Normalized Difference Vegetation Index (NDVI), N.D. Soil Index (NDSI) and N.D. Water Index (NDWI), extracted at household level risk surfaces. Serological investigations for the diagnosis of canine VL were performed using enzyme-linked immunosorbent assay (ELISA) and indirect fluorescent antibody test (IFAT). **Results:** The survey analyzed in this study had 997 serum canine samples, from November/2010 to August/2012. The positivity rate (6.5%) can be considered low when compared to other studies. It was possible to identify hot spots of transmission within the city and notice a random distribution of cases around. All sectors analyzed revealed courts with canine VL confirmed by serology. It was noted that most of the 93 confirmed dogs resided in sector one, which corresponds to 64.5% of the tests. **Conclusion:** In long term, we aim to incorporate protocols and standards based on mapping and remote sensing as facilitators for scanning foci and environments, giving new tools for surveillance and control programs dealing with leishmaniasis. At local level more elements and clues that can enable the clarification of results are needed. Geospatial risk modeling can constitute a strong tool to target the cases. Ecological and Health Risk of Toxic Metals in Smaller than 100 μm Road Dust from Different Functional Areas of Xi'an

Xinwei Lu, Huiyun Pan, Qian Wang

School of Tourism and Environment, Shaanxi Normal University, Xi'an, 710062, P.R. China, luxinwei@snnu.edu.cn

Abstract

Concentrations of toxic metals Co, Cr, Cu, Mn, Ni, Pb, V and Zn in smaller than 100 μm road dust particles collected from four functional areas of Xi'an were measured using X-ray fluorescence spectrometry, and their potential risks to local ecosystem and human health were evaluated using potential ecological risk index and health risk model. The concentrations of Co, Cr, Mn, Ni, Pb, V and Zn in the samples are in the range of 22.6-66.7, 120.1-300.7, 22.7-98.3, 281.7-429.7, 21.9-37.2, 45.5-208.4, 48.3-70.5 and 61.6-898.9 mg/kg, with an average of 34.1, 175.3, 48.9, 339.4, 28.3, 97.6, 55.8 and 164.9 mg/kg, respectively. Compared to the background value of local soil, the samples have elevated Co, Cr, Cu, Pb and Zn, which are 2.1-6.3, 1.9-4.8, 1.1-4.6, 2.1-9.7 and 0.9-13.0 times the corresponding background value of Shaanxi soil, respectively. Due to the influence of local human activities and the diversity of sources, the analyzed toxic metals in the smaller than 100 μm road dust particles of different functional areas have different variation characteristics. Co and Pb in the samples presented moderate ecological risk, while other toxic metals were in low ecological risk. The comprehensive ecological risk levels of toxic metals were low to moderate. Ingestion was the main exposure route of all analyzed metals in the samples to children and adults. The non-cancer risks of the studied metals to children and adults were within the safe range, and the cancer risks of Co, Cr and Ni were also within the currently acceptable range.

Key words:

toxic metal; dust; functional area; ecological risk; health risk; X-ray fluorescence spectrometry; Xi'an

Estimating the Actual Incidence of HIV/AIDS Cases at the Prefecture Level in Mainland China from 2004 to 2013

Junming LI, Jinfeng Wang Chengdong Xu

Institute of Geodesy and Geophysics, CAS, Wuhan, 430077 China lijm@lreis.ac.cn

Institute of Geographic Sciences and Natural Resources Research, CAS, Beijing, 100101, China

Abstract

We collected data on the annual incidence of HIV/AIDS cases reported by hospitals from the Center for Disease Control (CDC) in China, covering 338 prefectures from 2004 to 2013. We searched published papers from the China Knowledge Resource Integrated Database and public reports to compile the accumulative living HIV/AIDS cases, which were estimated using the workbook method. The ratio of hospital reported and the actual incidence of cases was calculated. Then the actual annual incidence of cases was obtained using hospital reported incidence data divided by the ratio. The estimated number of new HIV/AIDS infections in mainland China in 2004 was 157,616 (95% CI: 95,435-193,234), and the highest and lowest incidences were 387,089 (95%CI: 168,944-483,938) in 2005 and 142,537 (95%CI:111,118-218310) in 2010, respectively. Overall, there was a decreasing trend from 2004 to 2013. However, a minor increase occurred from 2010 to 2013, and a spatial '2+x' pattern structure formed. The spatial Gini coefficient of the distribution of the incidence of HIV/AIDS cases decreased from 0.808 to 0.505. Although the incidence of HIV/AIDS cases decreased overall, the spatial distribution of new HIV/AIDS infections is homogenous. The estimate result presented here is reliable to some extent based on primary accuracy validation.

Key words:

spatial patterns; spatial Gini coefficient; HIV/AIDS

Geoinformation-based Assessment of Primary Health Care Facilities in Oyo Town, Southwestern Nigeria

Adeleke O.O, Oluwafemi O.A, Olaitan A.,
Oyo State Hospital, Oyo State, Nigeria, toyinfemi007@yahoo.com

Abstract

This study developed a Geographical Information System (GIS) database and mapped the distribution of Primary Health Care Facilities (PHCFs) in a traditional Nigerian city, Oyo town. The list of PHCFs and ownership in Nigeria obtained from the Department of Health Planning and Research served as database for the study. Also, the National Population Commission census figures provided information on the population of the city. Handheld Global Positioning System (GPS) was used to acquire the locations of 34 existing PHC centers within the study area. Field observation, questionnaire and IKONOS multispectral imagery (1.1m resolution) acquired from National Centre for Remote Sensing were used to ascertain the road network, built-up areas, location and spatial coverage. Geospatial analytical operations employed using ArcView 3.3 include proximity analysis (buffering), overlaying and querying. Data show that there exists inequality in the distribution of PHCFs among the various administrative units in the city with Owode having highest distribution of 17.6%, followed by Sabo 14.7% and Apaara with no PHCF. The study identified three categories of PHCFs- Comprehensive Health Centre (38.2%), Health Centre (38.2%) and Basic Health Centre (23.6%). It was observed that the patient-physician ratio is (1:15), population-physician ratio (1:7035), patient-nurse ratio (1:5) and population-nurse ratio (1:2438) for the three categories of PHCFs. Private organizations dominated the PHCFs ownership in Oyo city with 58.8%, and government 41.2%. Hence, appropriate authorities should endeavour to achieve a more fair distribution of health facilities in the city, taking into consideration health-dependent parameters so as to generate social justice.

Modelling Input-output Flows of Severe Acute Respiratory Syndrome in Mainland China

Li Wang^{1,2}, Jinfeng Wang^{1,2,3*}, Chengdong Xu^{1,2}, Tiejun Liu^{1,2}

¹LREIS, Institute of Geographic Sciences and Natural Resources Research, Chinese Academy of Sciences, Beijing 100101, China, wangli@lreis.ac.cn;

²Key Laboratory of Surveillance and Early-warning on Infectious Disease, Chinese Center for Disease Control and Prevention, Beijing 102206, China.

³Jiangsu Center for Collaborative Innovation in Geographical Information Resource Development and Application

Abstract

Severe acute respiratory syndrome originated in China in 2002, and it spread to 26 provinces in mainland China and 32 countries across five continents in a matter of months. However, the spatial features and potential determinants of SARS input-output flows remain unclear. We used an adjusted spatial interaction model to examine the spatial effects and potential factors associated with SARS input-output flows. The presence of origin-based spatial dependence positively affected the SARS flows from the neighbours of the origin regions. The origin-based and destination-based spatial dependence positively affected migrant flows from the neighbours of origin and destination locations. Similarly, the destination-based spatial dependence also positively affected hospitalization flows from the neighbours of destination regions. Differences in regional income drove the SARS input-output flows, urban income had a positive effect, whereas rural income had a negative effect. Total interregional flows increased by 3.54% with a 1% increase in urban income, and intraregional flows increased by 8.35%. In contrast, the total interregional flows decreased by 3.38% with a 1% increase in rural income, and intraregional flows declined by 2.29%. Railway capacity, PGDP, urban rate and the law of distance decay also affected the flows. Our results confirm that the SARS flows presented significant geographic spatial heterogeneity and spatial effects. Income differences were the major cause of the flows between pairs of regions. Railway capacity, PGDP, and urban rate also played important roles. These findings provide valuable information for the Chinese government to control the future spread of nationwide epidemics.

SARS flows; spatial interaction model; spatial dependence; spillover effects; income difference

Modelling the Distribution of Suspended Particles in the South of Tehran by AERMOD Model, (A Case Study of Tehran Cement Plant)

Aliakbar Shamsipour ¹, Elham Ashrafi ²

¹Associate Professor of Climatology, Faculty of Geography/University of Tehran, Tehran, Iran, shamsipr@ut.ac.ir

²ME environmental assessing/Payam-e-Noor University, Tehran, Iran, elhamashrafi39@yahoo.com

Abstract

The cement industry has 79 years of record in Iran and with total cement annual production capacity of 66 million tons; Iran is the largest cement producer in the Middle East. In the various stages of production process of the material, many pollutants are released into the environment. Cement industry has always been associated with air pollution. From different types of pollutants, particulate matter is the most important pollutants of the cement plants. In this research, AERMOD has been used for the simulation of dispersion patterns of the particulate matters emission from the cement plant for time average of 1 hour and monthly for both summer and winter conditions. Spatial analyses methods have been done by Arc/map10.1 software on Geographical Information System (GIS) in composite the natural and humanity variables are affected by air pollutants of the factory. According to the air pollution dispersion modelling outputs, Particles in the summer entry to Tehran from the plant origin increased further, and covered to 15km of the source. Considering the concentration of standard particles in Iran and EPA, it is observed that the result for the model output is more multiple than the standard rate. Man-made and natural environments are equally affected by the plant pollutants. Irrigated farms and gardens that are increasingly developing there, urban water reservoirs and also a bit far in the east, the runoff water sources and protected wild life zones are affected and very sensitive to air pollutants.

Modelling the Impacts of Climate on Hand-Foot-Mouth Disease Transmission in Heterogeneous Socioeconomic Space

Wang, Jinfeng, Ren, Zhoupeng

LREIS, Institute of Geographic Sciences and Natural Resources Research, Chinese Academy of Sciences,

A11, Datun Road, Beijing 100101, P.R.China, wangjf@lreis.ac.cn; renzp@lreis.ac.cn

Abstract

HFMD is the most prevalent disease in China, around 1-3 million new cases each year. The infectious disease spreads by EV71 and Coxsackie virus through fecal-oral route, that is subject to climate condition, hygiene behavior and social contact structure. We model the socioeconomics using geographical evolution tree. A set of regions in the study area are classified by their industrial and employment structures and are represented by the branches in a tree structure; the regions are also classified into several developmental stages by per capita income and are represented as the twigs linked to the branches; and the regions are finally displayed as leaves on the twigs. A twig is placed near to the root of the tree if it is at higher developmental stage and is placed near to the top of the branch if it is at initial developmental stage. We use multilevel modelling to regress the HFMD and climate factors under the tree structured socioeconomic structure. The results have lower errors than that of global modelling, and the interaction between socioeconomics and climate on HFMD transmission is presented.

Hand-foot-mouth disease; socioeconomic and climate determinants; geographical evolution tree (GeoTree); multilevel modeling; contextual effects

Neighborhood Environment and Location-based Daily Walking Behavior: A Case Study in Tokyo Metropolitan Area

Hou, H., Murayama, Y.

Graduate School of Life and Environmental Sciences, University of Tsukuba, Tsukuba, 3058577, Japan,

houhao880828@gmail.com

Abstract

Fast development in transport technology has brought great convenience to people's daily life, especially for those who live in highly urbanized areas. However, a significant proportion of people were found to be a lack of physical activity due to the convenient lifestyle. Daily walking behavior is the most popular physical activity and the promotion of it is constructive in improving the physical activity. In this context, the evaluation of neighborhood walkability is important since it provides information on how to build a walkable neighborhood. In this study, utilitarian walkability, which refers to a mobile method to arrive at a destination for further behavior, was evaluated as evidence has shown that it has a higher connection with regular daily walking behavior compared with recreational walkability. Multi-criteria Evaluation (MCE) method was adopted for the evaluation process. Residential density, road accessibility, land use diversity, bus stops density and railway station accessibility, were the five criteria selected to run the MCE approach. The weights of these criteria were determined by the Analytic Hierarchy Process (AHP). After evaluation of the whole study area, the case study was done in two sites which have representative utilitarian walkability for relating the results to social-economical attributes of residents. The daily walking behavior was separated into walking happened within and without neighborhood based on the neighborhood boundary. With the findings from this study, the patterns of daily walking behavior of residents in Tokyo were detected. In conclusion, advice on how to build a walkable neighborhood was proposed.

daily walking behavior; Multi-criteria Evaluation; neighborhood environment; people flow; utilitarian walkability

Outdoor PM_{2.5} Air Pollution and Hospital Admissions for Hypertension disease in Shenzhen, China: A Small-Area Geographical Study

Wang Z, Yue Y, Li Q, Liang S

Shenzhen Key Laboratory of Spatial Smart sensing and services, Shenzhen University, Shenzhen, 518060, P. R. China,
wangzhensheng@szu.edu.cn

Abstract

Hypertension is the leading cause of cardiovascular and cerebrovascular mortality and about 90-95% of cases are categorized as primary hypertension, defined as high blood pressure with no obvious underlying causes. In this paper, we attempted to investigate the association between the hypertension hospital admissions and PM_{2.5} exposure and to explore heterogeneity of the variation of relative risks across regions by conducting a small-area geographical study. The research was conducted in a relatively small scaled area of city level, Shenzhen, which is a highly urbanized area in China. We used 762 community geographical units as the unit of analysis and extracted post coded data on hypertension hospital admissions for the study area in 2013. PM_{2.5} exposures were interpolated from 19 fine particle fixed-site monitors in the same period, and then the population-weighted exposures were also calculated. Data on potential confounders (age, sex, smoking proxy, alcohol use proxy, socioeconomic status, roadway density, human mobility) were included in this study. To allow for small numbers and unstable rates of hospital admissions, we applied Poisson regression models with an additional random effect term to account for over-dispersion and residual heterogeneity. The results indicated that after adjustment for potential confounders, the relative risk of hospital admissions for hypertension was 1.08 (95% confidence interval 1.05 to 1.17). Although the results were robust to adjustment for roadway density, road traffic noise should be considered in further research. Limitations included the inability to adjust for confounders at individual level.

Seasonal Effects of Weather Factors on Hand, Foot and Mouth Disease in Beijing

Wei Hua Dong

State Key Laboratory of Remote Sensing Science, Beijing Key Laboratory for Remote Sensing of Environment and Digital Cities & School of Geography and Remote Sensing Science, Beijing Normal University, China, dongweihua@bnu.edu.cn

Abstract

The morbidity and mortality of hand, foot and mouth disease (HFMD) are increasing in Beijing, China. Previous studies have indicated an association between incidents of HFMD and weather factors. However, the seasonal influence of these factors on the disease is not yet understood, and their relationship with the enterovirus 71 (EV71) and Coxsackie virus A16 (CV-A16) viruses are not well documented. We analysed 84,502 HFMD cases from 2008 to 2011 in Beijing to explore the seasonal influence of weather factors (average temperature [AT], average relative humidity [ARH], total precipitation [TP] and average wind speed [AWS]) on incidents of HFMD by using a monthly geographically weighted regression (GWR) model. The results indicated that weather factors differ significantly in their influence on HFMD depending on the season. AT had the greatest effect among the four weather factors, and while the influence of AT and AWS was greater in the summer than in the winter, the influence of TP was positive in the summer and negative in the winter. ARH was negatively correlated with HFMD. Also, we observed that there were more EV71-associated cases than CV-A16, and that AT and TP might have a stronger relationship to EV71 than CV-A16, but there is no convincing evidence to show significant differences between the influences of the weather factors on EV71 and CV-A16. These findings could be further tested in future laboratory and epidemiological studies.

weather factors; HFMD; geographically weighted regression; EV71; CA16

Spatial Analysis for Detecting Environmental Risks for Plague Foci in Ulan County, China

Mengxu GAO, Juanle Wang

State Key Laboratory of Resources and Environmental Information System, Institute of Geographic Sciences and Natural Resources Research, CAS, Beijing, 100101, P. R. China, gaomx@igsnrr.ac.cn

Abstract

The Ulan County in Qinghai Province is belongs to the Qinghai-Tibet Plateau Himalayan marmot plague natural foci, which is the most active plague foci in recent China. The existing plague surveillance technology are far from being able to meet to foci of risk monitoring and management, there is an urgent need to introduce geospatial technical means for plague risk prediction. In this study, we acquired 45 Himalaya marmot position points based on the field monitoring in 2006-2009 carried out by the CDC of Ulan County, combined with our GPS data of field survey in 2010 and 2014. According to the habitat characteristics of Himalaya marmots, the related ecological environment variables including DEM, slope, aspect, slope, NDVI, land surface temperature (LST) and Land Cover were extracted by satellite and remote sensing software. We achieved the Plague risk prediction using ArcGIS and MaxEnt maximum entropy niche modeling method, the AUC value of training and test data were 0.942 and 0.932, respectively. The results show that the maximum entropy model combined with the ecological environment remote sensing variables can predict the spatial risk distribution of Himalayan marmot plague foci, which is more accurate than the administrative statistics in county level. The variables of NDVI and LST have the greatest impact on the plague risk distribution. The research can provide important reference for the control and prevention of plague epidemic in the county and other similar areas.

Spatial Identification of Potential Health Hazards: A Systematic Areal Search

Approach

Portnov BA, Svechkina A

Department of Natural Resources & Environmental Management, Faculty of Management, University of Haifa, Mt. Carmel, Haifa 3498838, Israel, portnov@research.haifa.ac.il

Abstract

Major metropolitan areas often exhibit multiple morbidity hotspots. However, the identification of specific health hazards, associated with the observed morbidity patterns, is not always straightforward. In this study, we suggest an empirical approach to the identification of specific health hazards, which have the highest probability of association with the observed morbidity patterns. According to the proposed approach, the morbidity effect of a particular health hazard is expected to weaken with distance. To account for this effect, we estimate distance decay gradients for alternative locations and then rank these locations based on the strength of association between the observed morbidity and wind-direction weighted proximities to these locations. To validate the proposed approach, we use both theoretical examples and a case study of a major metropolitan area in Israel, which is characterized by multiple morbidity hotspots. In our theoretical examples, the proposed approach helped to identify correctly the predefined locations of health hazards, while in the real-world case study, the main health hazard was identified as a spot in the industrial zone, which hosts petrochemical facilities. As we conclude, the proposed identification method appears to perform effectively and can be used by researches in cases in which specific sources of locally elevated morbidity are unclear or cannot be identified by traditional methods.

Spatial-temporal Distribution and Hotspots of Hand-Foot-Mouth-Disease (HFMD) in Guangzhou City

Chen XY, Xu Y, Cui YQ

Guangzhou University, Guangzhou, 510006, P. R. China, davidcxy@163.com

Abstract

Hand-Foot-Mouth-Disease (HFMD) is an emerging viral disease, which has been reported for increasing outbreak in Chinese cities. This study aimed to elucidate the phenomenon of HFMD outbreaks from 2005 to 2014 using general statistics and spatial-temporal analysis employing a GIS-based method in the study area of Guangzhou. The spatial analysis examined data at the sub-district level to create a map representing the distribution pattern, mean center, standard deviation ellipse and hotspots for the cases. A temporal analysis was used to analyze the correlation between monthly case data and impact factors as supplement of the spatial analysis. The results indicate that the disease was observed to occur at any time of the year. However, peak appeared regularly in certain months of the rainy and cold seasons. The distribution of outbreaks exhibited clustered patterns. Moreover, the source of the disease sometimes differed from the reported location. With the GIS-based simulation, the actual target area of the disease as well as the diffusion trend can be obtained, which is significant for the control and prevention of the disease.

Hand-Foot-Mouth-Disease; GIS; Spatial-temporal Analysis

Spatio-temporal Analysis of Schistosomiasis Japonica in the Dongting Lake Regions of Hunan Province, China

Wang, E.¹, Wu, Z.², Luo, Z.³, Zhao, Z.³

¹University of North Dakota, Grand Forks, ND 58202, U.S.A., enru.wang@und.edu

²Hunan Institute of Science and Technology, Yueyang, 414006, China

³Hunan Institute of Parasitic Diseases, WHO Collaborating Centre for Research and Control of Schistosomiasis on Lake Region, Yueyang, 414000, China

Abstract

Schistosomiasis japonica, a chronic disease caused by the blood fluke *Schistosoma japonicum*, was one of the most serious parasitic diseases in China with a documented history of over 2,100 years. Over the past six decades, China has made great strides toward reducing the prevalence of schistosomiasis japonica by taking some comprehensive and highly effective strategies. However, further progress towards elimination of schistosomiasis is hampered by factors such as climate change, ecological transformations, socio-economic changes, and the transformation of the health sector; *Schistosoma japonicum* remains a major public health concern in twelve provinces of southern China. With the strategy shifting from morbidity control to transmission control, one challenge is to locate hotspots of transmission risk for precise control in low-prevalence areas. Based on annual parasitological data collected at township and village levels in the Dongting Lake regions in Hunan Province during 2000-2015, this paper presents a fine-scale spatio-temporal analysis of transmission risk of Schistosomiasis japonica in a geographic information system (GIS) environment. We first conduct a spatial cluster analysis using spatial autocorrelation indices to describe the spatial distribution and autocorrelation of schistosomiasis over time. Then, we run spatial regression models to reveal the relationships between human prevalence of schistosomiasis and environmental factors. Results show statistically significant clustering patterns both in space and time. Environmental factors, especially those related to habitats of snails which serve as intermediate hosts, can explain the spatio-temporal variations of schistosomiasis. Spatial regression models fit better than ordinary least square (OLS) regression models and can better show spatial heterogeneity effects.

Schistosomiasis japonica; spatio-temporal analysis; GIS; Dongting Lake; China

Spatiotemporal Analysis of Visceral Leishmaniasis in São Paulo State, Brazil (1999-2013)

Matsumoto, PSS, Casagrande B, Guimarães, RB

Universidade Estadual Paulista FCT/UNESP, Presidente Prudente-SP, Brazil, pamatsumot@gmail.com

Abstract

The Visceral Leishmaniasis (VL) is a serious disease that affects people, causing a huge problem to public health system. Since 1999, cases were reported in northwest side state of São Paulo and the disease has been spread to other cities. Under those circumstances, the aim of this paper was to map the spatiotemporal data cases disease and its propagation through spatial analyses, considering areal studies. The data source comes from National Diseases Reported Database (in portuguese, SINAN - Sistema de Informação de Agravos de Notificação). We combined geographical and temporal data reported from 1999 to 2013 using Geographic Information System (GIS) tools, especially cluster analysis. Our results show that the disease has its frequency increased aside from a huge geographical expansion. We believe that this study can give an important view to understand the behavior of the disease in São Paulo state, consequently, it guide us some clues in order to understand the disease spread.

Spatiotemporal Change of HIV/AIDS in Visakhapatnam District-A Medical GIS

Approach

P. Jagadeeswara Rao,

Professor of Geo-Engineering and Centre for Remote Sensing, College of Engineering (A), Andhra University,
Visakhapatnam-530003, India, peddada.geoengg@gmail.com

Abstract

Visakhapatnam, the largest Municipal Corporation in Andhra Pradesh, often called as “industrial city” has gained international significance. The study area, the Visakhapatnam District, is well connected by road, rail, sea and air. Floating population and migrants from the rural and tribal areas concentrated in urban slums, besides posh flesh trade, are leading to spread of incurable Human Immuno deficiency Virus (HIV) is one of the causal agent for disease Acquired Immuno Deficiency Syndrome (AIDS). Spreading disease will impact on different socio-economic factors. Therefore, it is important to evaluate and monitor causative factors which are to be controlled by effective measures. Geographical Information System (GIS) is a powerful tool for monitoring and planning the HIV/AIDS control programs based on the geographical location and other parameters. The factors influencing spreading HIV cases in the study area is studied. Study reveals the HIV cases are not increasing in recent years. However, Primary Health Centers’ (PHCs) and other hospitals are to be equipped with necessary medical equipment and medicines in order to curb this disease. Authors opined, Psychologist counseling must be required to get rid from the social stigma besides regular medication for longevity of patients.

The Geographical Distribution of the Number of People with Hemophilia in China

Yang Shao-fang¹, Ge Miao^{1*}, Liu Shan-xi^{2**}, Liu Yi-guo², Cen Min-yi¹, Liu Xinlei¹, Zhang Wen¹

¹Institute of Healthy Geography, College of Tourism and Geographical, Shaanxi Normal University, Xi'an, 710119 Shaanxi, China, yangsf_111@nwsuaf.edu.cn

²Hemophilia Research Group, Hematology Institute of Shaanxi Medical University Xi'an 710032, Shaanxi, China

Abstract

Summary: Background: For 50 years, the World Federation of Hemophilia (WFH) has been committed to improving care for people with bleeding disorders regardless of where they live. However, the level of hemophilia care is still far from being satisfactory in China.

Objective: To preliminarily explore the geography distribution of the number of people with hemophilia in China during 2005-2014, aim to promote eugenics and provide a new idea for prevention and treatment of hemophilia.

Method: The method of thematic mapping with the quality base method and Natural breaks method are used to draw the geographical distribution of the number of people with hemophilia in China.

Results: Since the availability of collecting the number of people with hemophilia, the geographical distribution of the number of people with hemophilia is "extremely high or low" and then "high-low alternating in China. Overall, there is a concentration of people with hemophilia in the southeast and central regions, while few people with hemophilia are in northwest and some parts of southwest, as the effects of such population flow, environment and so many potential factors may have a profound effect upon the geographical distribution of the number of people with hemophilia.

Conclusion: The geographical distribution of the number of people with hemophilia is "extremely high or low" and then "high-low alternating". (Project 40971060 supported by National Natural Science Foundation of China and the Central College Fund (PhD) (No. GK201504015).)

The Relationship between Built Environment and Residents' Health Based on the Medical Big Data

Yang Cao, Feng Zhen

School of Architecture and Urban Planning, Nanjing University, Nanjing, 210093, P. R. China, 834154997@qq.com

Abstract

Human healthy or disease incidence in different districts is always compared to the investigate district's impact. However, in those investigations, the relationship between urban built environment and residents' health has not received enough attention. Socioeconomic status, community environment and family influence of human beings tends to be ignored. That's because census data used in those investigations is lack on that three factors. Nowadays, information and communication technology (ICT) is applied in the medical and health field, which make us get more detailed and comprehensive record of the residents' daily medical activity information. Also, the era of medical big data make it possible to study from the perspective of residents' medical activities. Though literature reviews of medical geography, this research will fully excavate the patients' medical big data, residential location records and social economic attribute from the perspective of residents' medical activities, which combine with the medical statistics yearbook, field survey data, etc. On the basis of patient's privacy protection and data integrity, this research will analysis the space-time path and spatial-temporal characteristics of medical activities by the aid of spatial analysis, mathematical statistics, qualitative analysis and other analysis methods. We will analysis the relationship between medical services (supply, usage, and accessibility) and built environment furthermore. Using this information, we will in-depth analysis the impact between built environment (especially the neighbourhood environment) and residents' health and summarize the general rule of the main influencing factors and mechanism.

Key words:

Medical big data; built environment; residents' health; facilities layout optimization;

The Spatial Distribution of Hepatitis C Virus Infections and Associated Determinants

– Targeting Risk Groups Using Geographically Weighted Poisson Regression

Abstract

A large proportion of Hepatitis C virus (HCV) infections remain hidden to care due to the mostly asymptomatic characteristics of HCV. Screenings targeted on behavioural risk groups only had not proven to be effective in revealing these hidden infections. Geographic Information Systems (GIS) and spatial epidemiological methods may therefore provide a more feasible basis for screening interventions through the identification of hotspots and local risk factors.

Analysed data included all HCV tests performed in the southern area of the Netherlands between 2002-2008. Population-based data were matched to the HCV data. The spatial scan statistic was used to detect areas with elevated HCV risk. Geographically weighted Poisson regression modelling was then applied to determine local risk factors for HCV.

HCV prevalence varied geographically and clustered in urban areas. The main population at risk were middle-aged males, non-western immigrants and divorced persons. Socio-economic determinants consisted of one-person households, persons with low income and low mean property value. However, the association between HCV prevalence and the identified risk factors displayed strong regional and intra-urban differences.

The detection of local hotspots in our study may serve as a basis for prioritization of areas for future screening interventions. Risk factors associated with HCV show regional differences underlining that risk factors for HCV depend largely on the place of residence. Targeting the identified risk groups within the detected clusters might lead to cost-effective screening interventions aimed at those who are most at risk in specific locations.

Hepatitis C; Geographic Information Systems (GIS); Geographically weighted regression (GWR); spatial scan statistic (SaTScan)

Use of Geography Information Systems to Determine the Spatial Distribution of Asthma Patients

Mehmet Fatih DÖKER, Selin YILDIZ

Sakarya University Department of Geography Sakarya, Türkiye fdoker@sakarya.edu.tr

Abstract

The increasing urbanization process from day to day has become a serious problem that affects people's lives. Approximately %48 of the world's population live in urban areas and this rate is increasing daily. This process of urbanization bring with spatial problems in urban. One of them is the health problems that are caused by urbanization. Today, asthma is one of the most important respiratory diseases raised from human factors such as industry, transportation. In this study, the effects of air pollution and busy traffic on asthmatics was investigated. The relationship between the main Access roads and the places where people live has been demonstrated using Geography Information Systems. Accordingly, information of age, gender and address in selected asthmatic patient records has been examined and spatial datas in this study were analysed using software ArcGIS 10.x The effects of spatial problems in the distribution of asthma patients was researched.

Spatial Analysis of Gastric Cancer Morbidity in Regions of Rapid Urbanization: A Case Study in Xiamen, China

JiLai Liu, XinHu Li

Beijing Normal University, China, 289752312@qq.com

Abstract

This paper is purposed to detect the spatial laws of gastric cancer in the rapid urbanization area and analyze relationships between gastric cancer and urbanization. Gastric cancer incidence data in Xiamen between 2006 and 2009 was collected from Xiamen CDC (Centre of Disease Control and Prevention). Urbanization age of Xiamen Island was calculated from remote images and terrain maps. Analysis results showed that 995 gastric cancer cases, accounting for 61.64 % was in Xiamen island, compared with 619 cases, accounting for 38.36 % outside. The average gastric cancer incidence was 32.98/1000,000 in Xiamen Island, compared to 16.13/1000,000 outside. The top ten sub-districts of gastric cancer all located in Xiamen Island, and urban areas have as more than twice gastric cancer incidence as rural area, with 28.62/100,000. The most likely spatial cluster of gastric cancer was Xiamen Island. Correlation analysis results indicated the urbanization age and spatial cluster degree had a significantly positive correlation relationship. Rapid urbanization in Xiamen changed the environment, namely acquired factors including land use change, air–water–soil pollution, less activity, electromagnetic radiation and contaminated sea foods. These are risk factors of gastric cancer. This research indicated that Xiamen Island was prevalent of gastric cancer with a positive correlation with urbanization age.

Abstract

This paper aims at studying the regional variation of normal reference value of alanine aminotransferase in healthy adults and revealing the relationship between it and geographical environment. This research is made to study the relationship between the normal reference value of 121,977 samples of ALT in healthy adults and geographical factors in 93 units of China via the methods of correlation analysis、ridge regression estimation and trend surface analysis, and one regression equation is inferred the reference value of alanine aminotransferase in the local area by using the simulation equation under the condition of known local geographical factors.: There is a significant relationship between six geographical factors and ALT of healthy adults;2)The normal reference value of ALT in healthy adults in western region is higher than that of eastern region and whole country are divided into three regions. The normal reference value of ALT is influenced by the geographical environment, and showed distribution regularity.

Dengue's Epidemic in Brazil: The Influence of Urbanization

Mendonça F, Aquino Junior J, Oliveira D C, Oliveria M M F, Rodrigues Z M R, Gurgel H, Mattozo W, Fogaça T

The Brazilian Association of Geographers . UFPR/Centro Politécnico. 81531-970. Curitiba, Brazil. chico@ufpr.br

Abstract

The WHO estimates that 50 to 100 million people are infected with dengue fever annually in the entire world. Approximately 42% of the world's population lives in areas where the dengue virus can be transmitted. The re-emergence of this disease in Brazil occurred from the 1970s on, and the last few years the epidemics reach all regions of the country (around 1.5 million cases in 2015). The occurrences of epidemics and especially the elevation of the number of cases intensify the action of Public Health Care throughout major programs of the disease's contention, notably after the Chikungunya and Zika virus registration in the country. The climatic conditions and the urbanization are the main factors for the dispersion and transmission of the disease in Brazil; the urbanization intensifies the natural vulnerabilities of the population to the disease, which makes the risk more accentuated. Brazilian population lives in cities (around 85%), and also the vector (*Aedes aegypti*) of dengue fever with needs special places to reproduce itself and act to transmit the virus. Spatial organization of Brazilian cities contributes to intensify the risk and the spread of dengue fever. In this study, we analyze the spatial dynamics of dengue's fever in 10 Brazilian cities (Manaus, São Luís, Fortaleza, Recife, Brasília, Campo Grande, Rio de Janeiro, São Paulo, Curitiba and Porto Alegre), and we observed similar and different factors (sanitation, waste, housing, tires and old inner dumps, vehicles and people flux, etc..) between them that influence a lot the epidemic situations.

Key words:

Dengue fever; epidemics; urbanization; Brazil

Geography of Health, Health of the Geography: Toward A Re-Foundation of a Quartered Discipline

SALEM, Gérard, J.

University of Paris Ouest Nanterre- LADYSS. ICSu, salem.gerard@gmail.com

Abstract

Geographical studies of health have known a tremendous development the two last decades, with trivialization of methods as spatial analysis, or of tools as GIS. New approaches as *"One Health"*, *"Pathocenosis"*, *"Health in every policy"*, *"inter-sectorial approaches of health"*, *"contextual and multi-level methods"*, *"impact of places"*, etc. are more or less inspired by geography.

However, is the discipline more recognized and shared? The trivialization of geographical methods and tools could be deadly for the discipline, and as a consequence, the end of the most relevant heuristic contribution of to geography to Health Sciences, and to ... geography. We've observed such dilution of geography as a discipline in urban, cultural or environmental studies, and suppression of many departments of geography in Universities. It wouldn't be a real problem if the stake weren't the links between health ad geography, social sciences and health sciences, research and action.

It's one thing to describe spatial heterogeneities of health, to correlate with risks factor, (i.e spatial epidemiology approaches), it's another one to give sense, to understand process, which lead to these situations.

That's why it's urgent to refound the discipline, capitalizing technical progress, experiences with other disciplines, through it's main aim: simultaneous study of spatialisation of society, and socialization of space, in order to understand socio-territorial construction of health. The three concepts, Space, Place, Territory, dangerously confused or opposed, are in fact inseparable and complementary. By the way, Health geography will contribute to general geography, to Public Health challenges, and to public policy.

Geographical concepts; social sciences; inter-disciplinarity; public policy; training

Global Health Challenges: Trade Agreements

Thomas Krafft, Christoph Aluttis, Eva Pilot, Andra Stancu

Maastricht University, Faculty of Health, Medicine and Life Sciences, CAPHRI School for Public Health and Primary Care, Department of Health Ethics and Society, Maastricht, Netherlands, thomas.krafft@maastrichtuniversity.nl

Abstract

For new comprehensive trade agreements among the major economic powers have raised questions about the potential global health implications. In the public and scientific debate on the current negotiations on far reaching trade agreements (CETA, TTIP, TPP etc.) concerns are expressed regarding (a) a possible roll back of health protection provided by accomplished standards and legislations and (b) the impact on the future development of standards and regulations. The concepts envisaged for a regulatory cooperation that have emerged from the few preparatory documents available (for example) on TTIP could have a considerable impact on global health. The trade agreement negotiations aim for harmonizing of regulations and reduction of existing or perceived trade barriers that result from non-tariff or technical regulations. Regulatory coherence should be achieved through the introduction of an institutional regulatory framework that oversees the development and implementation of relevant legislation in the signatory states of the trade agreements. Stakeholders will have the right to appeal to these regulatory institutions if they fear potential trade impacts from planned regulatory or legislative initiatives. ISDS (Investor state dispute settlement) instruments that are intended to provide effective investor protection under the trade agreements can have far-reaching impacts on health related policies (emission standards, tobacco control etc.). The transatlantic tensions on the adoption of the precautionary principle as detailed in Article 191 of the Treaty on the Functioning of the European Union (EU) is one example for future challenges related to the trade agreements.

Key words:

Trade Agreements; Global Health; TIP

Health Risk for Tourists

Łukasiewicz N.

Faculty of Geography and Regional Studies, University of Warsaw, natalia.lukasiewicz@student.uw.edu.pl

Abstract

Nowadays as a result of globalization processes travelling is available to almost everyone. However according to present unstable economic and political situation in countries known as holiday destinations tourist traffic intensity rate are getting lower. That situation refers to numerous Arabic countries such as Egypt, Tunisia not to mention specific situation in Syria. Since Arab Spring protests the tourist market have visibly suffered from lack of tourist. If people decided to spend holiday there, they usually are placed at closed resorts. Recent incidents including terrorists attacks in Paris and Asia shows that tourists could not feel safe anywhere. There are different types of health risk for tourists, except terrorist attacks tourist should face with thefts, various accidents and of course communicable diseases in specific regions of the world. Researches were initiated during fieldwork in Cairo in 2014, where different risk factors have been observed. Presented study is based on surveys conducted on different groups of academic students and pupils at high schools. Questionnaire survey contains pictures of the main world's tourists attractions according to World Tourism Organization. Respondents were ask to rank those places using given health risks scale, specify the type of risks and answer the question if they want to spend their holidays there. That will show if tourists are aware of what to expect during travelling, if and how they prepare themselves for going abroad and what in their minds are the safest holiday destinations. Results are presented on the map of tourist health risk.

Health risk; travel medicine

Innovations in Integrated Disease Surveillance at Municipality level in Pune, India

Pilot E¹, Krafft T¹, Singh V^{1, 2}, Patsute S³

¹ Maastricht University, Faculty of Health, Medicine and Life Sciences, CAPHRI School for Public Health and Primary Care, Department of Health Ethics and Society, Maastricht, Netherlands, eva.pilot@maastrichtuniversity.nl;

² Public Health Foundation India, Indian Institute of Public Health Hyderabad, Hyderabad, India ³ Pune Municipal Cooperation, Disease Surveillance Cell, Naidu Hospital, Pune, India

Abstract

The purpose of the presentation is to analyse the complex and fragmented set up of municipal disease surveillance in the Indian context. With the implementation of the Integrated Disease and Surveillance Program (IDSP) the central Indian government tried to bridge existing surveillance components and programmes and to integrate them under one umbrella. As a case in point the potential and challenges of the implementation within the Pune Municipal Cooperation will be assessed and lessons learned discussed.

Methods: The research is based on a literature search, semi-structured expert interviews and infectious disease surveillance concept mapping.

Conclusion: the IDSP initiative has improved the traditionally difficult monitoring of disease burden and outbreak control but is still rather patchy and has challenges which needs to be address like the urban area coverage with strengthening hospital based disease surveillance. The IDSP continuous to face serious challenges that needs to be overcome to strengthen the early warning capacity and to bridge the urban rural divide in the interest of public health. This paper discusses the progress made and the challenges remaining also in the context of the implementation of the International Health Regulations (2005).

New Epidemics Outbreak in Developed and Developing Countries

Izabella Lecka

Faculty of Geography and Regional Studies, University of Warsaw, Poland, ilecka@uw.edu.pl

Abstract

The main goal of the presentation is to analyze a new outbreak of epidemics as swine flu (from 2009), Ebola (2014/2015) and Zíka virus (2016). Emphasis will be placed on the ways and trails determining the spread of these diseases; way to prevent them in the contemporary global world; cultural background of the implementation of different preventive methods in different countries.

Finally it will be presented an evaluation of existing methods to combat new epidemics, especially the role of international cooperation and it will be indicated good practices promising for the future.

Key words:

The Geography of Free Skilled Birth Attendance and Maternal Mortality in Ghana

Joseph Oppong

University of North Texas, United States, oppong@unt.edu

Abstract

Fueled by poor access to skilled birth attendants, maternal mortality is unusually high across sub-Saharan Africa. Many governments have instituted free maternal care as a way to boost health care access, increase delivery by skilled birth attendants, and reduce maternal mortality. Thus, the Ghana government introduced the user fee exemption policy for maternal healthcare in 2003. Nevertheless, use of skilled birth attendance varies significantly across geographic space and maternal mortality remains high.

This paper examines the geography of access to skilled birth attendance across Ghana using DSHS 2014 and 2010 Ghana national population census data. The results show that poverty and place of residence – rural or urban – are significant determinants of skilled birth attendance. Thus, providing free access to skilled birth attendance services does not assure use of these services when enabling factors are not addressed.

Abstract

There has been growing understanding about the coexistence of underweight and obesity in developing countries. However, evidence related to changing socioeconomic differentials in the burden of under-weight and obesity over time have not been assessed across states in India. Therefore, this paper attempts to examine socioeconomic differentials in burden of underweight and obese women across socioeconomic factors over time. Using data on 38762, 50242 and 195928 ever married women 15-49 years of age from three cross-sectional national representative surveys (Indian National Family Health Survey 1998-1999; Indian National Family Health Survey, 2005-2006; Reproductive and Child Health- District Level Household Survey 2011-2012 respectively), socioeconomic differentials in weight status of women was measured through body mass index (kilogram/meter²). Indicators of socioeconomic indicators included wealth status, educational status and place of residence (rural and urban). Cross tabulations, chi-square tests, mean score of BMI, One-way ANOVA and panels of multiple regression models were fitted to investigate the socioeconomic patterning of body mass index of women in India. Results indicated stark socioeconomic inequalities in underweight and obesity among women in India. Large proportion of women from high socioeconomic categories recorded obesity contrary to those from poorer categories. On the other hand, burden of underweight predominated among women from under-privileged socioeconomic strata. This pattern remained true over the study period.

Key words:

Body mass index; Underweight; Obesity; Socioeconomic status, Multiple Regression, India.

A Case Study to Present the Historic Authenticity of the Spatial Morphology of Historic Districts: Take Nanluoguxiang and Beiluoguxiang Area of Beijing as an Example

Zhao Huanxi

College of Resource Environment and Tourism, Capital Normal University, Beijing, 100048, P. R. China,

zhaohx@cnu.edu.cn

Abstract

In the field of historic districts of Beijing, the discussion concerning spatial morphology still have spaces for further studying. Recent achievements about spatial morphology of historic districts mainly focus on the viewpoint of district planning and architecture preservations. With regard to the authenticity of historic districts, the discussion is relatively few. Historic districts today take root in the spatial morphology of the districts in historical periods. Therefore, deeply analysing these districts in ancient time, and comparing the spatial morphology in certain period of history to today's situation, would be helpful for exploring cultural geography of certain districts in the past and present, and could be meaningful for the sustainable developments of historic districts in the future. This study will also help us to rethink the questions of what the spatial morphology of these districts should be embodied today that homogenization of districts can be avoided, and what the range of restoration of a historic district should be presented. This paper will take the Nanluoguxiang and Beiluoguxiang area as an example, comparing district morphology between Qing dynasty and the present. As to the Qing period, the main research materials used in this article are <Qianlong JingchengQuantu> and other historical documents, base on which the actual patterning of these two districts in Qing dynasty will be presented; and as to the comparing study part, this paper will focus on the differences of overall layouts, base on which can give reference to today's heritage conservations and tourism developments of these areas.

Key words:

historic districts; historic authenticity; spatial morphology

An 'Absent Presence' – New Zealand and the International Geographical Congress

1895 to 1952

Michael Roche

School of People Environment and Planning, Massey University, PB 11-222 Palmerston North, New Zealand 4410,
m.m.roche@massey.ac.nz

Abstract

As a prequel to the centenary of the IGU in 2020, this paper will discuss the connections that have been made since the late 19th century between New Zealand and the IGC up to the 1952 IGU Congress in Washington. This commentary will be positioned against both a larger backdrop of the development of university geography in New Zealand since 1937 and the relationship between New Zealand geographers and the IGU since 1952 which forms a larger project. The main focus will however be one the way in which New Zealand featured as an example in the work of others at early IGU Congresses, to the era when New Zealand was included as part of the British Empire, and finally to the first direct New Zealand representation in 1949 and 1952. Consideration will be given to how New Zealand geographers represented themselves and New Zealand to the wider geographical community.

Key words:

New Zealand; International Geographical Union

Aspects of Borders That Create Discontinuity in the Ryukyu Archipelago: A Study of Cultural Territoriality

Naoki Oshiro

Meiji University, Japan, oshiro@meiji.ac.jp

Abstract

This report investigates the relationships between culture, politics, and borders in the Ryukyu Archipelago. Two subjects will be dealt with. The first is an attitude toward borders that has become familiar to us in modern times. It is not based on an open territorialism in which the influence of imperial and monarchical centers of power is weakened (a concept that the formation of the modern nation-state erased). Rather, this outlook is founded on a xenophobic value system that highlights the binary opposition between “us” and “them,” “inside” and “outside,” in which the territory is bounded by a closed curve. The second issue covered in this report is how political discontinuity (that is, the formation of borders) interrupted the cultural innovation transmitted in concentric circles from these pre-modern, open centers; this subject is discussed with reference to examples from pre-modern times. In both cases, reference is made to the theme of the “between-ness” of this land, bordered by Amami and Okinawa, the southern and northern extremes of the Ryukyu Islands.

First, the report discusses graves, which are physical manifestations of these themes. The morphological discontinuity between Amami and Okinawa came about in the following manner. When the Satsuma Han invaded the Ryukyu Kingdom in 1609, and the Ryukyu Kingdom surrendered, the Amami Islands were ceded and came under the direct control of the Satsuma Han. Thus, the political relationship between Amami and Ryukyu was severed; at the same time, cultural diffusion was also cut off. This discontinuity must be considered alongside the possibility of basic continuity. To this end, it is necessary to consider the interactions between physical changes and shifts in value systems.

Next, the report considers the treatment of “native” lifestyles under the nation-state in Ryukyu/Okinawa after it became part of Japan through the so-called “Disposition of Ryukyu” in 1879 (that is, when feudal domains were abolished and prefectures established in their place). The relationship with China – to which the Ryukyu Kingdom paid tribute and by which it was granted official status in pre-modern times – was severed, and the “discovery” of “the thing called Okinawa” as a “mirror of ancient Japan” served as a significant turning point in Okinawa’s folk customs. The discovery that temporally “distant” things remained in this spatially “distant” land, one of the ideological paradigms of Japanese folklore studies, has been the target of criticism in recent years. From this point onward, the influence of Chinese culture upon Okinawa began to weaken. We can understand this as another case in which the drawing of national borders dissolved something that had continuously existed until that point, and meanings changed as a new value system took hold.

Key words:

border; historicity; territoriality; folk geography; Ryukyu archipelago

Conceptual History and Historical Geography

GAEBLER, Karsten

Friedrich-Schiller University Jena, Department of Social Geography, Jena, Germany,
karsten.gaebler@uni-jena.de

Abstract

Although conceptual history and historical semantics have gained remarkable scientific attention in historiography as well as in social and cultural studies, their impact in geography has so far been comparatively low. With the ascent of non-representational approaches in social and cultural geography, criticism to language-centered approaches has arisen and a shift towards investigating practices and performances seems to have occurred.

However, this paper argues that the conceptual history approach not only helps understand the constitution of past geographical realities, but also has the potential to enlighten theoretical debates about the relationship between concepts and “reality”. With its focus on genealogies and the historical change of meanings in language use, conceptual history carves out society’s (historical and contemporary) self descriptions and offers an interesting bridge between language- and practice-centered approaches.

Using the example of geographical language games like “time-space compression”, the “death of distance” or the “annihilation of time and space”, I will trace back some of the genealogies of today’s spatio-temporal language. In particular, this paper will highlight the specific metaphors that emerged with the introduction of the railway and the telegraph in the 19th century and thus call attention to the semantic continuities and discontinuities in describing (historical) society-space relationships.

Key words:

historical geography; conceptual history; society-space relationships; social and cultural geography; time-space compression; spatial language

Concisely Survey on Rivers' System and the Environment of Waterscapes Recorded in *the Book of Songs*

Jie-sheng AN

Centre of Historical Geographical Study, Fudan University, Shanghai, China, jsan@fudan.edu.cn

Abstract

As a kind of important data and document about the Pre-Qin time of China, *the Book of Songs* surely provided much valuable information about the geographical condition of that time, including rivers' system and natural environment. The history of many ancient kingdoms in pre-Qin time fixed a relation with some rivers that could be called by the name of "Mother River". Many important rivers, that covered the central part of China, could be found out in *the Book of Songs*, and peoples had realized that these rivers made up two giant systems, the Yellow River and Yangtze River, that all finally flows into the sea. There were numerous descriptions about river and waterscape in many songs. Rivers and waterscapes made an important part of the environment of that time. A lot of aquatic plants and birds could easily be found out in these songs. Boats made by wood of cypress and poplar were the popular transport tools to cross river. Fishing was also an essential industry for peoples' living and many writers of songs extolled the taste of fish-dishes. So the author of this paper wants to emphasize that the Book of Songs gives us some valuable clues and angles of observation to study the environment of China in the pre-Qin Time.

Key words:

Rivers' System; Environment; Waterscape; *the Book of Songs*

Footprints of the Past: Reimagining Darjeeling through Conversations with the Colonial Accounts

Aparajita De, Rajib Nandi

India, University of Delhi, ade.dse@gmail.com

Abstract

It was largely the colonial administrators and travellers who started documenting and archiving ecological and social aspects of the eastern Himalayas. A substantive part of these studies were developed for the administrative purposes but later became the primary source of data for researchers writing on the eastern Himalayas and sub-Himalayan Bengal. In Darjeeling, a large volume of local writings is on social and political issues that have become a focal point of today's Gorkhaland movement. For the local authors, colonial documents serve as crucial reference point in writing the history and geography of the region. Colonial accounts on one hand contribute to the knowledge building but on the other add a layer of politics through developing colonial categories and methods of analysis. The paper argues that local writings are not mere products of apolitical memories and personal experiences alone but engage with and is highly influenced, consciously or unconsciously, by a set of power relations within which people place themselves in. Thus, they are in a continual dialogue with the colonial literature at times in agreement and at others in resistance to it. This brings us to the main argument of the paper - the epochal division of past and present is a constantly evolving line that stresses the inter-connections between the social and political landscape of past and the present where past cannot be seen in isolation but is subjected to the demands of the present within a complex spatio-temporal nexus between past, present and future.

Key words:

Mapping the past; politics of knowledge creation; landscapes; colonial knowledge; local writings; Darjeeling; India

Geography at the Turn of the Nineteenth Century: A Preliminary Study on the Naval Chronicle (1799-1818)

Yannan Ding

Shanghai Jiao Tong University, Shanghai, 200240, P. R. China, dingyannan@sjtu.edu.cn

Abstract

In the last two decades, historians of science have been attracted to the social and spatial dimensions of scientific knowledge. To understand the production of scientific knowledge is to understand, among other aspects, the place where it takes place. In deed, there is an emerging field of the ‘historical geography of science’ (as per Naylor 2005). In the same vein, geography as a discipline is also under scrutiny. What counts as geography in early modern times, for instance, is a heatedly debated question. New studies have taken a more holistic and contextualized approach. In particular, researchers have found that, contrary to previous conceptions, the eighteenth century is a remarkable era of exploration and discovery (Withers 2006; Withers and Mayhew 2011). Geographical knowledge circulates not only via conventional means, such as books, maps and globes, but also in less tangible ways such as personal and societal communications (Ogborn 2002; Livingstone 2007). The pivotal transition from pre-modern to modern geography later in the nineteenth century is not conceivable without the rich accumulations from the eighteenth century to early nineteenth century. In this paper I will present a preliminary examination on a rich and yet understudied reserve of geographical knowledge produced at the turn of the nineteenth century. The Naval Chronicle (1799-1818) includes many first-hand observations and communications from Royal Navy officers and mariners. It is unquestionably the best and most comprehensive collection of geographical knowledge in early nineteenth century.

Key words:

Geographical knowledge; Naval Chronicle; History of geography; Nineteenth century; Britain

Histoire de la géographie / Géographie historique: deux genres différents du discours géographique

Berdoulay V.

Université de Pau, Pau, France, vincent.berdoulay@univ-pau.fr

Résumé

L'histoire de la géographie a souvent été confondue avec la géographie historique. C'est une tendance qui revient actuellement, notamment dans la géographie anglophone. Il y a certes des avantages à cette position. Mais je vais présenter, dans cette communication, le point de vue contraire et je vais proposer une façon de conceptualiser leur contribution respective à partir de la notion de genre du discours géographique.

Premièrement, je montre quelles sont les raisons d'une relation bénéfique, mais ambiguë, de l'histoire de la géographie et de la géographie historique. Deuxièmement, je montre qu'il y a une vraie régression épistémologique si une confusion est établie entre les deux domaines de recherche. Troisièmement, j'insiste sur l'intérêt d'aborder leur relations en les considérant comme des genres différents du discours géographique, qui ont chacun leur originalité propre. L'histoire de la géographie implique une réflexivité particulière, celle d'un géographe-sujet à saisir du point de vue géographique (avec les lieux qui le conditionnent et qu'il contribue à fabriquer), dont le point de vue est à la fois décentré, narratif et prospectif.

Mots-clés :

histoire de la géographie; géographie historique; genre du discours

Indian Ocean Toponyms in Idrisi: Between Text and Maps

Tolmacheva, M.A.

Washington State University, Pullman, WA 99164-4030, U.S.A., tolmache@wsu.edu

Abstract

This paper focuses on some historical Indian Ocean placenames in the world geography of the 12th-century Arab scholar al-Idrisi. Composed in Sicily in the middle of the 12th century, *Nuzhat al-Mushtaq* (“Entertainment for the Desirous of Travel”), was highly regarded and often quoted by later Islamic cosmographers, but the accompanying maps were much less frequently copied or imitated. In Palermo Idrisi had access to European and Arabic sources, and his world map has long been recognized as influenced by Ptolemy. Idrisi’s descriptive information includes a mixture of ancient Greek and medieval Arab narratives, but Idrisi the cartographer created a unique system of dividing the Inhabited Quarter of the earth into rectangular sectional maps. His projection significantly distorts the representation of the Indian Ocean, especially the East African coast.

The paper first examines the extent to which the sectional maps of the Indian Ocean correspond to the information from the *Nuzhat al-Mushtaq*. Following the Greeks, Idrisi begins his description of the Inhabited Quarter in the west and numbers the latitudinal climates from the Equator to the Polar Circle. Unlike Ptolemy, however, he does not use degree coordinates for placename location. Next, the paper looks at Idrisi’s own abbreviated version of the *Nuzhat al-mushtaq*, titled *Uns al-muhaj wa-rawd al-furaj*. Despite the much condensed narrative, this version is also provided with sectional maps. Both the text and the maps will be compared with the better known maps and text of the extended *Geography* for the southern/East African Indian Ocean sections.

Key words:

Medieval geography; Islamic cartography; Indian Ocean; Idrisi; East African coast

Internal and External Spaces of Reality-Borrowing Animation

A Certain Magic Index and Its 'location' (Tachikawa, Japan)

Aramata M

Toyo University, Tokyo, Japan, hzk01607@nifty.com

Abstract

Japanese animations often represent real landscapes within their settings. Recently, there has been a trend wherein spectators visit the 'location' sites. This phenomenon is called 'pilgrimage' or 'animation tourism' ('content tourism'). Many geographical studies are published to use it as a tool of activation of the area, and there have been already examples of effective communication between animation-focused visitors and local communities. However when people visit a location, they see the place through an animation and the local community tries not to disappoint them. Therefore, a pertinent question is how animations represent, cut, and hide the local realities. In this paper, I would like to show a plausible collaborative work of visitors and local community in order to hide the history of the city. To this end, I would like to use a methodology of literary research. A Japanese scholar, Maeda Ai, analysed 'internal space' of texts, which refers to the elements read in the works of literature from the perspective of space. He compared it with real space and time and showed that the two spaces are related but different. This paper analyses the 'internal space' of a science-fiction animation *A Certain Magic Index*. It uses the landscapes of Tachikawa City in a thoughtful manner. Further, Tachikawa Bureau of Tourism has organised animation-related events for visitors. The animation looks successful, but it does not mention the military history of the area, and that phenomenon could help the authorities who want to change the image of the city.

Key words:

animation, location visit, internal space, Tachikawa city

L'histoire de la géographie comme l'histoire de l'espace

ESPINOSA, Rolando; HERNÁNDEZ, Keren Hapuc

Doctorat en Géographie-Université Nationale Autonome du Mexique, Mexico, Mexique,

rolando_eh@comunidad.unam.mx

Résumé

Pour Henri Lefebvre —un des penseurs les plus influents dans la géographie sociale et dans l'urbanisme—, l'histoire de notre société est aussi, au fond, une *histoire de l'espace*. Néanmoins, cette question —proposée à l'origine, en 1941, par l'historien suisse Siegfried Giedion— ne se limite pas à la recherche sur la production, le développement et le crépuscule des espaces sociaux, c'est à dire, autour les conditions qui ont permis la fondation des civilisations dans certains territoires. L'histoire de l'espace comprend également l'histoire des manières dont l'espace même a été conçu ou théorisé : par les philosophes, les mathématicques, les architectes, les géographes, etc. Si on assume l'histoire de la géographie comme l'histoire de l'espace —selon la formulation de Lefebvre— on est encouragé à rendre compte de la relation réciproque —harmonieuse ou conflictuelle— entre les modes historiques de production de les espaces sociaux et les conceptualisations sur la spatialité environnante. Mais, comment cette proposition théorique pourrait contribuer au développement de la géographie aujourd'hui ? Répondre à cette question, c'est précisément le but de cette présentation.

Mots clés:

Histoire de la géographie ; histoire de l'espace ; production de l'espace ; Henri Lefebvre

Les écrits privés des géographes : des objets de recherche comme les autres ?

Pascal Clerc

Université Claude Bernard Lyon 1, France, clercpascal@wanadoo.fr

Résumé

Le savoir géographique s'expose dans des livres et des articles, des communications et des conférences. Il est conservé principalement sous la forme d'imprimés (et de fichiers numériques aujourd'hui). Ce sont ces supports textuels et/ou iconographiques, plus rarement sonores, qui constituent l'essentiel des corpus sur lesquels les historien(ne)s de la géographie s'appuient. Ces supports (livres, articles, entretiens, photos, cartes, graphiques, enregistrements...) ont en commun la caractéristique de circuler dans la sphère publique, au moins dans le petit monde des géographes, et de participer au développement des savoirs disciplinaires.

Mais en amont ou parallèlement à cette production académique, les géographes, comme chercheurs/chercheuses et comme individus, produisent de nombreux écrits⁶ qui n'ont pas vocation à être diffusés. Je les désigne ici comme des écrits privés.

Avec cette proposition, mon objectif est double : commencer à établir un état des lieux de ces productions, dans une perspective programmatique, et réfléchir au sens que cela peut avoir de les intégrer dans une recherche lorsque l'on est historien(ne) de la géographie.

La première étape sera de définir ce que l'on peut entendre par « écrit privé ». Au sens le plus étroit, l'écrit privé relève de la sphère intime : on écrit pour soi (le journal intime) ou on écrit à d'autres (la correspondance). Une autre approche concerne tous les écrits professionnels qui ne sont pas destinés à être publiés. Ce sont des productions intermédiaires, préparatoires, des brouillons, des épreuves. Elles prennent la forme de carnets de terrain dans lesquels des croquis sont intégrés, de photos, d'esquisses de cartes, de schémas griffonnés sur des feuilles volantes, de notes diverses... À l'articulation de l'intime et du professionnel peut être identifié un autre genre : le récit de voyage, dont la spécificité est de passer parfois dans la sphère publique.

L'ensemble de ces productions constitue un immense corpus, souvent peu accessible, parfois peu connu, et posant en outre des problèmes de compréhension lorsque l'écriture des auteur(e)s est peu lisible ou en raison des ellipses, sous-entendus, raccourcis que prend celui ou celle qui écrit pour lui-même ou elle-même.

Je m'interrogerai ensuite sur l'intérêt et les limites de ce type de corpus en m'appuyant à la fois sur des travaux de recherche le mobilisant et sur des écrits privés non encore analysés. Ainsi les carnets de terrain de Paul Vidal de la Blache, ceux de Jean Dresch, la correspondance d'Albert Demangeon, le journal intime de Maurice Zimmermann ou les récits de voyage de Jacques Weulersse seront notamment questionnés.

Mots-clés :

Écrit privé ; histoire de la géographie

On Geographical Landscapes of Canton in the First Half of 19th Century: Based on *Chinese Repository*

Wu Hongqi, Liu Yuqiong

Historical Geographic Research Center of Jinan University, Guangzhou, 510632, P. R. China, liuyuqiong06@163.com

Abstract

Chinese Repository, published in Guangzhou, etc. from 1832 to 1851, was a comprehensive English journal edited by several missionaries such as Elijah Coleman Bridgman. It aimed to provide all-sided introductions of China to Western world, and made many reports concerning Canton geographic situation. These reports not only dealt with Canton physical geographic landscapes including geomorphology, climate, rivers and coast, but also recorded human landscapes in Canton such as administrative divisions, agricultural production landscapes and traffic landscapes. Based on Chinese Repository mainly and other Chinese historical materials, this paper investigates Western society's intuitive descriptions and scientific measurements on Canton geography in the first half of 19th century, with expectations to restore Canton's geographic condition at that time and facilitate to examine Canton's historical geographic conditions at different periods.

Key words:

Chinese Repository; Canton; physical geographic landscapes; human geographic landscapes

Opening Geography to the General Public: Towards a Genealogy of the International Geographical Exhibitions in Europe (1871-1902)

Shimazu T

Wakayama University, Wakayama, 640-8510, Japan, shimazu@center.wakayama-u.ac.jp

Abstract

Historians of geography have recently recognized that geography has not a single, seamless history but multiple, spatially differentiated histories. It follows from this that these multiple histories presuppose multiple geographies, that is, varied geographical thoughts and practices. Included in those are geographical exhibitions, which have rarely been touched in the historiography of geography. A geographical exhibition refers to an event where are displayed such items as maps, atlases, geography or travel books, globes, and surveying instruments. It has been valued by geography teachers as facilitating geographic literacy and skills. In the late nineteenth century West, however, the events called “geographical exhibition” or “geographical exposition” could be larger in scale. They were occasionally held as national or international events. This paper focuses on the genealogical thread and meaning of the international geographical exhibition in Europe. It originated as a public event accompanying the first international geographical congress held in Antwerp in 1871. Subsequent international congresses, the second in Paris (1875), the third in Venice (1881), the fifth in Berne (1891), and the sixth in London (1895), had respectively their own geographical exhibition. The fourth congress in Paris was itself held in connection with the Exposition Universelle in 1889. The seventh congress in Berlin (1899) had no official exhibition. Instead Antwerp again hosted an international geographical exhibition in 1902. These were supported by the state, the local government, or the geographical societies. They were intended to popularize the content of geography, and in doing so, to naturalize European supremacy and colonialism.

Key words:

history of geography; international geographical congress; geographical societies; colonialism

Photography, the Rural Landscape, and Geographical Imagination in Japan in the Early Twentieth Century

Fukuda, T.

Osaka Prefecture University, Sakai, Japan, tamami@hs.osakafu-u.ac.jp

Abstract

Since its introduction, photography has been a powerful tool in our engagement with the world, and scholars and critics in a wide range of disciplines have conducted debates over the role of photography from the viewpoints of vision and modernity. Geographers are not exceptional; they have investigated photography for picturing places and fostering geographical imagination. Photography plays an important role when geographical facts are ordered and images of places and landscapes are constructed. This paper focuses on landscape photography of the early twentieth century in Japan. Based on the investigation of pictures in the photography magazine *Asahi Camera*, which was first published in 1926 for a nationwide society of amateur photographers, the All-Japan Association of Photographic Societies, it explores how the rural landscape was represented. Representation is more than an image; in this case, it was an idea regarding the rural landscape that was socially constructed. Thus, this paper discusses the ways in which the geographical imagination associated with the Japanese rural landscape was produced and reinforced according to other social practices, including global trends in photography and the production of geographical knowledge through photography in the discipline of geography.

Russian Orthodox Mission in Beijing: Geographical and Topographical Investigation in the First Half of the XIX Century

Feklova T.Yu.

Saint-Petersburg Branch of the Institute for the History of science and thechnology, Russian Academy of sciences.

University emb., 5, Saint-Petersburg, Russia, 199034. Tat-feklova@yandex.ru

Abstract

From the XVII century, China entered the sphere of interest of the Russian Empire. Russia has managed to obtain from the Chinese government permission to establish an Orthodox Mission in Beijing. In addition to the priests of the Orthodox mission included scientists from the Russian Academy of sciences, who, under the auspices of the mission have been studying the country closed to foreigners. Not only scientists, but also priest under the rule of the instructions on the Russian Academy of sciences made the ethnographical, zoological and botanical investigations. The geographical and topographical investigations were one of the main task for the Russian scientists and members of the Russian Orthodox mission. Due to the interaction of scientists of the Academy of sciences and Beijing Orthodox Mission in the XIX century, Russian science has been enriched by the knowledge of the closed Chine Empire. The investigation, which were held by the Russian scientists have a major positive impact, both on the development of Russian-Chinese political relations and the cross-cultural ties between Russia and China.

Sanitation, Modernity and Subject: Contradictory Processes of Introduction of New System in Modern Japan

ONJO AKIO

Kyushu University, Fukuoka, Japan, aonjo@lit.kyushu-u.ac.jp

Abstract

The contradictory processes of 'introduction' or 'translation' of new system and its establishment are one of basic issues of the research of geographical thought. After Meiji Restoration, Japanese society introduced new ideas and technologies, social and economic systems and built environments from West. Especially, the introduction of 'sanitation system (Germany: Gesundheitspflege)' was a large project, because it included not only the issues of 'public health' and 'illness' or 'disease', but also infrastructures like sewage, urban planning and various social organizations. It also matters as ideas and as materials. So this process had an impact on the discursive and bodily practices, perception of environment and social relationships of the people in everyday urban life. This paper examines specific ways in which sanitation project matters in modern Japan politically and socially. By highlighting an important role of 'Neighborhood Sanitation Association' that aimed to produce a self-governing and moral subject through mutual surveillance, this paper traces historical geography of unequal and contested sanitization and urbanization.

Key words:

sanitation system; subject; modern Japan; neighborhood sanitation association

She Speaks: An Oral History of Women in American Geography Today

DeVivo, M.S.

Grand Rapids Community College, Grand Rapids, MI, USA, mdevivo@grcc.edu

Abstract

Oral history became recognized for its inestimable value in charting the course of the geographic discipline shortly after the birth of *Geographers on Film*. Its architect, Maynard Weston Dow, initiated the series in 1970 with an interview of Carl Sauer, and soon thereafter he filmed conversations with other luminaries in the field. Also in the 1970s and 1980s, Anne Buttimer made a tremendous contribution to geographic thought with the *Dialogue Project*, a production of numerous interviews with notable geographers. Regardless, Dow's series persisted until after the turn of the century; before he passed away in 2011, more than 300 interviews were completed. Within weeks of Dow's passing, the *Conversation with a Geographer* oral history series was founded, resulting in a number of filmed interviews on the GRCC TV YouTube network, which have exceeded 5000 views; most of the subjects interviewed are women in American Geography who reflect on the paths they trod, the leaders that inspired them, and their own roles as mentors and scholars. The majority of students in American colleges and universities are also women, and the number pursuing Geography as a major field of study is increasing. Indeed, as many have found inspiration in shaping their own futures by pondering the accounts related in the *Conversation with a Geographer* series, oral history has been shown to be pedagogically priceless. This paper offers a glimpse of this endeavor in the history of Geography and discusses how it may be emulated in academic Geography departments across the globe.

Spatial Dimensions in the Classical Geography of China

HAN G

College of Resources and Environmental Sciences, Hunan Normal University, Changsha, 410081,
P. R. China, hanguang@hunnu.edu.cn

Abstract

Classical Chinese geography (before 1900) is characterized by deeply rooting in daily life and firmly focusing on application to social realities. It, on one hand, endeavours to understand the surrounding settings in order to guide socio-economic activities, on the other hand, seeks to learn remote environments by trade, military action, religion mission, colonization, and the like, to enlarge spatial visions of ancient China for the sake of safety and communication. Historically, styles of farming and living govern the size and distance of settlements such as house, village, town and city for the purposes of convenience and efficiency. The capacities of both man's physical power and transport facilities limit spatial dimensions of administrative divisions, and political, economical, military and diplomatic needs define the spatial extremes. What is more, the perception of spatial dimension varies considerably not only amongst governors, officials, merchants, soldiers and generals, and farmers and herdsman, but also between historical periods or dynasties.

Key words:

spatial dimension; settlement size; styles of farming and living; transport facilities; man's physical power; administrative management

Studies on Romania by the French geographer Emm. De Martonne

Bălteanu D., Ielenicz M.

Institute of Geography, Romanian Academy, Bucharest, 023993, Romania, igar@geoinst.ro

Abstract

An outstanding personality of French and international geography, Emm. De Martonne is known primarily for his *Treatise of Physical Geography* and Geomorphological works and also for the activity he discharged as General Secretary and President of the International Geographical Union. Between 1897 and 1947, Emm. De Martonne paid numerous visits to Romania, publishing over 70 scientific works on a wide range of subjects in the following areas:

Geomorphological studies on the denudation platforms and glaciation in the Romanian Southern Carpathians (*Les Alpes de Transylvanie*), the Subcarpathian relief, river terraces, neotectonic movements, and several extreme phenomena, e.g. strong earthquakes and floods;

Studies on population distribution and density, maps of nationalities in Transylvania, transhumant shepherding; studies of toponymy and rural geography;

Regional and monographic studies on Romania and on some Romanian provinces, e.g. *La Valachie* (1902), *La Dobroudja* (1918), *La Bessarabie* (1919).

Among De Martonne's contribution to the development of Romanian geography, we would recall the courses held at the Cluj University (1921), the lectures delivered at the Royal Geographical Society of Romania, the organization of inter-university trips, he also helping some young Romanian Geographers to enrol at Sorbonne University.

Studying Urban Areas from the Spanish Geography, Past and Present

Delgado-Viñas, C.

University of Cantabria, Santander, Spain, carmen.delgado@unican.es

Abstract

Geography has found in urban areas an attractant challenge. Generally, geographers have understood the city as a subject in itself, as an active element, in permanent construction and reconstruction to the beat of historical socio-economic changes. In line with these premises, my research has consisted of a historiographical analysis on the approaches to the city from the Spanish Urban Geography. I have studied the evolution of the research that the Spanish geography has made about the cities since the early twentieth century to the present.

The first geographic researches about the Spanish cities were elaborated in the thirties of the twentieth century and continued after the end of the Civil War, following the paradigm and methodology of French Geography of the first decades of the century.

The Spanish Urban Geography reached its highest growth since the 1970s, while there was a significant expansion of the space field of study of urban geography and, on the other hand, a great epistemological and methodological renewal.

At the global level, urban areas have experienced large changes since the nineties of the twentieth century, especially due to the processes related to globalization. Since then, the Spanish Urban Geography has been evolving in several directions. On the one hand, there has been a notable increase in the number of researchers working in this field of study. On the other, have been diversified even further the issues under discussion, has reinforced the approach to urban planning and there has been a relative estrangement from history.

Key words:

Urban historiography; Urban historical geography; Urban Geography, Urban History, Urbanism, Cities, Urban areas.

The 60th Anniversary of the International Conference of IGU in Rio De Janeiro: On Turning Points and Controversies

Lamego, M.

State University of Rio de Janeiro, Rio de Janeiro, Brazil, marilamego@gmail.com

Abstract

Exactly sixty years ago, Brazilian geography had lived a turning point in occasion of the 18th International Conference of IGU, held in Rio de Janeiro, Brazil. The importance of that reunion could not be neglected by any researcher interested on the histories of Brazilian geography (Schimdt 1995; Monteiro, 1975). After a so called period of implementation of scientific geography in Brazil, from the mid-1930s, the 18th International Conference of IGU represents a huge and unprecedented effort of affirmation of Brazilian scientific geography, since it was a reunion of producers of geographical knowledge agents engaged in different projects. Despite their distinctive disciplinary views, teachers and professors, researchers from institutions such as the National Council of Geography, the Military Geographic Services, the Association of Brazilian Geographers and the Pan American Institute of Geography and History, among others, throw themselves on the challenge of organizing and carrying out the first IGU congress in Latin America. Taking into account this recognized turning point, the present paper seeks to bring some light of that episode, focusing on its facts, acts and actors, in order to outline some of the main impacts on the construction of Brazilian geographical knowledge. My ultimate intent is to explore some methodological controversies in Brazilian geography which are manifest in the rich produced material before and after the conference.

Key words:

The 18th International Conference of IGU; Brazilian geography; turning point; methodological controversies

The 1825 Street-Map of Fribourg (Switzerland) as First Modern Geography Lesson

Le Plan de Fribourg en Suisse de 1825 comme première leçon de géographie moderne

Minder P.

CERF, University of Fribourg, Switzerland, patrick.minder@unifr.ch

Résumé

One of the greatest Europeans pedagogues Father Gregoire Girard of Fribourg (Switzerland) was the author of numerous books on methodology dedicated to education on many subjects. He was the assessor of Pestalozzi, who recognized him as one of his peers. Celebrated all over Europe, he took a great interest in the renewal and the development of the nascent geography on new bases.

His main idea was to reverse the view of the geographical approach, until then classic, starting from the specific — the known and moving towards the general — the unknown. This new approach to geographical science was applied by developing a new street-map of the city of Fribourg accompanied by an explanatory book and by a small brochure created more specifically for teachers.

To mark the 250th anniversary of the birth of Gregoire Girard, our research has provided a better understanding of the process at the origin of his project. Contrary to the misconception, his method was the subject of wide diffusion; the immediate effects being delayed by a difficult context.

Today, the heritage of the Girard's method is firmly established in the teaching practise but also in the approach to urban or cultural geography.

L'un des plus grands pédagogues européens, le Père Grégoire Girard de Fribourg (Suisse), fut l'auteur de plusieurs ouvrages de méthodologie destinée à l'éducation pour de nombreuses matières. Il fut l'évaluateur de Pestalozzi, qui le reconnut comme l'un de ses pairs. Célébré dans toute l'Europe, il s'intéressa à renouveler et à développer la géographie naissante sur de nouvelles bases.

Son idée principale a été d'inverser la perspective de l'approche géographique, jusqu'alors classique, en partant du particulier, du connu, pour aller vers le général, vers l'inconnu. Cette nouvelle façon d'envisager la science géographique trouva son application dans l'élaboration d'un plan de la ville de Fribourg, assorti d'un ouvrage explicatif et d'une notice destinée plus particulièrement aux enseignants.

A l'occasion du 250^e anniversaire de la naissance de Grégoire Girard, notre recherche a permis de mieux comprendre la démarche à l'origine de son projet. Contrairement à l'idée reçue, sa méthode a été l'objet d'une large diffusion dont les effets immédiats ont été retardés par un contexte difficile.

Aujourd'hui, l'héritage de la méthode de Girard est solidement ancré dans les pratiques de l'enseignement mais aussi dans la manière d'aborder la géographie urbaine ou culturelle.

The First Draft of the French Concept of Pioneering Fringe Produced by Pierre Monbeig (1930-1935)

Lira, L. A.

USP, EHESS, São Paulo, Paris, Brazil, France, lara.lira@gmail.com

Abstract

Pierre Monbeig (1908-1987) was a French geographer graduated from Sorbonne between 1924/1925 and 1929 and rooted in the prestigious school of Vidal de la Blache. After these studies, he spent a short period in Spain (1930- 1932), during which he tried to write his first PhD thesis regarding the Balearic Islands (Spain). However, on occasion of the outbreak of the Civil War in Spain in 1936, he gave up his first PhD project. Then, his subject matter changed so as to highlight the pioneering occupation of São Paulo and after had been invited by the French diplomacy to teach geography in Brazil. Thanks to his courses and research, Pierre Monbeig played an important role concerning the foundation of the Brazilian academic geographic tradition. From the contributions of an intellectual history focused on continuities, we shall attempt to point out, at first, the definition of the pioneering occupation as a network of American and French traditions. As a matter of fact, he then incorporates contributions from American geographer Isaiah Bowman whose book *The Pioneer Fringe* appeared in 1931. However, we may argue that the first draft of the pioneering fringe lands model, which was supposedly developed later (the publication of *Pionniers et Planteurs de São Paulo* dates from 1952) had already been present in his studies during the period ranging from 1930 to 1932 in Spain, therefore prior to his arrival in Brazil (1935) and also previously to the incorporation of contributions from the American geographer supposed dating from circa 1935.

The Legacy of Political Geography in Sweden

Stjernström, Olof

Department of Geography and Economic History, Umeå University, SE-901 87 UMEÅ, Sweden

Olof.stjernstrom@umu.se

Abstract

In this paper the story of the Swedish contribution to the early 20th century political geography is described and analysed. From Kjellén to contemporary issues in the Swedish Geographical Society. Swedish Geography and Swedish Geographers were rather influential before WWII. The traditional political geography research tradition came to an end in Sweden 1945. A more neutral quantitative based geographical research was emphasized. Swedish geography developed in accordance to the international geography in that matter. Two important directions however characterise Swedish post war geography. Firstly, physical and human geography diverged and the legacy of political geography was never discussed. The paper analyses the development of Swedish geography with a focus on how the post war geographical tradition in Sweden dealt with its history. The paper also discusses the importance of a nuanced understanding of geographical representations, maps in particular, and the problematic power of maps and how that relates to the legacy of political geography.

The Normal Way: Exploring the Careers Paths of Early Women

Geographers in the United States: 1880-1950

Monk, J

School of Geography and Development, University of Arizona, Tucson, AZ 85721, U.S.A.

jmonk@email.arizona.edu

Abstract

In the late 19th century with expansion of public education in the United States, women became significant as faculty in “Normal Schools”, institutions that were designed to prepare teachers of children, including the teaching of geography, for the expanding public schools. In contrast geography was marginal in most colleges and universities. In this presentation I will explore how women geographers in such institutions came to, approached, and experienced their work. In addition to teaching, their activities included publishing on approaches to geographic education, writing text books, and being active within the National Council of Geography Teachers (later known as the National Council for Geographic Education). After outlining the larger context, I will present case studies emphasizing two institutions, highlighting transformations in the place of women within them as the normal schools were “upgraded,” first to state teachers colleges and then to universities. In the process, men geographers came to be preferred as faculty. In exploring the women’s pathways I will review their educational backgrounds, approaches to teaching, relations with colleagues, and leadership roles they played in the profession, illustrating how the history of our discipline is shaped by institutional cultures and, in particular, how ideas about gender have permeated the history of higher education and of our profession.

The Reconstruction of Geography: 1950s in P.R. China

Jiuchen ZHANG

Institute for the History of Natural Sciences, CAS, Beijing 100190, P.R. China, zjc@ihns.ac.cn

Abstract

The movement on scientific critique and "Learning from Soviet Union", which began in the early period of P.R. China, had deal with a wide range and gone for a long time. Therefore, it had a deep influence on Chinese scientific development and discipline construction. Taking geography as a case study, this paper analysis the reasons, contents and characteristics of scientific discipline reconstruction and the changing of geographical classification system in 1950s. Meanwhile studies the influence of the movements of scientific critique and Learning from Soviet Union on geography. From this study, the paper would explore the relationship between science and society.

The Genglubu's Construction Founction to Marine Silk Road of the Pattern of the South China Sea

Zhaoliang, Zhangzhengsheng

School of Geography, South China Normal University, China, zlookbook@163.com

Abstract

According to sailing experience, generations of Hainan fishermen have been compiled a road book called Genglubu, which is an important navigation guide book for ancient Maritime Silk Road and records the Chinese history. Its function as a sailing direction book is gradually fade out, on the contrary, the book, bearing the ancient Chinese cultural, political attribution, has huge significance in the construction of spatial pattern of the South China Sea area. Genglubu and Maritime Silk Road are interrelated and promoted each other. Genglubu provides a new research idea and theory support for the building of regional spatial structure of the South China Sea.

Key words:

Genglubu; Maritime Silk Road; the South China Sea; spatial pattern

War against War? Arcangelo Ghisleri from Pacifism to Interventism

dell'Agnese E.,

Università di Milano-Bicocca, Milano, Italia, elena.dellagnese@unimib.it

Abstract

Geography has been often accused of being a discipline useful, above all, to make war. Nevertheless, many geographers of the past have been also involved with peace research and peace movements. Between the end of the Nineteenth century and the beginning of the Twentieth, for instance, the anarchist geographers Kropotkin and Reclus (Herb, 2004) promoted the idea that geographic education was a fundamental instrument for the creation of peace. In the same perspective, the Italian geographer Arcangelo Ghisleri he founded journals like “La geografia per tutti” and “Cuore e critica”, in order to demonstrate that there where no scientific bases for gender and racial discriminations. He was also actively engaged against colonial wars. In 1906, together with other Italian exiles in Lugano (like Rensi and Bignami), he founded a journal, “Coenobium”, which motto was “Guerra alla Guerra” (War to war). All the same, as many pacifists of the time (included Nobel Prize winners, like Ernesto Teodoro Moneta), in 1914 Ghisleri embraced the interventionist cause. The paper tries to investigate the reasons of this apparent reversal of attitude, questioning the different meanings that the ideas of peace and of pacifism could have at the time and now, and the difficulties of intercomprehension, not only between different languages, but also between different historical moments.

Key words:

peace; peace movements; Arcangelo Ghisleri

Wu Shangshi-An Outstanding Modern Chinese Geographer as a Third Generation Student of P. Vidal de la Blache, France

Wu, C. Y.

Center of Coastal Ocean Science and Technology Research, Sun Yat-sen University, P. R. China, eeswcy@mail.sysu.edu.cn

Abstract

Wu Shangshi (1904-1947) is considered one of the outstanding modern geographers emerging in the early 20th century in China. It is partly a result of the introduction of modern sciences from the West. Wu graduated as a gold medalist in Sun Yat-sen University in 1928. He was then granted scholarship to study geography in France. His first supervisor was A. Allix of the University of Lyon. In 1932, Wu transferred to the University of Grenoble, the leading school of geography other than that of Paris at the time. His major professor was R. Blanchard, one of the best known students of Vidal de la Blache. M. Pardé, who dedicated all of his life to hydrography, was another one of Wu's supervisors. In 1935, Wu finished his study in France and returned to Sun Yat-sen University to serve as a professor of geography. He was head of the department in 1939-1945 during the Japanese aggression. The university moved constantly to flee the flames of war. The thousands of miles across south and south-west China became Wu's research field. Excessive hard work in tough environments ruined his health. Wu died in 1947 at the age of 43.

Wu's work covered a wide range of disciplines of geography: geomorphology, hydrography, climatology, cartography, regional geography, etc. Most of his research involved a combination of keen observation, incisive logical deduction, broad knowledge and professional instinct. The present paper summarizes Wu's major accomplishments which are scientifically significant to the establishment of modern and contemporary geography in China; and reveals Wu's scientific thought and practice that can be traced to the French schools of geography. However, his accomplishments cannot be fully appreciated without understanding of the significant role that traditional Chinese culture played in his consciousness.

A scientific park is under construction by the City Hall of Guangzhou at the site where Wu identified an ancient wave-cut cliff in 1937. A statue of S.S. Wu will be placed in the park.

A Measurement and Analysis on the Coupling Relationship between Regional Rural Poverty and Ecological Environment: Taking Hunan Province of China as an Example

TIAN Ya_ping ZHENG Wen_wu CHANG Hao ZHANG Qing_shan

The Department of Resource Environment and Travel Management, Hengyang Normal University, Hengyang

421008, China, zhwenwu@163.com

Abstract

Authors established firstly the index system, which consists of poverty index system including per capita net income, the engel coefficient, electricity consumption per capita, the total output value of agriculture, the proportion of agricultural output, single grain output and the total power of agricultural machinery from two dimensions both the rural poverty and backwardness in agricultural production, and of vulnerability index system including the average slope, the annual rainfall, the rainfall proportion in rainy period, the drought index in less rainfall period, soil erosion area ratio, natural disaster area ratio and the cultivated land per capita mainly for the ecological environment vulnerability mechanism in Hunan province from the drought and flood, debris flows, landslides and other natural disasters common in Hunan of China. Next using X-score method for the original data standardization, using analytic hierarchy process (AHP) in the 1-9 scale method to determine the index weight, by weighted sum comprehensive index model, taking 90 counties outside the urban as basic assessment unit, authors calculated the poverty degree and vulnerability degree of all counties, and then taking poverty degree and vulnerability degree as the basic index, computed coupling degree of regional poverty and ecological environment, the calculation formula was as follows:

$$C = f(x)^k \times g(y)^k / [\alpha f(x) + \beta g(y)]^{2k}$$

Among them, $f(x)$ for the ranking position of the poverty degree, $g(y)$ for the ranking position of the vulnerability degree. According to the sorting of the comparative poverty degree and vulnerability degree, the coupling relationship was divided into two sorts of the benign coupling and the malignant coupling, which the benign coupling refers to the poverty degree and vulnerability degree be both low, and the poverty degree sorting be less than the vulnerability degree; malignant coupling refers to the poverty degree and vulnerability degree be both high, and the poverty degree sorting be more than the vulnerability degree.

The calculation results show that: i) 63% counties be ecological environment fragile in Hunan, including 90% state-level poverty-stricken counties and 94% Province designated poor counties; ii) 34.4% counties be height

poverty and extreme poverty, including all state-level poverty-stricken counties and 56% Province designated poor counties; iii) Most of counties be poverty and eco-environment highly coupling, extremely coupling, highly coupled, medium coupling and low coupling counties respectively being 58%, 9%, 21% and 12%; iv) Most of counties be malignant coupling in sort, benign coupling and malignant coupling counties respectively 48% and 52%, and the more high poverty levels be, the more high coupling levels be, and the more high coupling levels be, the greater the malignant coupling proportion be. In all of 20 state-level poverty-stricken counties and 18 provincial and impoverished county, extreme and highly coupled ratio be for 82%, the proportion of benign coupling and malignant coupling be respectively for 42% and 58%. v) The vulnerability, poverty degree and coupling degree shows synchronous regional differences, showed all Great West Hunan > Great South Hunan > North Hunan Around Dongting lake > Chang_Zhu_Tan area of Middle Hunan. In west and southern Hunan, 85% counties were ecological environment fragile and vulnerable; 51% counties in extreme poverty and poverty; 82% counties were ecology and poverty extreme and highly coupled; 92% counties showed malignant coupling; while in North Hunan Around Dongting lake and Chang_Zhu_Tan area of Middle Hunan, 71% counties showed moderate fragile and not fragile, 93% counties in moderate poverty and no poor, 54% counties were ecology and poverty moderate and low coupling, 61% counties performance for the benign coupling.

Key words:

regional rural poverty; analytic hierarchy process; regional rural poverty and ecological environment

Research on the Historical Geography's Mechanism about Evolution of Dalian's Spatial Structure in The Belt and Road Background

Liu Xu

Liaoning Normal University, Dalian, 116029, P. R. China, dutliuxu@sohu.com

Abstract

The evolution of city's spatial structure and sustainable development of region are the very important scientific problem concerned with the researchers of geography, history, and historical geography fields. This paper pays close attention to Dalian which is typical city of the coastal area in modern times. With modern technology, fieldwork and archaeological methods, social investigation and historical documents and so on, we can carry out fundamental research by interdisciplinary methods. Through the exploration of successive profiles of historical development in different times, we can reconstruct the historical process of Military town and Port city's development and evolution. From the aspect of traffic hub, trade contacts, culture exchanges, the function of city spatial structure and urban social spatial structure, we can discuss driving force which makes rapid progress of Dalian city from the value of military geography converting to the value of economic geography. Explaining historical geography's mechanism about the evolution of spatial structure of Dalian city, we can provide academic basis to city cultural landscape heritage protection and sustainable development of Dalian city. Opening up the new way to research city from historical geography's view and docking with national development strategy of the Belt and Road, we can achieve the value of pragmatism of historical geography.

Key words:

Dalian; Spatial Structure; Historical Geography; Mechanism; The Belt and Road

Research on the Relationship between Population Density and Land Use: A Case Study of Korqin Left Wing Middle Banner

WANG Qing¹, ZHANG Shu-wen^{2,1}, LI Fei¹, CHANG Li-ping², YANG Jiu-chun², BU kun²

¹College of Earth Science, Jilin University, Changchun, Jilin 130021, China, 393833247@qq.com;

²Northeast Institute of Geography and Agroecology, Chinese Academy of Sciences, Changchun, Jilin 130102, China

Abstract

The population density is one of the main forms to reflect the population distribution, and it has a close relation with land use. This article selected Korqin Left Wing Middle Banner as the study area, which is a typical farming-pastoral ecotone in the northern China. We based on population data, administrative data and land use data in 1985. With the help of Arcgis, we analyze the relation between population density and land use from the aspects of land use structure, land use degree comprehensive index, the degree of landscape fragmentation. We conclude that: (1) With the increase of population density, the proportion of arable land firstly rise, and then come down. The proportion of grass land firstly fall down and then rise. (2) The comprehensive index of land use degree has directly proportional relationship with population density. With the increase of population density, the influence of human become strong. (3) Population density increase, and the density of plaque first increase, then decreased.

Key words:

farming-pastoral zone; population density; land use.

Study of the Spatial Distribution of Bohai Kingdom Sites in DPRK

Jin Shi-zhu¹, Kang Ryong-chol², Sok Kwang-chol²

¹Geography Department of Sciences, Yanbian University, Yanji 13302, China, jinsz@ybu.edu.cn;

²School of Earth Environment Science, Kim Il Song University, Pyongyang, DPRK

Abstract

The spatial distribution of Bohai Kingdom site in DPRK by using the information of attribute and geographical location of Bohai Kingdom site in DPRK. The results shows that: 1. There are 42 sites of Bohai Kingdom in DPRK which can determine the location. They are distributed in South hamgyong and North hamgyong, and the number of sites in North hamgyong is higher than South hamgyong. 2. In DPR Korea have five types of Bohai Kingdom site, including the town site of plain, the mountain site, the burial site, the construction site, the temple site. They are distributed in the sliver of Sea of Japan coastal from northeast to southwest, which is getting into xinluo called the along xinluo in the period of Bohai Kingdom. 3. The relationship of Bohai Kingdom site and environment. First, Sites are distributed in less than 90m and from 90m to 150m elevation that is accounts for 73.8% of the total number, it is the relationship with the altitude. The sites are distributed in the area elevation obviously. Second, which is the relationship with slope, There are 76.2% of the site distribution in between 0° to 9° slope, that means most of sites are distributed in the wild lower ground. This shows that most of the site point are distributed in the more moderate slope. Third, in the site and aspect, the sites of the whole study area are distributed to the East and south, to the southeast.

Key words:

Bohai Kingdom site; Sites; DPR of Korea; Spatial distribution;

The Change of Land Use and Urbanization in Micro Level of Wuxi in China

Yixin PAN

Kyoto University, Kyoto, 606-8501, Japan, heartofart@163.com

Abstract

As one of the most industrial city in 1990s in China, Wuxi started the process of moving the factories out of the inner city, which has changed the land use of the city in two aspects at least. On one hand, part of the former agricultural land started to be used as industrial land in the form of Industrial Zone, which is also called Economic Development Zone or Area in China. On the other hand, the former industrial land in the inner city was mostly redeveloped for commercial residential building area, which is called Xiaoqu in Chinese. Obviously, the process has brought great influence to the urbanization of Wuxi as well, both on the expansion and the structure of the city.

This paper chooses North Street Sub-district, called Beidajie Jiedao in Chinese, belongs to the former Beitang District of Wuxi as the object of study. Trying to restore the process in details by using the archives of the Sub-district Office as the first-hand data. Obviously, this will be a try to research a macro theme like urbanization in a micro perspective, which is necessary and maybe not that enough at this moment for the research of the urban geography of China. The author believes that this paper will have implications for similar historical geographical research.

Key words:

land use; urbanization; North Street Sub-district

The Changing Distribution Patterns of Rural Settlements during the Process of Urbanization: The Case of Gongyi (1929-2013), China

Abstract

Rapid urbanization undergoing in China has caused, and will continue to cause, tremendous changes of rural settlements. Regions at various stages of economic development and with various geographical backgrounds may witness different changing patterns. This paper uses data of rural settlements stretching 84 years from 1929 to 2013 in a county-level city -- Gongyi in Henan province, China, to examine whether such changes in a traditional rural area have evolved towards the urban structure. As one of the earliest areas in development of rural industries in China, the rapidly industrial growth since 1980s in Gongyi has dramatically transformed the traditional characteristics of rural settlements. By employing Zipf's index, fractal dimension and Gini coefficient, and village data in the county, we have preliminary found that: first, Zipf's indexes based on village sizes of the past 84 years were generally much smaller than results based on cities, but growing rapidly. The larger settlements were less prominent, but increasing fast in past two decades. Second, fractal dimensions were big but delaying. The larger size in the settlements, the faster increase in their population. Third, Gini coefficient was small but significantly increasing, especially accelerating after the 1990s. Fourth, the spatial patterns have gradually changed from linear concentration pattern along Yiluo River to the more balanced patterns over the plain and the hills. The increases in large settlements and their sizes, were forming hierarchy of the central place in market principles. Along with process of urbanization, centralization of population leads changing patterns of rural settlements, with the first rank settlement dominating rank size hierarchy in a region.

The New Culture Movement Heritage Cultural Space Reconstruction

Wei Huijie

Capital Normal University, China, congcong9456@163.com

Abstract

Beijing as a famous historical and cultural city which has profound historical background and rich cultural resources. The internal of urban present a variety of cultural space that have lays a good foundation for the urban cultural development. Currently, the study of the cultural space of Beijing on Modern and Qing Dynasty are in larger quantities, by contrast, less research cultural space of the republic of China. Republic of China refers to the transition from the Qing dynasty perish to the the period before the establishment of People's Republic of China, national unrest is frequent, nature of the state transition from feudalism to the people are masters of the country, everyone's ideology get enlightenment. During this period the most representative event is the New Culture Movement. In this period, the urban cultural space has changed dramatically with the change of ideology, politics, culture and education. In the centenary commemoration of the New Culture Movement, this article attempts to expound the historical track of the New Culture Movement, to discuss Beijing cultural space in the Republic of China, and the impact on that time and modern development and construction of the city.

The Research on Space Structure and the Regional Response of Shandong Section of the Grand Canal Linear Cultural Heritage

LiuCC

Capital Normal University, Beijing, 100101, China, 2543100514@qq.com

Abstract

As a typical linear cultural heritage, The Grand Canal has the common characteristic of the linear cultural heritage. The Canal heritage possesses richly historical, cultural and economic value, it mainly composed of itself, the relevant water way engineering, material cultural heritage which is related to its history, and intangible cultural heritage which reflects people's life along the coast. The Grand Canal in Shandong section through the five cities, including eight section of the canal and fifteen sites, occupies one third of the total river, and heritage point more than a quarter, it has an important role in the whole Grand Canal. This paper selects the Shandong section of the Grand Canal as the research subject, has a systematic carding and research of the relevant heritage by the method of combining literature research and on-the-spot investigation, and processes spatial structure analysis of its cultural heritage by using the skill of Arcgis. Finally, analyzing the development and utilization of canal heritage in the current situation, and planning how to make rational and comprehensive protection, in order to realize and promote the heritage and development of the Grand Canal.

Key words:

Are the Islands Sinking? Political Ecologies of the Maldives

Malatesta S., Schmidt di Friedberg M.

MaRHE Center, University of Milano-Bicocca, Milano, p.za ateneo nuovo, 1, 20121, ITALY, stefano.malatesta@unimib.it

Abstract

In 2012, Joe Morgenstern, on *The Wall Street Journal*, commented *The Island President*, the documentary on Mohamed Nasheed, former president of the Republic of the Maldives: “Jon Shenk's fascinating documentary personalizes the threat of global warming, and nationalizes it too.” Two features emphasize the impact of power on the fast changing political and socio-environmental crisis of the country: the personalization of politics and climate change as a “national-building” force. Since the beginning of the Twenty-First century, the Maldives has become a symbol of the vulnerability to climate change; mitigation and adaptation have been converted into keywords of the national political agenda. The peak of this visibility coincided with president Mohamed Nasheed (2008-2012) attending the COP 15 Copenhagen Climate Change Conference on 2009. At the same time Maldivian communities have been coping with a number of transformative forces affecting socio-environmental adjustments, knowledge and practices. The Government has been reinforcing its control on local dynamics, while keeping the fight against global climate change as a key national narrative. We will discuss the ambivalence of political ecologies in the Maldives at two levels: at the national level, presenting Mohamed Nasheed's role in the national discourse on climate change and its interpretation by the new government; at the local level, presenting, a local entrepreneur's project, Islands Organic, the first Maldivian organic farm in the Maldives, pioneered by Shahida Zubair and forced off Baa-Maarikilu island by the Government, to keep the control of the island.

Maldives; Political Ecology; Climate Change; Human Ecology of Islands

Ecosystem-based Adaptation of Climate Change in Penghu Islands

Shui-Liang Yu¹, Huei-Min Tsai²

¹ Penghu University of Science and Technology, slyu@gms.npu.edu.tw

²Taiwan Normal University, China

Abstract

Ecosystem-based adaptation (EbA) raises much attention recently. It is considered to be cost-effective, and can protect human and ecological communities from the impact of climate change. This includes sustainable management, conservation and restoration of ecosystems to provide ecological services and help people adapt to climate change brought about by the many adverse effects. The study aims to understand the adaption of climate change in the Penghu islands and propose the action plans such as set up a low-carbon island, national parks and wetland protected areas, as well as the creation of economic values from these conservation initiatives. Currently the concept of marine protected areas are proposed to set up fish body length harvesting restrictions, ban restrictions, limitations of fishing gear and methods of fishing season restrictions. The management of protected areas that need to be taking into accounts the interests and opinions of the local community. Only management plans get public support and it can play its proper function. On the wetland area management, village residents are performing major partners. The NGO's opinions and discussion are also important. Penghu is currently set up adaption plans in response to climate change. These include first marine national parks and wetland areas by cooperation of local residents and government. People wise use of nature resources also take into consideration the public interests. Future cooperation is raised between government and villages to train local residents to perform the management aims of protected areas. This helps local economic improvement with conservation and ecotourism development.

Key words:

climate change; Penghu Islands; environmental governance

Geography of New Arctic Islands Formed due to Glacial Recession

Ziaja W, Ostafin K

Institute of Geography and Spatial Management, Jagiellonian University, Krakow, Poland, wieslaw.ziaja@uj.edu.pl

Abstract

Glacial recession (result of climate warming after the Little Ice Age, i.e. since the beginning of the 20th century) accelerated since the 1980s. Hence, many Arctic coasts experienced dramatic changes of their landscape. The biggest changes occurred in places when bedrock of receding tide-water glaciers was situated below the sea level. The majority of such places, flooded by the sea, were transformed into new bays, including fjords. The rarer outcrops (areas) of bedrock elevated above the sea level, surrounded by depressions below the sea level filled by glacial ice, were transformed into new islands. These new islands may appear due to melting of glacial tongues (streams) which: (1) connected rocky peninsulas (headlands, promontories, etc.) with a mainland, (2) surrounded nunataks protruding from bedrock situated below the sea level, (3) covered rocky hills protruding like above. New straits appeared in bedrock depressions, between the islands and their mainland. Greenland coasts are the most predisposed to this process due to a big decrease in thickness of glaciers (flowing out of the ice sheet most often). Ca. 25 new islands appeared there since the 1970s. Next 5 new islands appeared in the European Arctic (Franz Josef Land, Svalbard, Novaya Zemlya). However, the process is ongoing and the new islands will split off from Greenland, Spitsbergen and Hall Island (Franz Josef Land) in the nearest future. They are subject to animal colonization and plant succession. Some new straits may be significant for navigation (e.g. the strait Hornsund-Hambergbukta being just formed in Spitsbergen).

Key words:

glacial recession; formation of new islands; Greenland; European Arctic

Influence of Economic Activity on Geosystems of Peter the Great Bay Islands (the Sea of Japan)

Ganzei K., Kiselyova A., Rodnikova I., Pshenichnikova N.

Pacific Geographical Institute FEB RAS, Vladivostok, Russian Federation, geo2005.84@mail.ru

Abstract

There are over 30 islands in Peter the Great bay. Economic activity increased at the end of XIX century when the area of Primorskii Krai had been begun developing. Considerable damage has been caused with deer-breeding and military management.

In this paper we study contemporary state of Popova, Rikorda, Reyneke, Bolshoy Pelis and Stenina island geosystems and analyse degree of anthropogenic transformation under different types of economic activity.

Human impact on island geosystems has caused partial destruction of typical polydominant island forests and their replacement with shrub-grass communities; decreasing lichen diversity and common distribution of anthropogenic habitat species; active sheet erosion of soils and landscape diversity reduction. Protected area creation helps to restore relative native geosystems and save native ones on big islands. Succession from grass communities to polydominant forests occurs on Bolshoy Pelis and Stenina islands: young lime-forests replace communities of *Artemisia gmelini* and then change to polydominant broad-leaved forests. Lichen cover consists of natural habitat species, anthropogenic habitat species occur rare. Forest vegetation restoration contributes to processes of “forest” burozem and typical burozem formation.

Geosystems of Popova, Reyneke and Rikorda islands are influenced by high anthropogenic pressure, it leads to spreading of anthropogenic transformed vegetation, common distribution of anthropogenic habitat lichens, developing of soil erosion and depletion, decreasing island specificity. Human impact on landscapes causes disturbance of material-energy flows in landscapes and leads to irreversible island nature destruction. These processes are observed on Russky, Popova, Reyneke islands.

The study was supported by the grant of RFBR (project 15-05-01419).

Islandness and Maritimity as a Philippine Identity

Boquet, Y.

Université de Bourgogne, 4 boulevard Gabriel, 21000 Dijon, France, yves.boquet@u-bourgogne.fr

Abstract

As an archipelagic nation, the Philippines has to deal with spatial discontinuities inherent to the interaction between land and seas. Maritime transportation between the islands is essential and marine biodiversity in the “7107 islands” theme has proven a very popular theme in tourism promotion, while geopolitical issues range from the archipelagic doctrine to tensions over islets on the South China Sea. As a West Pacific country subjected to many seaborne hazards, the Philippines position on global warming issues appears comparable to small island nations.

We have surveyed a sample of Filipinos in diverse parts of the country, coastal and non-coastal, to examine their feelings about the sea and the islands. It appears that the idea of “islands” refers foremost to tourist spots such as Boracay and local islands which are well known by fisherfolk. In contrast, few respondents cite the largest islands (Luzon, Mindanao) as islands, reinforcing the idea of islands being small spaces. Interestingly, in a country exposed to typhoons and tsunamis, the sea is not seen as a source of danger by most respondents, but rather as a clean peaceful space in sharp contrast to city life and Manila.

Key words:

Island; maritimity; Philippines; perception

Resilience happened on Vulnerability: The Spatial Resistance of New Developed Communities in Remote Islands of Taiwan

Ni, Chin-cheng

Professor, Department of Environmental and Cultural Resources, Hsin-chu University of Education, Taiwan, China,
ccni@mail.nhcue.edu.tw

Abstract

Recently, small islands were gazed by international societies. In the past, researchers were focused on the issues of sustainability and vulnerability; nowadays, they pay more attention on resilience theory because of unchangeable global development. The study would take two communities, Nanliao and Xihu in Penghu islands, based the similar vulnerability for comparison of their different resilient responses. And the two communities would be realized by the critical approach but different branches, including using critical ethnography for Nanliao and using critical theory for Xihu. Following literature review as the focus in the initial stage, the project then conducts field survey, contextual analysis, participant observation, and in-depth interview for analysis on adaption and resistance of island communities. The results include as following: (1) Through full understanding of the context of these two communities, the community leaders oriented by the retired persons from public sectors. So, the local government could persuade, recruit, and train this kind of people by suggestion of the study. (2) Identified solution by critical approach on island community development has presented the empowerment and negotiation by the professional NGOs would be required and the emancipation also is essential by suggestion of the study. (3) Comparison of spatial adaption and resistance between the class I(Nanliao) and class II(Xihu) remote communities, it is more necessary to create or develop a public sphere(an idea from Habermas) for social issues of the ones belonging to class II. (4) Finally, this study will be offer an emergent and feasible way for island communities in addition to adding casino industry.

Key words:

resilience; resistance; critical approach; community; remote islands

Sustainable Tourism under Island-Land Linkage Model: A Case Study of Changdao Island, China

Zhou X, Xu X

College of Urban and Environmental Sciences, Peking University, Beijing, 100871, P.R. China, xxg@urban.pku.edu.cn

Abstract

Tourism is one of the primary industries in islands especially in that near coast. However, it has a big contradiction among the rapid development of tourism and the scarcity of water resources, limited traffic condition, and low tourism environmental carrying capacity. It is hard for island to resolve these problems. From the view of sea-land coordination, island-land linkage may provide a new opportunity for the sustainable development of island tourism. Changdao Island is the typical research area for island-land linkage. (1) The six different types of tourism population water using quota in Changdao Island are determined by analysis of the balance of water supply and demand including water diversion mode from Penglai land. (2) land-island transportation between Changdao and Penglai traffic capacity is calculated by the condition and set of the ships. There are two aspects to improve the transportation, increasing ship or route. (3) The tourism carrying capacity inside the island is calculated by the mathematical model of tourism environment carrying capacity with minimum law, which including scenic space tourism carrying capacity, service facilities, the largest water diversion capacity and island-land transport capacity for tourists. (4) Finally suggestion is put forward from the angle of island-land linkage, to promote tourism integration between Changdao Island and Penglai coast to achieve sustainable development. This research is supported by the NSFC Project (No.41271102).

Key words:

Island-land linkage, tourism, sustainable development, coast, Changdao Island

The Meanings of Island Place- a Case Study of Lieyu Island (Little Kinmen Island), Taiwan

Wen-Hua, Huang; Su-Hsin, Lee

Taiwan Normal University, Taipei, China, ecohook@gmail.com

Abstract

Kinmen County, where is in the stage of economic take-off and rapid changes for past decade in Taiwan's outlying islands. Lieyu is the second-largest island of Kinmen County. This island is near the border between Xiamen and Kinmen. Recently, the rapid development of theses Islands affected Lieyu. This small island also launched its large tourism development and construction, and that catch our attention. This study used long-term observation (from 31/7/2013 to date) and interview on Lieyu Island. We used the perspective of human geography: Place to be our research approach and analysis. This study wants to probe: what kind of place is this island? what is the place memory and imagination of islanders? how do they construct and maintain their local culture? what is the meanings of island development? The study found that this small island is a place of historical context, political border and regain the relation with sea. Islanders mainly by religious activities, daily movement (on this island and inter-island), the relationship between villages and clan groups to construct and maintain local culture, but the influence of public sector is raising in these few years. Many islanders believe the current development of Lieyu is a solution of local economy and way out of depression. The construction of Kinmen Bridge (connect Kinmen and Lieyu) is the long-standing imagination of Islanders. This imagination is better for Lieyu to gain more health care, convenient transportation and tourism development. The rustic, battlefield, large vegetation and many elderly is their memories of place.

Island; Place; Lieyu; Kinmen

The Resilience of Kiribati Atolls (Micronesia) to Drought: Comparison Between an Urban System and a Rural System

Longépée E

Centre Universitaire de Mayotte, Dombéni, France, esmeralda.longepée@univ-mayotte.fr

Abstract

Atolls are fragile environments offering limited resources making them very susceptible to frequent droughts. In the context of climate change, sea-level rise is often presented as the main threat for the habitability of atolls. Yet, IPCC experts emphasize that projections of changing rainfall patterns and drought are very unsatisfying and uncertain.

The Gilbert archipelago in Kiribati (Micronesia) is prone to drought during La Niña phase of El Niño Southern oscillation. This archipelago, where most of Kiribati's inhabitants reside, is composed of one urban atoll and fifteen rural atolls. In the urban atoll of Tarawa, rapid urbanization has led to ecosystem degradation and the pollution of freshwater lenses and coastal waters. In rural atolls, inhabitants who have not migrated to Tarawa live from subsistence economy. When comparing the difference in structure and functioning of an urban atoll to a rural atoll, assessing their respective resilience to drought helps to identify key variables helpful for drought management.

The results of a population survey and semi-structured interviews conducted with key informants were used to build conceptual models of atoll social-ecological systems. From these models, we estimated the resilience of both atolls to drought to be dependent on two key variables: fresh groundwater and food security. In rural atolls, these two variables remain above an acceptable threshold during drought. In Tarawa, dependency on foreign countries for food has decreased the resilience of this urban system to drought.

Key words:

resilience; social-ecological system; drought; model; urban; rural; atoll; Kiribati; Micronesia

Assessment of the Specialized Projects for the Islands Through a Sustainable Development Index

Sunmi Shin, Byungmin Choi, Byungseol Byun

Department of Urban Planning, Inha University, Incheon, Korea, 01090458921@daum.net

Abstract

Islands are holding excellent natural landscapes and cultural and living resources. Korea is pushing ahead with the policies to utilize these resources and change the islands into the ones which local residents want to live and tourists want to visit. In particular, Incheon Metropolitan City's islands are located near Seoul and hold excellent ecological and cultural resources, inviting the citizens of the Seoul metropolitan areas to enjoy their charms. However, the policies for the islands have been so far mainly for their development for the convenience of the residents and tourists, putting their inherent characteristics at risk of being extinct. Recent policies for the islands are featured by specialized projects for preserving their inherent characteristics and improving the quality of life of the local residents and the tourists' satisfaction. Incheon Metropolitan City is making efforts to create the tourist resources, trails, and landscapes which reflect the islands' characteristics. The specialized projects for the islands are only the temporary policies, and thus, some lasting policies should be provided to make sure that the local government and residents can play a leading role in highlighting the regional characteristics. This study, therefore, aims to develop an assessment index that reflects the ecological, cultural, and economic characteristics of the islands, and to evaluate Incheon Metropolitan City's ten islands, the target areas of the specialized projects, in terms of a sustainable development.

Key words:

Incheon Metropolitan City; sustainable development. island tourists want to visit; peace & ecology village

Deforestation, Protection, Local Use and Governmental Policies on Mangrove in Hainan Island

Ren'ya SATO and Tingzuo WANG

Osaka University, Osaka, Japan, rsato@let.osaka-u.ac.jp

Abstract

This study aims to describe the relationship between the governmental policies concerning mangrove in Hainan Island (China), where mangrove had been both destroyed and tried to be protected with national initiatives, and decline of mangrove use by local people living in small scale economies, who had long been using mangrove in various ways. We used aerial photos taken by US Army in 1940s for the reconstruction of mangrove before destruction, and conducted field survey among villagers around the Dongzhai Harbor Mangrove National Reserve Area in 2012 and 2013, for research on changes of subsistence economy among local people. Mangrove of this area experienced two major destruction since the mid 20th century: a large scale national farm construction (the Sanjiang Farm) in 1970s promoted for strengthening food production, and expansion of aquaculture ponds in the late 1990s. The former was constructed by administrative initiatives, while the latter was advanced by local governmental authorities and farmers being stimulated by national policies for fishery promotion. Meanwhile this area was designated as a mangrove reserve in 1980, and as a result, various traditional uses of mangrove by local people had been gradually controlled or banned and people had been excluded from the access to mangrove. It can be said that both extremes of destruction and protection of mangrove appeared alternately since the latter half of 20th century, and local people who had formerly extracted various resources from mangrove have been tossed about by inconsistent policies.

Key words:

mangrove; national reserve; fishery; subsistence economy; Hainan

Grain Size Characteristics of the Surface Sediments on the Intertidal zone in Weizhou Island

Wang Minjing^{1,2}

1. School of Geographic and Oceanographic Sciences, Nanjing University, Nanjing, 210023, P. R. China, njtogether@163.com

2. Institute of Geochemical Exploration and Marine Geological Survey, ECE, Nanjing 210007, P. R. China

Abstract

Weizhou Island is located in the Beibu Gulf in the South China Sea. It is the largest and youngest Quaternary volcanic island in China. There are various geomorphic types in the island, with different bed rocks and sediments. Based on the previous research, investigation of 13 profiles and experiment of 40 samples, this paper analysed the grain-size characteristics of the sediment on the intertidal zone in Weizhou Island. Medium sand is the main type; coarse sand and fine sand secondly, and gravel least. The average of mean grain diameter, sorting, skewness and kurtosis are 1.075Φ , 0.689, 0.174 and 0.973. The distribution of different sediment types can be summarized as follows. Gravels are mostly distributed in the small bay of rock capes and on the wave-cut platform in the southwest, west and southeast coast, where the marine abrasion landform is the main geomorphic type. Sands are mostly distributed on the beaches in the east, north and northwest coast, and Nanwan Bay. The bottom of most beaches in the east and west coast is volcanic rock platform. There are two major reasons for the sediments distribution. Material sources of volcanic rocks and coral reefs are the first reason. Power of wind wave is the second reason, which erodes the rocks and reefs into gravels and sands, then transports them to the intertidal zone. The strong NW wind leads to the result that the sediments in most west and southwest coasts are coarser than that in most east and north coasts.

Key words:

Weizhou Island; coastal geomorphology; grain-size characteristics; sediment distribution

Insularity, Eco-Frontiers and Environmental Governance. Changes in the Perception of Wetlands in Sardinia (Italy)

Corsale A., Farris M., Sistu G.,

Universidad de Chile – Departamento de Geografía, Santiago, Chili, massimilianof@uchilefau.cl

Abstract

Islands can be seen as a multifaceted representation of a frontier. In fact, over the history, they often became confinement areas surrounded by sea. Sardinia (Italy), due to its strategic position at the centre of the Mediterranean Sea, has long been considered a land of conquest and an “internal frontier”. The widespread wetlands located along its coastline crucially contributed to this image, as they were diffusedly seen as worthless and dangerous environments needing strong human intervention in order to effectively and/or symbolically expand productive land uses. Several case studies within the island will be presented through the analysis of the complex relations among traditional economic activities, environmental protection and threats caused by agricultural, urban, industrial and tourism expansion, within changing institutional frameworks. Interesting examples of growing awareness of the value of ecosystemic services will be examined. The overlapping of projects related to recreation, education and tourism and the revitalization of fishing traditions and productions, along with widespread critical issues still related to the expansion of human activities in fragile environments and to a persistently marginal socio-economic context, creates crucial challenges for local development. The analysis of these systems shows their changing character, through complex forms of relations among wetland environments and human societies, and highlights the features of locally managed planning.

The authors will discuss these changing visions of nature through a geographic and a political-ecologic approach. The implications in terms of new territorial perceptions, changing power relations and expansion of new key sectors, primarily tourism, will be discussed.

Key words:

Insularity; eco-frontiers; local development; sustainability; tourism; Nature; wetlands Sardinia; Mediterranean Sea.

Remote Sensing Image Classification of Mapping Satellite-1 Based on SVM Method

Caixia Liu*, Hongli Liu, Zhixiang WU, Wenbao Song, Tengfei Sun, Qian Zhao

College of Resources and Environment and Tourism,

Capital Normal University, Beijing 100048, China, 1261078957@qq.com

Abstract

Remote sensing image classification is a key technology in field of remote sensing applications. Traditional machine learning methods to remote sensing classification mostly are based on the principle of Empirical Risk Minimization, its premise is the need for enough number of samples, and generally requires a greater number of. Unfortunately, the number of samples is actually limited. In this paper, we use the statistical approach of pattern recognition with the image of Mapping Satellite-1 as the experimental data. And based on the support vector machine (SVM) method, we set up SVM classifier. And we also analyze the influence of the selection of kernel function and the parameter setting on the classification of SVM classifier. And We demonstrate the superiority of the SVM classification method by comparing with other methods.

Key words:

remote sensing; SVM; Empirical Risk Minimization; classification

Spatio-Temporal Patterns of Climatic Changes in Hainan Island in Recent 55 years

Sun Rui, Wu Zhixiang, Chen Bangqian, Yang Chuan

Rubber Research Institute, Chinese Academy of Tropical Agriculture Sciences, Danzhou, 573717, P. R. China,

sunrui_85@163.com

Abstract

The spatio-temporal patterns of climatic changes in Hainan Island were analyzed based on the observation data of major climatic variables (i.e., daily mean temperature, precipitation, average wind speed, relative humidity, sunshine duration and pan evaporation) in seven meteorological stations from 1959 to 2013. And the results revealed that the annual mean temperature and precipitation of the island displayed a significant increasing trend while the rest four climatic variables exhibited a significantly decreasing trend during the last 55 years. According to the Mann-Kendall method, the abrupt changes of the temperature and average wind speed mainly occurred in the early 1980s, the precipitation jump mostly occurred in 2007 around, and the abrupt changes of the relative humidity, sunshine duration and pan evaporation primary took place in the early 1990s. The warming rate was the fastest in the central mountainous area and the increase rate of precipitation was the largest in the south of the island. And the decrease rates of relative humidity, average wind speed, sunshine duration and pan evaporation were the largest in the northeast, east, north and central mountainous area of the island respectively. Furthermore, the average annual precipitation and relative humidity were the most in the central mountainous area and the least in the west of the island, whereas the spatial distribution of the rest four climatic variables was the opposite.

The Measures of the Tendency to Stony Desert of the Li River

Zhenwen Gao

Guilin Zhongshan Middle School ,Guilin,541001,P.R.China,18978389526@qq.com

Abstract

The Li River of Guilin has an excellent geographical position with the typical Karst geography. It has good value of natural science, art, and historical culture. One of the problems is rebuilding and protecting the circumstance of the Karst geography from damage or destruction. There're some measures which follow the basic principle of geography, biology, biological economy aim to solve the tendency to stony desert. All of the viewpoints in this article are just for your reference.

Key words:

Discussion on Generation Mechanism Matters of Overland Flow on Hillslope with Karst Bare Stone-Teeth

Chen Xiaoping, Wu Jiayang

Yunnan Geography Institute, College of Resource Environment and Earth Science, Yunnan University,
Kunming, 650091, Yunnan, P. R. China, xpchen@ynu.edu.cn

Abstract

Abstract: Due to special surface and underground double space structures of the karst area, overland flow on karst and non karst area is quite different, but there is also short of the karst slope runoff, overland flow on karst area, the author of this paper, especially stone teeth with overland flow on slope surface of the methods, process, characteristics and influence factors, through the study in the sample area, combining the theory of the karst area runoff and general overland flow on karst research, to analyze the slope runoff yield conditions, methods and influence factors. According to the observation, study of slope runoff samples in the critical rainfall of 10mm/h, there are three kinds of runoff way: hydrogels containing aquitard in saturated soil, saturated runoff; Crack surface local rock not development or low surface soil infiltration rate lead to excess infiltration runoff; Stone teeth surface runoff quick replenishment lead to surface karst belt fully saturated, produce saturated surface runoff. We analyzed stone teeth exposed to the influence of karst slope runoff.

Effect of Urbanization on Hydrogeochemical Evolution of Karst Water System, a case from the Laolongdong Watershed of Chongqing

Zhang Hai-Yue, YANG Ping-Heng

South Wset University, China, 1070891703@qq.com

Abstract

In order to study the evolution status of groundwater quality in karst area, the monitoring datas of the underground river of Laolongdong from 2008 to 2012 were chosen to discuss the influence of urbanization. Using some water chemical indicators such as the pH, conductivity, water temperature, potassium, sodium, calciumion, magnesiumions, bicarbonateions, chloride, nitrateions, sulfatideon, phosphateion of Laolongdong, and combines the water quality in Zhaojia springs and upstream of the sewage discharged point, to analyzed the evolution tendency of water quality of the Laolongdong underground river basin. The results indicated that in the process of urbanization, the concentrations of the chemical composition in this water region were changed, the ion concentrations of sodium, chloride, phosphateions, calciumion, magnesiumions, bicarbonateions rised, because they were directly from human activities. In the meanwhile, the ion concentrations of nitrateions, sulfatideon decreased due to the urbanization effect. The recharge source of Laolongdong groundwater was highly complex, among that, human activities and geological background of the carbonates rocks played a crucial role to the quality of groundwater; the water quality of all water points in this region were polluted in different degrees because of the improvement of the urbanization levels and regional environment change. Some ion concentrations like chloride, nitrateions, sulfatideon in the upstream's sewage discharge points and the groundwater regions exceed greatly, with a V class. What's more, the water quality of Zhaojia spring and Laolongdong underground River was still deteriorating .

Evaluation of The Biological and Speleogenetic Interior Towards a Comparison of Karst Area Quality (South Franconian Alb, Germany)

Martin Trappe

Institute of Geography, University of Eichstaett-Ingolstadt, 85072 Eichstaett, Germany, martin.trappe@ku.de

Abstract

Within the scope of the European Union monitoring program on the conservation of natural habitats and of wild fauna and flora (FFH) several caves occurring along the Altmuehl valley (South Franconian Alb, Germany) were studied in terms of cave fauna and cave habitat status. Besides the first documentation of numerous caves main objective of the study is the long-term habitat protection, or at least the conservation of status quo of the cave.

Most of the caves are open to the public. Thus, sometimes they are used for several purposes: visits of local people for private recreation, wild tourism by cavers, esoteric meetings, illegal dump grounds, storage rooms, and show caves. The consequences for cave life, cave morphology and hydrology have to be regarded carefully. Finally, the intention of the study is an overall assessment of the entire Franconian Alb or parts of it to estimate and evaluate the conditions or modifications of caves.

First results of the study show numerous disturbances of the caves by structural alteration or installations, destruction of the cave ground, introduced waste, fireplaces, extensive sooting of walls or ceiling. On the other hand various caves remained unaffected or they show little variations. In conclusion, the data indicate a relatively positive state of the cave habitats and the faunal distribution. However, further interpretation regarding cave size and length, climatic differences and human influence is necessary.

Key words:

cave evaluation; habitat; fauna; human influence

Evolution of Physicochemical Property and Contaminated Characteristics of Karst Groundwater Under the Influence of Tourism Activities: A Case Study of Shuifang Spring in the Jinfo Mountain World Heritage Site of China

REN Juan

South Wset University, China, junely199299@163.com

Abstract

To investigate the variation of physicochemical property and pollution characteristics of karst groundwater in the densely populated area, the physicochemical parameters of the Shuifang spring in Jinfo Mountain, which is a typical karst area in southwestern china, were continuously monitored during the peak period of tourism activity. Results indicate that the pH and dissolved oxygen values were decreasing with the electrical conductivity, turbidity increased. Meanwhile, all the physicochemical parameters fluctuated sharply during the the peak period of tourism activity, when the Jinfo Mt hosts tourist; The ion concentration fluctuation of pollutants were dominated by the human activity, which is discharged and introduced rapidly dissolution of carbonate. The indexes of Cl^- and Ca^{2+} , the particular pollutant and products of carbonate dissolution, were analyzed respectively with other ions via the method of correlation analysis. The concentration variation of K^+ , Na^+ , Cl^- were primarily caused by contaminations of tourism activities, while HCO_3^- , Ca^{2+} , Mg^{2+} , Si , Al^{3+} and Ba^{2+} were resulted from rapidly dissolution of carbonate due to the discharge of contaminations. The piston and dilution effect of rainfall led to concentrations of Sr^{2+} , Ba^{2+} , NO_3^- increased first and decreased afterwards in the early peak of tourism activities, the latter Sr^{2+} , Ba^{2+} decreased as results of the decline of precipitation. NO_3^- was barely affected by human tourism activities. The results of the study indicate that the groundwater is susceptible to intensively human activities in short time, and is suffered from pollution easily.

karst groundwater; physicochemical property; tourism activities; pollution; carbonate dissolution

Karst spring water stable isotopes (^{18}O and ^2H) Characteristics in Heilongtan Springs, Kunming, China

Liu Hong^{1, 2} Huang Hua-Cheng¹

¹.School of Resource Environment and Earth Science, Yunnan University, Kunming, Yunnan, 650091,

hongliu@ynu.edu.cn;

²Joint International Research Center for Karstology, Yunnan University, Kunming, Yunnan, 650223

Abstract

Heilongtan springs located at foothill of Wulao Mountains in the northern suburb of Kunming City, emerges along east branch of Heilongtan Fault after karst water meets quaternary sedimentary at edge of Kunming Basin. There are three springs, named as Qingshuitan, Hunshuitan and Xiaoshuitan. Isotope technique was used to investigate the characteristics in stable isotope (^{18}O and ^2H) of spring waters to identify the sources of springs. Through the spring water and precipitation stable isotope composition measurement, characteristics of deuterium ($\delta^2\text{H}$) and oxygen 18 ($\delta^{18}\text{O}$) were analyzed. It is revealed that (1) the contribution of precipitation to three springs is the main source, especially the summer rainfall; (2) the recharge of Qingshuitan Spring is not only from the Yemao Mountain, the proposed recharge area, but also some from the runoff infiltration along groundwater flow paths. For Hunshuitan spring, the recharge sources are distinctly different in wet and dry seasons, which recharged by basalt fissure aquifer and karst aquifer during wet season, and mainly by karst aquifer water during dry season. Xiaoshuitan Spring is recharged by the northern karst aquifer. (3) the $\delta^{18}\text{O}$ values of three spring samples ranged from -12.60‰ to -11.64‰, -12.22‰ to -10.81‰ and -12.19‰ to -11.27‰ respectively. The values of Qingshuitan Spring are lighter than Hunshuitan and Xiaoshuitan springs'.

Karstological Contributions of Jovan Cvijić Related to Geohazard Issues in the Dinarides and the Carpatho-Balkanides in Serbia

Ćalić J, Radovanović M.

Geographical Institute "Jovan Cvijić", Serbian Academy of Sciences and Arts, Belgrade, Serbia, j.calic@gi.sanu.ac.rs

Abstract

The history of scientific karstological research in Serbia started at the end of the 19th century with the works of Jovan Cvijić, who is worldwide regarded as the founder of karstology as a scientific discipline. Although at the time of Cvijić's explorations the notion of geohazards was not used at the extent and context as it is today, it is possible to analyse the elements of natural hazard research in karst areas. Serbian karst is distributed in two belts – Dinaric on the west and Carpathian-Balkan on the east. Limestones cover about 9% of the territory of the country, and they occur mostly in smaller patches, which are under the strong influence of the surrounding non-carbonate terrains. The aim of the paper is to overview and analyse the karstic processes and landforms studied by Cvijić and his successors, which would, by contemporary criteria and terminology, be categorized as geohazards. These include the examples of various types of collapse and/or subsidence, occurring either at the time of the study or in previous phases of morphological evolution. The questions of conservation of karst landscapes, subjected to the geohazard issues, are considered.

Palaeolithic painting conservation in cave Kapova (Southern Ural, Russia)

Lyakhnitsky Yu. S., Trofimova E.V., Abdullin Sh. R., Trofimov A.A., Ushko A.A.

Institute of Geography, Russian Academy of Sciences, 119017 Moscow, Russia, e.trofimova1@gmail.com

Abstract

Kapova Cave is the one of the most known caverns of Russia, situated on the Southern Ural. In 1959 the masterpieces of the Cave Palaeolithic were found in this underground cavity (the pictures of animals and different geometric signs). As for today the unique Palaeolithic scenery of Cave Kapova is in the danger of degradation in relation with the influence, on one hand, of the man-made and, on other hand, of the natural negative factors. The man-made factors are caused both by unregulated visits of tourists, leaving the recent graffiti directly over the Palaeolithic masterpieces, and by the artificial opening of paintings. The natural factors are due to, mainly, by the microclimatic and hydrological peculiarities of underground cavity. In 2003 a free access inside to the cave was stopped: the tourist path by the length of 230 m was elaborated including the review of Palaeolithic scenery copies. Concurrently some measures diminishing the negative actions of natural factors to the Palaeolithic decorations were carried out: the tamponage of ponor in the canyon Shulgan-Tash, the creation of summer polyethylene screen between first and second levels of underground cavity, etc. Now the Catalogue of pictures and signs of cave Kapova contains the descriptions of 195 images.

Paleo Hydrography and Speleogenesis of Serpeng Cave and its Surrounding Area

Haryono E., Diah M.

Universitas Gadjah Mada, Indonesia, e.haryono@geo.ugm.ac.id

Abstract

Serpeng Cave is situated in the northern border of Gunungsewu karst with the Wonosari basin. The cave drains the surface runoff from the basin, therefore the speleogenesis and the development of the cave is associated with the hydrography of the basin. There should have been different hydrography during the early initiation of the cave and in the present situation. The research documented here is an effort to reconstruct the paleo environment especially paleo hydrography surrounding the Serpeng Cave and its influence to the speleogenesis of the cave. The results show that formerly the surrounding area of Serpeng Cave used to be a lake. The paleo lake is proven by the distribution of lake sediment in the the surrounding area of Serpeng Cave. Lake sediment of the area is composed of clay in the bottom and overlaid by volcanic ash. The dry out of the lake must have coincided with the enlargement of ponor in the base of the lake. The ponor then developed to be a cave forming Serpeng Cave. The cave is characterized by vertical shaft with the depth of 60 meter before finally sloping and ended to the underground lake. Such cave is typical for point recharge cave develops under base of doline or other karst depression.

The Relationship between a Karst Landscape and Tourism Messages in the Limestone Coast Region of Southeast South Australia

Birss, K and Lawrence, Ruth E

Outdoor & Environmental Education, La Trobe University, Bendigo, Australia, r.lawrence@latrobe.edu.au

Abstract

The 'Limestone Coast' is a term used to describe both a geological region and one of twelve designated tourism regions in the State of South Australia. Being about 100,000 km² in area, Limestone Coast tourist attractions feature several wine districts, primary production outlets, extensive coastal plains and world-heritage cave and karst environments. The purpose of this study was to explore the relationship between karst landscapes and tourism in the Limestone Coast region through the analysis of tourist literature and interviews with managers. Firstly, the relationship between regional geology and tourism was explored by identifying karst features promoted for tourism and assessing similarities between karst sites and significant tourist developments. Secondly, the way in which a scientific understanding of karst landscapes were interpreted at touristic sites in the Limestone Coast were explored. Several guides, managers and owners of karst-related tourism sites were interviewed to see how they both obtain their understanding of karst features and processes and deliver those messages to the public.

The Temporal Stability of Soil Aggregates under Different Land Use Patterns in Karst Peak-Cluster Depression Area

Zhang Jianbing, Hu Baoqing, Zheng Huamin, Feng Chunmei

Key Laboratory of Environment Change and Resources Use in Beibu Gulf (Guangxi Teachers Education University),

Ministry of Education, China, Nanning, Guangxi, 530001, P. R. China, gxtczjb@163.com;

Guangxi Key Laboratory of Earth Surface Processes and Intelligent Simulation (Guangxi Teachers Education University),

Nanning, Guangxi, 530001, P. R. China,

Abstract

As one of the main karst geomorphology, peak-cluster depression area suffer from serious soil erosion, which influenced by land use patterns. It is important to study the soil anti-erodibility, mainly reflected by soil aggregate composition and stability, for soil erosion research and soil conservation. The objectives of this paper were: (1) to study the soil aggregate composition under four land use patterns, including conservation tillage, sugarcane planting, corn planting and forest land; (2) to analyse the temporal stability of each soil aggregate grade. The soil aggregate composition presented by the content of each soil aggregate grade, consist of >10cm, 7~10cm, 5~7cm, 3~5cm, 2~3cm, 1~2cm, 0.5~1cm, 0.25~0.5cm, <0.25cm. The temporal stability of soil aggregate was presented by the content of each grade after the continuously shake of 5、10、15、20、25、30、40、50、70、90 minutes by electric shaking sieves. Results shows that soil aggregate content (>10cm) of conservation tillage and forest land more than sugarcane planting and corn planting significantly, and this phenomenon appear to the contrary when it comes to the soil aggregates content of <0.25cm. There was no significant difference was observed between conservation tillage and forest land, sugarcane planting and corn planting. With the same tendency, the content of soil aggregates grades changed when the shaking time increasing. Soil aggregate content (>10cm) decreased and the content of smaller grades increased. However, the decreasing rate and increasing rate among the four land use patterns have different order, in sequence of corn planting, sugarcane planting, conservation tillage and forest land. It is proved that small soil disturbance is favorable to promote the temporal stability of soil aggregates and beneficial to soil erosion resistance.

Key words:

soil aggregates; temporal stability; land use patterns; soil anti-erodibility; karst peak-cluster depression area

The Theory of Critical Zone and the Review in the Typical Karst Cluster-Peak Depression Areas of Southwest China

Ling li^{1,3}, Xiongfa Mai², Baoqin Hu^{1,2}

Abstract

Karst Cluster-Peak Depression is a typical Karst landform in Southwest China. Basing on the environmental geological background, the region has the characteristics such as the high altitudinal gradient, the complex of the landform and the closure in the material energy cycle. There are many environment problems in this region, such as lack of the available water, the soil fertility deterioration, the backward economic development, and improper human activity. The Karst Cluster-Peak Depression area is one of the senior fragile ecological environment region. In order to solve those problems advanced, Basing on the earth critical zone theory, the paper proposed the concept of Karst Cluster-Peak Depression critical zone (KCD-CZ), and analysis the characteristic and contents in the KCD-CZ. This study is a karsts area in the development of cutting-edge academic issues, not only of theoretical significance, but also for different regions of Karst Cluster-Peak Depression in the region to provide reference for sustainable development. The paper structure including five parts. 1. The first part is introduce the earth's critical zone science, including the definitions, the boundry, and general characteristics of the critical zone; 2. Basing on the earth's critical zone science, the paper propose the theory of Karst Cluster-Peak Depression critical zone (KCD-CZ), analyzes and discusses the contents of the KCD-CZ, and then Researches on the framework such as forcing, coupling, interfacing, and scaling; 3. Analyzed and discussed key technologies in KCD-CZ: the standard of the critical zone observatories; the interdisciplinary research; the Evolutionary mapping-monitoring-modeling framework; the integrating and sharing information; 4. In order to provides a perspective on the current state of the research on CZ and Karst Cluster-Peak Depression, there was reviewed on these subjects; 5. In the end, the paper made a discussion.

Key words: Karst Cluster-Peak Depression; Critical Zone; reviewe; Southwest China

Typical karst landscape and their evolution in Southwest China

Abstract

In Southwest, there 540,000 km² exposed carbonate rocks distribute from the foot of Tibet plateau to sea beach of Guangzhou and Guangxi. With the tectonic movement and climate variation, the karst landscapes are developing in different types: the calcareous tufa related to over 1000m deep buried karst on the elevation 3500-4000asl(foot of east Tibet Plateau), for example, Huanglong tufa in northwest Sichuan and Baishuitai tufa in northwest Yunnan; karst faulted basins in east Yunan and karst tableland south Chongqing on the elevation 2000-2500masl(Yunan-Guizhou Plateau), cases of Mengzi, Jianshui and Luxi karst faulted basins and Jingfoshan karst tableland hill; Tiankeng(big collapse dolines) and very deep shaft on the top of the slope from Yunnan-Guizhou Plateau to Guangxi basin with elevation 1000-2000masl, cases of Tianxing and Qiken shafts with 600-1000m deep in Chongqing, and Dashiwei Tiankeng with 60m long, 420m wide and 613m deep; Fengcong(peak-clustter) mainly locates on the middle of the slope; and Fenglin mainly locates flatland or plain in east Guangxi and Guangdong. Most karst landscape sites already listed Global Geopark and World Natural Heritage site.

Using $\delta^{34}\text{S-SO}_4^{2-}$ and $\delta^{15}\text{N-NO}_3^-$, $\delta^{18}\text{O-NO}_3^-$ to Trace the Sources of Sulfur and Nitrate in Lihu Underground Water, Guangxi, China

XIAO Qiong, LI Rui

Key Laboratory of Karst Dynamics, MLR/ Guangxi, International Research Center on Karst Under the Auspices of UNESCO, Institute of Karst Geology, Chinese Academy of Geological Sciences, Guilin 541004, China, xiaoqiong@karst.ac.cn

Abstract

To reveal the temporal and spatial variation of groundwater water chemistry in Lihu, ascertain SO_4^{2-} and NO_3^- sources, expose the reasons for the change of water quality, provide scientific basis for reasonable exploitation and protection of karst water resources. Several samples, collected from January to December in 2010 and May, October in 2014, has been analyzed. The result shows that ① The hydrochemical style of the underground water is HCO_3^- - Ca type and effected by the seasonal precipitation and human activity, the temporal and spatial variation of the main cations is obvious. ② The sulfur concentration was slightly decreased after the sewage plant operation. Compared to 2010, the nitrate pollution aggravated in 2014. Impacted by human activity, the concentration of sulfur and nitrate is higher in the upstream Nandan river, Layi cave and the midstream Liangfeng cave, Gantianba than in the downstream Xiaolong cave. ③ The $\delta^{34}\text{S-SO}_4^{2-}$ values range from -4.12 ‰ to -0.93 ‰, it indicates that the emission of the sulfur oxides by burning coal cause the rainwater acidification, which inputs a large amount of SO_4^{2-} into the underground water. ④ The $\delta^{15}\text{N}$ of nitrate ranged from 0.26 ‰ to 11.58 ‰, with an average value of 7.61 ‰, the $\delta^{18}\text{O}$ of nitrate ranged from -2.33 ‰ to 21.76 ‰, with an average value of 9.38 ‰, this shows that the main source of nitrate in the groundwater is soil organic nitrogen, manure and sewage.

karst underground water; hydrochemistry; sulfur isotope; nitrate and oxygen isotope;

Variation characteristics of Atmospheric Pollutants Concentration in the Urban Area of Chongqing in 2014 and their relationship with meteorological conditions

chen zhiqiu

South Wset University, China, 379129663@qq.com

Abstract

According to the air quality data in Chongqing from January to December in 2014, air quality index (AQI) $PM_{2.5}$, PM_{10} , CO , SO_2 , NO_2 and O_3 , as well as the variation characteristic of atmospheric pollutants concentrations were analyzed in Chongqing. Combined with the monthly average precipitation、average temperature、sunshine time、average relative humidity、average wind speed and air pressure and other meteorological data, in order to study the atmospheric pollutants impact of meteorological factors in Chongqing through the correlation analysis. The results showed that the changes of concentrations of AQI and $PM_{2.5}$, PM_{10} on the monthly scale are obviously U-shaped variation, appeared the low in middle and high on both ends. On the quarterly scale, the concentrations feature of AQI and $PM_{2.5}$, PM_{10} with highest in winter and lowest in summer, it means air quality is the worst in winter and the best in summer. The concentrations of $PM_{2.5}$ and PM_{10} are significantly correlated. Correlation analysis showed that the correlation coefficient of mass concentration of $PM_{2.5}$ and PM_{10} was 0.99, and the ratio of $PM_{2.5}/PM_{10}$ was 0.80 revealing a significant contribution of $PM_{2.5}$ to PM_{10} . A positive correlation existed between the mass concentration of $PM_{2.5}$, PM_{10} and high average relative humidity, mainly because of it tended to cause the formation of particulate. And there is a significantly positive correlation existed between the mass concentration of $PM_{2.5}$, PM_{10} and average air pressure, because of atmospheric circulation is affected by low pressure in summer, but high pressure in winter in Chongqing.

Key words:

PM_{10} ; $PM_{2.5}$; atmospheric pollutants; mass concentration; meteorological conditions; Chongqing

Karst Landforms as the Objects of Tourism Development in Mangystau Region

Akiyanova F., Bekkuliyeveva A.

Kazakhstan National Geographic Society, Astana, 010000, Republic of Kazakhstan, akiyanovaf@mail.ru

Abstract

Mangystau region is located in the Caspian region of Kazakhstan and due to the broad extension of the karst rocks is characterized by the development of karst processes. Within of this region the seashore niches and caves are widely developed and had been used for a long time by the local population for farming and recreational purposes. Moreover, niches and caves have a great scientific importance as they present the preserved traces of ancient states of the Caspian Sea. Karst landforms of the region create a unique karst landscape and they are an important natural resource for recreation and tourism. The main attractions of the region's karst landscape are the karst valley Tamshyly, karstic lake Saura and others. Valley Tamshyly is included in the list of specially-protected areas as a natural monument. The caves are an interesting karst forms for the development of tourism. There are about 30 caves of various sizes and types. The favorite places of cavers and tourists are Buly-Oyyk, Otebay and Karagan-Bosaga caves characterized by distinctive ecosystem. The artificial karstic caves (Becket ata, Shopan ata, Surule, Sultan apa, Kapam) represent the whole complex of natural and man-made structures. They were constructed in karst rocks and used in the past by hermits. Nowadays they are the objects of pilgrimage tourism. Thus, in Mangystau region the development of karst processes and karst landforms which create unique landscapes and ecosystems has a great resource for extension of tourism and will contribute to their conservation and management.

Key words:

Mangystau region; karst processes; unique karst landscapes; karst landforms; caves; development of tourism.

Research on Spatial Structure of County in Underdeveloped Karst Area Under the Perspective of Complexity-Use Guizhou as an Example

dingyang fu

South China Normal University, China, 842797908@qq.com

Abstract

Karst plateau basin is flat terrain, Guizhou's cities and medium-sized towns are concentrated in this terrain, the study for karst plateau basin area Settlements mainly to large settlements or urban settlements, and use GIS technology to research land use structure in karst area cities, to a certain extent, can reflect the spatial characteristics of karst city settlements. Fully aware of the karst plateau basin settlements spatial distribution and evolution is of great importance for the regional town planning, building a new socialist countryside and sustainable development. Previous studies showed that karst plateau basin settlement spatial distribution and evolution of karst region with a strong genetic and spatial distribution distribution exhibits complexity. Currently, the city as a complex adaptive system has become a general consensus. Based on the unique karst in Guizhou, in view of complexity research and development characteristics of urban space in this unique landscape, combining relevant spatial development of urban space structure pattern of elements in order to provide a study of the spatial structure of the city for its karst new perspective.

Key words:

Karst; spatial structure

¹³⁷Cs Profile Distribution and Estimation of Erosion Rate in Opencast Mine Area of Zhundong

Liu W, Cao Y E, Yang J J, Wang J, Wang G, Li X H, Zhou Y

College of resources and Environmental Science of Xinjiang University, Urumqi, 830046, P. R. China, 331837976@qq.com

Abstract

To quantitatively estimate soil erosion of Zhundong opencast mining area, ¹³⁷Cs tracer technique was employed to analyze radioactivity of 7 soil profiles in study area. The results showed that ¹³⁷Cs existed in 0-15 cm and 0-20cm of soil in non-cultivated and cultivated land, respectively. The erosion characteristics of 7 soil profiles were analyzed based on the profile distribution and activity of ¹³⁷Cs. It was found that the YN₇ and YN₁₅ were typical soil eroded profiles, while YN₅ was a sedimentary profile and YN₁₈ was farmland profile. In YN₂, ¹³⁷Cs distribution layer of ¹³⁷Cs were quite complete and showed negative exponential distribution curve, which can be regarded as an ideal sampling site of ¹³⁷Cs background value. YN₁₉ was an erosion-deposition profile, in which ¹³⁷Cs mainly distributed in shallow soil and showed high activity. Based on the profile distribution of ¹³⁷Cs, we analyzed the soil erosion rate in the 7 profiles and found that soil erosion rate of farmland was very low (0.240t/ (hm²·a)) due to the effects of farming activities. However, serious erosion occurred in the sampling site. On semi-fixed dune, the wind erosion particles were accumulated due to the terrain features. The compaction of surface soil greatly prevented wind erosion and even resulted in accumulation of wind erosion particles, which mainly depended on soil types. Generally, in arid area, vegetation coverage, land-use type, terrain and soil type should be considered in estimating wind erosion rate by ¹³⁷Cs technique.

Abstract

Water erosion results in reducing productivity of farmland. With cultivation time increased, the agricultural productivity is facing significantly increased vulnerability. Therefore, it urgently needs to quantify the assessment of productivity vulnerability of farmland. This paper, based on the APEX model and global hydrological watershed unit, selected the Huaihe River watershed as a case to explain the methodology of cumulative loss surface. Erosion variable controlled method was used to make soil and water conservation measures scenarios to study the relationship with the long-term erosion and productivity loss and fit the surface of soil erosion - loss of productivity - cumulative years. Results showed that: 1) The “water erosion intensity-cumulative years-loss rate surface” fits well. The highest R-square is 0.92 and the lowest R-square is 0.36. It has important significance to understand the long-term effects on productivity. 2) There is a significant pattern regional difference of potential productivity loss of all basins located at middle and upper reaches of the Huaihe River. It indicates that long-term water and soil loss have a significantly impact of productivity loss, especially to the southern region of middle and upper reaches of the Huaihe River. 3) Using the accumulating loss surfaces can conduct the potential loss of productive under long-term soil erosion, the maximum loss of productivity, and the time when the maximum loss happens. Namely, the earlier of 100% loss occurs, the more vulnerable of watershed productivity is due to soil erosion, and the more urgent of reforestation measures should be taken.

Analysis of NDVI Time Series for Assessing of Vegetation Dynamics on the Baikal-Gobi Meridional Transect

Tsydypov Bair Z.

The Baikal Institute of Nature Management SB RAS, Ulan-Ude, 670047, Russia, bz61@mail.ru

Abstract

Land degradation and desertification processes are widespread in natural and economic territories of Russia and Mongolia. A number of model monitoring polygons was established in different latitudinal zones of the Russian and Mongolian territories along the Baikal-Gobi meridional transect (51-43 °N, 105-107 °E). These polygons include a wide range of territories with dry climatic conditions. This investigation revealed the main factors, agents, and trends of desertification processes development in different climatic zones.

Monitoring of the status and dynamics of vegetation cover of the key sites are conducted on the basis of processing and analysis of multitemporal Landsat and MODIS Terra imagery.

During the field expedition studies, the in-situ landscape indication of NDVI areas with different values was conducted. The natural and anthropogenic factors of the dynamics of their changes were studied. Phytocenotic diversity is revealed on the model key sites, geobotanical profiles are laid, and characteristics of the spatial organization of vegetation cover are given. Landscape indication of the key sites is held based on satellite imagery and complete geobotanical descriptions. Created large-scale vegetation maps will allow to evaluate the ecological state, to determine the dynamics of vegetation cover changes and provide a comparative analysis of the dynamics.

The conducted analysis of NDVI indicates current trend of aridization of already sparse vegetation on the Mongolian polygons.

desertification; vegetation degradation; dry climatic zone; aridization; Landsat; NDVI; landscape indication; geobotanical description

Analysis of Rainfall Erosivity under Monsoon Regime in Maharashtra State, India

Pethkar, SHRUTI

Department of Geography, S.N.D.T. Women's University, Pune- 411038, India, shruti.pethkar@gmail.com

Abstract

About 57 % of total geographical area of India is suffering from various forms of degradation. Maharashtra, basically is an agrarian state with soil being the crucial resource. But rapid industrialization and development by acquisition of more agricultural land is exerting pressure on available land resources. This necessitates the proper analysis of the climatological, pedological, physiographic and anthropogenic parameters which plays a major role in degradation of soil resources. Rainfall is the main source for the supply of energy to detach and transport soil particles from soil profile. The aggressiveness of the rain to cause soil erosion is termed as Rainfall erosivity which depends upon the Kinetic energy and intensity of the storm.

Maharashtra, displays diversified landscapes, which is responsible for the differences in distribution, duration and intensity of rainfall which ultimately controls the erosivity. Much of the rain is brought by the south-west monsoons during summer. About 90 percent of the rain falls in the four months from June to September with average annual precipitation of 795 mm.

Daily rainfall data for 367 stations obtained from India Meteorological Department is used for the analysis of the rainfall erosivity. As per the eight rainfall zones identified based on distribution of rainfall, a regression analysis was performed to obtain an approximate relationship between rainfall data and the rainfall erosivity. The higher values of correlation coefficient signifies that relationship between Rainfall and Erosivity fit to a power function. Accordingly two equations were formulated for high and low rainfall zones.

Key words:

Rainfall Erosivity; degradation; kinetic energy; duration and intensity of rainfall

Assessing Soil Erosion by Remote Sensing in the Middle Reaches of the Yarlung Zangbo River, Tibet

Fan Jianrong^{1,*}, Zhang Xiyu^{1, 2}

Institute of Mountain Hazards and Environment, Chinese Academy of Sciences & Ministry of Water Conservancy, Chengdu, 610041, P. R. China, fjriong@imde.ac.cn

University of Chinese Academy of Sciences, Beijing 100049, P. R. China

Abstract

The middle reaches of Yarlung Zangbo River, in the south of the Tibetan Plateau, is the political, economic and cultural center of Tibet Autonomous Region. However, with many types of serious soil erosion, this area has a fragile ecological environment. In this paper, based on multi-source and multi-temporal remote sensing data, land use/land cover types was obtained by object-oriented classification method, with the overall accuracy of 90.62%. Then, utilizing the land cover types data and the Normalized Difference Vegetation Index (NDVI) data in the peak of the growing season, the vegetation coverage was estimated by density sub-pixel model and non-density sub-pixel model with 90.60% overall accuracy. Moreover, we extracted other soil erosion factors including slope, aspect, annual precipitation, and annual freeze-thaw cycle days, and phase transition water content in freeze-thaw process. Afterwards, criterion and weight of these factors for different erosion types were formulated respectively by establishing soil erosion discrimination and evaluation models. Combining remote sensing, geographic information system and field investigation, we completed a comprehensive soil erosion evaluation at 1: 50,000 scale. The accuracy of evaluation is 93.60% with 125 field verification points. Finally, we analysed the spatial distribution characteristics and causes of different erosion types. The results illustrate that, 1) soil erosion area is 46588.51 km² (accounting for 69.89% of the study area), of which 80.36% suffers moderate to severe erosion; 2) different soil erosion types have significant spatial distribution pattern. The evaluation methods and results are of great significance for soil erosion research in Tibetan Plateau.

remote sensing; soil erosion evaluation; land use/land cover types; vegetation coverage; Yarlung Zangbo River

Characterizing Land Surface Temperature and Vegetation Changes near Son-Ganga Confluence, India, during 2000-2015 period using MODIS Products

Aman Arora¹, Masood A. Siddiqui¹, Manish Pandey²

¹ Department of Geography, Faculty of Natural Sciences, Jamia Millia Islamia, New Delhi, aman.jmi01@gmail.com

² Centre for the Study of Regional Development, SSS-III, Jawaharlal Nehru University, New Delhi

Abstract

Uninterrupted monitoring of land surface temperature (LST) and vegetation cover is one of the results of advancement in space technology. Understanding surface temperature variations and vegetation changes at the Son-Ganga confluence zone in the Middle Ganga Floodplain (MGF), Bihar, India, is main objective of this study. LST and Normalized Difference Vegetation Index/Enhanced Vegetation Index (NDVI/EVI) MODIS satellite products onboard Terra (1km spatial and 8-day composite temporal resolution for LST, and 250m spatial and 16-day composite for NDVI/EVI) for the period 2000-2015 were used in the study. LST product (scale factor of 0.02) was analyzed over the period starting from March 05, 2000 to December 27, 2015. NDVI/EVI MODIS product (scale factor 0.0001) used in the study spans over the period from February 18, 2000 to December 19, 2015. Day time LST indicates a slightly decreasing monthly trend with average pixel temperature 301.62K on March 5, 2000 and 293.64K on December 27, 2015 and night time LST shows the declining monthly trend with average pixel temperature 288.29K and 282.76K on the same corresponding dates. NDVI values for the area reveals an increasing trend (NDVI ranges between 0.09-0.23) and EVI during the same period also shows the same rising monthly trend (EVI ranges between 0.26-0.34). Increasing values of NDVI/EVI and decreasing trend of LST in the area least affected by human settlements (because of frequent flooding around confluence zone) indicates an inverse relationship between temperature and vegetation. This study signifies the use of satellite derived data in environmental monitoring in floodplain areas.

Coal Mining Subsiding Land and its Consolidations in Jining City

Chen Yuanyuan^{1,2}, Lü Changhe^{1,*}, Yan Hongwen³, Shang Kaili³

1.Key Laboratory of Land Surface Pattern and Simulation, Institute of Geographic Sciences and Natural Resources Research, Chinese Academy of Sciences, Beijing 100101, China, chenyy.15b@igsnrr.ac.cn;

2.The University of Chinese Academy of Sciences, Beijing 100049, China;

3.College of Geography and Environment, Shandong Normal University, Jinan 250014, China

Abstract

Jining City, located in the North China Plain, is a typical coal resource-based city, the coal mining has caused a lot of land subsidence in the last fifty years. In this paper, we accorded to the field survey data and Landsat OLI remote sensing images of Jining in 2015, through visual interpretation to extract the distribution and type information of coal mining subsidence area, proposed the direction and mode of consolidation and use for different type. The study found that the total area of coal mining subsidence of Jining in 2015 is 27,343.15 hectares, accounting for 16.23% of the total land area, mainly located in the south of Rencheng, the "Golden Triangle" area at the junction of the Yanzhou, Qufu and Zoucheng, the east of Weishan Lake. According to the degree of subsidence, coal mining subsidence area can be divided into mild, moderate and severe subsidence area, the consolidation direction should be reclamation into arable land, comprehensive development of agriculture, forestry and fishing or as ecological land.

Key words:

coal mining subsidence area; consolidation mode; Jining city

Coastal Land Suitability Evaluation for Fishponds in Indramayu Indonesia Using Landsat Thematic Mapper Imagery and Geographic Information System

Nandi, Somantri, L.

Department of Geography Education, Universitas Pendidikan Indonesia, Bandung 40154, nandi@upi.edu

Abstract

The coastal area has the potential for development. This potential can be inland and marine fisheries, which could be a high potential development aspect. Inland fisheries have not become a major source for local revenue due to the low management of the region, particularly on the coastal areas fisheries utilization. The goal of this study is to evaluate the suitability of fishponds in relation to the physical characteristics of the coastal areas. It aims to provide accurate data and precise information regarding the suitability of land for the fishponds by using remote sensing and geographic information systems (GIS). The specific objectives to be achieved in this study were (1) to analyse the characteristics of the coastal areas (2) to evaluate the land use of coastal areas for the fishponds using remote sensing and GIS, and (3) to analyse the direction and planning of the coastal area, especially in the use of fishponds. The method used was remote sensing and GIS by using survey techniques. Research findings reveal that the fishponds are suitable, fit reasonably, and they are very appropriate. The results of the evaluation of the suitability of fishpond can be used for the selection of the best fishpond location and in determining how to develop coastal areas in the Indramayu, Indonesia.

Land Suitability; Land Evaluation; Coastal Area; Fishpond; Indramayu (Indonesia)

Crop Salinization Vulnerability Curve Construction Based on EPIC Model: A Case Study of Global Maize

Lian F, Lin D G, Wang J A

School of Geographical, Beijing Normal University, Beijing, 100875, P. R. China, lianfang2023@mail.bnu.edu.cn

Abstract

This study addressed on exploring the method of crop salinization vulnerability curve construction. Current researches mostly concentrated on using the experimental method or model simulation to quantitatively assess the relationship between productivity and single index such as soil salt concentration or electric conductivity, and the curve's application had regional limitation. Considering multiple environment elements, salinization stress index as a comprehensive index was designed in this study. With variable controlling and IPCC AR5 RCP2.6 climate data, global maize production losses in different salt concentration irrigation scenarios were simulated by EPIC model. Then global maize salinization vulnerability curves were constructed in $0.5^{\circ} \times 0.5^{\circ}$ grid scale and continent scale. The results showed: 1) The curves were excellent in fitting with R-square range from 0.68 to 0.99. Curves varied from grid to grid and showed a regional vulnerability difference in different environments. 2) The curves had three basic shapes judged by the inflexion, namely 'standard S-shape', 'slow growth' and 'rapid growth'. 3) Max production loss can be used as the criteria of vulnerability assessment, i.e., the larger max production loss, the more vulnerable. With this criteria, Asia is most vulnerable of salinization, then comes Europe, North America, Africa, South America and Oceania. This study can provide basic data and serve as reference for quantitative assessment of salinization risk.

Key words:

Vulnerability curve; Salinization; Global; Maize; EPIC

Desertification & Land Degradation Status Mapping of North East India: Special reference to Assam and Meghalaya

Mipun, B.S.¹ Rajawat A.S.² Sastry K.L.N.², Bora, A.¹

¹Department of Geography, NEHU, Shillong

²Space Application Center, ISRO, Ahmedabad

Abstract

The causes for desertification are mainly improper management practices, overgrazing, tree felling, over cultivation etc. The vegetal degradation, erosion processes, water logging and salinization lead to loss of soil fertility, soil compaction and soil crusting. Urbanization, mining and recreation also cause land degradation. The objective is to assess the status of desertification in some areas of North East India at 1:50,000 scale using Resourcesat and LISS III data and collect information on various land degradation processes and their severity. As 2011 report the total forest cover in Assam is 27673 km² (35.28%), in Meghalaya is 17275 (77.02%). The total area under the process of desertification/land degradation in Assam is about 21.31% and in Meghalaya is 38.07%. The most significant processes are vegetal degradation and water logging. In Assam the area under desertification/land degradation processes is vegetal degradation 15.77%, water logging 5.54%. The area under no apparent degradation is about 71.88% and water body/drainage 6.18%. In Meghalaya the area under desertification/land degradation processes is vegetal degradation 35.59%, water logging 0.55%, water erosion 1.93%. Area 61.89% comes under no apparent degradation and water body 0.04% and 0.3% respectively. DSM for 5 vulnerable districts of Assam and Meghalaya viz Golaghat, Hailakandi, Kokrajhar of Assam, Jaintia Hills and West Khasi Hills of Meghalaya are carried out on 1:50,000 using three seasons LISS-III data of two different time series so as to compare the change in the status of the desertification over the years. Three seasons LISS III data used are of 2003-04 & 20012-13.

Key words:

desertification; degradation; and apparent; vulnerable; status

Desertification Causes, Effects and Solutions: A Study in Environmental Geography

Sinha, Dr. Ashok Kumar

Professor & Former Head, University Dept. of Geography, Magadh University, Bodh Gaya 824 234 (INDIA),
draksinha@rediffmail.com

Abstract

Desertification is a global phenomenon. It affects over 1.2 billion people living in more than 110 countries around the world and it also affects about 10 million square kilometers area. Seventy percent of the agricultural land in arid, semi-arid and dry sub-humid lands is already degraded. Desertification causes poverty with social economic and political instability.

Desertification is a process in which soil becomes bare and dry, and cannot support vegetation. It can happen very quickly over a few seasons. It is caused by climatic factors such as climatic change and drought, as well as over cultivation, over grazing, bad farming or irrigation methods and deforestation. Desertification damages soil and makes it infertile for growing crops, it destroys communities of plants and animals which reduces biodiversity. It leads to poverty, famine and ill-health and encourages social and political unrest.

Desertification in China is a major environmental problem which has been mainly caused by deforestation and overexploitation of land for farming and grazing resulting 1.65 million square kilometers of area and sixty percent of China's population lives in desertified areas.

Mesopotamian (modern Iraq) marshlands have been reduced one-tenth of their original size i.e. 1500-2000 square kilometers and is expected to disappear in the next 5-10 years. The reason is that water from the Tigris and Euphrates rivers was diverted from its normal flow via canals and ditches and construction of dams on the rivers to store water – this leads desertification of the region. It affected badly to Marsh Arabs or madan who lived in the marshlands for over 5000 years in which they learned to live in harmony with their environment. Biodiversity of the region has been destroyed.

Barsa Kelones used to be an island located off the north-western coast of the Aral Sea in Kazakhstan has now been turned into a peninsula due to no water flow from the Amu Darya and Syr Darya rivers to the Aral sea which used to irrigate huge areas of cotton and rice that were grown on the land around the sea. The wildlife and biodiversity of Barsa Kelmes have been badly affected by the desertification of this region these are the few examples of desertification and its bad impacts.

Harmful human activities and harsh climatic conditions are causes of desertification all over the world. Hence we should educate ourselves about the causes and consequences of desertification and promote awareness of desertification in our community at all levels through various programmes and actions in the interest of good environment and humanity.

Determining Sources of Sediments at Nkula Dam in the Middle Shire River, Malawi, using Mineral Magnetic Approach

Mzuza M.K.¹, Zhang W.^{1*}, Chapola L.S.², Tembo M.³ and Kapute F.³

¹State Key Laboratory of Estuarine and Coastal Research, East China Normal University, Shanghai 200062, China, wgzhang@sklec.ecnu.edu.cn

²The Catholic University of Malawi, P.O. Box 5452, Limbe, Malawi.

³Mzuzu University, P/Bag 201, Luwingu, Mzuzu, Malawi.

Abstract

Shire River is the largest and longest river in Malawi. Siltation is now a major problem in the Nkula Dam on Shire River due to catchment degradation. This study analysed sediment samples from western and eastern tributaries of the Shire River to determine sources of sediments that cause siltation in the Nkula Dam using mineral magnetic approach. Representative samples were collected from tributaries of western and eastern sides of the Shire River and Nkula Dam, and subjected to magnetic measurements on bulk samples and sized fractions (<250 µm and >250 µm). Our results show that, eastern tributaries have significantly higher ferrimagnetic mineral contents and ferrimagnetic to antiferromagnetic ratios than western tributaries. Rock geology is interpreted to be the main reason for magnetic contrast between the two sides of the river. It is suggested that most of the sediments in the Nkula Dam originate from the western part of the Shire River, which is caused by intensive erosion in the western side of the middle Shire River. This study demonstrates that magnetic method is a promising approach in assessing fluvial sediment source.

Ecological Sustainability and Land Management in Aravalli Hill Ranges of Tonk District, Rajasthan, India

¹PRASAD Rama, ²SINGH Rani, ³UPRETI pallavi

^{1,2}University of Rajasthan, Jaipur, Rajasthan, India, ramaprsad10@gmail.com

³Research Scholar, HNB Garhwal University, Srinagar, Uttarakhand, India

Abstract

The Aravalli hill region of south Rajasthan served its area and the people as a rich resource area providing forest products. Ecosystems are frequently disturbed by natural factors and humans actions leading to the degradation of land and also lead to the extinction of species of plants. Land degradation resulting disturbances in ecological stability causes problems at three levels. At the local level, it reduces productivity; at the national level it increases the effects of natural disaster like floods, drought and depletion of natural resources. At the global level, a complex cause- effect may impact soils as a terrestrial carbon sink, increase of greenhouse gases, climate change, famine in arid and semi- arid areas. Degradation and destruction of the natural resources is now assuming massive proportion in many countries.

The study area is located in central Aravalli in state of Rajasthan. The climate on the whole is semi-arid. This study examines the nature, spatial pattern, degree and causes of land degradation in central Aravalli hilly tract, which has ultimately disturbed and affected the ecology of the area. Main objectives are to analyze the factors responsible for ecological imbalance, to correlate the frequency of the rainfall with forest ecology under the influence of physical factors, to diagnose the spatial distributional pattern of forest ecology (flora and fauna) at different level. Further, the sustainable development has been putforth, which is the development without destruction and deterioration of natural resources.

Environmental Change and Conflict in Nigeria: An Overview

Nabegu, A.B.

Department of Geography, Kano University of Science and Technology, Wudil, Kano, Nigeria

Email: aliyunabegu@gmail.com

Abstract

Although, the relationship between environmental degradation as seen in Northern state of Nigeria and poverty is clear, its linkage with violent conflict in the region is subject to debate. This paper assesses the change to Nigeria's environment and its impacts on livelihoods and associated human response. The paper observes that the main impact pathways for environmental change induced conflict include competition for land especially arable land and clean water, habitable land, which is likely to become scarcer, more crowded, and more costly as a result of continued rapid disruption to landform and landform processes, these factors will cause large-scale poverty, and deadly human migrations that will also push populations dependent on rainfall or irrigated agriculture to fierce competition for productive resources. As the conflict intensifies it aggravates old divides of religion and ethnicity, which threatens not only the states but the entire country and the West African sub-region as a whole. The paper recommends that conceptualizing the challenges posed by environmental change in Nigeria will allow it develop strategies for dealing with the consequences of environmental change in a coherent and rational manner.

b_hishgee0715@yahoo.com

Abstract

Recently, land degradation has increased due to inappropriate land-use such as rangeland overgrazing, mining activities, road expansions, and steppe and forest fire in Mongolia. Approximately 72 percent of total rangeland areas in Mongolia have been classified as degraded to the certain degree as a result of poor management of rangelands and some other factors.

The objective of this study was to identify the ecological state of rangeland located in the forest-steppe zone of Mongolia and define factors that influence land degradation. In this study, we used several variables including livestock number in sheep forage unit, air temperature, precipitation and vegetation cover, the forage yield, soil humus, density, and texture. We defined that 60.7 percent of total rangeland had been degraded with the twice higher number of livestock as compared to the actual carrying capacity.

Gully Erosion Mapping in the Sancha River Catchment of Northeast China Based on Multi-Scale Remote Sensing Data

Wang R, Zhang S

Northeast Institute of Geography and Agroecology, Chinese Academy of Sciences, Changchun, 130102, P. R. China, wangranghu@163.com

Abstract

Gully erosion generally is considered as an indicator of desertification and land degradation. The objective of this research was to develop an overall methodology based on multi-scale remote sensing data for gully erosion mapping in the Sancha River catchment of Northeast China where gullies extend over a vast area. The research compared various remote sensing data including satellite images (such as Landsat 8, SPOT-4, ALOS, SPOT-5, ZY-3, GF-1, Pleiades-1A), aerial images and unmanned aerial vehicle (UAV) remote sensing data on gully mapping for the different temporal, spectral and spatial resolution (ten meters and meter level to decimeter and centimeter level). Image visual interpretation with field verification were used to map gully geometric features and evaluate gully erosion. The results showed that the study area suffered more serious gully erosion, which mainly occurs in cultivated land, and the highest gully density occurs at the northeastern of the catchment. We also found that sub-meter images have a good ability in the recognition of ephemeral gully and obtained satisfactory result. In addition, UAV remote sensing data showed great potential for reducing the data gap between field scale and satellite scale by providing digital terrain model and orthoimage with very high resolution on a centimeter level. This study provides information on the location of gullies, gully dynamics over a period of time, and the degree of land degradation (gully density) for developing comprehensive soil and water conservation management in the study area.

Key words:

land degradation; gully erosion mapping; multi-scale remote sensing data; UAV; gully density; ephemeral gully; Northeast China.

Hopf Bifurcation and Hysteresis Route in Arid Ecosystem; a Tool to Predict Desertification

Adel Sepehr

Dept of Desert and Arid Zone Management, Ferdowsi University of Mashhad, Mashhad, Iran, adelsepehr@um.ac.ir

Abstract

An ecosystem with a tipping in equilibrium state shows a bistability point with two equilibrium states for one set of conditions. In this case, changing the internal conditions and external perturbations can both cause the ecosystem to jump from one stable state to the other. Emerging desert landscapes is a consequences of non-linear responses of ecosystem to these outgoing environmental perturbations. These reactions are with resilience oscillations and equilibrium states alterations in an ecosystem. This paper presents chaotic behaviour of arid ecosystem over far from equilibrium where bifurcation points in stability route of ecosystem can represent a stable state of desert landscape over time. Adding one or more dimensions of periodicity to the ecosystem lead to a periodic orbit. In other word a path of stable equilibria is replaced by a periodic orbit which is a common behaviour in all of ecosystem with naturally periodic characteristics. This switch is called a Hopf bifurcation. This article shows that analysing ecosystem behaviour close to the tipping points (thresholds) can be a useful tool to predict desertification process. In this paper base on equilibria route concepts, has been explained desertification phenomenon over Hopf bifurcation and resilience oscillations in arid ecosystems. The results shows that less stable ecosystem indicated a higher amplitudes of fluctuation; conversely, a cessation of periodicity can signify a collapse in ecosystem which called desertification state.

Abstract

Archeological researches have proposed arguments for human mobility and long-distance trading over the Eurasia before the Silk Roads. Here we utilize biologically available strontium isotope analysis to assess the extent of pre-Silk Road population movements and cultural communications across the Asian interior. From an early Iron Age cemetery (ca. 2500 yr B.P.) on the eastern Pamir Plateau, mean $^{87}\text{Sr}/^{86}\text{Sr}$ ratios from 34 individuals display considerable isotopic variability, and 10 individuals are distinguished as migrants based on the local strontium isotope range of 0.710296 - 0.710572 by 12 ovicaprine bones. Comparison of the fraction (10/34) with the regional census data conducted in 1909 A.D. (3% non-locals) suggests a highly migratory behavior on the plateau 2500 years ago. Furthermore, exotic mortuary objects, such as silk fabrics from eastern China and angular harp originated from the Near East, clearly demonstrate an active interaction between the pre-Silk Road cultures on the plateau in the early Iron Age.

Identification of Soil Erosion Hotspot Areas for Sustainable Land Management in the Gerado Catchment, Northeastern Ethiopia

Bahir L. Asmamaw, Ahmed A. Mohammed, Desta T. Lulseged

Department of Geography and Environmental Studies, Addis Ababa University, Addis Ababa, Ethiopia, E-mail:

abahir675@gmail.com

Abstract

In Highland Ethiopia, soil erosion is one of the main forms of land degradation which has a wide range of undesirable on-site and off-site impacts. It is therefore essential to mitigate soil erosion through site-specific and problem-oriented management practices. The research employed Revised Universal Soil Loss Equation (RUSLE2) model to identify hotspot areas of soil erosion and prioritize land management intervention in the Gerado catchment, North-eastern Ethiopia. The parameters required for the model were acquired from different sources and integrated with ArcGIS tools to estimate soil loss rates of the study catchment. Mean annual soil loss rates were estimated to be between 5 and 100 t ha⁻¹ yr⁻¹ on flatter and steeper slopes respectively. Over 75% of the catchment area had an average soil loss above the estimated tolerance soil loss rate of 18 t ha⁻¹ yr⁻¹ for the country. In order to identify hotspot areas, the catchment was classified into severe, very high, high, medium, low and very low erosion risk categories. Based on the study result, it is recommended that areas with severe, very high and high erosion risk with estimated soil loss of 25 t ha⁻¹ yr⁻¹ or over are prioritized for land management intervention. Areas which require the immediate implementation of soil management approximately accounted for 75% (5025 ha) of the total catchment. The results showed that the severity of erosion was linked to the steepness of slope, cultivation of steep slopes, absence/lack of effective conservation measures and sparse nature of the steep slope vegetation cover.

Key words:

soil loss tolerance; RUSLE2; erosion factors; management prioritization.

Integrated Landscape Policy

Gale R

UNSW-Australia, Sydney, Australia r.gale@unsw.edu.au

Abstract

Landscape scale management and conservation involves a range of geographic scales for addressing land degradation and environmental change issues. The bio-geophysical design principles of wildlife corridor planning for biodiversity conservation, for example, are largely established in ecological and bio-geographical literature. In addition to ecological knowledge, however, landscape-scale policy development requires more theorization about geographic scale, scale effects, and place-based spatial phenomena. An understanding of how differences in the evidentiary scale for policy diagnosis and prognosis can lead to other readings of the problem and hence different responses or solutions is critical for policy outcomes.

This paper reflects on Australia's National Wildlife Corridors Plan for biodiversity conservation, a plan to address land degradation and climate change. Although the Plan was not implemented, it continues to provide a partial basis for addressing issues such as: landscape scale connectivity; contested ideas of landscape; land-use planning; multi-scalar analysis in integrated natural resource management; private sector market failure; and government public policy failure. Its major shortcoming lies in its restricted political conception in biodiversity conservation as an election commitment rather than as a component of a comprehensive and integrated landscape scale policy initiative.

Drawing on Irish experience with the European Landscape Convention, the case is made for a broader conception of geographic scale in managing impacts on landscapes that are important for heritage, cultural, economic, and biodiversity conservation reasons. A recommendation is made for an explicit Integrated Landscape Policy that recognizes landscapes as place-based spatial phenomena at local and national levels.

Integrating Measurements of Grassland Function Using Remote Sensing

Guo X

Department of Geography and Planning, University of Saskatchewan, Saskatoon, SK S7N 5C8 Canada,
xulin.guo@usask.ca

Abstract

Grasslands provide vital global ecosystem services, are sensitive to disturbance and invasion, and prone to rapid functional collapse. Critically, grassland ecosystems are carbon sinks or sources depending upon management practices largely surrounding cropping and grazing. Grasslands worldwide have been degraded in recent decades due to intense human activity and climate change and this degradation not only threatens ecosystems but negatively affects ecosystem services. The pressures from degradation emphasize the need to understand, evaluate, and monitor grassland ecosystems. For decades, studies have used remote sensing tools to determine solitary measures of grassland growth and productivity including leaf area index, biomass, canopy height and cover, structural heterogeneity, and burn and grazing effects. While this approach has advanced our understanding of how to monitor specific elements of the grassland community in isolation, a barrier to continued progress in assessing community effects of herbivory and human use for ecosystem services is a comprehensive assessment of vascular, non-vascular, biotic and abiotic features of grasslands. A comprehensive grassland assessment is hindered by uncertainties of optical grassland remote sensing resulting from existing non-photosynthetic vegetation (NPV) and biological soil crust (BSC), and constrained by lack of an effective approach to quantify NPV and BSC. Further, NPV is critical for determining herbivore carrying capacity in winter; however, it is an understudied field for remote sensing. Thus, this study is to make an important advance in large scale grassland ecosystem monitoring and conservation using remote sensing tools through focusing on BSC and NPV and integrate this with established spectral relationships.

Land Use and Topographic Effects on the Spatial and Temporal Soil Physicochemical Properties on the Uplands of Rwizi Catchment in the Lake Victoria Basin

Bamutaze, Y, Brigitta, S, Wanyama, J, Tenywa, M, Meadows, M, Thiemann, S, and Opedes, H
Department of Geography, Geo-Informatics and Climatic Sciences, Makerere University, PO Box 7962, Kampala, Uganda, yazidhibamutaze@gmail.com

Abstract

Soil properties are an important proxy of the quality and resilience of the land and its associated practices. In this study we investigated the effect of land use and topographic factors on the magnitude and spatio-temporal variation in 12 soil physical and chemical properties in Rwizi catchment, Lake Victoria Basin. Using land use, topographic segment position as fixed factors; we selected 36 locations for composite sampling of soil properties representing 4 land uses, 3 slope segment positions and three replications. The soil samples were tested in the lab using standard techniques. The results show a moderate to high spatial variation of the soil properties. Between the three studies years, the variations were not consistent with SOM, N, P, showing gains while texture shows losses on a short timescale. Land use has a significant ($p < 0.05$) effect on soil texture and SOM, while topographic position seems to be dominant significantly affecting 8 of the 12 studied physicochemical properties. The greatest changes were observed for samples on the lower segment slope positions. Strong and significant correlation between the soil properties and environmental variables (slope gradient, altitude, aspect, latitude and longitude) are observed for SOM, texture, N, P and K.

Physicochemical properties; Land use; Topography; Lake Victoria Basin

Landscape Mapping of Selenginsky Middle Mountains (on the Example of the Ubur-Dzokoysky Hollow)

Sayapina Daria O., Tsydypov Bair Z., Garmaev Endon Zh.

The Baikal Institute of Nature Management SB RAS, Ulan-Ude, 670047, Russia, daria832@yandex.ru

Abstract

Satellite imagery are widely used in the most different areas of human activity – research of natural resources, monitoring of natural disasters and an assessment of their consequences, studying of influence of anthropogenous impact on environment, construction and design and exploration work, the city and land registry, planning and management of development of territories, town planning, geology and development of a subsoil, the industry, rural and forest farms, tourism, etc. Modern GIS technology and creation of maps of different scales can not do without the use of satellite images and the use of remote sensing methods.

The purpose of work is studying of differentiation of geosystems by creation of the landscape map of the Ubur-Dzokoysky hollow.

In this article we consider the mapping of landscapes and their classification on the example of the Ubur-Dzokoysky hollow. Landscape mapping was made on the basis of the developed structural-genetic classification. The obtained results disclose the modern status of the environment. The analysis of the spatial structure of landscapes was made with defining the dominant and background landscape complexes.

Marshland Degradation in Xingkai Lake and the Restored Strategy for Habitat

Liu X H, Jiang M, Wang L, Zhang S J

Northeast Institute of Geography and Agroecology, Chinese Academy of Sciences, Changchun, 130102, P. R. China,
liuxh2752@126.com

Abstract

With the rapid growth of population and the national demand for foods, the natural marshlands in northeastern China had been damaged extensively since the 1950s. Global climate change is increasing the frequency and magnitude of the floods and droughts, augmenting the vulnerability of wetland ecosystems. According to the topographic map and remote sensing images in ArcGIS, the marshland area decreased 56.6% during 1954-2010, but the rice paddy area increased 1.28 times from 1980 to 2010. The marshland in the region of Xingkai Lake had undergone the dramatic loss and the patches of marshland were fragmented. By the investigation of the historical rice paddy in the core and experimental areas in Xingkai Lake, the migrated ducks on their paths resulted in the yields loss up to 70%. For the policy maker, the habitat was urgently restored. So it showed that the ecological compensation was conducted where had no production within the one kilometer buffer around Xingkai Lake National Nature Reserve.

Key words:

marshland pattern; waterbirds habitat; restored strategy

Monitoring and Analysis of Soil Erosion in the Loess Plateau of China Based on CSLE -

A Case Study on Dongzhiyuan in Loess Plateau

³ Research Center of Desertification Control, Longdong University, 745000, Qingyang, China

Abstract

Soil erosion is a worldwide ecological and environmental problems, which has become an important manifestation of the ecological threat to human security. The soil erosion has been listed as one of the top ten environmental issues for the advent of mankind. The Loess Plateau of China is the most serious soil erosion area in the world, while Dongzhiyuan is the largest plateau in the Loess Plateau. There are known as the first loess tableland. According vegetation maps, topographic maps, soil maps, site rainfall interpolation maps, TM / ETM images and other information of the Loess Plateau Dongzhiyuan, we have set up the China soil loss equation CSLE (it has been successfully applied to the 1st national water census and Water Conservation census in china) based on the technology of RS and GIS. The CSLE is based on the US Universal Soil Loss Equation (USLE). Those result can provide a reliable basis for monitoring and analysis the soil erosion area, exploring the cause of the soil erosion and making the soil conservation measures.

Soil erosion; CSLE(China soil loss equation); RS/GIS; Loess Plateau; Dongzhiyuan

Pasture Use in the Eastern Zambezi Region, Namibia; A People - Cattle Grazing System Under a Flood – Drought Regime

Colpaert, A. Kumpula, T. Gbagir, A-M

Department of Geographical and Historical Studies, University of Eastern Finland, Joensuu, Finland,

alfred.colpaert@uef.fi

Abstract

Cattle grazing and subsistence farming are still of major importance in the rural areas of northern Namibia. The grazing cycle of cattle in the eastern Zambezi region of Namibia (previously known as the Eastern Caprivi region), is defined by an annual flooding and drought cycle. National Parks and other conservation areas as well as national borders (permanent rivers, Zambezi and Chobe) define the space available for grazing. Increasing numbers of cattle and settlements in the area create pressure on the environment, which results in land degradation and erosion. This paper seeks to analyze the trends during the last 15 years using MODIS NDVI satellite data and aerial photography. Two years of GPS cattle tracking data provides data to relate cattle movement to flooding intensity. An aerial photo mosaic series from 1970 – 2006, provides detailed data on land clearance and degradation for the Salambala conservation area. During the flooding period (March – May) cattle has to leave the grazing areas on the flood plains and livestock numbers on the higher sandy areas increases above the ecological carrying capacity. The same higher grounds are also becoming more and more densely settled, ad settlements are often focused near the main roads, where clean water, electricity health and educational services area more readily available. This negative cycle of settlement concentration, unproductive farming practices, charcoal burning and grazing on confined spaces is easily seen in the environment.

Key words:

Namibia; Zambezi region; cattle; flooding; drought; land degradation; land cover change; MODIS; GPS-collar tracking.

Reflection of Land Use in Landforms and Sediments of Small Catchments

(Meghalaya Plateau, NE India)

Rączkowska Zofia, Bucała Anna, Prokop Paweł

Institute of Geography and Spatial Organization PAS, Department of Geoenviromental Research, Kraków, Poland,

abucala@zg.pan.krakow.pl

Abstract

Geomorphological mapping, morphometric and sediment analysis were used a base for evaluation of human impact on the relief in Meghalaya Plateau. Two small hilly catchments of altitude 1750–1840 m asl. with similar environmental features (lithology, climate) and area (~3 ha) but different land use, was chosen for studies. Both catchments agricultural and with natural forest - so-called "sacred forest" are located in the northern part of Myllem granite batholith, in the Nongkrem village. The climate is monsoonal with 14°C of mean annual temperature and 2400 mm of mean annual rainfall. Slopes are covered by sandy clayey grus weathered up to 15-20 m with developed sandy-loam and silty-loam Ultisols.

The longitudinal profiles of both catchments are a step-like, with thresholds formed by giant granite boulders. Terraces formed with using a giant boulders are characteristic feature of agricultural catchment with intensive root crops cultivation. More distinct thresholds, deeper incision, steeper slopes and presence of branch valleys in its head distinguish the forested catchment. Giant boulders are scattered in both catchments. However, less number of boulders found in agricultural one is related to their selective extraction. In contrast, higher contribution of fine sediment found in agricultural catchment, results from tillage mixing of surface soil horizon.

Morphometric and sediment features evidence dominant role of human impact in recent relief transformation of agricultural catchment. Detailed geomorphological mapping is an useful tool in recognition of land degradation.

The research is outcome of PAS-INSA bilateral cooperation.

Key words:

landform; land use; geomorphological methods; Meghalaya Plateau

Research on the Application of Structural Vegetation Coverage in Soil Erosion

Gao, Y, Wang J

Beijing Normal University, Beijing, 100875, P. R. China, gaoyuan_@hotmail.com

Abstract

Vegetation is one of the most important influence factors of soil erosion. In soil erosion research, the influence of vegetation on soil is usually expressed by vegetation coverage. Commonly used projection vegetation coverage has some limitations in the characterization of vegetation's soil and water conservation functions. Structural vegetation coverage is proposed to overcome this limitation and comprehensively reflect the influence of community coverage on soil erosion, but most relevant research is still on theoretical stage. The research is carried out in the Yan River Basin, which belongs to the Loess plateau, mainly through RS and GIS spatial analysis technology, using the daily rainfall data, Landsat 8 OLI images, SRTM DEM, land use map, soil K value map, transfer station measured runoff/sediment data. Based on structural vegetation coverage remote sensing model and dimidiate pixel model respectively, structural vegetation coverage and NDVI vegetation coverage in the study area were extracted and compared in various respects. With the two vegetation coverage as the index of vegetation factor respectively, USLE-based quantitative soil erosion evaluation and validation were conducted to analyse the rationality of structural vegetation coverage, and the applicability of structural vegetation coverage remote sensing model in the quantitative evaluation of regional soil erosion. The results illustrate that structural vegetation coverage can more accurately reflect the actual situation of regional soil erosion, and is more suitable for quantitative evaluation of regional soil erosion.

Research on the Rocky Desertification Poverty Effect and Benefit Evaluation of Poverty Reduction by Control Project in Typical Villages

Zuo Taian, Chen Qunli

Guizhou University of Engineering science, Bijie, 551700, P. R. China, dilikexue2012@sina.com

Abstract

Rocky desertification and rural poverty are the two most prominent issues in Karst Mountains of southwestern China and the basic starting point of this research is to connect them organically. This project is the continuity of my doctoral dissertation and thoughts on the new issue remaining to be studied. The pre-stage research thinks the rocky desertification poverty is the poverty caused by the rocky desertification, which deprives farms' development opportunity of improving life condition through agricultural production. When the rocky desertification causes the changes on resource gift, the accurate, timely and efficient adjustment on rural industrial structure becomes the key for the rocky desertification poverty. But the pre-stage sample only has one village and the research length is too short. In addition, through investigation, after the acceptance of many rocky desertification governance projects, researches on the follow-up efficiency assessment on projects are very few due to the insufficient funds and fail to consider the projects implementation's long-term influence and the sustainable inspection on rural economy into consideration. Therefore, select 4-5 classic villages as sample, combine methods of 3S technology, mathematical analysis, laboratory and field investigation, inspect rocky desertification's specific influencing method on rural economy, make emphasis on the rural social economy situation before the implementation of the project, in the acceptance of the project and after the implementation of the project and make assessment on the poverty decreasing efficiency of rocky desertification governance project. This project provides decision-makings and references for breaking the rocky desertification poverty.

rocky habitat restoration; succession dynamics; poverty reduction; benefit evaluation; natural village

Socio-Economic Factors and Consequences of Desertification Process in Mongolia

Darbalaeva D.A., Mikheeva A.S., Batomunkuev V.S., Zhamyanov D.Ts. -D., Sanzheev E.D., Osodoev P.V.

Baikal Institute for Nature Management SB RAS, Ulan-Ude, Russian Federation, darimchik@rambler.ru

Abstract

Change of economic system and system of grassland farming led to negative consequences such as enlarged proportion of goats in herd because of the increased demand for cashmere, increased migrations of population and concentration of livestock breeders around the large regional centers and the cities, pasture overload as a result of overgrazing that involves degradation of pastures. The model territories problems with public and nomadic economy water supply, negative influence of mining on grassland farming are shown up. The structural and logical scheme of factors and consequences of desertification process is offered. The results of sociological poll of the model territories population confirmed the existence of interrelations between desertification processes and life quality deterioration, found out the main reasons for migrations in the perception of local population. In the issue of research, the measures aimed at decrease of negative impact on pastures are suggested.

nomadic economy; pasture degradation; socio-economic consequences; migration

Soil Characterization and Land Evaluation in the Kemite Watershed: A Way Forward for Sustainable Rural Land Use Planning in Ethiopia

GESSESSE, B.

Earth Observation Research Division, Entoto Observatory and Research Center (EORC), Addis Ababa, Ethiopia, berhanavu@gmail.com

Abstract

The quality of agricultural land varies mainly in its soil's physical, chemical, biological and hydrological characteristics. This variation mainly results from soil degradation as well as agroecological and socioeconomic constraints; and these restrictions have highly affecting the quality of soil and farming systems to a great extent. Land evaluation is an essential approach to identify major limiting factors of farming activities, and to optimize yields sustainably. The aim of this study was to explore biophysical land quality constraints for the cultivation of *tef* (*Eragrostis tef*) crop in the *Kemite* watershed, Ethiopia. A physical land evaluation approach of 'the maximum limitation method' was employed. The findings of this study indicated that *tef* crop cultivation was constrained by the deficiency of soil macro-nutrients, poor soil drainage characteristics, shallow soil depth, rooting conditions and frost hazard, though the degree of limitations vary across the different land mapping units (LMUs). However, poor soil drainage systems and soil nutrient deficiencies were the most severe limiting factors. As a result, among delineated twelve LMUs, nine of them were categorized under actually unsuitable but potentially suitable (N1), while three of them were grouped as marginally suitable (S3) for the cultivation of *tef* crop. Considering the severity level of the identified limiting factors in each LMU, land management measures such as soil and moisture conservation, fertility improvement and land-use alternatives were proposed. This can offer inputs for policy briefs to device appropriate land use planning and land management options to enhance agricultural productivity in Ethiopia.

Land evaluation; land management; maximum limitation method; rainfed agriculture; soil characterization; Ethiopia

Spatiotemporal Analysis and Mapping of the Relationship between Gully Erosion and Controlling Factors in Northeast China

LI Maojuan, Li Tianqi

College of Environment and Planning, Henan University, Kaifeng 475001, P. R. China, skye8@sina.com

Abstract

Gully erosion in black soil region of northeast China cause mass land degradation. The gully distribution data in 1965 and 2005 was derived from Corona image and Spot5 image respectively, and a field survey was taken to ensure the result of interpret. The relationship between spatial distribution of gullies and controlling factors, such as slope gradient, slope aspect, SPI, as well as land use and lithology are discussed in the Kebai region of Heilongjiang Province. The result showed that average of gully density in 2005 was over 10 times more than in 1965 in study area, and the highest gully density was over 22000m²/km² for individual area. Farm land with high slope gradient and high SPI value area is the most vulnerable region for gully erosion, over 80% of gully distribution can be explained by these three factors both in 1965 and 2005. Two patterns of gully erosion in different substratum were identified via the overlay analysis. Temporal change of gully erosion showed that human disturbance of the land system, such as exploiting of grassland or forest, is the most promoting factor for gully dynamics. Based on the analysis, a simple method is proposed to identify the region with high risk of gully erosion at large regional scale.

TETIS Model Based Runoff and Sediment Simulation of Wuyuer River Basin, Black Soil Region of Northeast China

Zhiying LI, Haiyan FANG, Min GUO

Institute of Geographic Sciences and Natural Resources Research, CAS, Beijing, 100101, P. R. China, fanghy@igsnrr.ac.cn

Abstract

Soil erosion is one of the severe environmental problems worldwide and modelling approach is an important way to simulate runoff and erosion processes. However, modelling research is inadequate in black soil region of Northeast China. In this paper, the distributed hydrological and sediment model TETIS was used to simulate runoff and sediment in Wuyuer River Basin with an aim to understand runoff characteristics and sediment distribution, and to evaluate the applicability of TETIS model in the black soil region. With daily discharge and sediment data of 1970-1987, we calibrated and validated the hydrological and sedimentological sub-models of TETIS, and evaluated the results compared with other models. The results illustrated that the TETIS model gave satisfactory performance at daily time-step in the study area, with Nash and Sutcliffe model efficiency coefficients (NSE) higher than 0.7 and volume errors (VE) lower than 15%. The total flow is mainly composed by overland flow (54%). Gully erosion plays an important role and sediment yield (SY) during spring and summer accounted for majority of the annual SY. Soil erosion rate in most parts of the basin is less than $200\text{t}\cdot\text{km}^{-2}\cdot\text{a}^{-1}$ and arable land is responsible for most SY. Thus, TETIS model performs satisfactorily compared to other models applied previously in the black soil region. This research will have significant implications for modelling research in black soil region of Northeast China.

³ National Engineering Laboratory for Crop Water Efficient Use, Yangling, P. R. China

Abstract

Carbon trading and its resultant market for carbon offsets are one of the policy options to solve the problem of atmospheric climate change. The price on carbon is expected to generate demand for carbon offset schemes. In a market-based framework, the carbon price should be high enough to compensate for the opportunity costs. We studied a highly modified agricultural system in the Guanzhong-Tianshui economic region in China that is the typical one of many temperate agriculture zones of west China. We quantified the economic returns from agriculture and from carbon plantings (e.g. monoculture crops and mixing trees and shrubs) under five carbon-price scenarios. The mean carbon sequestration is $33.62 \text{ CO}_2\text{-e Mg ha}^{-1}\text{yr}^{-1}$, and average annual payment increases by $\text{¥}1145.51 \text{ ha}^{-1}$ at a medium carbon price of $\text{¥}50/\text{CO}_2\text{-e Mg}$. Thus, it may be more cheaply in a carbon market to restore and protect the high-priority areas. However, the carbon is less to be sequestered by mixing native trees and shrubs overall.

carbon sequestration; Guanzhong-Tianshui economic region; carbon-price; economic returns; net present value

The Changing Distribution of Rocky Desertification in the Guangxi Region, 1930s To 2000

Han Zhaoqing¹, Ran Youhua², Liu Junxiu¹, Li Jun¹

¹Center for Historical Geographic Studies, Fudan University, Shanghai 200433, China, zhqhan@fudan.edu.cn;

²Cold and Arid Region Environmental and Engineering Research Institute, CAS, Lanzhou 730000, China

Abstract

This article begins by defining the stony hills as places where light and more severe rocky desertification occurred in the Republic of China, based on an identification of stony hills found in a contemporary archive entitled *Protection Regulations for Stony Hills and Forest in the Counties of Guangxi Province*. We have digitized all of the stony hill areas that were depicted on 1:100000 scale topographic maps of Guangxi by the Land Survey Bureau of General Staff Department of Nationalist Government of China in the 1930s, and we have compared them with the distribution of rocky desertification in 2000 Guangxi Zhuang Autonomous Region through a graphics overlaying operation, thus revealing the spatial change in the distribution of rocky desertification in Guangxi in the past 70 years. We conclude that: 1, the area of light and more severe rocky desertification in Guangxi in the 1930s comes to 31922.25km², which is 4799 km² more than 27123 km² in 2000. This shows that rocky desertification in the Republic of China covered a larger area than that of contemporary Guangxi. However, the spatial change varied in different areas: in some places rocky desertification increased while in others it declined. 2, the data of 2000 shows that the area of rocky desertification declined in 47 counties, and the total reduction is 9045.5km². The reduction was mainly observed in the western and central part of Guangxi. The most significant reduction occurred in Du'an County. 3, the area of rocky desertification expanded in 30 counties, concentrated in northeastern Guangxi. The expansion is the greatest in Quanzhou, being 556.55km².

The Current State of Desertification in Mongolia

Mandakh N.

The Institute of Geography and Geoecology, Ulaanbaatar, 15170, Mongolia, maaggi@yahoo.com

Abstract

Approximately 90 % of the territory of Mongolia is recognized as arid, semi-arid and sub-humid land and has been undergoing intense land degradation processes in the last few decades, which have resulted in severe degradation of its natural resources. The objective of this paper is to identify degraded areas due to desertification in the country based on the 7 influencing factors of desertification (soil erosion by water and wind, vegetation cover change, aridity index, drought, livestock density and population density), which were calculated for two different periods: 2000 and 2010. Each indicator were assigned weights ranging from 1 to 5 representing the good and the worst conditions, respectively, and indicating classes with low, moderate, high and severe states of desertification. The results indicate that 77.8 % of the country territory is under the certain state of desertification. The areas that are affected by desertification have increased by approximately 5.8 % ($83.4 \cdot 10^3 \text{ km}^2$) comparing to 2005. The result of this assessment and the mapping methodology provides the basis for decision-making that involves mitigating actions.

The Impact of Land Use on Morphology and Sedimentology of Streams Draining the Margin of the Darjeeling Himalaya in India

Prokop P, Wiejaczka Ł, Płaczkowska E

Institute of Geography and Spatial Organization, Polish Academy of Sciences, Department of Geoenvironmental Research, Jana 22, 31-018 Krakow, Poland, pawel@zg.pan.krakow.pl

Abstract

Two pairs of forested (>90% forest) and agricultural (<65% forest) small catchments (~5-25 km²) were selected for comparison of land use impact on morphology and sedimentology of streams in the Darjeeling Himalaya. The catchments have similar rainfall (5000 mm annually), lithology (deep weathered gneisses) and soils (sandy loam and silty loam brown soils). It was hypothesized that the streams in agricultural catchment would have significantly higher runoff, discharge, wider channel and finer sediment than the stream in forested catchment. The majority of runoff, discharge, the morphological parameters as well as sediment patterns measured at stream cross-sections in the mountains failed to demonstrate significant differences at the 0.05 probability level. Frequent landslides along streams in both forested and agricultural catchments can mask impact of land use through delivery of large blocks to the channels that locally determine channel gradient, geometry and sediment patterns. In contrast, the same streams in the foreland of the Darjeeling Himalaya reveal consistent and significant differences in the bank stability, channel width and particle size on the stream bed. Land use impact on morphology and sedimentology of mountain streams can be easier recognized in the mountain foreland in comparison to headwater areas of the Darjeeling Himalaya.

The Soil Heavy Metal in The Khovd City Area, Western Mongolia

Lkhagvasuren.Ch, Batkhishig.O

Khovd state university, Khovd, 16/4300, Mongolia, Hovd_lha157@yahoo.com

Abstract

The Khovd city is one of biggest city of western Mongolia. Last decades human impact increasing surrounding of Khovd city area and environment condition is worsening. Specially soil quality and soil pollution is becoming threatening issue. Aim of our research is Khovd city vicinity area soil heavy metal content and distribution specifics. Analyzed 32 soil samples with definition of Cr, Pb, Cd, Ni, Zn, Cu content in the soils by Atomic Absorption Spectrophotometric methods.

Study area located north of Khovd city in the Buyant river basin area with elevation 1300-1400 meters a.s.l. According by Mongolian national soil classification system Gobi Brown soil distributed on study area. Average soil Chromium (Cr) content is 17.36 mg/kg, Lead (Pb) is 17.68 mg/kg, Nickel is about 14.01 mg/kg, Zinc is 73.69 mg/kg, Copper is 11.85 mg/kg, Cadmium is 0.05 mg/kg. In the topsoil organic horizons accumulated Lead, Copper, Zinc and soil forming sandy loam sediment characterized by comparatively low accumulation of heavy metals.

The city water sanitation facility area soils marked some increase of heavy metals in the soils. But those values not exceeding Mongolian soil standard (MNS: 5850) guidance. However, these situations threatening Buyant river water pollution and agriculture fields. Further need to be more detailed investigation soil heavy metal contents in Khovd city area.

³ University of Chinese Academy of Sciences, Beijing 100049, China

Abstract

Land salinization is a severe environmental hazard in the lower reach of Taoer River Basin. Saline land was identified by using a physically based transformation method through Landsat images from 1983 to 2013. The spatio-temporal dynamic of saline land was recognized. The results indicated that the area of saline land showed an upward trend and increased by 2.2 km² per year from 1983 to 2013. With a nonlinear change process, the years with relatively large area were from 2000 to 2005, while the area was relatively small in other years. Besides, the spatial dynamic of saline land was depicted by analyzing its distribution gravity. The results showed that the saline land distributed mainly in the northwest part of the salinization region and the change of distribution was irregular. The positive relationship between the gravity change distance and the changed area indicated that the increase of area was induced mostly from the addition of area in the periphery part. With nearly continuous saline land area and water area sets, a quantitative relationship was depicted and the causal connection between land salinization and water cycle change in year scale was confirmed. The results could support operational land and water resources management practices in the lower reach of Taoer River Basin, where climate change and intensive anthropogenic interruption is changing water cycle. (Foundation: National Natural Science Foundation of China, No.41201568; Major Science and Technology Program for Water Pollution Control and Treatment, No. 2013ZX07102-006-04; National Natural Science Foundation of China, No.41201572; Population, National Health and Family Planning Commission of China, No.201011)

Vegetation of Eolian Relief Ubur-Dzokoyskoy Hollow of the Selenginsky Middle Mountains (Republic of Buryatia)

Zharnikova Margarita A., Alymbaeva Zhargalma B.

The Baikal Institute of Nature Management SB RAS, Ulan-Ude, 670047, Russia, rita_zharnikova@mail.ru

Abstract

One of the clearest indicators of degradation processes and desertification of lands in the steppe zone are eolian processes.

In this paper we have studied features of phytocenotic diversity sand areas of southern part of Selenginsky middle mountains. Bases of vegetation of sands make psammophytic phytocenoses different stages of development. Vegetation on mobile eolian sands is characterized by small coenotic and taxonomic diversity. The vertical structure of the community is weakly expressed. The coenoflora of the psammo-steppes consist of 45 species of the higher vascular plants. Along with the dominance of species psammophyte (*Oxytropis lanata*, *leymus racemosus*, *Bromopsis korotkiji*, etc.) in the composition of plant communities are well represented steppe plant species, like *Vicia cracca*, *Galium verum*. The applied ordination methods have allowed to explain the ecological differentiation of psammo-steppe vegetation.

Detailed studies of the spatial structure of psammosteppe vegetation were deployed in key areas with the preparation of large-scale maps. The distribution of vegetation depends on the provisions of the relief shape determined of the prevailing wind direction. On the ridges of the dunes and the leeward slopes it is noted the dominance of communities with very low projective cover. In the aligned spaces between the dunes of the general projective cover of the species is increasing. It is marked difference in the composition of phytocenoses developing on modern and ancient mesoform eolian relief.

Wind Erosion Measurement Circle

Liu, B., Yang, Y., Guo, Q., Nearing, M.A., Hai, C., Jiang, H., Zou, X., Shi, P., Gao, X., Liu, Y.

State Key Laboratory of Earth Surface Processes and Resource Ecology, School of Geography, Beijing Normal University, Beijing, 100875, P. R. China, baoyuan@bnu.edu.cn

Abstract

Wind erosion is a serious environmental problem that has been systematically studied for over a century. Numerous samplers have been constructed to efficiently collect aeolian sediment and to accurately measure sediment flux. The field quantification of wind erosion soil loss, however, remains a difficult task. Wind direction and intensity under field conditions usually change instantaneously; it is hard to locate the area from which the collected sediment originates, and for which the measured sediment flux is representative. A novel experimental approach, termed the Wind Erosion Measurement Circle (WEMC) was proposed here, which effectively delimits the field area subject to wind erosion and estimates the corresponding soil loss driven by wind. This approach was applied to monitor wind erosion on a corn field and a grass field in Inner Mongolia, China, and both results are comparable to those quantified with the isotope technique. This new approach benefits from ease of use and owns many advantages over existing methods. It has the potential to be the standard technique for wind erosion research, correspondent to the runoff plot method used in the research of water erosion.

Abstract

Expansion and intensification of modern human activities represent the most significant anthropogenic disturbance to global denudation system. The semiarid Loess Plateau in China is a fragile landscape with large magnitude of soil erosion, which threatens ecological integrity and ecosystem services. Therefore, a series of conservation measures have been implemented during the past decades. Understanding sediment dynamics responding to principal driving forces is critical for conservation efficiency evaluation and contemporary strategy adjustment. This paper examines the temporal trend of long-term observations on sediment yield in the Yanhe River, and explores the dominant factors that are responsible for the observed changes. It was found that fluvial sediment regime demonstrates decadal changes since the 1950s. Both annual water and sediment has experienced constant decrease, which were mainly contributed to decline in the wet season. Although changes of precipitation and runoff production may have impact on regional erosion and sediment transport, the observed trend of sediment yield was predominantly contributed by multiple human practices. The potential hydrological effect differs depending on the specific trajectory of human activities. Soil conservation measures that were installed on upland hillslopes (i.e., reforestation, land abandonment, terrace building, conservative tillage) contributed to significantly reduce sediment supply from distal source areas, while construction of cascade check dam system has intercepted a substantial proportion of mobilized sediment load and enhanced channel stability. Continuing practicing of restoration measures will lead to constant reduction of water and sediment yield in this region.

³ Key Laboratory of Xinjiang wisdom city and environment modeling Urumqi, 830046 Xinjiang

Abstract

Vegetation coverage of environment and natural environment as a natural system to evaluate the quantitative indicators, the authors studied the change of vegetation coverage is of great significance. Take Ebinur Lake Wetland National Nature Reserve (ELWNNR) as the study area, and this paper selects 1972, 1998, 2007 and 2013 Landsat MSS、Landsat TM and Landsat OLI as the main datum. Pixel dichotomy method is used to get vegetation coverage, and has carried on the classification of vegetation coverage, and then transfer using the transfer matrix method, and we analyzed the dynamic changes over time and the driving force of natural and human factors on the vegetation coverage. The results are as follows: the vegetation coverage of the Ebinur Lake Wetland National Nature Reserve showed a general decrease trend. The results of vegetation coverage classification show that vegetation has greatly increasing in 1972-1998 year, the increasing of vegetation area is 22.44 km². From 1972 to 1998 year, vegetation decrease significantly and the vegetation was decreased by 14.88 km². From the point of view of spatial variation, the vegetation coverage of the Ebinur Lake Wetland National Nature Reserve decreased area is 14.88 km² from 1972 to 2013. The regions with decreasing vegetation coverage located in the counties of the east of Ebinur Lake Wetland National Nature Reserve. Vegetation coverage change affected by natural and human factors of in the Ebinur Lake Wetland National Nature Reserve, the analysis that natural factors and human factors are not conducive to vegetation healthy growth.

Abstract

Land Use Land Cover (LULC) based ecosystem service change assessment is very much essential to assess the spatiotemporal nature of various regulating and supporting ecosystem services. LULC change is now considered as a proxy indicator to estimate the trade-off between economic and ecosystem services value of a particular land parcel. In this study, a Light Use Efficiency (LUE) based ecosystem model Carnegie Ames Stanford Approach (CASA) was adopted to estimate actual Net Primary Productivity (NPP) and Value of Carbon Sequestration & Oxygen Production services (VCSOP) and Value of Organic Matter Provision services (VOM) in Sriniketan Santiniketan Planning Area (SSPA) which is now under threat by rapid urban expansion. Mean and total NPP was estimated as $3.7 \text{ gC m}^{-2} \text{ month}^{-1}$ and $402.4 \text{ ton h}^{-1} \text{ month}^{-1}$ in 1994 and $7.0 \text{ gC m}^{-2} \text{ month}^{-1}$ and $757.47 \text{ ton h}^{-1} \text{ month}^{-1}$ in 2014 respectively. This study has also revealed that the total amount of NPP in SSPA was increased over $350 \text{ ton h}^{-1} \text{ month}^{-1}$ as the mean Normalize Difference Vegetation Index (NDVI) value was increased from 0.14 in 1994 to 0.17 in 2014 respectively. Spatiotemporal increase of NPP is accounted for the increase of VCSOP and VOM and hence it improve the overall status of different ecosystem services. Uncontrolled expansion of urban land in the North Western part of this study area was mainly accounted for the decrease of NPP. Total VCSOP services of his study region was increased from 710983 US \$ in 1994 to 1338213 US \$ in 2014 respectively. Overall, land use change was accounted for more than 150% of Ecosystem Service Value (ESV) changes during 1994 to 2014 in SSPA.

LULC; Ecosystem Service; Carbon Sequestration; Oxygen Production; Trade-off.

New Indices to Evaluate the Effects of Rainfall Pattern on Runoff and Soil Erosion Under Different Vegetation in the Loess Plateau, China

Jianbo Liu, Guangyao Gao, Lei Jiao, Bojie Fu

State Key Laboratory of Urban and Regional Ecology, Research Center for Eco-Environmental Sciences, Chinese Academy of Sciences, Beijing, 100085, P. R. China, bfu@rcees.ac.cn

Abstract

The maximum rainfall intensity in 30 min (I30) is commonly used to represent the influences of rainfall on runoff and soil erosion, which cannot completely express the information of rainfall. In this study, the peak zone of rainfall intensity (PZRI) and intra-event intermittency of rainfall (IERI) were developed to detect the effects of rainfall pattern on runoff and soil erosion under different cover types in the Loess Plateau of China. The runoff and soil loss in three types of vegetation cover (wood, shrub and grass) and bare land were measured from 2012 to 2015. The PZRI was significantly correlated with average rainfall intensity (I-aver) and I30. However, the runoff coefficient (RC) and soil loss were not significantly correlated with I-aver, but significantly affected by I30 and PZRI ($p < 0.05$). So the I30 and PZRI explained more information about rainfall event. More IERI indicated more proportion of PZRI in rainfall duration. The positive correlation between RC and IERI was found. The fitting degree between RC and PZRI was the best, while the value between soil loss and I30 was the highest under all cover types. Therefore, extending the duration of PZRI ignoring the changes of I30 could promote the runoff productivity of rainfall, but could not significantly affect erosion. In addition, the position of PZRI in the rainfall profile had an important role on runoff and erosion. The occurrence period of rainfall peak played different role in runoff and soil erosion under rainfall events with different intensity levels.

Runoff; Soil erosion; Rainfall pattern; Vegetation; New indices; Loess Plateau

Quantification of Deflation-Induced Soil- and Nutrient-Loss on Chernozem Types, Based on Field Wind Tunnel Experiments

Farsang A., Szatmári J., Barta K., Bartus M.

University of Szeged, Department of Physical Geography and Geoinformatics, Szeged, Hungary, farsang@geo.u-szeged.hu

Abstract

Long-term forecasts predict rise in summer temperatures and decrease in summer precipitation in the following decades in the Carpathian Basin (Central-Europe). These changes in climatic conditions may result in a 30-50% increase in wind erosion dynamics (MEZŐSI, 1996, 1998). It is important to emphasize that the wind erosion risk of our soils is not exclusively a soil protection problem, but it also poses economic (loss of nutrients, crop reduction), environmental (infill and eutrophication of surface waters and channels due to sediment deposition), and human health problems (GOOSSENS ET AL., 2002; BARRING ET AL., 2003; 1990; FARSANG ET AL., 2013).

Besides the quantification of sediment transport, the element and organic matter composition of the transported material is also important to study. We carried out mobile wind tunnel field experiments on a chernozem area of south-east Hungary, in July 2014. We used a newly developed horizontal active isokinetic sediment trap, the WAST (Wet Active Sediment Trap). It is a wet trap, what samples at different heights with good efficiency at any standard particle size ranges.

Our results show that the eroded soil mass increases with wind speed between 1.5 and 15.4 t/ha in 10 minutes. The amount of eroded humus and nutrients was calculated based on the weighted nutrient content in the sediment traps and the total amount of eroded soil. The amount of eroded humus can reach even 5.5-6.6 g/m², phosphorus (P₂O₅) loss can exceed 0.11-0.78 g/m², while potassium (K₂O) loss is between 1.5-13.9 g/m² at the wind speeds of 9-13 m/s.

Abstract

It was of great significance to carry out a study on soil moisture dynamics of different-aged *Caragana korshinskii* Kom. for vegetation restoration in Loess Hilly Region. In our study, soil moisture dynamics under different-aged *Caragana* shrubs and the abandoned land were monitored to a depth of 0-600cm during the growing season (April to October) in 2013. By analyzing, the main findings were as follows: 1. Soil moisture seasonal dynamics under different-aged *Caragana* shrub lands and the abandoned land were highly consistent with the seasonal variations of precipitation, while the annual variations were quite different. The overall performance of soil moisture was that 10a *Caragana* > 20a *Caragana* > the abandoned land > 35a *Caragana*. 2. Due to the various forest ages, the utilization of soil moisture varied with soil depth and presented different vertical distribution patterns. As well, the difference of soil moisture among soil profiles reached significant level ($P < 0.01$). On the basis of vertical soil moisture variation, the soil profile could be divided into three layers: active layer, second active layer and relatively steady layer. 3. According to the evaluation of soil moisture availability, all sample plots didn't exist most easily available soil moisture and hard-unavailable soil moisture, except for little proportion of hard-unavailable soil moisture in 35a *Caragana*. With the growth of stand age, the average relative soil moisture content in *Caragana* shrub lands was decreasing. Meanwhile, the thickness of easily available soil moisture decreased, but the thickness of moderately available soil moisture increased.

Soil Nutrient Dynamics in Relation to Vertical Root Distributions in the Riparian Zone of Three Gorges Reservoir, China

Ronghua Zhong, Yuhai Bao, Xiubin He, Adrian Collins

Asian International Rivers Center of Yunnan University, zhrhua1987@163.com;

Institute of Mountain Hazards and Environment, Chinese Academy of Sciences;

Sustainable Soils and Grassland Systems Department, Rothamsted Research, North Wyke, Okehampton, United Kingdom

Abstract

The riparian zone of Three Gorges Reservoir (TGR), has been subjected to seasonal submersion and exposure due to regular reservoir impoundment and the occurrence of natural floods. The severely altered hydrological regime has caused numerous environmental changes. This study was conducted to understand grass root distribution and its impacts on soil nutrient content in the water level fluctuation zone (WLFZ) of TGR. The roots of four prevailing grass species, namely, *Cynodon dactylon*, *Hemarthria altissima*, *Hemarthria compressa*, and *Paspalum paspaloides*, and corresponding soil nutrients, were investigated. Root length density (RLD) and root surface area density (RSAD) were measured using the WinRHIZO image analysis system. The relationship between root distribution with depth and soil nutrient content was tested using Pearson correlation analysis. The results showed that roots were mainly distributed in the upper 0-10cm soil layer. Both RLD and RSAD decreased exponentially with increasing soil depth. RLD values ranged from 0.24 cm/cm³ to 20.89 cm/cm³, and RSAD estimates varied from 0.16 cm²·cm⁻³ to 13.44 cm²/cm³ for the selected grass species.. Soil organic matter (SOM) and total nitrogen (TN) contents in a bare control area were significantly lower than the corresponding values in the grass lands. TN of *H.compressa* land and natural recovery land were higher than the other grass areas. RLD and RSAD were significantly correlated with SOM and TN content for the four grass lands. The present results suggested that plant roots play a significant role in the distribution of soil nutrients in soil profiles in the WLFZ along the TGR. However, further research is needed to determine the specific mechanisms of interaction between plant roots, soil nutrients and water level fluctuation.

Abstract

The study was to identify rapidly the key soil properties affecting non-point source phosphorus loss by contrasting the spectral characteristics of soil from cultivated land and orchard land at Meiliang Bay watershed, Taihu Basin. Results showed that using the spectrum directly determine the key soil properties affecting intensity of non-point source phosphorus loss of agriculture land was difficult, however, the correlation coefficients were higher when land-use type was divided into cultivated land and orchard land. Both soil organic matter and moisture were significantly correlated with the intensities of non-point source phosphorus loss in the two land-use types. The intensity of non-point source phosphorus loss was lower in cultivated land where with high soil organic matter and low moisture content. In contrast, the intensity of non-point source phosphorus loss was higher in orchards land where the soil was with high organic matter and low water content.

Study on Carbon Storage of *Pinus elliottii* Artificially Forests in Lakeside Sandy Desertification of Poyang Lake, China

Cao Yun, Zhen Lin, Yang Jie, Wang Xiuwen

Key Laboratory of Poyang Lake Wetland and Watershed Research, Ministry of Education, Jiangxi Normal University, Nanchang, 330022, P. R. China, yun.cao@163.com

Abstract

This paper investigated the ecological restoration of desertification land in Poyang Lake area through field survey and laboratory analyses. From 2008 to 2010, 110 hm² ecological restoration area was established at Poyang Lake Area, which provides access to the detailed data. The results showed that: (1) The aboveground carbon storage of the tree layer in severe, moderate and mild desertification areas were: 1.88, 3.45, 19.22 t·hm⁻², the order of each component carbon storage in mild and moderate was trunk > branch > tree leaves; (2) The carbon storage of the soil layer in severe, moderate and mild desertification areas were 0.59, 0.9, 1.3 t·hm⁻², the carbon accumulated mainly in the surface layer for 0-10cm, with the soil layer deeper, the soil carbon and soil carbon density was diminishing, but in mild desertification area, the tendency shows that surface layer > deep soil > middle soil; (3) The carbon storage of the litter layer in severe, moderate and mild desertification areas were 0.12, 0.59, 1.22 t·hm⁻². The mild desertification area, where has a better ecological environment with a greater carbon sequestration capacity, is more suitable for vegetation restoration. The high-density simple community structure makes the survival and expansion of understory vegetation more difficult. The land desertification control should start from mild desertification area to severe desertification area. After the pioneer species get settled, other herbaceous and broad-leaved vegetation species should be timely introduced so as to improve community structure and enhance the carbon storage of the desertification area's planted forest.

Study on Landscape Classification and Ecological Restoration Strategies of Shangyi County

Ma Li, Tang Chong

Capital Normal University, Beijing, 100037, China, malidlx@163.com

Abstract

This paper discussed the principles and methods of landscape classification on the basis of related theories of integrated physical geography and landscape ecology. Based on the total differences reflected in the alteration and interaction of physical factors and human factors in Shangyi County, we take geomorphy and land use type as the key indicators to classify the landscape. There are two interrelated ways of landscape classification: the “top down” division and the “bottom up” subsumption. Combining site of the two ways is the senior land unit: land system type, along with field verification. The landscape classification hierarchic system is composed of two levels. At the first level, the county’s landscape is divided into 8 categories, which are further divided into 23 subcategories at the second level. The 8 landscape categories are: Grazing and farming landscape on the river and lake beaches; Farming, grazing and forest landscape in the low-relief terrains; Grazing, farming and forest landscape on the high plateaus; Grazing, forest and farming landscape on mountains on the edge of the high plateaus; Farming, grazing and forest landscape in the river valleys; Grazing, forest and farming landscape on the rocky hills; Grazing and farming landscape on the loess tablelands; Forest, grazing and farming landscape on the lightly eroded, middle sized mountains. Corresponded with the natural conditions and environmental problems of each landscape category, the ecological restoration strategies are proposed under the guidance of landscape planning theories and methods, which may act as reference for the environmental rehabilitation, ecological restoration and protective measures against environmental degradation.

Temporal and Spatial Variation of the Chinese Terrestrial Measured NPP Simulation from 1960s to 2000s

Erping Shang, Hongqi Zhang, Liu Fang

Key Laboratory of Land Surface Pattern and Simulation, Institute of Geographic Sciences and Natural Resources Research, Chinese Academy of Sciences, Beijing 100101, P. R. China, shangerping7@126.com

Abstract

In resolving issues such as the single nature of the current estimate of the measured NPP, uncertainty of the results of the current application of the model to estimate the NPP pattern of vegetation in China, the time short characteristic of using remote sensing data to calculate NPP and other issues, we collected, compiled and compiled measured data of vegetation related to NPP in different periods and regions of China. Then complete the temporal and spatial variation of NPP patterns of 3 main vegetation types of crops, grasslands and forests in China since 1960 based on the data from sample plots. The results show that: the Chinese terrestrial vegetation NPP from northwest to Southeast rise, high value concentrated in the tropical rainforests of southern Hainan and Yunnan; low concentration in Inner Mongolia, Tibet and other desert grassland and farmland; 1960s-2000s vegetation NPP is first decreased and then increased trend.

Key words:

The Impact of Wind-Blown Sand on Crushed-Rock Embankment along the Qinghai-Tibet Railway (QTR), China

Ruiping Zu, Zhilin He, Jianjun Qu, Yumei Zong, Kecun Zhang

Key Lab. of Desert and Desertification, Cold and Arid Regions Environmental and Engineering Research Institute, Chinese Academy of Sciences, Lanzhou 730000, Gansu Province, China, zurp@lzb.ac.cn

Abstract

The crushed-rock embankment, widely used along the Qinghai-Tibet Railway (QTR), has been proved to have active cooling effect and thus could effectively protect permafrost beneath the roadbed. However, with the increasing degree of desertification in Tibetan Plateau, the crushed-rock embankments along the QTR were frequently filled up or buried by wind-blown sand and in addition, the impact of wind-blown sand on the cooling effect of the crushed-rock embankment has not yet clearly addressed. This paper simulated the ground temperature variations of the frozen earth beneath the crushed-rock layer under different situations through indoor experiment. The results show that the bare crushed-rock layer has good cooling effect on underlying frozen earth, but after filled or covered by windblown sand, the cooling effect will significantly weaken or even disappear, and the thicker the windblown sand layer, the higher the ground temperature of frozen earth. This indicates that the windblown sand could be a potentially serious threat to the crushed-rock embankment along the QTR in the long term. It is urgent to establish comprehensively sand-prevention system in some key places in order to protect the crushed-rock embankment from windblown sand damage more effectively.

Key words:

Wind-blown sand; Crushed-rock embankment; active cooling effect; the Qinghai-Tibet Railway

The Research of the Straw-checkerboard Fencing Life Based on Its Characteristics of Erosion and Deposition

Wu Wangyang¹, Zhang Dengshan^{1, 2}, Tian Lihui^{1, 3}, Gao Shangyu¹, Zhang Pei¹

¹ Key Laboratory of Environmental Changes and Natural Disaster, Ministry of Education, Beijing Normal University, Beijing 100875, China, bnuwwy@yeah.net;

³ Institute of Desertification Studies, Chinese Academy of Forestry; College of Earth and Environmental Sciences, Lanzhou University, Lanzhou 730000

Abstract

In the alpine sandy land of China, there is a great peculiarity and regional difference in the erosive and depositional features of straw-checkerboard, and its fencing life is primarily affected by the erosive depth change of each inner part among years. After a continuous and seasonal observation to the erosive depth of nine kinds of straw-checkerboards, which included three norms ($1\text{m} \times 1\text{m}$ 、 $1.5\text{m} \times 1.5\text{m}$ and $2\text{m} \times 2\text{m}$ intervals) and each located in three slope positions (toe, middle and top of the windward areas) in Ketu sandy land, eastern shore of the Qinghai Lake. There some rules could be concluded. Firstly, the worse erosion always happened in the center and south-oriented parts of those straw-checkerboards with bigger norms and higher slopes, equally, the greater deposition obviously appeared in the north and west-oriented parts of those smaller norms and lower slopes, all those differences were caused by the change of prevailing wind changes which were controlled by the northwest wind in winter and northeast wind in spring. Secondly, through the statistics of erosive and depositional rates in winter and the whole year, the 1.5m intervals checkerboard in the middle slope would have the longest fencing life about averagely 5 years with a stable concave and balanced erosion (deposition) effect, while the 1m intervals in the toe and the 2m intervals in the top had to face an over-erosion or an over-accumulation problem so that made their life time limited to 2 years. Finally, it can be directed for desertification controllers that the straw-checkerboard should be allocated optimally according to the erosion and deposition effects, generally, a medium norm maybe applied in all slope positions, while the small one and the big one are respectively at best paved in the top and the toe. (The study was financially supported by the National Science Foundation of China (NSFC 41461002) , the Provincial Science Foundation of Qinghai (2014-2J-902),and the National Key Technologies R&D Program (grant no. 2012BAD16D0102))

Using Geospatial Approach in Estimating the Impact of Climate Change On**Desertification in Northern Borno, Northeast, Nigeria**Ojeh. V.N ¹, Philip H John², and ²Nkeki, F.N¹ WASCAL-GRP WACS, Department of Meteorology & Climate Science, The Federal University of Technology, Akure, Nigeria²Department of Geography & Regional Planning, University of Benin, Benin city Nigeria.; drojehvn@hotmail.com**Abstract**

Nigeria is one of the most desert prone countries in Africa and the problem of desertification is expanding southwards from 12° 30' to 10° 30'. In addition, rivers and lakes are being silted leading to rapid drying up of water bodies. A typical example is the case of the receding Lake Chad. This environmental problem has led many researchers to investigate the magnitude and monitor its spread, as a result, the geo-spatial approach has become the most widely used because of its efficiency. Majority of these studies are focused on the extent of the problem neglecting the fundamental causal factor of desertification. It is evident from available literature that few or no study has estimated the impact of climate change on desertification using a geo-spatial approach. Based on this, this paper investigates how climate change facilitates desertification in the north eastern part of Nigeria within the context of geo-spatial analysis and in addition, to map the magnitude of desertification in the region. The paper utilized climatic data and supervised classified remotely sensed data in Microsoft Excel and ILWIS environment respectively for detecting climate change and desert encroachment in the study region. The results showed that climate change facilitates desertification and that over 31 percent of the land surface of the region has become bare and the problem became worsened during the study period from 1986 to 2006. This problem was highly facilitated by extreme climatic conditions.

Analysis of the Recreational Load on the Green Space of Kyiv

Kochetkova I.

Taras Shevchenko National University of Kyiv, Ukraine, kiv_univ@ukr.net

Abstract

The capital of Ukraine Kyiv located on both banks of one of Europe's largest rivers - the Dnipro.

This has led to the presence of large areas for parks, which contain the remains of the natural elements. These are islands on the Dnipro (Truhanov, Great, Holguin). In the north and in the south of the city, these green space are connected to the forests that surround Kyiv. Kyiv territory unequally provided recreational landscapes. Total in Kyiv 127 parks, 367 garden squares, 77 parkways. Their total area is about 15% of the capital area. Provision of the population of Kyiv green areas is 14,4 m²/person, with the state standards of 20 m²/person. Almost every residential area in Kyiv within 20-30-minute access to a recreational area that provides opportunities for active recreational activities every day. In 2012 - 2015 years conducted research on the state of Kyiv urban recreational landscapes. We took into account indicators: Quarter area, the average number of floors, building density, demographic population indicators. The results showed an uneven distribution of green areas and a significant differentiation in terms of recreation loads. The values of the recreational load in the range of 6 to 43 pers./m² (with an average of 16.5 pers./m²). The highest intensity of the recreational load in the parks that are near the new residential areas that were built on the left bank in the early 1990s, as well as quarters that are adjacent to industrial zones.

Abstract

An accurate and updated natural vegetation map is imperative for sustainable environmental management. This paper proposed a novel natural vegetation mapping algorithm based on time series images. Several indices of temporal dispersion and continuity were established for this purpose: Low Density (LD), Medium Density (MD), High Density (HD) and Medium Continuity (MC). These indices were developed based on the particular percentiles-determined section of the EVI2 temporal profiles obtained through continuous wavelet transform. The natural vegetation was generally characterized as with lower temporal dispersion and greater temporal continuity compared with agricultural crops. The proposed methodology incorporated the indices of temporal dispersion and continuity and was applied to 13 provinces in central east China based on 500 m 8-day composite Moderate Resolution Imaging Spectroradiometer (MODIS) Enhanced Vegetation Index with two bands (EVI2) in 2013. An overall accuracy of 92.97% was obtained when compared with 2,715 ground truth sites. There was also a good agreement (kappa index = 0.8049) on the distribution and areas of different vegetation types between the MODIS-estimated image and the Landsat 8 OLI interpreted data on two test regions. This study demonstrated the efficiency of the transform and metric integrated time series classification approaches in the fields of land and vegetation cover mapping.

Key words:

Dynamic Response to Urbanization in Patna Regional Development Area, Bihar, India

Khushbu Sharma

Research scholar at C.S.R.D., Jawaharlal Nehru University, New Delhi, e-mail: khushbo167@gmail.com

Abstract

River morphological study is a very challenging field of study as fluvial geomorphology deals with a system response that is always in dynamic condition. Moreover, alluvial rivers are more dynamic in nature as well as self-adjusting in any response to the change in the environment. The present study also deals with the response of the river channel with changing condition in an urban metropolitan and its nearby area. The study area is based on the border limit of Patna Regional Development Area that has been delimited by the Patna Regional Development Authority of Bihar in 2014. The present study mainly deals with the plan-form changes in the river channel in near vicinity of the urban hub. The rapid urbanization of the area has affected the river channel. The study has been conducted for short term change in the study area. The study area has three major river channels in its coverage area i.e. Ganga, Gandak and Punpun. The Significant change in the plan-form has been noticed in the Ganga and Gandak channel. There is total area loss of 15 sq. km and 21 sq. km gain in the study area from 1988 to 2014. The Ganga – Gandak confluence near Patna has shifting zone of confluence. The phenomenon of avulsion is visible in the study area of about 7 kms. The city has been expanding and this sensitivity of LU/LC change is dependent on numerous factors. Thus, the study area has much dynamism in all respect.

Key words:

River Plan-form; Land-use and Land-cover change; Avulsion; Confluence; Patna regional Development Area; Bihar

Impacts of Landscape Patterns on Soil Ph of Croplands in the Liuxihe Watershed, South China

Yuan Yuzhi, Guo Zhixing, Chai Min, Sun Hui, Cao Fulong

Guangdong Institute of Eco-Environment and Soil Sciences, Guangdong Key Laboratory of Integrated Pest Management in Agriculture, Guangzhou, 510650, P. R. China, yuanyuzhi1989@163.com

Abstract

According to the *Status of the World's Soil Resources Main Report in 2015*, soil acidity is a serious constraint to food production worldwide, soil degradation caused by soil acidification has become a global consensus. Landscape pattern is an important influence factor of the ecological process, but the relationship between landscape patterns and soil pH was not well understood. We select the Liuxihe watershed as the study area and the soil sample buffer as the research unit, based on 759 samples of croplands top soil and land use in 2010, distribution map of soil pH in 1980s. Research methods included landscape pattern index analysis, spatial analysis, correlation analysis and redundancy analysis. The purpose of this study was to discover the spatial pattern of croplands top soil pH and watershed landscape, to quantitative examine the impacts of landscape patterns on soil pH of croplands. Preliminary study results show that: the overall croplands top soil pH are acidic in this watershed, the pH mean of soil samples is 5.79, the sample of pH value < 6.5 and < 5.5 are respectively occupied 86.1% and 31.3%; The low value area of soil pH appear in the northwest of the upper reaches and southeast of the middle and downstream reaches, The high value area of soil pH appear in southwest downstream reaches; Croplands soil acidification is significant in the last 30 years, the mean of soil pH decrease from 6.49 to 5.79, soil acidification sample occupy 30.5%; We found that there is a significant correlation between the some landscape pattern index and soil pH. The study results provide new information and scientific basis croplands soil acidification control and remediation.

Abstract

Connectivity is a vital element of landscape structure, Landscape functional connectivity is considered to be a very important factor for a wide range of ecological processes. A least cost path method which integrated graph theory and minimum cumulative resistance model (MCR) can provide a more efficient approach to identify function connectivity in heterogeneous landscapes, and has been increasingly used in the research of ecological corridors and ecological network simulation. Connectivity model based on circuit theory used resistors instead of edges in the graph theory, resistance distance instead of cost weighted distance, can identify current flow centrality and pinch point in corridors, which have important influence on landscape connectivity, consequently, the importance of different areas in corridors can be understood. This paper took simulated landscape as the object, integrated circuit theory to identify ecological corridor and its importance. Also analyzed the influence of corridor width on the location of pinch point, and discussed the Size effects of connectivity model based on circuit theory. We believe that the method can provide certain scientific basis for regional landscape planning and corridor design.

Key words:

connectivity; least cost path; current flow centrality; pinch point; circuit theory

Land Suitability Assessment of Crop production using Boolean and Multi-Criteria Decision Analysis Methods: A case of Dornod province of Mongolia

Munkhdulam O., 1- Avirmed A., 1-Enkhtaivan D., 1-Davaagatan T., 1-Batnyam Ts

Department Physical Geography, Institute of Geography and Geoecology, Mongolian Academy of Sciences,
munkhdulamo@gmail.com

Abstract

Agriculture is important as a source of food and income. The main purpose of this study is to prepare land suitability evaluation for cropland based on Boolean and multi criteria decision analysis methods. We selected several factors such as three topographic, two hydrologic, four soil, three climatic and land use indicators to calculate the suitability of land for crop production in Dornod province, Mongolia. We combined suitability assessment with fuzzy analysis to standardize the criteria. We used the analytical hierarchy process to determine the weight of these criteria and used multi-criterion decision analysis (MCDA) to aggregate the criteria. Then we calculated the suitability score for each evaluation unit. The suitability level had categories of highly suitable, suitable, moderately suitable, unsuitable and highly unsuitable using the reprocessing module of ArcGIS according to the FAO land suitability classification. We compared the data of field soil measurements between 1989-2009 obtained from the Organization of Geodesy and Cartography to control kappa index and error of matrix accuracy of land suitability evaluation and validations. General accuracy was 0.81, while classis validation and kappa index were 80-95% and 0.81, respectively. Study results showed that land suitability assessment for crop production can be done by applying geographic information system and remote sensing technology in Mongolia. The method mentioned above for assessing land suitability for crop production saves time for land management and enables making research-based decisions. Further study is necessary to test the accuracy of data and ensure better quality.

Mapping of the Selenga River Delta Vegetation Using Hyperspectral Survey

Alymbaeva Zh.B., Ayurzhanaev A.A., Garmaev E.Zh., Tulokhonov A.K., Zharnikova M.A.

The Baikal Institute of Nature Management SB RAS, Ulan-Ude, 670047, Russia, ajargalma2@gmail.com

Abstract

The Selenga River is the largest among 365 rivers and streams flowing into Lake Baikal and provides 50–60 % of water runoff and 60 % of sediments that go into the system. Vegetation of the Selenga River delta plays a special and important role in the formation of geochemical barriers and the ecological status of water bodies. The delta surface is under the constant influence of fluvial, erosion and accumulation processes.

The goal of this work is mapping of the Selenga river delta vegetation on base of hyperspectral images obtained in frame of International expedition “Leman-Baikal”. We conducted a survey of the delta surface using hyperspectral camera (400-1000 nm) installed on ultralight aircraft board – trike. The result is a map of the vegetation of the delta with a high spatial resolution of 1 m/pixel and spectral library of delta vegetation species. We spent geobotanic route descriptions for verification of aerial images.

Key words:

Selenga River delta; vegetation mapping; hyperspectral image; aerial survey

Preventive Assessment of Flood Danger based on Landscape-Hydrological Analysis of Altai (Russia)

Chernykh D.V.^{1,2}, Zolotov D.V.¹, Biryukov R.Yu.¹, Pershin D.K.^{1,2}

¹Institute for Water and Environmental Problems of Siberian Branch of the Russian Academy of Sciences (IWEP SB RAS)

²Altai State University (ASU), Barnaul, Russian Federation, zolotov@iwep.ru

Abstract

In terms of hydrometeorological information lack for the Altai (Altai Krai and Republic of Altai), the development of alternative methods of floods forecasting is called.

Based on the author's landscape map (1:500000) a series of interpretive maps of climate-hydrological, lithologic-hydrological and topo-hydrological background was created. The original map units were typified in accordance with the analyzed characteristics.

Climate-hydrological map is composed over the ratio of precipitation and heat (Selyaninov hydrothermal coefficient); lithologic-hydrological map – by the maximum field carrying (water) capacity of the top meter soil layer. Topo-hydrological map is constructed using the author's classification of locations based on the combination of the two priority (out of a possible four) functions of landscape in relation to the runoff formation: autonomous, transit, regulatory and accumulative. As a result, the spectra of background characteristics for 73 catchments including the three internal-drainage basins are obtained.

It is shown that of 70 catchments of the Ob, Katun and Bija first order tributaries, in 36 more than 75 % of the area is occupied by landscapes with all three landscape-hydrological characteristics favorable for the runoff formation. These mountain landscapes are located in excessively humid areas and characterized by low water capacity soils and a predominance of slope surfaces. The Altai territory is exposed to a high risk of floodings.

The hydrological safety assurance and reduction in expenses for post-flooding remedial actions are possible only via preventive evaluation. It should result in landscape planning in the catchment to use landscapes potential for overcoming and minimizing floods risks.

Key words:

landscape-hydrological background; mapping; catchment

Production of Space and Creation of Place at Music Festivals: A case study of Taihu Midi Music Festival, China

WANG Man-man, ZHANG Min

School of Architecture and Urban planning, Nanjing University, Nanjing, 210093, P. R. China, wangmm0302@163.com

Abstract

Music festival is a cultural geographical phenomenon spreading rapidly in China in recent years. Taking the case of Midi Music Festival, which is the earliest and most famous music festival in China, this paper describes how the music festival space is constructed and explores the underlying characteristics of the space. To better illustrate the liveness of the festival scene, the authors combine the theory of the production of space to the performance theory. Main conclusions are as follow: (1) The integration of the two theories is proved to be useful to understand the specific “realness” of the music festival practice. (2) The triad spaces assimilating the performance theory has new connotations. The spatial practice of the space is dominated by the operation of the social relations. Representations of space include the physical space within which the operation of codes is conducted and the impromptu space generated from the performance. The representational space is a continuation of the performance, having the power to reshape the structure of the festival space and resist the rules of the mainstream society. (3) It’s difficult for the music festival to build into the local place, however, the festival can be constructed as a fluid “place” because of the dialectical process of the production of space. There are dynamic connections between each pair of social relations, festival scene and spatial internalization, embodying as supporting, activating and shaping each other, which contributes to the festival to become a place with cultural context, cognitive value and emotional memory.

Key words:

music festival; production of space; performance; place; fluid placeness; festival

Socio Economic Change in Urban Mobility and Land Use Land Cover Using Remote Sensing and Geo-Informatics-A Case Study of Ajmer City, Rajasthan, India

Chauhan G.S.¹, Khan Sabir²

¹Deputy Secretary, University Grants Commission- Central Regional Office, Bhopal, Madhya Pradesh, India 462016, chauhanugc@gmail.com

²Department of Remote Sensing and Geo-informatics, Maharshi Dayanand Saraswati University, Ajmer, Rajasthan, India 305001, sbrkhan784@gmail.com

Abstract

Land use/ land cover is an important parameter in understanding the interactions of the human activities with the environment and thus it is necessary for conserve natural resources and monitoring environmental changes. Urban mobility is responsible for a variety of urban environmental issues like decreased air quality, increased surface runoff and subsequent flooding, culmination of water quality, increased local area temperature. The main focus of this study is to analyse urban growth and land use change and its correlation with the demography, migration and urbanization led problems related with water and environmental degradation in Ajmer city during 1975–2015. To calculate urban growth and land use changes, satellite images are utilized in different time spans. Acquire five temporal data for this study, 1975, 1985, 1995, 2005 and 2015 year of data acquired by Landsat series satellite. Supervised classification methodology has been applied using maximum likelihood technique in Arc-GIS 10.2 Software. By applying classification methods to the satellite images five main types of land use were extracted: Built-up, Water bodies, Agriculture, forest and Wasteland. Change detection analysis shows that built-up area has been increased and agricultural land reduced. The city was found to have a pattern for major expansion in three different directions: East, North and south. Information on urban mobility, land use and land cover change study is very useful to government, Private sector and urban planners for the best future plans of the city.

Key words:

Land use/land cover; change detection analysis; remote sensing and GIS

Spatial Modeling of Landscapes Territorial Structures for Landscape Planning

Implementation

Udovychenko V.V.

The Geographical Society of Ukraine, Kiyv, Ukraine, reussite303@gmail.com

Abstract

Nowadays humankind deeply depends on nature and natural resources which help to sustain and fulfil human life, but yet in Ukraine the values of nature are typically ignored in decisions or not all its features taken into account. Therefore, landscape planning (LP) are widely seen as the key opportunity to solve such problems and situations, particular driver and catalysts of economic growth and well-being in modern societies. Mapping and modeling landscapes and ecosystems can help to assert the benefit provided to people by nature and distinguished how these benefits might be used under different management options for the purpose of innovation advancement towards and in a knowledge-based economy.

LP introduces specific approaches and methods and should include such stages as: 1) landscape genetic-morphological structure study, mapping, modeling and according to it – landscape diversity estimation; 2) landscape geochemical structure study, mapping and evaluation; 3) defining, mapping, assessment of basin territorial and basin landscape territorial structure with detailed characteristics of its subsystems and topical systems; models for watershed services; 4) landscape positional-dynamic structure: essence, study, map modeling, evaluation; 5) econetworks and its peculiarities, territorial aspect and essence of modeling for the spatial optimization tools implementation; 6) actual state of landscapes, way of its using; estimation levels of anthropogenic changes take places in landscapes; 7) landscape based territorial planning graphic and mapping models creation; 8) an overview of the skills needed to use created models, including recommendations for how to effectively summarize and communicate model outputs to stakeholders and other audiences.

Thai People's Perceptions and Responses to Land Quality Changes in Cultural Landscapes of Mountain Vietnam

Nguyen An Thinh*, Pham Minh Tam, Dang Thi Huong Giang

Centre for Advanced Research of Global Change (CARGC), Hanoi University of Natural Resources and Environment (HUNRE), Vietnam

* To whom correspondence should be send: email: anthinhhus@gmail.com

Abstract

In Vietnam, mountains cover about 74% total area, range throughout the Northwest and Central parts of this country, and was settled by ethnic minorities such as Thai, Mong, Dzaio, and etc. The Thai people group has their population about 1.5 million people, is ranked third among the 54 ones in Vietnam. Traditional cultural landscapes of Thai people are formed long time ago by a mosaic of rural settlements, paddy fields, crop patches, and forests; however, it nowadays has changed more and more significantly due to both natural and human driving forces, especially during early 21 century. This paper therefore deals with the application of Pressure - State - Response (PSR) framework based on land quality indicators in study the perceiving and responding of Thai people to land quality changes in Thai people's villages of Son Thinh commune (Van Chan, Vietnam). 90 questionnaires with 65 closed questions and 10 opened questions based on the 5 point Likert scale were collected during 2014-2015. The result shows that: (i) climate-related hazards are the main biophysical pressure on sloping land use, whereas the highest impact of the socio-economic factors is the change in the number of crops due to agricultural development policy at local scale; (ii) the most considerable change of land quality is erosion and land degradation. The increase of economic interesting plants undergoes the considerable change in the state of cultivation system on slope land. The change in agriculture income is the most important state of the particularities of slope agriculture by ethnic minorities; and (iii) traditional farming techniques, cultivation options, land use policies, and land use technologies on slopes are considered as the most significant response factors. The recommendation for responses of cultural landscape are mainstreaming indigenous knowledge to sloping land use and land management, and making decision and implementing sloping land use management policy for Thai people community.

The Geodesign for the Mekong Delta: A Proposal

Hung-Fei Lei

Assistant Professor, Department of Geography, Chinese Culture University, Taiwan, China, hungfeilei@ntu.edu.tw

Abstract

The working paper aims to present the geodesign for the Mekong Delta and its surrounding area in response to both climate changes and the potential changes of its social environment. A literature review on the geography of the Mekong Delta is presented. It is then followed by a description of the landscape ecosystems of the Mekong Delta, including the probably scenario of the impact from the climate change and the long-term outcomes of the political ecology of this area under the prevalent development. The geomorphic and landscape ecosystem of the area is delineated into landscape units with characteristics that are addressed, and the work is based upon open data being available from web resources. By using these geographical knowledge, the third section offers the characteristics of the Mekong Delta. The main issues in using the Mekong Delta and their implications of physical geography are highlighted. Based upon these works, it is suggested that a geographical framework of the sustainable development for the Mekong Delta and settlements around should include a reinforced development of both a local management system and a regional governance platform where the monitoring system and the decision-making system with the development of modern settlements can be reasonably built up by citizens and their chosen managers for the safety and health of spatial interactions between Human and Nature. Three preliminary suggestions in geodesign for the Mekong Delta is proposed, including schemes for the water head, the lowland, and the channel system of the Mekong Delta. It leaves the guidelines on management and governance for the future sustainable development in the Mekong Delta undiscussed, although some notes are given for these issues.

⁴Institute for Landscape and Open Space, University of Applied Sciences Rapperswil, Zurich, Switzerland

Abstract

Urban and sub-urban parks are the important elements in urban landscape. Besides their microclimate benefits, these areas also provide many other ecosystem services such as cultural, educational and economic values. "Gerdab-e Ben" is a national tourist hotspot in the suburban area of city Ben, Iran. Gerdab-e Ben plays important cultural, recreational and economic roles for residents; also it has been recognized as an outstanding national tourist region by the government since 2010. In this study, context and current situation of the site and its challenges and potentials for future development were evaluated through field observation and aerial images. Based on the field observation, plant species, traffic communication and tourists' preferences were identified. According to aerial images, green patches size and density, connection between the green spaces of the lagoon and the city were analyzed using GIS software. The results revealed that although the site has an eye-catching beautiful landscape due to its natural context (lagoon, mountain and trees), it has a considerable potential for improvement, which would help to attract more tourists and offer better ecosystem services as well. Also the study showed that currently there is the lack of evergreen tree species, poor traffic communication, the discontinuous tree lines on the eastern side of the lagoon and the disconnection between the green spaces of the lagoon and the city. Finally an analytical proposal was offered by the authors to overcome the current problems and for future development of Gerdab-e Ben.

A New Spatial Index to Characterize Urban Expansion Dynamics: Multi-Order Adjacency Index

Jiao L.M., Liu J.F., Dong T., Gu Y.Y.

Wuhan University, Wuhan, 430072, P. R. China, liujaifeng@whu.edu.cn

Abstract

Most of the landscape metrics or indexes can only characterize the static spatial pattern at a certain time point and cannot provide adequate information about the dynamic changes of urban expansion. Landscape Expansion Index (LEI) and Multi-order Landscape Expansion Index (MLEI) have been proposed to solve such problems, which could measure the expansion degree of newly grown patches by considering their relationships with old patches and their spatial context in the process of urban expansion based on multi-temporal data.

However, these metrics cannot differentiate the expansion degree of newly grown leapfrog patches since the LEI/MLEI values of the patches with distance from the old patches beyond given threshold will be designated to zero. But the expansion degree of these patches is very important for measuring the degree of urban sprawl. In this study, Multi-order Adjacency Index (MAI) is designed to measure the expansion degree of all new patches no matter how far away from old ones, all of new patch has its own value, and it has clear mathematical definition and scaling of values.

The calculation method for MAI is as follows: series buffers for new patches with a fixed radius will be established until the outermost buffer intersecting with old patches; the ratio of the intersection area to the area of the outermost buffer will be used to calculate the expansion degree of the new patches.

The results indicate that MAI is able to distinguish urban expansion's process information and measure the spatio-temporal changes of urban structure.

Multi-order Adjacency Index; Multi-order Landscape Expansion Index; urban expansion; dynamic changes

Construction of Ecological Security Patterns in Nebula Lake Basin Based on GIS

ZHU Jun, LI Yi Min

Department of Environment and Resource, Yunnan University Yunnan Institute of Geography Kunming 650091

Abstract

Ecological security patterns of lake wetland was constructed as a commitment to biodiversity protection, maintain of the ecosystem structure integrity, function and process. it is a effective protection to the ecological security ,control of environmental deterioration and the water in urban and agricultural using security. Taking Nebula lake basin in YunNan province as the study area, the factors such as ecological suitability of land, ecological security index and the land quantity structure optimization are gained by using Various GIS spatial analysis technologies and muti-objective programing model based on natural geography and humanity data to construct ecological security patterns in Nebula lake basin that will gives some effective scientific directions to management and construction of the district ecological system, achieving maximization of economic and ecological benefits in land using and further form the harmonious coexistence of more structure, multilevel and diverse ecosystems and integrated ecosystem of "human-economic-ecological".

High Scale Landscape Mapping for Mountain of Khamar-Daban (Near Lake Baikal, Russia)

Rusanova, P.A.¹, Solodyankina, S.V.^{1,2}.

Irkutsk State University¹, The V.B. Sochava Institute of Geography SB RAS², Irkutsk, Russia, babushok_pa@mail.ru

Abstract

Classification of homogeneous geosystems (landscapes) and its reflection on the map could be a base for effective organization of economic activity. Landscape patterns and landscape units can be used in the assessment of ecosystem service supply. Geosystem defined as uniform territory, with regular and typical repetition of some interrelated combinations of geological structures, landforms, surface and groundwater, microclimates, soil types, phytocoenoses and zoocoenoses. The aim of research is analysis and mapping of the landscape diversity of the key area (125.3 km²) of the Khamar – Daban mountain range. This mountain range distinguished by the uniqueness of vegetation related to climate features: significant moisturizing, high snow cover and other. We used the following data: fieldwork (73 test areas), DEM, and remote sensing. Fieldworks were conducted in summer seasons 2010 and 2015 years where collected data about wood and grass species and their projective cover, soil characteristics. Software Quantum GIS (Qgis) 2.10 was used to create the landscape map. At the first step the area was divided on the base of SRTM data on categories of landform: surface of drainage divide, river and stream valleys, several classes of slopes according their steepness, exposure. Then these patterns divided on the base of Landsat 7 image (2010 year) in band combination 753. Results of fieldworks and the geoinformation analysis were used to form the classification of the landscapes which became the map legend. In classification 38 types of landscape defined. On the map 528 homogeneous landscape patterns digitized. Map accuracy was tested under field conditions.

Land Use Structural Optimization Based on Grey Liner Programming and Land Degradation Risk in Yunnan Mountain of China

Zhao Xiaoqing¹, Yang Honghui², XU Xinhui¹

¹School of Resource Environment & Earth Science, Yunnan University, Kunming 650091, P. R. China, xqzhao@ynu.edu.cn

²Yunnan Design Institute Group, Kunming 650228, P. R. China,

Abstract

Land use structural optimization and adjustment is an effective approach to realize land resource sustainable utilization, allocate limited land resource rationally and reduce the risk of land degradation. Grey liner programming (GLP) model based on land degradation risk (LDR) minimization is constructed and applied to Menglian County in Yunnan province. The result shows that GLP model has more practical applicability, and takes land degradation risk minimization, cultivated land protection and food security guarantee into consideration. There are three programs after optimization. Program I degrade the land degradation risk largest. It can meet the normal food security in the study area, but is insufficient to resist against food security problems caused by sudden natural disasters. Program II is a bigger plan of the land degradation risk reduction. It can meet the needs of the most stringent cultivated land demand in a short time not in a long period. Program III is the smallest plan of the land degradation risk reduction, but there is strong sustainability for cropland demand. Compared to the "Land use overall planning", garden land, forest land and construction land are all increased. The economic, ecological and social benefits and the land utilization rate will all get improved, the land use structure is more reasonable. So land degradation risk reduction, farmland protection and food security will be realized in program III. The study results can support the government to the land resources utilizing reasonably and decisions making.

Key words:

Significance of the Hemeroby Index as Indicator in Landscape Monitoring and Assessment of Mountain Areas

Borisova B.¹, Koulov B.², Assenov A.³, Dimitrov P.⁴

¹University of Sofia "St. Kliment Ohridski", Sofia, Bulgaria, bilyana08@gmail.com

²National Institute for Geophysics, Geodesy and Geography – BAS, Sofia, Bulgaria

³University of Sofia "St. Kliment Ohridski", Sofia, Bulgaria

⁴Space Research and Technology Institute – BAS, Sofia, Bulgaria

Abstract

This study posits that, in combination with landscape metrics' methods, the hemeroby index significantly contributes to landscape monitoring and qualitative assessment of its natural capital and respective land use policies.

Hemeroby is interpreted here as an indicator of the degree of deviation of the landscape from its natural prototype under the influence of human activity. The study applies Eurostat's rating scale for the agro-ecological indicator "landscape state and diversity". It studies landscape units as integrated natural-anthropogenic systems and uses selected key indicators to analyze their spatial structures. The investigation traces anthropogenic transformations, in terms of both characteristic landscape neighborhoods and different hypsometric bands.

Five municipalities of the Smolyan District, situated in the Rhodope Mountains of Southern Bulgaria, constitute the object area of the study. Landscape heterogeneity is typically very high. The region stores a full range of representative natural complexes (including 49 protected areas and 8 protected NATURA 2000 sites), and anthropogenic landscapes with historically inherited discontinuous land use.

Study results, including the belt of active anthropogenic presence (600-700 m asl), show a high share (53%) of semi-natural landscapes. Some localities above 1200 m asl exhibit gross violations in the landscape contours and development of fragmentation processes, which carry a high risk of natural capital loss. Field verification confirms that the focus on the small watershed scale is most conducive for monitoring purposes in terms of obtaining representative data. This approach facilitates the accurate interpretation of the spatial landscape structure and analysis of the diverse tendencies of the anthropogenic transformations.

Studies on Ecological Security Assessment Index System of Cultivated Land in

Guangzhou City

Yao Yiyi, Wu Dafang

Geographical Sciences of Guangzhou University, familyyao@163.com

Abstract

Cultivated land is the material basis for human's survival and development which is an important part of land resources. On the basis of reviewing the research progress of cultivated land ecological security, this paper made a deep analysis of its connotation and development status and analyzed the relationship between sustainable utilization of cultivated land resources and the evaluation of cultivated land ecological security as well as discussed the basic ideas, principles, methods and other aspects of the evaluation index system of cultivated land ecological security. Taking Guangzhou for example, we analyzed the factors affecting the ecological security of cultivated land. On the basis of study on the model of PSR model, this paper selected 30 levels of screening three evaluation indicators from the cultivated land natural ecological security, economic and ecological security, social and ecological safety and constructed the evaluation index system of cultivated land ecological security in Guangzhou, so as to lay a foundation for better analysis of the current situation and forecast the future development trend of the cultivated land ecological security. Through this study, we can promote the coordinated development of economy, society and land security, and provide a theoretical basis for the future development of farmland and land security warning.

Study on Water System Landscape Pattern Planning of Kaifeng in the Basis of Green Infrastructure Theory

SHI Xue-min, QIN Ming-zhou

College of Environment and Planning, Henan University, Henan; Kaifeng, 475004, shixuemin@163.com

Abstract

Green infrastructure theory emphasizes on connectivity, network nature and integrity. As an important part of the green infrastructure network system, the city water system space and its carrying ecological service function play significant role in urban ecosystem. Applying 3S technology and landscape analysis methods, this article analyzes the spatial-temporal change characteristics of Kaifeng water system landscape pattern since it began to be considered as “Song Capital water system planning project” in 2002 till 2015, and advances out important planning requirements of water system as a green infrastructure, which will provide a theoretical basis for Kaifeng water system project construction and similar decision making of urban green infrastructure construction in future.

The Contributions of Climate Change and Human Activities on the Runoff of the Tingjiang River

ZHANG Jie, ZHANG Zhengdong, WAN Luwen, YANG Chuanxun, YE Chen

School of Geography Science, South China Normal University, Guangzhou 510631, P. R. China, 562349881@qq.com

Abstract

Based on 1965-2012 average daily runoff measured data of control hydrometric station (xi kou) in the Tingjiang basin, and daily precipitation and daily temperature data of three meteorological stations in the Tingjiang basin (yong ding, chang ting, shang hang). This study used in paragraph mean comparison, 5a sliding, trend line analysis, cumulative anomaly and the improved cumulative slope rate comparison method (SCRCQ) to nearly 50 years of climate change and human activities on runoff of Tingjiang for quantitative analysis. The results show that: The Tingjiang river basin runoff changes are volatile, runoff change down - up - general downward trend. The runoff from 1971 to 1980 compared with a 21.8% increase in the 60 s, From 2001 to 2012, runoff was down 10.9% compared with the 90 s. Runoff mutation for 1971, and 2001 years, so the runoff change is divided into three stages from 1965 to 1972, 1973-2001, 2002-2012. Period from 1965 to 1972 as the base period, 1973-2001 and 2002-2001 annual flow rate were 25.8%, 20.2%, precipitation and average air temperature change rate were 16.8%, 10.2%, the contribution of climate change on runoff change were 65.1%, 50.5%, the contribution rate of human activities on runoff change were 34.9%, 49.5%. The results reveal the Tingjiang river basin runoff change since nearly 50 a trend and its main influencing factors of contribution rate, the future of the basins in this play an important guiding role on the development and utilization of water resources.

Key words:

runoff; climate change; human activity; Contribution rate; Tingjiang River

The Morphometric Characteristics of Gobi Desert Pavement Analyzed by a Rapid Image-Based Method

Yue Mu, Xiaoyang Cao, Pu Zhang, Xiaoming Cao, Feng Wang, Yiming Feng
Institute of Desertification Studies, Chinese Academy of Forestry, China, gfjiyue@163.com

Abstract

The gobi desert is one of the most widespread landscapes in northwest China. Its prominent feature is that on most of the surface exposed gravels and bare rocks but not sands. The gravel coverage, size distribution and morphological characters are often used to understand the evolution process of gobi desert, even as the evidence for relative age of its formation. However, some traditional methods e.g. sieving and eye estimating, is time-consuming and difficult to quantify accurately. Therefore, this research proposed to analyze the gravel coverage (G_c), average size (G_s), size distribution and aspect ratio (AR) of an alluvial gobi by methods based on plenty of orthoimages taken in the field-survey.

The main results are listed here:

- 1) The G_c and G_s values were significantly correlated with elevation ($r^2=0.752$, $p<0.001$ and $r^2=0.798$, $p<0.001$, respectively). It means that the nearer to the source area, the larger gravel coverage and average size is.
- 2) The AR values fell first then rose with decreasing elevation, were not correlated with elevation ($r^2 = 0.107$). It may be codetermined by fluviation, weathering and lithology.
- 3) The size distribution showed that with elevation drop, fine gravel content is higher, and size distribution is more concentrated.

Compared with traditional methods, the validation results showed the proposed image analysis method is a fast and precise approach to quantify the morphometric characteristics of gobi desert. This method could be extended to explore the source region of deposits and the transport/deposition process in the formation and evolution of gobi desert.

gobi desert; morphometric characteristics; digital image processing; gravel cover; gravel size

The Research of Decorative Art Based on the Data Visualization Platform—Taking the Ancient Civilian Residences of Minnan as an Example

Vivian Chen

East China University of Science and Technology, China, 2522007603@qq.com

Abstract

Under the trend of long-cherished wish of Planning and Research: "Grasping characteristics, inheriting historical, emphasizing participate and more detailed", the data visualization platform to protect historical and cultural is particularly important. This thesis is initiated from the decorative art of the ancient civilian residences of Minnan, basing on the cross study, generalization and discussion of books, information and present research of different historical stages, analysis of the decorative art's database creation to explore the ancient civilian residences of Minnan through the construction data platform system. And digitalizing the traditional data to formed with a wide range of value of data. Accordingly, to explore the activation of the decorative arts' conservation and utilization, to revival of cultural heritage.

data visualization platform; decorative art; ancient civilian residences of Minnan; activation; conservation and utilization

The Risk Assessment of Cultivated Land in Guangzhou City

WU Jiaxin*, WU Dafang, ZHONG Jialiang

School of Geographical Sciences, Guangzhou University, Guangzhou 510006, China, 381629501@qq.com

Abstract

This paper based on statistical data of Guangzhou city, using the statistical analysis, entropy method and GIS spatial to constructed the risk assessment system of cultivated land in Guangzhou city, which include 22 factors from three aspects of natural pressure, economical pressure and social environmental pressure, to explain the risk assessment of each districts of Guangzhou cultivated land, spatial difference and the driving forces from 2005 to 2014, reaching a conclusion that the general regularity about the change of the risk assessment of cultivated land. The result showed that economic factors and policy factors played important factors in change of ecological risk of cultivated land in Guangzhou city, compared and analyzed the driving force and many aspects between the Guangzhou city and other developed cities. We found that between 2005 and 2014, natural and economic risk of cultivated land in general was on the decline, as well as social environmental risk rose up in Guangzhou city. The pressure of social environmental risk in 2014 increased three times than 2005. In the past three years, the trend of rapid growth is still. Therefore, we can't ignore the environmental protection the process of cultivated land resource protection and development in Guangzhou city.

A Comparison of Urban Growth and Their Influencing Factors of Two Border Cities: Laredo in the US and Nuevo Laredo in Mexico

Zhao, Chunhong, Jensen, Jennifer

Texas State University, San Marcos, Texas, 78666, zhaoch@txstate.edu

Abstract

The twin cities of Laredo in the US and Nuevo Laredo in Mexico have been growing at an unprecedented pace over the last few decades. The trans-boundary flows of commodities and capital between these two cities, as well as significant population growth in the two cities have created an interdependent system, making this area a unique region for analysis and thus providing an opportunity to thoroughly examine drivers behind landscape changes in the two cities. The aim of this study is to examine urban growth and the influencing factors of Laredo-Nuevo Laredo. Results of initial remote sensing-GIS analysis indicated that there was considerable urban expansion in both cities in the three decades from 1985 to 2014. Spatially, Laredo demonstrated a more disperse growth pattern with a higher speed compared to that in Nuevo Laredo. A logistic geographic weighted regression using data at the pixel level on both sides of the border for the year 1985, 2000, and 2014 are implemented to reveal a number of factors that affected urban growth in different degrees for both cities and different time period. These potential factors included: (1) DEM elevation, (2) distance to nearest urban clusters, and distance to transportation roads, and (3) density of urban pixels, population density and density of highways. Furthermore, globalization factors related to industries/maquiladoras also played a significant role in affecting urban growth.

Key words:

Influencing factors; urban expansion; geographic weighted regression; US; Mexico

Assessment of Land Use and Land Cover Changes (LUCC) along the Middle Shire River Catchment, Malawi, using GIS and Remote Sensing

Mzuza M. K., Zhang W., Shen F., Kapute F., Tembo M. · Chapola L. S.

State Key Laboratory of Estuarine and Coastal Research, No. 3663 North Zhongshan Road, 20062, Shanghai, China,
wgzhang@sklec.ecnu.edu.cn;

Mzuzu University, P/Bag 201, Luwinga, Mzuzu, Malawi.

The Catholic University of Malawi, P.O. Box 5452, Limbe, Malawi.

Abstract

Land use and land cover changes (LUCC) contribute to local and global environmental change as well as human well-being. The Middle Shire River in Malawi, southern Africa, has been heavily affected with silt due to soil erosion arising from land cover removal in its catchment. In this study, spatial and temporal knowledge has been used to determine changes in vegetation cover along the Shire River catchment area to understand the driving forces using Envi v.5.1 and ArcGIS v.10.1 Software. Landsat images of between 1989 and 2015 followed by classification accuracy assessment between 82% and 94% were used. Results show a high rate of deforestation ranging from 1.6 to 3.4% per annum. This may be attributed to rapid population increase and high immigration rate of people from the neighboring countries especially Mozambique. In addition to that, geographical position, artificial surfaces and social- economic factors also contribute to LUCC. There is a significantly strong correlation ($P < 0.01$) between artificial surfaces, population, cultivated lands and increased silt from runoff deposited into the Nkula Dam. This study has demonstrated the importance of using multi temporal satellite imagery in understanding landscape dynamics. This may suggest that use of geographical Information System (GIS) and remote Sensing could provide clues for similar situations in future environmental management plans to reduce or stop further degradation.

Key words:

driving forces; population; geographical position; artificial surfaces; social economic factors

Assessment of Land Use Changes and Forest Fragmentation in High Himalaya terrain in India

Batar A K, Watanabe T

Hokkaido University, Sapporo, Japan amitbatar.geo@gmail.com

Abstract

The study area i.e., Rudraprayag district is part of the high mountain Himalaya region of India. Three Landsat 2 (MSS), Landsat 5 (TM) and Landsat 8 (OLI) images were extract for land use and land cover map. Post-classification and a cross-tabulation in GIS module detection method was used to detect land use changes. The landscape fragmentation tool was used to map the forest fragmentation and to analyse the forest pattern. The aim is to point out of observed land cover changes and forest fragmentation in last 38 year from 1976 to 2014. The results indicate that the major land cover was forest in this study area and forest have decrease in last 38 years. The increase of built-up (9.13 km²) areas and agriculture lands (82.12 km²) indicate that increasing of land uses significantly altered in the loss of natural vegetation and contribute to as a non-forest area in the region. An increase in the area of scrub land (43.16 km²) and barren land (45.96 km²) also contributed to wasteland land or non-forest land. Total area of forest patches increased from 1976 to 2014, which are completely degraded by the edge effect. The main causes of land cover changes were expansion of agriculture land and built-up area. Forest fragmentations were increase by anthropogenic activity such as agriculture expansion, roads, and settlements, hydro-project and other hand, at same time forest fragmentations were also affected by natural hazards such as landslides and floods in last two decades in this high vulnerable mountain terrain.

Key Words:

LULC changes; Forest fragmentation; High Himalaya terrain; GIS

Assessment of Urban Sprawl and Land Use Changes in the Metropolitan Zone Of Budapest

Zoltán Kovács

University of Szeged, Hungary, zkovacs@geo.u-szeged.hu

Abstract

Like other post-socialist cities Budapest was affected by extensive suburbanization after 1990. Urban sprawl became one of the most significant phenomena of the transition. The mass outflow of better off households started right after the collapse of communism and generated a substantial demand for new housing. In addition the suburbanization of industry and services also set into motion in the late 1990s, converting former agricultural land to spaces of businesses. These processes substantially rearranged the spatial pattern of land use and land cover around Budapest. By the middle of the first decade of the millennium when the negative effects of urban sprawl became evident a new Act on Spatial Planning in the Agglomeration of Budapest was adopted, the first law in this regard in post-socialist Eastern Europe. However, the real impact of this law on long-term development proved to be marginal, as municipalities had enough time to create their territorial reserves for development decades in advance. The main aim of this paper is to analyse land use changes and assess the environmental loads of suburbanization around Budapest. Land use and land cover changes will be investigated over a longer period of time (i.e. from the 1950s) with the help of different methods (e.g. topographic maps, Corine, Urban Atlas). The intensity of urban sprawl and its impact on the environment will be assessed. Main triggering factors (transport, land prices etc.) of urban sprawl will be defined.

Key words:

urban sprawl; land use; post-socialist city

Assessment the Policy of Returning Farmland to Lake in Poyang Lake, China

Xie Zhenglei, Yang Liu, Zhang Xiuxiu, Qi Shuhua

Key Laboratory of Poyang Lake Wetland & Watershed Research, Ministry of Education (Jiangxi Normal University),
School of Geography & Environment, Jiangxi Normal University, Nanchang, 330022, P.R. China, 85755267@qq.com

Abstract

A great deal of high quality cultivated land has been converted to developed land and low quality cultivated land generated from other land use types, which has resulted in a serious threat to food safety. However, research on the impact of policy implementation on people's livelihood and activities and the driving mechanism of lake turning lake into farmland in China is incomplete. Better understanding will not only be helpful to explore the mechanism of land use policy in river-lake interaction change on the occurrence frequency and mechanism of drought and flood disasters of Poyang Lake, but also understanding the driving forces. This study combined the land use change derived from remote sensing images with the household survey to investigated the land use status, agricultural status, land transfer of farmland, in the returned levees. The reasons of farmland in the returned levee are also studied, including the water level caused by the implement of Three Gorge Dam, sand mining, livelihood, soil quality. The above factors have contributed to the farmland activities in the returned levee. Moreover, the policy recommendations on how to protect the people's safety and establish the compensation policy in the storage basin. The government should improve the land transfer policy and stipulate the big farmers to receive the land operation right from the farmers. It is urgent to approve the PL single embankment consolidation plan, compensation mechanism and maintain the single embankment can play ecological function.

Key words:

Returning farmland into Lake; Land use Policy; Hydraulic change; people livelihood; Poyang Lake

Changes on the Coastal River Basin Landscape: A Case on the Kholpetua Basin, Satkhira, Bangladesh

Krishna Prosad Mondal, Bangladesh

Beihang University, China, krishna.ju38@yahoo.com

Abstract

The aim of the research is to know about the changes occurred due to human activity on coastal river basin landscape of the Kholpetua. Kholpetua River is one of the most important coastal river of Satkhira districts in the south western part of Bangladesh. In term of topography, salinity level and drainage pattern, the Kholpetua river basin landscape plays an important role in coastal ecosystem and to the economy. The area is under semi-saline tidal belt. Most of the area is under intense shrimp farming zone. Thereby come under rapid physical transportation, ignoring the consequential effects on hydrological, biological and geomorphic characteristics of the basin. In this context satellite image of two different years (1990 & 2014) were analyzed using unsupervised classification supplemented with ground truthing techniques. The interpretation reveals that landscape has changed substantially. Within an area of 66956.22 hectars (3 km buffer area), the declined area includes natural water bodies' cover 12.08% area, agricultural land 0.17%. The increased area includes Shrimp farming (8.98%) and homestead vegetation area (8.24). Besides, the physical process, human activities are mainly responsible for changing land use crop production to shrimp farming. It is an important positive development that people are aware of the benefits of homestead vegetation (tree) and they try to plant trees as part of their profit maximization effort and ensuring environmental protection against natural adversaries like cyclonic wind. It is a debatable issue of the expansion of shrimp farming promotes benefits to the wider section of the local people or befits to a few needs to examine further.

Key words:

landscape; land use; shrimp farming; coastal river basin; satellite image; water bodies

Evaluation of Spatio-temporal Dynamics of Land Surface Temperature Change (LSTC) and Land Use Land Cover Change (LULCC): A Case Study

Dr. Md. Surabuddin Mondal¹, Dr. S. H. Kutoglu², Dr. Çetin Mekik³

¹Asst. Professor, Dept. of Geomatics Engineering, Bülent Ecevit University, 67100 Zonguldak, Turkey. msk.iit@gmail.com

³Professor, Dept. of Geomatics Engineering, Bülent Ecevit University, 67100 Zonguldak, Turkey.

Abstract

An attempt has been made to assess spatio-temporal dynamics of Land Surface Temperature (LST) and to establish the relationship between Land Use Land Cover Change (LULCC) & Land Surface Temperature Change (LSTC) in the study area. Landsat time series data for time period of in between 1985 and 2015 have been used for this study. The results showing that the land surface temperatures (LST) are significantly increased in the study region for the time period between 1985 and 2015. The results also showing that there are positive relationship between Land Use Land Cover Change (LULCC) & Land Surface Temperature Change (LSTC) in the study area.

³Graduate School of Global Environmental Studies (GSGES), Kyoto University, Kyoto, Japan.

Abstract

Urbanization is a world-wide phenomenon. Urbanization refers to a growth in the proportion of a country's population living in urban centers of a particular size. Java is the most populous island in the world and is home to 57% of Indonesia's population although the area is only 7% of the total land area of Indonesia. Number of population in Java was increasing from around 100 million in 1986 and become 143 million in 2014. Urbanization, urban population and urban development in Indonesia have been growing rapidly and centered in large cities, especially those are located in Java. The objective of this research is to explore local driving forces that are affecting rapid urban expansion in Java using Geographically Weighted Regression (GWR). By employing GWR model, it was found that local demographic, social, and economic factors spatially affected urban development in Java. The most influenced area which potentially converted to urban area is located in the western part of Java (including DKI Jakarta, Banten and West Java Provinces), since there are 2 metropolitan areas (Jabodetabek Megacity and Bandung Raya) located there. Higher population and economic activities in Java especially in both metropolitan areas have the implication in the high demand for food, natural resources and excessive utilization of land which results in the conversion of forest region, agricultural area or other greenery area to non agricultural/greenery area.

Key words:

local driving forces; urbanized area; Java; GWR

Impact of outmigration on Landuse Transformation in Lachi Gad Watershed, Garhwal Himalaya, India: Past, Present and Future Trends

S. K. Bandooni, L.Mirana Devi, Anupama M.Hasija

Department of Geography, Shaheed Bhagat Singh (Eve.) College, (University of Delhi), Sheikh Sarai, Phase-II, New Delhi-110017., skbandooni@yahoo.co.in

ABSTRACT

Many parts of Himalaya in India and Nepal are facing many problems. Among them the important one are high rate of outmigration, permanent settlement of out-migrants in the place of job, decreasing interest to cultivate the land, increasing area under waste and fallow land and decreasing interest to protect the environment and all these problem are very well inter-related with each other. Therefore, the present study focuses on impact of out migration on landuse/Landcover change in Lachi gad watershed for past, present and future. It is analysed by using the satellite imagery for three time period 1987, 2002 and 2015 (Landsat and IRS), Global positioning system (GPS) and socio-economic survey. It aims to understand the factors influencing the outmigration in house hold level and built the relationship between the environment including agriculture and demography, particularly migration. The field work is conducted to identify the factors behind changing land use and driving force for outmigration in Lachi Gad watershed. Socioeconomic surveys revealed that most of the out-migration is Adult and aging parents are left behind. It is also noted that most land cover change involved the conversion of Agriculture land to pasture, fallow, waste and barren lands. The study also tries to explore the future landuse change by considering the trend of out migration and population size and distribution, marketing of the agricultural product which is based on organic and the technologies etc. Therefore, it will help to facilitate future research and policy consideration in the study area to check the out migration.

Land cover change and its driving forces in the Republic of Korea since the 1990s

Yu H., Zhang B., Mao D.H., Wang Z.M.

Key Laboratory of Wetland Ecology and Environment, Northeast Institute of Geography and Agroecology, Chinese Academy of Sciences, Changchun, 130102, P.R. China, yuhao@iga.ac.cn

Abstract

Land cover change (LCC) has become an important aspect of global change studies. Republic of Korea (ROK) located in the southern part of the Korean Peninsula has large population density and experienced rapid economic development in the past decades, which imposed great pressures on the nation's land surface. In this study, based on multi-temporal remote sensing images, ROK's land cover data in 1990 and 2015 were obtained using the object-oriented classification method and LCCs during 1990-2015 were explored. In addition, combined with the socioeconomic data, the paper discussed major driving forces in regard to LCC and possible implications. Results showed that the overall classification accuracy of land cover data is 85.1% and 86.3%, for 1990 and 2015, respectively. Generally, land cover changes of ROK were characterized by shrinkage in lands with vegetation cover and expansion in lands with no vegetation cover. Areas of farmland, forestland and wetlands decreased by 322.3 km², 766.7 km² and 707.6 km², respectively. In the same period, built-up land area undergone dramatic expansion (+1731.5km²), an increase by 35.9% during the 25 years. Rapidly increased population and fast growing economy were the main driving forces for the expansion of built-up land, while the policies that emphasize the protection of forestland and farmland slowed down the declining trends of vegetation covered lands. Documentation of these changes in a reliable and spatially explicit way forms the foundation for sustainable managements of ROK's natural resources and environments.

Key words:

Republic of Korea; Land cover change (LCC); driving forces; remote sensing

Land Use Change in the Eastern Black Sea Mountains, Turkey

Somuncu, M.

Department of Geography, Ankara University, Ankara, Turkey, somuncu@ankara.edu.tr

Abstract

The aim of present study is to evaluate changes in land use and function in the yaylas (*Yayla: a temporary settlement in mountain pastures; plural: yaylas*) of the Eastern Black Sea Mountains, Turkey. For this purpose, four different types of sample have been taken based on a research in 30 yaylas from three provinces of the Eastern Black Sea Region. Both quantitative and qualitative research techniques has used in the study for collection of data. The change in number of homes in the yaylas during years of 1973-2004 has been determined with help of aerial photographs and geographic information system. Primary data have been collected by a household survey during summer of 2010 in which 900 households have participated from 30 yaylas of three provinces. The qualitative data have been collected through personal observations and in-depth interviews with 45 key representatives of local communities. As a result of the analysis it has been determined that pastoralists live in 357 houses and 543 houses are second homes in 30 yaylas located in the Eastern Black Sea Region. The number of second homes in the yaylas has increased respectively during years of 1980-2010. The other change in the yaylas is functional change. The yaylas once primarily used by local people as mountain pastures in summer for grazing activities until the 1980s have been currently used for recreation purposes by amenity migrants and turned into holiday resorts. These changes in land use and function of yaylas have environmental, economic and social effects.

Keywords:

Summer pasture; land use change; mountains; Eastern Black Sea Mountains; Turkey.

Land Use Change Trends and Land Degradation in Mongolia

Myagmartseren P, Myagmarjav I, Zaya Ch, Munkhnaran S, Bazarkhand Ts, Gantulga G, Bolormaa B, Chinbat B, Erdenejargal, Enkhtuya N, Ganpurev D

Department of Geography, National University of Mongolia, Ulaanbaatar city, 210646, Mongolia,

land_management@num.edu.mn

Abstract

By the increasing demand of land for agriculture, concentration of urban land in central region, development of mining industry and land privatization the ecological conditions of Mongolian land usages are getting more unsuitable.

The goal of our study was to assess impact to main land use types of Mongolia, change trends since 1975. Using the baseline data of state land cadastre inventory and National Land Information Database we defined land use changes in 40 years. Land use change trend is dividing into two periods from 1975-1990 and 1990-2015, which had been presented by quite different social and economic constraints and stimulations to diverse type of land use.

General land use changes in two periods are: agricultural sector development and destruction, rapid urbanization (rural population in-migration to urban) and transformation of nomadic livestock husbandry to semi-sediment husbandry. Main reasons of land degradation are the overgrazing and desertification, global warming and human impact which have been presented by reduction of forest and surface water areas.

Land Use/Cover Changes in Selected Protected Areas in Romania

Dumitrașcu M., Bălțeanu D., Kucsicsa Gh., Popovici A.

¹Institute of Geography, Romanian Academy, Bucharest, Romania, stefania_dumitrascu@yahoo.com

Abstract

The paper analyses land use/cover changes with direct impact on the biological resources of protected areas in Romania. The national network of protected areas is formed of 79 scientific reserves, 13 national parks, 130 monuments of nature, 661 nature reserves, and 15 natural parks. A number of 3 biosphere reserves, 19 Ramsar sites and one World Heritage site have acquired international status. In addition, there are 408 Sites of Community Importance (SCI) and 184 Special Protection Area (SPA) which are part of the Natura 2000 protected area network.

Some of these protected areas were affected by land use/cover changes in the wake of farming and forestry works, fragmentation of natural habitats through infrastructural developments and extension of build-up areas, water and air pollution, some industrial activities and tourism.

The political and economic changes that took place in the early 1990s had a great impact on land use in Romania, affecting also some protected areas mainly by deforestations, overgrazing, mining activities, and uncontrolled tourism. Resorting to several geospatial/statistical data-sources and GIS, the major land use/cover changes were identified and highlighted in several protected areas selected for various biogeographical regions of Romania. The intensity of land use/cover changes was estimated based on a number of indicators yielded by analyzing the resulted data for two intervals, before and after the protected areas were established.

The results are aimed at assisting the administrations of big protected natural areas to identify sustainable management solutions.

Key words:

land use/cover changes; protected areas; Romania

Land Use Transitions and Their Dynamic Mechanism: the Case of the Huang-Huai-Hai Plain

yongqiang liu

liuyongqiang@nbu.edu.cn

Abstract

Land use transition refers to changes in land use morphology, including dominant morphology and recessive morphology, of a particular region over a period of time driven by various factors. Recently, issues related to land use transition in China have attracted interest among a wide variety of researchers as well as government officials. This paper examines the patterns of land use transition and their dynamic mechanism in the Huang-Huai-Hai Plain during 2000–2010. First, the spatio-temporal patterns of land use transition, their characteristics and the laws governing them were analyzed. Second, based on the established conceptual framework for analyzing the dynamic mechanism of land use transition, a spatial econometric regression analysis method was used to analyze the dynamic mechanism of the five types of major land use transition in the Huang-Huai-Hai Plain at the county level. Land use pattern changes in the study area were characterized by an increase in construction land, water body and forested land, along with a decrease in farmland, unused land and grassland. The changes during 2000–2005 were much more significant than those during 2005–2010. In terms of factors affecting land use transitions, natural factors form the basis, and they have long-term effects. Socio-economic factors such as population and GDP, however, tend to determine the direction, structure, size and layout of land use transition over shorter time periods. Land law and policy factors play a mandatory guiding and restraining role in land use transitions, so as to improve the overall efficiency of land use. Land engineering is also an important tool to control land use transitions. In general, the five types of major land use transition were the result of the combined action of various physical, social and economic factors, of which traffic condition and location condition had the most significant effects, i.e. they were the common factors in all land use transitions. Understanding the spatio-temporal process of land use transitions and their dynamic mechanisms is an important foundation for utilizing land resources, protecting regional ecological environment and promoting sustainable regional socio-economic development.

Land use transition; Dynamic mechanism; Farming area; Huang-Huai-Hai Plain

Land Use/Land Cover Change and Water Deficit Estimation for Irrigated Regions: Central Asia, Fergana valley

Nikanorova A.¹, Milanova E.², Dronin N.², Telnova N.², Kalutskova N.², Kirilenko A.³

¹ Diplomatic Academy of Ministry for foreign affairs, Russian Federation,

² Moscow State M. V. Lomonosov University, Faculty of Geography,

³ College of Health & Human Performance, University of Florida, USA

Moscow, Ruzjeiniy pereulok, 4, str.1. 124, Russian Federation, aleksanika@gmail.com

Abstract

The Central Asia has one of the most modified land cover under irrigation influence and related ecological problems. The study is devoted to analysis of water security in connection with land cover and land use changes in Fergana Valley with transboundary position in Central Asia at territories of Uzbekistan, Kyrgyzstan, Tajikistan within the Syr Darya river basin. The modern land cover of the Fergana valley differs significantly in terms of irrigation that causes geography of water scarcity, features and intensity of salinization and waterlogging. Geographical information system "Allocation of water resources for irrigation in Fergana valley" was used to elaborate scenarios of water shortage for irrigation and to define how significant the landscape structure, groundwater level and soil texture characteristics impact the differences in irrigation conditions, geography of water scarcity, manifestations of ecological problems. Assessment of current conditions for the development of irrigated agriculture allowed to reveal that the landscape complexes with a high risk of salinization and waterlogging occupy in the Fergana valley respectively 20 and 50%. The most acceptable scenario to avoid water deficit in unstable transboundary irrigation system of Fergana valley is differentiation and updating of irrigation norms according landscapes' characteristics, optimization of crops' composition with the transition to the cultivation of horticulture plantations and winter crops. That will allow to reduce twice the proportion of land to water demand and to enhance up to 80 % efficiency of irrigation techniques. The results of study will be presented in the further volume of the IGU/LUCC Atlas.

Peri Urban Growth: A Spatio-Temporal Analysis of Large Metropolitan Cities of India

GUHA. Pallabi, GOMES. Veronica

Centre for the Study of Regional Development, School of Social Sciences, Jawaharlal Nehru University. New Delhi 110067, pallabig10@gmail.com

Abstract

Urbanization in India had occurred at an unprecedented rate making it inevitable for cities to spill over their boundaries into nearby hinterland, termed as *peri urban* regions. The growths of these regions are marked by uneven development and arbitrary land use change.

The aim of the study is to analyse spatial development and changes in six major metropolitan cities, Delhi, Kolkata, Mumbai, Hyderabad, Bangalore, Chennai and their peri urban areas using Census, Remote sensing data over decades 1991-2001 and 2001-2011. The main objective is to identify urban built-up area and measure the changes in urban extension over the peri-urban, based on object oriented hierarchical approach. The spatio-temporal changes would be analysed in two steps, first involving analysis of different parameters, such as absolute real growth, built-up densities and landscape metrics. The second stage involving insight into detailed spatial gradient with respect to increasing distance from the city to peri urban areas, focusing on the complex mechanisms of peri urban growth.

In first stage urban footprints would be computed, using classification of urban types in net diagrams with aid of eight quantitative parameters such as absolute urban area, build up density, landscape shape density, largest patch index, number of patches, patch density, edge density and total edge. The results would be statistically analysed.

In second stage Spatial zonal based pattern would be observed using two parameters built-up density and SHAPE to analyse the zonal based gradient analysis using six zones of concentric rings around the main urban centre.

Key words:

peri urban; urban footprint; urban expansion; remote sensing.

Remotely Sensed Monitoring of Dynamics of Coastal Wetlands in the Yellow River Delta and Yangtze River Delta of China

Ren C.Y., Wang Z.M., Song K.S., Zhang B.

Northeast Institute of Geography and Agroecology, Chinese Academy of Sciences, Changchun, 130102, P. R. China, renchy@iga.ac.cn

Abstract

Coastal wetlands are among the most productive yet highly threatened systems in the world, and the reclamation of coastal wetlands for agricultural, industrial, and urban land use has occurred extensively in coastal regions of China. To make effective conservation and management, it is essential to understand the coastal wetlands' distribution and changes. In this study, China's Yellow River Delta and Yangtze River Delta were taken as the research areas. Based on multi-temporal remote sensing images and field observational data, dynamic trends of coastal wetlands in the study areas were detected from 1970s-2015 and the comparative analysis of coastal wetlands changes were conducted. Results indicated that natural wetlands (including saltmarsh, freshwater marsh, beach and mudflat) and human-made wetlands (including canal, reservoir, aquaculture pond and salt field) both had dramatic changes in the two study areas. In the Yellow River delta, natural wetlands kept decreasing over the 45-year period and the area of mudflat declined from 1696 km² in 1970s to 849 km² in 2015. The area of aquaculture ponds increased by 1407km² during 1970s-2015 and salt field increased by 909 km² from 1970s to 2015. By contrast, in the Yangtze River Delta, area of natural wetlands and human-made wetlands showed the same trends over the study period, but fluctuated greatly in different periods. For the two study regions, increased aquaculture ponds and salt fields were mainly converted from natural wetlands (mudflat and saltmarsh), while those lost natural wetlands mostly converted into human-made wetland, cropland and grassland.

Research for the Relationship Between the Land Use Change and the Terrain Gradient In Counties in the Loess Hilly Gully Region: as Pengyang County As An Example

Zhuang Zhuzhou

Nanjing University, China, zhuangzhuzhou@163.com

Abstract

Land-Use and land-Cover change (LUCC) is the most direct manifestation of the interaction between human activities and natural environment, and is an important factor to reflect the extent of human activities as well. Based on the DEM data in 1995 and 2014 and the land use status, the quantitative analysis of the characteristics of land use change based on terrain gradient in Pengyang County, which was made with the aid of GIS space analysis and terrain niche index, dispersion index, and the comprehensive index, illustrates three points. Firstly, from 1995 to 2014, the area of cultivated land and unused land decreased dramatically. The grassland area, on the other hand, increased largely, and the area of woodland, waters and construction land also showed an upward trend. Secondly, with the elevation of the terrain niche, the distribution Index of cultivated land, waters and construction land were in decline, while that of woodland and grassland was on the rise, and the distribution Index of unused land first rose then fell. Also, the dominance distribution section of grassland increased two terrain niches, while that of unused land decreased two. Overall, waters' dominance distribution section concentrates on the low position; cultivated land and construction land's dominance distribution section are mainly on the low-to-mid position and woodland, grassland and unused land's dominance distribution section are mainly on high position. Thirdly, Compared with the comprehensive index of the extent of land use in 1995, that in 2014 increased in all terrain niches. This paper provides a theoretical basis for the optimization of land use pattern and sustainable utilization of land resources for Pengyang County.

Spatial Patterns and Controlling Factors of Soil Organic Carbon in a Tributary Catchment of The Nanka River Basin Across the China-Myanmar Border

Meiling Zhang, Hui Fan*, Dongmei Tang, Yurui Ma, Yuan Jin

Asian International Rivers Center of Yunnan University, Kunming 650091, China;

Yunnan key laboratory of international rivers and transboundary eco-security, Kunming 650091, China

Abstract

Soil organic carbon (SOC) plays an important role in global terrestrial ecosystem carbon cycling. However, the relationships between land-use and SOC stocks remain unambiguous and poorly quantified, especially in extremely complex mountainous terrain. This paper addressed to investigate the correlations between SOC stocks and multiple confounding factors (e.g. soil properties, topography and land-use type) in a small catchment located in the low-latitude hot and humid valleys across the China-Myanmar border.

We used a grid sampling method to locate 73 sampling points, where 219 soil samples were collected at three sampling intervals along the 60cm-depth soil profiles for each sampling point. After air drying and sieving through 200-mesh and 2mm mesh, physical and chemical properties such as pH, organic matter content, total and alkali-hydrolyzable nitrogen content, and grain composition of soils were measured in laboratory. SOC stocks were estimated in the mineral soil up to 60cm depth by the soil type method. Spatial pattern of soil organic carbon across the study area was simulated by the Kriging interpolation method. Variables associated with topography such as elevation, slope and aspect were extracted from the local topographic map with a contour interval of 20 m. The relationship between environmental factors and soil organic carbon was analyzed using Pearson correlation analysis.

The results highlighted the importance of environmental conditions such as soil properties and topography rather than land-use types on SOC stocks. The SOC is strongly correlated with soil bulk density ($R=-0.645$, $P<0.01$), total nitrogen content ($R=0.672$, $P<0.01$) and topographical variables such as elevation, slope and aspect ($P<0.05$). Higher SOC mainly occurred in the areas with a slope range of 15° - 25° and in sunny slopes. SOC increased with elevation at lower elevations and decreased with elevation at higher elevations. Vertically, topsoil had higher SOC stocks, which accounted for 43% of the total SOC stocks in the whole examined soil layer up to 60cm depth. However, proportion of SOC stocks in topsoil horizons differentiated among land use types. Secondary forests had higher values than planted forests and rain-fed farmlands. Overall, topography has a predominant impact on the horizontal distribution of SOC stocks at a catchment scale in the area of mountainous terrain, whereas land use and management mainly affects the vertical pattern of SOC stocks.

Spatiotemporal Comparative Analysis of Agricultural Development Processes between the Three Largest Black Soil Regions in the World

Yang Jiuchun, Zhang Shuwen, Liu Tingxiang, Chang Liping

Northeast Institute of Geography and AgroEcology, Chinese Academy of Sciences, Changchun, 130102, P. R. China,

yangjiuchun@iga.ac.cn

Abstract

Spatiotemporal comparative analysis of land use and land cover changes between the three Black Soil Regions over a long time scale will be beneficial to further understand the processes of agricultural development, corresponding driving forces in different social backgrounds and future sustainability. The Mississippi River Basin in America, Ukraine Plain and Northeast China are the three largest regions of black soil in the temperate zone of the world. The soils are mainly chernozem and black soil with high natural fertility. And they are located between the zones of temperate forest steppe and temperate steppe with flat to gently rolling plains, suitable for farming and having become important grain production bases. This study used the Harmonized Land Use Database (Hurt et al. 2011) and Land Use and Land Cover Database of Northeast China to compare, analyze and map the temporal and spatial change characteristics of cropland, forestland and grassland of the three regions over the past three hundred years. The results showed much differences in processes, historical length, transition sources and present situation of agricultural development in the three regions. It suggested that the processes of agricultural development from Mississippi River Basin and Ukraine Plain which have experienced traditional to mechanized to modern industrial agriculture, would provide rich and advisable experiences for reference to developing China.

Spatiotemporal Conversion from Rural Settlements and Arable Land in the Process of Urbanization in Beijing during 1985-2010

Yuanyuan Yang, Yansui Liu

Institute of Geographic Sciences and Natural Resources, Chinese Academy of Sciences, Beijing, 100101, P. R. China,
yangyy@igsnr.ac.cn

Abstract

Over the past decades of Open and Reform Policy in 1978, urbanization in China has taken place at an unprecedented rate and encroached upon a great lot of arable land and rural settlements, resulting in increasingly prominent conflict between the urban and rural areas. Especially, rural issues, such as depopulation, farmland loss, abandoned residential land, and hollowed village etc, have seriously influence rural sustainable development. In this context, this paper tries to explore the dynamic spatiotemporal characteristics and trend of rural settlements loss and arable land depletion under urbanization, which could offer theoretical basis and scientific support for further research of rural development and rural restructuring. In this paper, we applied non-agriculturization intensity index and GIS-based buffer analysis using the remotely sensed land cover data to quantify this spatiotemporal conversion from 1985 to 2013 in Beijing, China. Results showed that: (1) About 80% of urban growth has been at the expense of rural settlements (23.42%) and arable land (57.14%) in Beijing. (2) An obvious rural non-agriculturization intensive belt was observed in spatial units, mainly distributing between the Fourth Ring Road and the Fifth Ring Road. (3) The spatial distribution of most high-speed, medium-speed and fast-speed non-agriculturization began to transfer from northern area to southern area after 2005. (4) The curves of variation of rural non-agriculturization intensity under urbanization along urban-rural gradient presented inverted “U” shapes away from the socioeconomic center while that along the motorways displayed exponential decay.

Abstract

Croplands dynamics are undergoing constant changes because of both natural and anthropogenic factors. To obtain the spatio-temporal dynamics of croplands in Northeast China and their driving forces, Landsat TM/ETM+/OLI imageries in 1990, 2000 and 2013 were selected and classified by object-oriented methods. Results indicated that in 2013 the area of croplands was $41.66 \times 10^4 \text{ km}^2$ (including 13.76% of paddy land and 86.24% of dry land), which occupies 33.51 percentage of total area of Northeast China. During 1990-2013, cropland increased by $2.27 \times 10^4 \text{ km}^2$, including 451.71 km^2 of paddy land and 1825.68 km^2 of dry land. Spatio-temporal distribution changed obviously during last two decades. Croplands in north of study area increased, while cropland in south regions decreased. More than 32 percentage of the formal croplands transformed to built-up area because of urbanization, these areas were mainly distributed around large cities. Reclamation of wetland, woodland and grassland resulted in the increase of croplands. We also found that regions where croplands changed significantly has those conditions: annual precipitation range from 500 to 700 mm, mean annual temperature between 2°C and 4°C , slope less than 3° , and elevation less than 200 m. The area-weighted centroids of paddy land moved to northeast with a distance of 207.41 km, but the area-weighted centroids of dryland rarely changed. During the last 23 years, although climate change impacted spatio-temporal changes of croplands, anthropogenic factors, e.g. policies regulation, population grow, urban sprawl and other factors were main factors contributed to croplands changes.

Study on Farmland Transfer between Plain Area and Mountainous Area in Northwest Arid Area: a Case Study of Zhangye

Xiao Xingyuan^{1,2}, Li Xiubin², Tan Minghong², Xin liangjie²

¹ College of Geomatics, Shandong University of Science and Technology, Qingdao, 266590, Shandong Province, xiaoxy_111@163.com

²Key Laboratory of Land Surface Pattern and Simulation, Institute of Geographic Sciences and Natural Resources Research, Beijing, 100101, P. R. China.

Abstract

Using official statistic and farmer interview and questionnaire data, based on the comparative analysis of farmland transfer characteristics between mountainous area and plain area in Zhangye, analysed the reasons for the differences of farmland transfer. The study found that: The farmland transfer form and transfer destination of plain area is complicated than mountainous area. Plain area farmland transfer form is mainly in lease, exchange and subcontract, transfer destination is mainly in producing individuals, cooperatives and family farms. Mountainous area farmland transfer form is dominant in lease and transfer destination is dominant in producing individuals. The transfer scale of mountainous area is significantly greater than plain area. The farmland scale operation area of mountainous area is 71.33×104 acres. The farmland scale operation area of plain area is 29.09×104 acres. Among them, mountainous area scale operation area is focused on 100-500 acres, while is focused on 50--100 acres in plain area. Zhangye farmland transfer periods are mainly temporary, mountainous area farmland transfer period generally is shorter than plain area. The difference of transfer purposes and agricultural income level which are caused by the difference of regional physical geography environment and irrigation water is the main reason for the difference of farmland conversion characteristics between mountainous area and plain area. At the same time, the different degree of fragmentation is the main reason. Accordingly, the paper put forward the corresponding policy suggestion, providing a reference for the government to formulate farmland transfer policy according to local conditions.

Study on the Spatial-Temporal Characteristics and Impact Mechanism of Urban Land Expansion: A case study of Jiangsu in China

Yang Qingke

Nanjing Institute of Geography and Limnology, Chinese Academy of Sciences, China, yangqingke66@163.com

Abstract

China is undergoing an unprecedented urbanization process in which massive amounts of rural land has been converted to urban use. Rapid urban land expansion in China has generated heightened concerns over consequences of urbanization and challenges to sustainable development. Jiangsu is the highly typical of evolution of the human-land relationship caused by urban land expansion, which becomes a typical case in the paper. Using official land use conveyance data from 2004 to 2012 we have found that significant spatial variation at the county level in Jiangsu exists in rapid urban land expansion, particularly the counties locating in the Sunan and municipal districts. There are mainly five aspects of natural factor, globalization, decentralization, marketization and development basis used to analyze the influence mechanism. Due to the significant agglomeration and dispersion characteristics and spatial autocorrelation of urban land change, the spatial lag model (SLM) is chosen to analyze the spatial lag effect. Regression result reveals that the theoretical framework can explain urban land expansion and present empirical evidence to support these arguments. Through the suitability of land development, population aggregation, adjustment of industrial structure, land planning and land use policy, the above five aspects impact on urban land use structure and land development intensity. As a result, they jointly affect the process of land urbanization. This study enriches the urbanization literature by providing a systematic understanding of rapid land urbanization in a transitional economy.

The Controlling Effects of China's National General Land Use Plan (2006-2020) on Construction Land Growth

Yan Zhou, Xianjin Huang, Yi Chen

College of Geographic and Oceanographic Sciences, Nanjing University, Nanjing 210023, China zhy555ylp@163.cm

Abstract

Assessment on the effect of land use policy implementation research is of great significance for improving the implementation of policy. The purpose of this study aimed to assess whether land use planning has controlled construction land growth. Taking 338 cities as the research object, methods of fixed effects model, random effects model and OLS model were employed. The result shows that China's National General Land Use Plan (2006-2020) is effective in controlling construction land growth during its midterm phrase. The decrease area of construction land reduced about 355.98 ha with a 1% increment of control rate. Furthermore, the study analyzes the "Absolute Effect" and finds that differs among cities on the controlling effects of construction land growth. In addition, the implementation of China's National General Land Use Plan has two phases , and the years 2006-2009 shows better than the years 2010-2012. Finally, considering both the effectiveness and planned objectives achievement, the implementation of China's National General Land Use Plan (2006-2020) is judged to be effective, but not completely successful. The current land management system, national development strategies, regional land-use policies and economic development level may have contributed to the implementation of China's National General Land Use Plan (2006-2020).

The Driving Factors of Land Urbanization in the Semi-Market System of China: A time-lag Approach

Cong Liao, Teqi Dai, Lin Sun, Wenxin Zhang, Fang Sun

School of Geography, Beijing Normal University, Beijing 100875, China; daiteqi@qq.com

Abstract

China's urban land expansion is extraordinary in the world and happens in a semi-market system, which cannot well explained by theories based on market institutions. Though many factors including institutional variables have been used in the models, the allocation process of construction land quotas in China has not been well included, which requires a time-lag technique. This paper develops a theoretical framework focusing on not only the market factors, but also the China's top-down process of land allocation by governments. According to the framework, we devise a multi-level model with some time lag variables reflecting the land allocation process. And using the official land use conveyance data from 2006 to 2008, it finds that the GDP, total population and the speed of economic development in the planning year have significant influences on the growth of construction land in the later years. And the different land uses have quite different influence factors. Urban land of cities and designated towns are mainly driven by population scale, while stand-alone industrial lands are mainly driven by the added value of the secondary industry and the rate of economic development. With a clearer framework on planning process, the effects of planning system and the market system can be compared in our framework and models, thus a better understanding on the urban expansion can be revealed.

The Impact Of Land Cover Changes on Social-Ecological Systems In Central Environmentally Sensitive Area of Sabaragamuwa Province In Sri Lanka: a Political Ecological Analysis

Nishan P. Sakalasooriya

Senior Lecturer, Department of Geography, University of Kelaniya, Sri Lanka, sakalasooriyanp@yahoo.com

Abstract

This study examines the relationships between the existing social issues of village areas in Central environmentally sensitive area in Sri Lanka and the land use cover changes within the last 100 years. Three different social ecological systems, Palawela, Buthkanda and Niththamaluwa, were studied using land use maps and the perceptions of settlers of the areas which were taken by life history methods and other related anthropological and political ecological approaches. The study further analyses the major land use and cover changes which were made by the last three generations of the villages or the outsiders to those social-ecological systems, in order to utilize their biophysical environment and immediate surroundings to sustain their livelihood.

The main livelihood of the permanent settlers in the three villages is agriculture, which has changed from shifting cultivation, intensive subsistence agriculture, to commercial crop production, both in large estates and in home gardens during the last 100 years. At a broader scale, commercial tea and rubber plantations, managed by private and government sectors in surrounding areas of the study sites, were established in the 1800s and have expanded since that time. Most of the hazards creating fragility in the social-ecological systems of the study sites are the result of land use transformation within the villages and in surrounding areas. Yet the National Physical Plan and other development plans of the Sabaragamuwa Province have categorized the landslides, floods, winds, and droughts as “natural”, rather than human induced hazards. The climate and topographical setting are merely proximate causes of disasters such as floods and landslides, but the root causes are practices of deforestation and monocropping, dating back to colonial times and continuing today. Colonialism itself is a deeper root cause and production for the open market continues as the act of colonialism, even today for the livelihood of the villagers in Sabaragamuwa area.

Under the open market system, commercial crops have been promoted on small scale land and home gardens in the Wet Climatic Zone areas of Sabaragamuwa province. When the prices go up for the mid country and lower country tea, the amount of land cultivated in these crops also increases. The land use pattern of the

study sites of Sabaragamuwa is decided by the market rather than by sustainable outcomes for the villages. These market-driven land use changes are unbearable though the repercussions of biophysical environment, to such transformations creates unsustainability of these social ecological systems in the long run.

The Processes of Land Use Change in Slovenia in the Last Two Centuries

Gabrovec M., Kumer P.

ZRC SAZU, Ljubljana, 1000, Slovenia, matej@zrc-sazu.si

Abstract

In 2016 we completed the entering of data from the Franciscan Cadastre of the first half of the 19th century into the database of land use on the level of cadastral communes. This collection had already contained the data from the land cadastre for the years 1900, 1953, 1961, 1971, 1979, 1994 and 1999. Available for the period from 2002 onwards are the data that have been collected by the Ministry of Agriculture and Environment for the needs of agricultural subsidies. These data are available on the level of land parcels. We also entered the borders of cadastral communes from the first half of the 19th century into the database. Even though cadastral communes were the most stable administrative units, rather numerous changes have nevertheless occurred as to their borders over the two centuries. The prevailing processes during the two-century period are presented by means of the established typology of land use changes; presented are the areas with prevailing afforestation, grassing over, land use intensification or urbanisation. In addition, the index of change has also been calculated, which has been prepared following the methodology of Czech geographers. In this way, a comparison between Slovenia and Czechia has been made possible, the two countries that have both developed in similar historical circumstances over the last 200 years.

land use change; franciscan cadastre; Slovenia

The Radiative Forcing Due to Black Carbon from Land Use Land Cover Changes in

Mt. Kenya Region

Mbithi D. M, Prof. Muthama J. N, Prof. Ininda J. M, Dr. Onwonga R.

University of Nairobi– Ph.D Thesis Scholar, Department of Meteorology, Nairobi, Kenya, mbithi_d@yahoo.com

Abstract

The study aims to estimate radiative forcing due to black carbon associated with land use activities and modeling of future temperature change over Mt. Kenya region. Data to be used include climate data spanning 1978-2015 from Kenya Meteorological Department (KMD), mass fraction estimates of BC derived from experimental data, BC Aerosols Optical Depth derived from OPAC model and RF estimates over the area of study. Spatial-Temporal Characteristics of the direct radiative forcing of BC Direct Radiative Forcing Mt. Kenya Region will be determined. The former will be carried out using surfer software while the later will be determined statistically and output determined by time series analysis. Correlation analysis will be done between the main Climatic parameters (Rainfall and Temperature) and RF_(ATM) estimates. Contribution of (RF)_{ATM} to global warming will be estimated using the IPCC net RF values as reference. The estimates will be mapped over the area of study. Future global warming will be estimated over the area of study using Model for Assessment of Green House gas Induced Climate Change: A Regional SCENario generator (MAGICC SCENGEN).

It is expected that radiative forcing due to black carbon over Mt. Kenya region will be determined and past and future precipitation and temperature scenarios generated. Results of this study will provide information on black carbon induced radiative forcing estimates over Mt. Kenya, radiative interactions and future climate scenarios.

Keywords:

Radiative Forcing; Black Carbon; Aerosols; Climate Change; Land Use land Cover; MAGICC SCENGEN

The Regional Differentiation of Vegetation Dynamics in Mainland China based on Time-Series MODIS data

Tao J, Wang Y

Key Laboratory for Geographical Process Analysis & Simulation of Hubei province / School of Urban and Environmental Sciences, Central China Normal University, Wuhan, 430079, P. R. China, taojb@mail.ccnu.edu.cn

Abstract

Land-cover change and vegetation dynamics is an important issue in the context of global climate change. It's of great value to obtain the regional differentiation of vegetation dynamics on national scale timely and to update it regularly using remote sensing images in remote sensing of vegetation. In this research we presented a new method to address the issue of vegetation process using phenological parameters from time-series MODIS products. Land surface phenology is defined as the seasonal pattern of variation in vegetated land surfaces observed from remote sensing. The 16-day composite Enhanced Vegetation Index (EVI) data from TERRA/AQUA-MODIS with 250 m spatial resolution covering year 2000 to year 2015 were downloaded and processed. The seasonal amplitude, a phenological parameter derived from MODIS EVI by TIMESAT was used for this purpose. Breaks for Additive Season and Trend project (BFAST) was used to detect and analysis the changes since 15 years. By employing this distinct metrics of phenological parameter and the advantages of MODIS data with high temporal resolution and intermediate spatial resolution, a remote sensing based model for mapping vegetation dynamics in mainland China was built through integration with land-cover data. The variation of vegetation dynamics with latitude, longitude, elevation, temperature and precipitation was analyzed. Our study indicates that apparent rule of regional differentiation can be observed. The proposed method provided a novel way to observe and monitor vegetation dynamics by information mined from time-series MODIS data.

Regional differentiation; vegetation dynamics; time-series MODIS data; phenological parameter

The Spatial-Temporal Coupling Characteristics of urban land expansion and population growth in China

Meng Hao, Xianjin Huang

College of Geographic and Oceanographic Sciences, Nanjing University, Nanjing 210023, China, menghao09@163.com

Abstract

China is experiencing rapid urbanization and important transition of urbanization. However, under the background of the urban rural dual system for population registration and social welfare, China's urbanization process is different from the western countries. Our research analyses the relationship between urban land expansion and population growth in China during 1994-2013. A coupling model, Coordination Index and Center Coupling Model are used to re-examine the process of urban land expansion and population growth. The conclusions have been drowned below. (1) The Coupling of urban land expansion and population growth in China is weak and decreasing. The speed of land expansion is faster than the rate of population growth. (2) The main types of coupling are rapid population growth, concentrate in East coast, along the Yangtze River and other economically developed regions. The number of rapid population growth and coordination are insufficient, mainly in the central and western regions of China. (3) The number of cities with land expansion has increased significantly, and the distribution has showed a trend of expansion. Meanwhile, the built-up area and population started to decrease in Northeast, north of Chengdu and other resource-based cities.

land expansion; population growth; coupling; temporal and spatial evolution

The Unique Role IGU Commission on Land Use/Cover Change can Play for Future Earth

Himiyama, Y.

Emeritus Professor, Hokkaido University of Education, Asahikawa, Japan, himiyamay@khd.biglobe.ne.jp

Abstract

Future Earth is a new grand initiative for sustainable future of the world which started in 2015. It was established on the bases of the achievements of the former big global programmes such as IGBP (International Geosphere-Biosphere Programme), IHDP (International Human Dimensions Programme on Global Environmental Change) and DIVERSITAS, yet put forward new principles such as trans-disciplinarity and enhancement of sustainability.

IGU-LUCC (IGU Commission on Land Use/Cover Change) was established in 1996 in order to support LUCC (Land Use/Cover Change Programme), which was initiated jointly by IGBP and IHDP in the same year. Ten years later, LUCC was merged with GCTE (Global Change and Terrestrial Ecosystems), and was re-named GLP (Global Land Project). GLP moved into Future Earth in 2015 at the conclusion of IHDP and IGBP. Unlike LUCC and GLP, IGU-LUCC has kept its objectives and mission till today since its start in 1996, supporting LUCC and GLP both from inside and from outside.

Land use is now recognized as a major global environmental issue in several different ways, as seen in "Future Earth 2025 Vision" which identifies eight "key focal challenges" such as food-water-energy, climate change, cities and rural areas, which are all related with land use in one way or another. IGU-LUCC has been an important platform for integrative basic and applied studies of land use changes, their backgrounds and consequences in the world. The paper discusses how the expertise and network of IGU-LUCC can be mobilized to consolidate land use research/education/information bases for Future Earth.

Key words:

IGU-LUCC; LUCC; GLP; IGBP; IHDP; Future Earth; land use; sustainability

Urban Green Space, Trend And Driving Forces In World Cities

Ruishan Chen

School of Geographic Sciences, East China Normal University, Shanghai, 200241, P. R. China, chenrsh04@gmail.com

Abstract

Green spaces support the sustainability of cities (Rydin, 2010; Hall, 2006; Chiesura, 2004). United Nations stated that, all city-regions should achieve a tree canopy of at least 25% of land area, and meet WHO's suggested minimum of 9 m² open space per resident by 2030 in its indicators on sustainable development goals (SDGs). However, statistics show declining urban green spaces worldwide with African situation been critical (Chen, 2014; McDonald et al., 2010; Fuller & Gaston, 2009). Rapid urbanization has changed green space into build up areas in order to hold the increasing population in a lot of cities in developing countries. Moreover, with its multi-function of urban green spaces, government from local to national become take it more seriously. Green space displays different pattern and process in different countries. It covers nearly 40% of land area in Shanghai, however, less than 10% coverage in many African cities (Adjei Mensah, 2014, MaConnachie et al., 2008). We propose that the pathway of urban green space is in a Kuznets curve which are correspondent to the stages of urban development and use data from ten cities all over the world to explore the process of urban green space change.

Urban Sprawl and Landuse change study in the Pimpri Chinchwad Municipal

Corporation, Pune, India

Dr. Kadam ANUSHRI D., Prof. Nagarale VIRENDRA R.

Department of Geography, SNDT Womens University, Karve Road, Pune – 411038, anushree.kadam@gmail.com

Abstract

Landuse study is an important area of urban study. The study of landuse change with reference to change detection and the growth of urban centres have gained prominence in the recent years. This process is termed as sprawl. Urban sprawl is basically another word for urbanization. It refers to the migration of a population from populated towns and cities to low density residential development over more and more rural land. GIS and remote sensing based study is carried out to comprehend the process of sprawl. LISS –III and IRS 1D (PAN) satellite imageries are used to study the phenomena for the years 2001, 2009 and 2011 respectively. Spatial analysis is done using GIS to chalk out the potentials and restraints of the region. The article aims to study the magnitude, growth and trend of urban sprawl taking place along the major transport arteries linking PCMC with the major development hubs of the nation during the last decades.

Key words:

GIS; Remote Sensing; Urban Sprawl; Landuse

An Assessment of The Effect of Abandoned Coastal Wetland Restoration in China-Achievements And Lessons

Du ZB, Xie ZL, Wang Y, Xiang LX, Xie C

¹School of Geography & Environmental, Jiangxi Normal University, Nanchang 330022 P. R. China

²Key Laboratory of Education Ministry for Poyang Lake Wetland & Watershed Research, Nanchang, 330022 P. R. China, xzl2121@163.com

Abstract

Estuary wetlands have been continuing to degrade under the pressures of natural factors and anthropogenic activities. The goal of restoration is to re-establish the hydrologic connection, and one of the most important methods of restoring abandoned wetlands is supplying freshwater to degraded wetlands. The decreasing Yellow River discharge and the altered flow regime during the last few decades are most likely a factor responsible for problems related to ecosystem deterioration, habitat loss, siltation of the river channel, groundwater depletion, and an increase in soil salinity. The Yellow River Conservancy Commission conducted water transfer engineering during the 10th flow-sediment regulation regime in the flood season of July, 2010. The water transferring project has resulted in significant positive ecological effects, including increased areas of freshwater wetlands, changes in vegetation types and bird diversity. The endangered species of red-crowned crane has increased by 11 and by 19 in 2010 and 2011, respectively, and the oriental white stork has increased by 18, suggesting the improved effects of Diaokou wetland ecological water transfer. It is necessary to establish a mechanism for the periodic monitoring of wetland resources. Coastal ecosystem degradation has led to the diagnosis, a restoration process, and an after-the-fact assessment, showing that adaptive management should be used in the practice of coastal ecosystem restoration. Therefore, future studies should incorporate water quality parameters to compare different restoration scenarios in achieving watershed-scale management goals.

Abstract

Food security has great impact on stability and development. Cultivated land is an important section of food security, therefore its changes and causes have an important significance for the study of food security of China. With the RS multi-temporal land use data (1990, 1995, 2000, 2005 and 2010) extracted in ArcMap, it's analysed the changes of cultivated land from 1990 to 2010 in China, compared the various provinces and watershed, and explored the main causes of those changes. The results illustrate that the area of cultivated land increased slightly in the whole time, but actually increased only in 1995-2010 while reduced in other periods, and the year of 2000 was the turning point of the spatial change to weaken. The proportion of construction land occupation increased definitely, which is related to the degree of regional development. Conversions from cultivated land to forestland or grassland have regional characteristics: most conversion of farmland to forestland occurred in the northeast and southwest regions, and most conversion of cultivated land to grassland happened in the northwest region. The steady source of added cultivated land is grassland, before 2000 forest was another main source, however exceeded by unused land later.

Automatic Identification and Dynamic Monitoring of Urban Ecological Space based on Multi-period Remote Sensing Data

Sizuo Wang¹, Feifei Zhao², Nisha Bao², Shuilian Shi¹, Peng Guan¹, Hongxing Li¹, Wei Cui¹

¹ Bureau of Land and Resources Investigation and Planning of Liaoning Province, Liaoning Shenyang 110032, China, 54439726@qq.com

² College of Resources and Civil Engineering, Northeastern University, Liaoning Shenyang 110819, China, Sgerphy@163.com

Abstract

Urban ecological footprint is not only a unified whole forming by interaction between the urban and its environment, but also a special artificial ecological space building up by human's adaption, process and transformation to the natural environment. The scale of urbanization and trends is determined by the urban ecological spatial distribution and succession laws in urban integration process. The automatic recognition and dynamic testing study of urban ecological space based on the majority of remote sensing data can be analysed in the huge impact and far-reaching significance on people's lives that urban ecological space have in urban integration process, and provide a reference for urban integration planning.

In this study, Shenyang as the centre city in Liaoning province is facing the challenges and opportunity during the city expansion, Shenyang-Fushun new district of Liaoning province was selected as the study area. The Landsat images with 30 spatial resolution acquired in 2006, 2010 and 2014 were used. Then, the urban ecology spatial information such as the urban area and urban green space area is extracted by the object-oriented method. Furthermore, the relative calculation and analysis of landscape pattern dynamic characteristics and multi-directional change features in the study region are processed. The features, such as NDVI, NDWI, NDBI and brightness were built to extract vegetation, water and towns algorithms rules by nearest neighbour classification method and fuzzy classification. And based on the semantic and logical relationship between different layers, complete information extraction based on object oriented urban ecological change. The overall accuracy of classification was 82.5%. And finally come to the following conclusions:

1. The total urban area in 2010 had increased by 9.63km² than in 2006, and the total urban area in 2014 is 65.35km², up 5.63km² over 2010. The Fushun area remains the focus of total urban area increasing, the part of Fushun had relatively higher enthusiasm response to the policy and constantly developed in direction of Shenyang.

2. The urban green space area in 2002 had increased to 20.38km² with 10.75km² in 2006, and the urban green

space area is up to 25.74km² in 2014. The urban green space mainly distributed on the banks of Hunhe River. The urban green coverage rate is increased from 9.85% in 2006 to 18.67% in 2010, and it reached 23.59% in 2014. Meanwhile the increase of urban green space and urban is positively and very significantly correlation. And the correlation is more and more high, which suggested that the urban ecological spatial structure of Shenyang-Fushun had drew closer gradually, and the Hunhe landscape belt will be built flowing the planning.

3. The average patch area and the largest patch index make increasing trend, the distribution-parallel and spread degrees index make decreasing year by year, which suggested that Shenyang-Fushun is uniform and planning, pay more attention to the plants and other large ecological park, urban green space types and the construction of the urban construction and planning.

Dynamic Process of Oasis and its Impact on the Environment (1986-2015): a case study of Dunhuang Oasis

Zhang Xiuxia, Xie Yaowen, Lv Lili

College of Earth Environmental Sciences, Lanzhou University, Lanzhou, 730000; P. R. China, zhangxx13@lzu.edu.cn

Abstract

Understanding the dynamic process of oasis and its impact on environment is crucial for the management and environmental health. The arid region of northwest China has experienced dramatic oasis expansion and serious environmental problem since 1980s. The purpose of this study is to investigate the change of oasis and influence on its environment. Dunhuang, a typical desert-oasis, located in the western end of the Hexi Corridor in arid northwest China, was used as a case study. Basing on the Landsat TM images, the distribution of oasis were extracted in five years time interval from 1986 to 2015. And the variation of area, spatio-temporal changes and landscape pattern were analyzed by a set of mathematical statistical models and indices of landscape ecology. The results showed that: the area of Dunhuang oasis increased gradually by 60.68% in recent 30 years. The most expansion happened at natural oasis and oasis-desert ecotone in the peripheral of oasis. The expansion of inner oasis included desolated beaches of the ancient river and complicated patches of oasis with the body internally filled expansion and progressively peripheral extension. With the patch increasing, the oasis landscape patch tended to be simple and uniform. These results also show that obvious widespread change of oasis occur within the study period and result in severe problems of environment (i.e. vegetation degeneracy and reduction of surface water).

oasis; Dunhuang; remote sensing; expansion; environment

Growth Paths of China Forest Resources

Liangjie Xin, Jiayue Wang

Institute of Geographic Sciences and Natural Resources Research, CAS, China, xinlj@igsnr.ac.cn

Abstract

Using data published since 1949 this study used the system GMM model to check whether or not China has a forest transition phenomenon, and to identify the growth paths behind China's forest growth. The results of this study show that: (1) There exists a good positive relationship between forest cover rate and per capita GDP, which means that China's economic growth effectively promotes the recovery and growth of China's forest resources, although economic growth brings serious environmental pollution. (2) China has already passed the forest transition turning point, and now the growth rate of China's forest resources slows down progressively along with economic development. The turning point of China's forest transition should be the period of the late 20th- and early 21st-century, rather than the 1980s, as some researchers have claimed. (3) China's forestry restoration is affected by both the economic development path and the forest scarcity path. Since 1990s, a large number of arable lands were abandoned and converted into the forest in mountainous areas because of the increasing wage. The marginalization of agricultural land may be the key driving force for forest transition. (4) The efficiency of forestry investment in China's northern provinces were lower than that in the southern provinces, so more China's forest investment should be put into the south.

Key words:

forest transition; China's forest growth; economic development path; forest scarcity path; the period of the late 20th- and early 21st-century

Impact Assessment of Land Use Land Cover Changes on Rainfed Watershed Hydrology Using Remote Sensing, GIS and SWAT Model

Sivasenareddy.A

Assistant Professor, Department of Civil Engineering, Amrita School of Engineering, Coimbatore

Amrita Vishwa Vidyapeetham, Amrita University, India, as_reddy@cb.amrita.edu

Abstract

Assessing the impacts of Land Use Land Cover (LULC) and vegetative vigor changes on watershed hydrology is critical for planning and management of rainfed watershed. This study aims to assess the impacts of LULC changes on runoff and sediment yield of Kaddam watershed, located in Godavari river basin, India. The study region is a typical rainfed watershed characterized by water scarcity with average annual rainfall of 745 mm and frequent drought conditions. Normalized Difference Vegetation Index (NDVI) fused with digital image classification technique is employed to describe the spatio-temporal characteristics of LULC and vegetative vigor using multi-spectral remote sensing data. A physically based semi-distributed hydrologic model namely Soil and Water Assessment Tool (SWAT) is employed for hydrological modeling, and simulated surface runoff and sediment yield at monthly and daily time scales, and validated with data for three monitoring stations in Kaddam watershed. The impacts of LULC change on Kaddam watershed hydrology for two different LULC scenarios are analyzed. The simulation results of runoff and sediment yield from the sub-watersheds outlet to Kaddam reservoir showed a high variability due to changes in LULC. Most of the sub-watersheds showed a greater increase in runoff, which varies from 2% to 63%. The results also showed increase in sediment yield, which varies from 4% to 50%. The impact of vegetative vigor on hydrological variables is analyzed by defining Change Detection Vegetative Index (CDVI), thereby assessed the change in vegetative status of forest lands, fallow lands and agricultural lands, and used for change detection in runoff and sediment yields in sub-watersheds. Results of the study demonstrated the utility of remote sensing, GIS and SWAT model for assessing the relative impacts of LULC transitions on hydrologic response of watershed.

Integrated Spatial Characteristics of Land Use Influencing Water Quality in Upper Catchment of Miyun Reservoir

Erqi Xu, Hongqi Zhang

Institute of Geographic Sciences and Natural Resources Research, Chinese Academy of Sciences, Beijing, PR China,
xueq@igsnrr.ac.cn

Abstract

Land use is closely related to eco-hydrological processes influencing water quality. Quantitative structures of land use have been conventionally used to predict water quality variables. Limited studies have tried to individually quantify spatial information, which directly influence the eco-hydrological process of pollutants. Lacking an insight to joint impacts of spatial characteristics could lead a statistical bias and confused understanding. The upper catchment of Miyun Reservoir is studied here as a representative area. Base on mathematic models and spatial techniques, a diagnostic framework of quantifying and integrating three spatial components of land use, including the slope, distance and arrangement, linking to water quality was developed and applied. Total nitrogen, total phosphorus and chemical oxygen demand of water samples from field measurements characterized the water quality in 52 sub-watersheds covering the whole catchment. Landsat-8 images were used to interpret land use. Integrating the spatial distance and arrangement, results detected a joint distribution of arable land and residential land. With a series of parameters calibration and variables determination, joint spatial characteristics were explored and coupled with land use quantitative structures. Compared to traditional methods, results shown a significantly statistical increase and confirmed the effectiveness of our method. Incorporating spatial information increased the explanatory power of land use on water nutrient concentrations. The jointly spatial characteristics of land uses can guide the optimization of spatial land use configuration and spatial setting of vegetal buffers to control water eutrophication.

Irregular Neighborhood Cellular Automata Land-Use Simulation Based on the GA-MCE algorithm

Yongheng Zhang

Liaoning Normal University, China, zhshhe0315@163.com

Abstract

The irregular neighborhood cellular automata land-use simulation determines the condition of cellular neighborhoods and their scope of influence in order to distinguish and calculate the cellular neighborhoods which have a high degree of influence on the central cellular by defining certain rules for the neighborhoods. Compared with the form of a neighborhood of the same size in the traditional cellular automaton model, irregular neighborhood cellular automata is far more realistic and effective. Based on modifying the cellular neighborhoods' range with the irregular neighborhood recognition algorithm and obtaining the parameters of the invert rules through a combination of the genetic algorithm and multi-criteria evaluation, we ran a simulation land-use changes in Jinshitan National Tourist Holiday Resort from 2004 to 2010. The simulation result shows that the coefficient of Kappa is 81.62, which was obtained through Kappa analysis and testing of simulative accuracy and is highly reliable. In addition, the result shows that this approach has certain advantages regarding the simulation between class plots and smash plots plaque, which will improve the simulation model for land-use/cover changes.

Petroleum Exploitation as A Driving Force of Urban Growth, A Case of Study from Lago Agrio in the Ecuadorian Amazon

¹Córdova D., ¹Fierro L., ¹Tuci C., ¹Simón-Baile D.

¹Universidad de las Fuerzas Armadas-ESPE, Quito, Ecuador, gcordova1@espe.edu.ec

Abstract

The Urban Ecuadorian Amazon is a complex system that developed in years of human exploitation, being the oil extraction one of its main driving forces since the 70's. The above is particularly true for the north of the region where Lago Agrio is the main city. Lago Agrio developed mainly due to the oil boom during the 90's and in that period, the growth of the city and its activities originated great changes in the land use and land cover and a subsequent negative impact. The present research aims at showing the territorial changes experimented in this Amazon area through a multitemporal study using a cellular automata model in order to determine the loss of natural habitat. For that purpose, two ETM Landsat satellite images from 2002 and 2012 were used in order to apply the algorithm of Maximun Likelihood Classification. The predictive model of cellular automata was obtained using IDRISI 17.0. Two maps of land use and land cover were obtained for 2002 and 2012 whose comparison highlights a remarkable growth of the urban sprawl. The predictive model showed that important areas of primary forest and even protected areas could be lost by 2020 due to the urban expansion. On the other hand, the current international contraction of the oil sector may affect the Lago Agrio area where the economic gap left by the petroleum could be filled by organized criminal activities resulting from the proximity to the Colombian border.

Problems and Perspectives of Land Use Management in the European Russia in connection with Climatic Changes

Mukhin G.D., Boldanov T.A.

Faculty of Geography, Lomonosov Moscow State University, Moscow, Russia, gd_mukhin@rambler.ru

Abstract

Global climatic changes appear in different ways at subregional level of the Northern Eurasia. Within 50-60° North Latitude in the European Russia meteorologic data show annual average temperature increasing in 1-1,5 °C for XX-th century. Researching warm trend period (1970-2009) has shown an annual average increase as 1,5-2 °C in the central and southern Non-Chernozem regions. The distinct correlation between annual average temperature increment and grain crops productivity has been detected with 0,6-0,75 correlation ratio in some oblasts.

However such favorable climatic trend had coincided with large-scale lands' withdrawal in Non-Chernozem and in South-East regions because of economic reasons. Crop areas had reduced in Non-Chernozem zone more than twice: from 28,8 to 13,2 mln ha during 1990-2009 period, while grain crops areas had decreased from 13,4 to 7,3 mln ha. As a whole crop areas in the European Russia has reduced in 33%, from 87 to 59 mln ha. So change of climatic conditions comes in collision with reduction of grain crops farming. Linear trends of grain crops' productivity have positive growth in the most part of regions. And only some boreal oblasts with unfertile soils haven't positive productivity trends because of low agrotechnical level.

As a whole the withdrawal of agricultural lands may be considered as unreasonable except for obviously non-productive lands. Taking climate warming into account it is necessary to return about 30-35% abandoned lands into agriculture use. Returning productive lands is an actual task for sustainable land-use management in Non-Chernozem regions whereas climatic changes supply favorable background.

Key words:

land use management; climatic changes; European Russia; crop areas and productivity

Quantitative Study On The Driving Factors Of Wetland Change Based on Geographical Detector

Liu J P, MA C D, Du B J

College of Tourist and Geoscience, Jilin Normal University, Siping, 136000, P. R. China, liujpjl@163.com

Abstract

The paper takes Sanjiang Plain as an example, for the wetland change is severe in there, resorting to GIS and RS technology, combined with the Geographical Detector methods, and then make the quantitative analysis of driving factors for wetland changes from 1986 to 2010. The results are as follows. Firstly, the loss of wetland area in Sanjiang Plain is severe, which loses 35.5% mainly in the floodplains, the slope of 1 -3 degrees and the elevation of 50-60m, meanwhile, the area of wetland loss decreases with increasing the distance from the river. Secondly, the main driving factors for wetland loss are the altitude, slope, soil, land-form, GDP, the annual average temperature, the distance from river and slope direction, the power of determinant to wetland loss of each driving factors are 29.3%, 17.3%, 16.1%, 12.3%, 9.7%, 8.9%, 8.3% and 7.2%. Thirdly, the interaction mutual enhancement of the driving factors focused on power of determinant (PD,H) is as follows: soil \cap altitude (36%) , the distance from river \cap altitude (34%) , population density \cap altitude (32%) , GDP \cap soil (28%) . The interaction mutual weakened of the driving factors according to power of determinant (PD,H) is as follows: slope direction \cap slope(22.3%), land-form \cap altitude(17.6%), the distance from river \cap slope direction(7.0%), GDP \cap land-form(5.7%), the interaction between the altitude factor and other factors is strong, which makes the altitude an important factor influencing the wetlands loss.

wetland loss; driving factor; Geographical Detector

Research on Land Use Change Driven by Farmland In Loess Hilly-gully Region

Xiaohu Lin, Wanqiang Yao

xi'AN University of Science and Technology, xi'an, 710054, China, 1508259352@qq.com

Abstract

Land use/cover change (LUCC) is an important component of global environmental change, at the same time, the production and human life is closely related to the social and economic development, so it has a long-term vitality of the hot research area. With the implementation of the national policy of returning farmland to forest, the land uses have changed greatly In Loess Hilly-gully region. In order to explore the land use changes and driving mechanism, this paper takes Zhifanggou Watershed AnSai County of Shaanxi Province as an example. Taking three periods of 1991, 2000 and 2013 years of TM and ETM images as the data source, combined with the terrain map, attribute data of field mapping, supported by ENVI and ArcGIS software, analyzed the law of land use changes around returning Farmland in Zhifanggou watershed. Using the principle of matrix multiplication, based on Visual C++ 6.0 platform and the pattern of land use in 2013, and applied the transition probability matrix determined by Markov model to carry on the simulation and prediction of the land use change in 2023. Results show that: Grain for Green Project accelerated the flow velocity of the basin, and changed the relations between the transfers of various land use types, but with the deepening of the project, this trend will decrease, eventually the area of forest, grassland, cultivated land will remain stable in dynamic balance.

Research on the Pre-Processing of Landsat OLI Images of the Cross-border Region of China, North Korea and Russia

Cui Guishan, Xiang Hengxing

Yanbian University, Yanji, 133000, China , cuiguishan@ybu.edu.cn

Abstract

Remote sensing image preprocessing is a better way to extract target information, the processing results directly determine the accuracy of the extraction of the target information. Especially for large coverage area, multi temporal data, image preprocessing directly affects the classification results. In this paper, the cross border area of China, North Korea and Russia as the research object, research methods of remote sensing image preprocessing at home and abroad. The Landsat8 OLI remote sensing image of the region was used for the pretreatment of the terrain correction, mosaic, clipping, removing the thin cloud and removing the shadow. The results indicated that the ratio operation effectively removed shadows on the nightside region, and by removing the cloud processing of images, can well restore the spectrum information of objects in the region.

Scenario simulation and landscape pattern dynamic changes of land use in the Poverty Belt around Beijing and Tianjin, in China

Sun P, Xu Y, Yu Z, Liu Q, Xie B, Liu J

China Agricultural University, Beijing 100193, P. R. China, lcu05yabo@gmail.com

Abstract

Scenario simulation of land use change is an important issue in the study of land use/cover change, and plays a key role in land use prediction and policy decision. Based on Landsat TM images in 1989, 2000 and 2010, scenario simulation and landscape pattern analysis of land use change driven by socio-economic development and ecological protection policies were reported in Zhangjiakou city, a representative area of the Poverty Belt around Beijing and Tianjin. The integration of Markov-CLUE-S model and landscape metrics were used to simulate future land use scenarios from 2010 to 2020 and analyze their landscape pattern characteristics in Zhangjiakou. The results indicated good consistency between the simulated results and actual land use situations according to the Kappa statistic. The conversion of farmland to construction land and forest land formed the primary features of land use change in the future. The simulations for land use demands showed that land use experienced different dynamic changes under different scenarios. The key susceptible to land use changes were mainly distributed in the administrative districts and their surrounding regions as well as Bashang Plateau and its neighboring mountainous areas. The landscape patterns of the four scenarios in 2020, compared with those in 2010, were more reasonable. Spatial differences in landscape patterns also existed in Zhangjiakou. The spatial distribution of land use could be explained by the driving factors, and the simulation results tallied with local situations, which provided useful information for decision-makers and planners to take appropriate land management measures in the area.

Key words:

land use change; Markov model; CLUE-S model; landscape metrics

Soil Conservation Benefits of Grain for Green Project at the Forest-Steppe Zone of Loess Plateau

Yayong Xue^{1, 2}, Xiaofeng Wang^{1, 3}

¹School of earth science and resources, Chang 'an University, Xi 'an, 710054, P. R. China, xueyayong123@163.com

² State Key Laboratory of Urban and Regional Ecology, Research Centre for Eco-Environmental Sciences, Chinese Academy of Sciences, Beijing, 100085, P. R. China

³ Shaanxi key laboratory of disasters monitoring & mechanism simulation, Baoji, 721016, P. R. China

Abstract

As the ecological transition zone and fragile eco-environment region, Loess Plateau has suffered severe and large-scaled soil erosion, which in turn greatly affected territorial eco-environment. Therefore, it is of great practical significance to assess soil conservation benefits of the Grain for Green Project for regional ecological restoration and economic development. In our study, on the basis of 2000, 2005 and 2010 meteorological data and land-use types, soil conservation benefits under various slope gradients, vegetation coverages and land-use types were separately assessed with the method of Revised Universal Soil Loss Equation (RUSLE) at the forest-steppe zone of Loess Plateau. By analyzing, the main findings were as follows: (1) Since the Grain for Green Project widely implemented from 1999, vegetation coverage has gradually improved, and the area of woodland and grassland have also significantly increased, with each increment of 2219.41 km² and 2205.27 km², respectively. (2) In 2000-2010, soil conservation quantity increased by 241 million ton, and that per unit area increased from 3033.15 t/(km²·a) to 5114.86 t/(km²·a), which in total significantly improved regional soil conservation benefits. (3) Soil conservation benefits were positively correlated to vegetation coverage. In different land use types, both of woodland, grassland and cultivated land had much higher soil conservation benefits than the rest land-use types, with each soil conservation quantity per unit area of 5405.57, 3598.41 and 3078.81 t/(km²·a). However, serious problems, like vegetation deterioration, ground collapse and soil erosion caused by the exploitation of mineral resources in northeastern part, should be solved in no time.

Spatial Disparity of Major Cities along Land Silk Road in China from 1970s to 2010

Li Na, Zhang Zengxiang, Zhao Xiaoli, Wang Xiao, Wen Qingke, Zuo Lijun, Liu Fang

Institute of Remote Sensing and Digital Earth, Chinese Academy of Sciences, Beijing, 100101, P. R. China, lina@radi.ac.cn

Abstract

As Chinese President Xi Jinping has initiated the strategic plan of constructing the "Silk Road Economic Belt" since 2013, cities along the Silk Road will access to a rapid development. In this study, information on the urban expansion process of the main Silk Road cities was retrieved from 1970s to 2010. For comparing and analyzing the influence of the "Silk Road Economic Belt", the expansion of the parallel geographical regions was adopted in this study. Through the analysis of stage characteristics, spatial expansion modes, influences on land use, centroid shifts, and spatial morphological evolution, the spatial differences of Silk Road urban expansion were revealed. Results indicate that 1) the expansion stages of Silk Road cities are more complex than those of similar geographical region cities, and the expansion ranges and speeds of the former are far higher than those of the latter; 2) significant spatial differences in the occupations of different land sources exist between the Silk Road cities and parallel geographical regions; 3) the spatial morphology of Silk Road cities tends to be compact, whereas that of parallel geographical cities tends to be loose. The "Silk Road Belt" has a powerful significance in terms of guiding urban expansion and its spatial differences in Silk Road cities. Urban expansion in Silk Road cities will encounter new opportunities and challenges under the guidance of new types of urbanization strategies.

Urban build up areas; spatio-temporal patterns; Silk Road Economic Belt; cross-city comparison

Temporal and Spatial Change of ecological services on Loess Plateau of Shaanxi

Province

Bao Yubin, Liu Kang, Li Ting

College of Urban and Environmental Science, Northwest University, Xi'an 710127, Shaanxi Province, China,
liuk63@126.com

Abstract

There are a series of factors driving ecosystem services, one of which is the change of land use pattern, and it is drawing more and more attention of ecologists. A series of ecological conservation projects launched since the 2000s altered the land use pattern greatly, and exerted a profound influence on the ecosystem services. Based on the Integrated Valuation of Ecosystem Services and Tradeoffs (InVEST), we assessed the historical fluctuation of sediment control, water yield, carbon sequestration, and habitat quality in the Loess Plateau. We set up a two-grade classify system of land use and interpreted the remote sensing images of 2000, 2005 and 2010 respectively, and then apply InVEST model, which is a space explicit model and based on land use, to map the ecosystem services, and analyze the influence of Land Use to ecosystem services during study period.

The result indicates, between 2000~2010, the forest, shrub, grass and constructional areas had expanded by 122.7km², 285.3km², 3204km² and 450.4km² respectively. However, agricultural field had shrunk by 3984.5km². The basins soil conservation and carbon sequestration were main increased, Soil conservation increased between 0 ~ 200 t/hm² for the most area, parts in more than 200 t/hm², and Carbon sequestration growth in 0 ~ 20 t/hm² for the most area, parts in more than 20 t/hm²; However, Water yield was main falling, damping between 0 ~ 50 mm for the most area and parts surpass 50 mm; Habitat quality became more better with habitat quality index increase between 0 ~ 0.2, part area in 0.2 above. Changes in the area of ecological services agree with land use / cover change regional, So, Land use / cover change has significantly affecting on the Loess Plateau ecological services.

The analysis of spatiotemporal varying relationships between urban expansion and related factors using geographically weighted logistic regression

Guanglong Dong^{1,2}, Erqi Xu¹ and Hongqi Zhang^{1*}

¹ Key Laboratory of Land Surface Pattern and Simulation, Institute of Geographic Sciences and Natural Resources Research, Chinese Academy of Sciences, Beijing 100101, China; zhanghq@igsnrr.ac.cn

² University of Chinese Academy of Sciences, Beijing 100049, China

Abstract

Urbanization not only improve the level of our lives, but also bring some problems threatening our human health and sustainable development. Revealing the spatiotemporal varying relationships between urban expansion and underlying driving forces which is far from thoroughly understood, especially in terms of the ubiquitous and fast growing small city, is a crucial prerequisite to solve this problems and realize sustainable development. In this research, Kunshan was used as a case study to make some supplements. Eleven variables from four aspects covering physical, socioeconomic, accessibility, and neighborhood were selected, and both logistic regression and geographically weighted logistic regression model were employed to explore the spatiotemporal varying relationships during 1991-2014. Results reveal that urban expansion is enhanced in Kunshan with the annual expansion rate in 2000-2014 is four times higher than that of 1991-2000. Besides, GWLR model performs better than LR model with the same explanatory variables indicated by lower Moran's I of residuals and smaller AIC. GWLR model has greatly improved LR model by revealing the spatial nonstationarity and local variations. The combinations and their relative importance of drivers varies with time and space. More importantly, despite all the local coefficients in GWLR models show distinctive spatiotemporal variations which is different from that in LR models, they show a consistent positive or negative effect with the corresponding variables in global models. Based on these findings, a regional diversity policy to manage urban expansion scientifically is recommended in this research.

The Ecological Footprint in Northeast Asia from 1990 to 2010

ZHANG Bai, LIU Weijie

Northeast Inst. of Geography & Agro-ecology, CAS., Changchun, 130102, P.R. China, zhangbai@iga.ac.cn

Abstract

With the population proliferation and science progress, human has change the environment at great scale and speed, and ecological environment has been effected and damaged unprecedented. The ecological environment problem was not just points source problem, but has developed into regional, and national and global problem. Northeast Asia is very rich of natural resources. However, with the rapid economic development in Northeast Asia, the region environmental issues have become even more serious. Northeast Asia is an important ecological protective screen in the eastern of Eurasia, its eco-environment quality directly impacts the national and regional ecological environment safety. This thesis in full control of the land-use data, on the basis of satellite remote sensing data for many years, with the method of ecological footprint(EF) in the Northeast Asia from 1990 to 2010, calculated the ecological footprint. After 1990 the EF of per capita is showed the approach motive trends in the different countries of Northeast Asia. Special into 21 century the EF value is growing in the R.Korea and Northeast of China, over the same period it's dropping in the Far-east of Russia., Japan and Mongolia. The EF value is lower still which was near 4 hm²/per capita until 2010, but with the rapid economical development the EF value will continue increase. Meanwhile, the huge population cause the total EF is quite larger even though the EF of per capita is lower level situation, so that how to save the natural resources and protecting eco-environment become more and more important duty for the government and the public.

The Simulation of Crop Productivity in the Guanzhong-Tianshui Economic Region Basing on the Remote Sensing Crop Model

Liu Y, Li J, Qin K, Yang X, Li T

Tourism and environmental college of Shaanxi Normal University, Shaanxi, 710000, P.R. China, lijing@snnu.edu.cn

Abstract

Food is the basis of our life and production and the Guanzhong-Tianshui economic region is one of the main grain producing areas in China. Therefore, exactly estimating the grain productivity is of great importance for government to work out proper grain policy. The winter wheat and summer maize are the main crops in the region. In this article we use the remote-sensing-photosynthesis-yield estimation for crops (RS-P-YEC) model to simulate the wheat and corn productivity in the research area from 2010 to 2015. For this purpose, a national-wide database (including land cover, leaf area index, meteorology data, and soil data) at a 1km resolution and a validation database were established. The model assumes a horizontally homogeneous, vertically laminar structure on a leaf and produces a multilayer-two-big-leaf model. The core of the model is to calculate the net primary productivity using and then to calculate yield by multiplying the net primary productivity (NPP) by the harvest index (HI). There are eight cities used to validate statistical productivity with the estimating results. As the result shows, Shang Lu City has the most productivity and Yang Ling City the least. And estimating yields shows satisfactory agreement with statistical ones (correlation coefficient 0.817, RMSE 671kg/hm², relative error 9.3 percent), which suggests that the RS-P-YEC model is suitable for crop estimation in the Guanzhong-Tianshui economic region.

Key words:

Winter wheat; Summer maize; Guanzhong-Tianshui economic region; RS-P-YEC model; NPP

Transition of Rural Settlements Productive Function: Analysis of Livelihood Strategies And Land Use Of Rural Settlements in Eastern China

Bailin Zhang¹, Fengrong Zhang², Weimin Cai¹

Abstract

Rural settlements are a multifunctional complex in China with a productive function of great importance. This paper explores the spatial-temporal transition of three rural settlements productive function (He Taoyuan, Da Wengshan and Gaoqiao) in Eastern China. The three rural settlements were all involved in agricultural production (first vegetable planting and then livestock breeding) after the founding of the People's Republic of China in 1949, and changed slowly over the years so that by the 21st century they evolved in different ways. Agricultural production (grain insolated and storage) was still dominant in He Taoyuan. Da Wengshan became an industrial-oriented settlement and Gaoqiao a commercial-oriented settlement. This is reflected in the transition of livelihood strategies of rural households and land use of rural settlements. Choice of rural households livelihood strategies affected by both livelihood assets and system, and policies for pure maximized benefits, are the causes that drove the spatial-temporal transition of the three rural settlements productive function. It is hoped that the research conclusions in this paper can provide references for governments across China to implement adjusted rural residential consolidation policies that will improve future production and quality of rural life.

An Estimation of the Extent of Cropland Abandonment in Mountainous Regions of China

Shengfa Li, Xiubin Li, Laixiang Sun, Guiying Cao

Institute of Geographic Sciences and Natural Resources Research, CAS, li_shengfa@126.com

Abstract

With the wages for migrant workers increasing dramatically in China since 2003, the size of agricultural labor forces has been shrinking quickly. The substitution of intensively use of agricultural machinery for the shrinking farm labor force is hardly possible for croplands in the mountainous regions of China where mechanization is difficult to achieve due to small field size and the rough terrain in these areas, which eventually has led to the abandonment of croplands in these regions. Considering the high pressure of food security in China with 1.3 billion populations, cropland abandonment in mountainous regions of China should not be ignored. This study aims at estimating the amount of recently abandoned croplands (period 2000-2010) and what changes can be expected in the future in China's mountainous areas by employing a novel method other than remote sensing technique. The results show that total extent of abandoned croplands in Chinese mountainous counties during the period 2000 to 2010 is estimated at 12.4 million hectare, which means that in total about 35% of croplands in mountainous counties was abandoned, including the croplands converted in the Grain for Green Programme. With three scenario assumptions, a sizeable extent of 10.9 to 11.9 million hectare of croplands may be abandoned during 2010 to 2030 with the rapidly decrease and aging of the projected farm labor forces. This could exacerbate the future challenges of maintaining China's food security. Substantial increase of investments in agricultural projects of land consolidation and agricultural productive fixed assets, especially micro-tillage machines could help to mitigate the risk of cropland abandonment. Additionally, the land-use and environmental policymaking should consider the fast expanding cropland abandonment in mountainous regions.

Abstract

The rapid urbanization in Asian developing countries over the past half century seems to have been followed by excessive of the urban population concentration in very large urban agglomerations which so called as megacities. The growth of megacities in Asia has led to various global problems and requires attention from global communities. Jakarta megacity has grown to become the second largest megacity in the world after Tokyo Megacity (RIHN, 2014), experiencing continuous growth and facing various problems that have not been obtained by other major cities in the world. One form of the urban expansion of Jakarta Megacity is the ongoing expansion along the main transport route linking Jakarta to the metropolitan Bandung within 120 km from Jakarta. The objectives of this study were to analyze (1) the tendency of urban physical expansion, as indicated by the land use/cover changes along 1978-2015, (2) the tendency of changes in the number and density of population along the Jakarta-Bandung corridor, and (3) describe some impacts of the Jakarta-Bandung conurbations to agriculture and environment. Spatial analysis was conducted by employing GIS and using Landsat imagery data. The conurbation has been accelerated after Cipularang highway road linking both cities and the establishment of new towns and industrial estates built by the private sectors along the corridors. The population densities along the corridor has grown much faster than population growth of its surrounding. Furthermore, it was followed by continuing paddy field conversion, declining of biodiversity and due to the declining of forest and agroforestry areas.

Abstract

Human benefits from multiple ecosystem services of wetland ecosystems, but massive wetlands disappeared due to human consumption. China is one of the hotspot regions of urbanization, and also a typical region of urban sprawl at cost of wetland losses. This study aimed to characterize the spatial-temporal pattern of urbanization-occupied wetland losses from 1990 to 2010 at national scale, using remote sensing datasets. Results indicate that there was 2883 km² of wetlands disappeared due to urbanization. The rate of wetland loss occupied by urbanization has been high between 2000 and 2010 (213.1 km²/yr), which was 2.8 times loss during 1990-2000 (75.2 km²/yr). Most of vanished wetlands caused by urbanization can be attributed to the expansion of urban built-up lands. Lakes and marsh are the primary wetland types lost to urban area. Around 2394 km² of wetlands disappeared due to urban sprawl were identified in the eastern regions. Considerable urbanization-triggered wetland losses were observed primarily in five identified hotspot areas, including the Liao River delta, Beijing-tianjin metropolitan region, Yangtze River delta, Jiangnan Plain, and Pearl River delta. In terms of increasing urbanization and industrialization trend, the expansion of urban built-up lands for middle-sized and small cities, the construction of industrial landscape in middle-sized and small cities, and denser traffic networks will strongly contribute to the wetland spoilage. Although great efforts were developed to protect wetland ecosystems, there would be new challenges for wetlands management, especially in preventing more wetlands occupation by urban expansion under new situation of rapid economic development.

City Lights. the Urbanisation Process in Spain as Shown by Night-Time Images of the Earth (1992-2012)

NEL·LO O, LÓPEZ J, MARTIN O.

Geography Department. Universitat Autònoma de Barcelona, Barcelona, Spain, oriol.nello@uab.cat

Abstract

The Spanish urban system has experienced significant transformations over the last two decades, affecting both the system's articulation and hierarchy, and the morphology of urban areas. The sources of information on land use, although increasingly precise and exhaustive, present some limitations when it comes to identifying and quantifying this development, most particularly because their sporadic character. In this context, the advances in the availability, precision, territorial coverage and recurrence of night-time satellite images offer new opportunities to assess the transformation of land uses. Under the assumption that there is a direct relationship between light emissions and the level of urbanisation, the present study identifies the development of the Spanish urban system between 1992 and 2012. In this respect, the level of brightness suggests that the transformation of land for urban uses has been much wider than the one assessed by using other sources, such as aerial photography or planning regulations. The contrast with these sources makes evident that, even if the suitability of night-time images is subjected to relevant limitations, they can be used with advantage in order to explain new patterns of land use. This is especially true when studying low density urban developments, such as those that have proliferated in Spain in recent decades.

Cultivated Land Use Transition during Rural-Urban Interaction in The Pearl River Delta, 1980s–2010

Xiaoqing Song¹, Zhifeng Wu¹, Jürgen Scheffran^{2,*}

¹Institute of Land Resources and Urban-Rural Planning, School of Geographical sciences, Guangzhou University, Guangzhou 510006, P. R. China, sonniasxq@163.com

²Institute of Geography, University of Hamburg, Hamburg, Germany

Abstract

Land use transition referring to shift of land use morphology between two qualitatively different states, focused on forest transition and rural housing land transition from the perspective of pattern analysis in the last two decades. Cultivated land use transition especially from the perspective of functional analysis, however, is currently a rather rudimentary and subjective issue. Forced by export-oriented economy model, urbanization has undergone a rapid period of development and has resulted in substantial rural changes in the Pearl River Delta. During the rural-urban interaction, cultivated land has experienced remarkable changes involving pattern and functional dimensions. The spatiotemporal changes of cultivated land use in this area were analyzed from the perspectives of pattern and functional analysis based on the research framework presented in this study using remote sensing images in 1980s, 1990, 2000, 2005 and 2010. Results of spatial metrics showed that cultivated land use pattern transition interpreted as shift of quantity change from accelerating to slowing down decline and shift from rapid fragmentation to concentrated scaled parcels occurred around 2005 at the delta level. Meanwhile, cultivated land use function developed from mono-functional state focusing on grain production to multifunctional state integrating food production with cultivated landscape supply and ecological regulating functions. Mutual feedback evolvement was found between cultivated land use pattern and function transitions resulting from rural out-migration, immigration and industrial upgrading during rural-urban interaction. Differences of cultivated land use transition modes and degrees, however, varied greatly amongst the nine cities of the delta. Cultivated land use transition analysis in this study provided implications for China to implement regional differentiated policies of multifunctional land management to overcome the dilemma of integrating food safety, urban expansion with ecological protection. We also proposed that land use function transition and its feedbacks on land use pattern transition should be emphasized in the future.

Abstract

The land-cover data obtained from the TM remote sensing images of 1990 as well as land-use map of 2005, 2011 were used in Turpan to set up a Markov model for predicting changes of land-cover. Given the accuracy of prediction in Markov model is closely relate to its simulated step, therefore, firstly, take 1990 as initial year to predict variant areas of land-cover on different classes in 2005, and found out the optimal simulated step by comparing the minimum difference between the simulate and actual areas of land-cover. Secondly, the changes of land-cover in 2011 was predicted by taking the optimal simulated step in Markov model, then analyzed the land use degree and land use space change dynamic analysis based on this. Results can be summarized as: (1) The areas of transform between unutilized land and grassland are enormous; (2) The cultivated land decrease quickly since 2005, which indicates that the contradiction between supplement and demand are being increased, and also means that the balance of the cultivated occupation and supplement has not implemented; (3) Nearly 6000 hectares of water was disappeared in 21 years which is largely probably associated with global warming; (4) Mainly due to the change of construction land and garden plot makes the land use degree increase year by year, it exhibits that the development of economy is an important factor which result in the changes of land cover; (5) Anthropoc factor is a major reason which leads to the changes of land-cover, people are taking more and more powerful means to affecting the land cover change. Therefore, some appropriate proposals are also offered according to the above results.

land cover; Markov model; land use degree; dynamic space change

European Land Monitoring – Recent Trends and 25-Year Data Analysis

Meiner, A

European Environment Agency, Copenhagen, 1050, Denmark, Andrus.Meiner@eea.europa.eu

Abstract

The Copernicus - The European Earth Observation Programme - comprises satellite-borne earth observation, in-situ data and a services component. Copernicus land monitoring service contains Global, pan-European, Local and In-situ components.

The pan-European component produces 5 high resolution (20 m pixel) data sets describing the main land cover characteristics as well as updates for the Corine land cover and change dataset (100 m raster, 44 land cover/land use classes, areal coverage ca 6 million km² of 39 countries in Europe).

Land cover change in Europe, based on Earth observation data has been already reported for the period 1990-2000 and 2000-2006 (EEA, 2005, 2010). A new reporting for 2006-2012 has become available in 2016. Re-analysis of 25 years data shows the slowing of annual general land turnover and reducing urban sprawl (area). However, share of arable land and permanent crops is still the predominant source for urban land uptake and its relative contribution has been steadily increasing (48% in period 2006-2012).

Integrated assessment of land resources puts the land take process in a number of contexts. One is soil protection, seeking to reduce detrimental impacts of soil sealing and loss of productive land. Another is degradation of terrestrial ecosystems and their ability to supply ecosystem services where land monitoring allows for better understanding of habitat change – one of the main drivers of biodiversity loss.

Next reference year for a pan-European component update is scheduled for 2018.

Key words:

Land monitoring; land cover change; urban land take; habitat change; Europe;

Expansion of Anthropogenic Land Covers during 1990-2014 in coastal zones of Liaoning Province of China

Li H.Y.^{1,2}, Li X.Y.^{1*}, Wang Z.M.², Jia M.M.².

¹ College of Earth Sciences, Jilin University, Changchun 130061 (China) lihuiyinghehe@163.com

² Northeast Institute of Geography and Agricultural Ecology, Chinese Academy of Sciences, Changchun, 130012 (China)

Abstract

Anthropogenic land cover (ALC) expansion is one of major drivers of regional environmental change in coastal zones. With increasing scientific and political interests in developed areas with fragile environments, there is strong impetus to better understand patterns, causes and environmental consequences of ALC expansion in the coastal zone of Liaoning province, China, one of areas with fast economic growth and high population density in the country. Satellite remote sensing images (Landsat TM, ETM+ and OLI) obtained from 1990 to 2014 were employed to detect anthropogenic land cover changes in the coastal zone of Liaoning Province. Based on multi-period land cover data, we analyzed the process of ALC expansion and investigated main drivers and regional implications of these changes. Our analyses documented 1317.2 km² growth of anthropogenic land covers, with industrial land having the largest scale expansion by 608.8 km². Dramatic aquaculture pond expansion (+565.4 km²), built-up land sprawl (+322.9 km²) and arable land decline (−270.1 km²) also characterized the changes of anthropogenic land covers of the study region. ALC changes differed markedly in 1990–2000 and 2000–2014: industrial land, aquaculture pond and built-up land expanded slowly during the first period, but grew rapidly in the second period. Arable land saw a small decline (−46 km²) during 1990–2000 but a considerable reduction (−224 km²) during the 2000–2014. Socioeconomic factors such as increasing population, booming economy, changing policies and globalization of market were the most significant factors driving ALC expansion in the coastal zone of Liaoning Province.

anthropogenic land cover expansion; coastal zone; remote sensing; human impact

Exploring Land Use/Land Cover Change as a Driving Force of Forest Fragmentation And Degradation For Song Watershed, India

Sahana, M, Ahmad, R, Sajjad, H

Department of Geography, Jamia Millia Islamia, haroon.geog@gmail.com

Abstract

This study attempts to assess forest fragmentation and degradation in response to land use/land cover changes in Song watershed, India during 1998-2014. Landsat TM and Landsat 8 OLI satellite data across two dates (1998 & 2014) were used to analyze land use/ land cover change and its impact on forest cover. The extent of forest degradation was analyzed using fragmentation model. Four categories of disturbance viz. core, perforated, edge and patch were obtained using 200 meters edge width. The result shows overall decrease of 7% in area under forest over 16 year. Area under open forest, mixed land use/land cover I (agriculture, forest & built up) and mixed land use/land cover III (agriculture & built up) has significantly increased while area under dense forest has decreased during the study period. Fragmentation model revealed lots of disturbance in forest located in mixed land use/land cover areas. Perforated and patch classes of forest have experienced a significant increase in their respective areas while core area has decreased at the expense of other fragmentation classes. Degradation of forest occurred at large scale at Hrishikesh and Thano forest ranges of Dehradun district and Gadol range in Tehri Garhwal district lying in the watershed. Rishikesh city in Dehradun district located in southern part of watershed recorded increase in patches due to developmental activities. Remote sensing and fragmentation model showed its effectiveness in analyzing forest degradation and monitoring the health of the forest in the watershed.

Land use/land cover; forest fragmentation; forest degradation; remote sensing; Song watershed

Land Cover and Landscape Diversity changes in two Model Vineyard Areas in the Male Karpaty Mountains (western Slovakia)

Hanusin J., Stefunkova D.

Institute of Geography Slovak Academy of Sciences, Bratislava, Slovak Republic, Institute of Landscape Ecology Slovak Academy of Sciences, Bratislava, Slovak Republic, hanusin@savba.sk

Abstract

Land cover (LC) and landscape diversity (LD) changes have been assessed in two model areas of the prevailing viticultural landscape in a part of the Svatý Jur and Modra cadastres (Male Karpaty Mts., western Slovakia) for the years 1896, 1949 and 2015. In both areas we analysed LC changes in large scale. The main trends of LC changes were identified by an overlay of LC maps from each analysed year. The model areas (sized 66 and 88 ha respectively) were divided into a grid (25x25 m) and LD values were evaluated for all cells for all years. The Shannon landscape diversity index was applied as the LD metric. Both LC and LD changes were more pronounced during the 1949 – 2015 period comparing to the 1896 – 1949 period in both areas. In LC pattern distinct decrease of vineyards was observed between 1949 and 2015. During the collectivisation process in the 1950s and 1960s traditional, prevailing non-terraced vineyards were mostly transformed into modern terraced vineyards in both areas. Increase of forest, grasslands and built up areas were also typical LC changes during the 1949 – 2015 period. LD rose during the 1949 – 2015 period in both model areas. The main driving force of this process was the dissection of homogenous smooth vineyard slopes into terraces which led to the increase of patches and the edge length and resulted in a higher LD. Presented methods enable the assessment trends in LC changes, a fine-scale LD evaluation and may contribute to the efficient landscape management.

Land Use Change, Agricultural Transformation and Soliga Communities: A case study from Southern India

Swaminathan. D. R.

Center for Development Research, University of Bonn, Bonn, Germany, divyarajeswari@gmail.com

Abstract

Many forests areas in India are inhabited by indigenous communities. The government has introduced policies and programs to improve their situation, however, with limited success. Indigenous communities living in forest use forest as a source for resources for their sustenance and livelihood. Indigenous communities apply a combination of multiple land-use systems such as agriculture, agro-forestry, forestry, and pasture. However, many indigenous communities are at the lower end of the social and economic order in India and do not have political decision-making power nor control over the land they use, particularly the forested areas. Most forests are under control of local governments and the lack of secure and proper land tenure rights makes it difficult for indigenous communities to adapt sustainable land management and livelihood systems. The research focuses on “how agricultural transformation and designation of Protected Areas impact on the land uses and livelihoods of the Soliga communities living in and around the Male Mahadeshwara and Sathyamangalam Wild Life Sanctuaries in Southern India?”. Qualitative participatory appraisals have been used to derive narratives of the past and existing situations using semi-structured interviews, oral histories and participant observations apart from a literature review and GIS mapping of landuse resources in the study area. The main outcome of the research has been to understand the agricultural transformation processes and the drivers of land use changes of the indigenous Soliga communities and to recommend for more sustainable land use policies and implementation that better reflects the needs and concerns of the Soliga communities.

Landscape Transition after the Collapse of Communism: Case Study Czechia

Lucie Kupková, Ivan Bičík

Charles University in Prague, Faculty of Science, The Czech Republic, lucie.kupkova@gmail.com

Abstract

The paper deals with landscape transition after the collapse of Communism in Czechia on national and local levels. The main trends of landscape transition on the national level (by cadastral units) in the period 1990–2010 are introduced. The indicators like Processes of landscape change (afforestation, grassing over, intensification, and urbanization), Index of change (the proportion of area where any kind of land use change occurred) and others are used. Two main processes were examined also on the local level, i.e. by parcels. These are trends of Extensification (shift to less intensive use of land, increase of forests and grasslands) and Suburbanization. The case study of Jirny showed strong suburbanization - fertile agricultural land has been turned into residential and commercial areas, roads; soil sealing was taking place. On the contrary, grassing over and afforestation was detected in Hošťka where arable land almost disappeared – it was either abandoned or replaced mainly by pastures between 1990 and 2010.

Abstract

Human activities affected around 100 M km² of the ice-free land surface leaving. Of this, 18–29% of the land surface has been deliberately converted for agriculture, infrastructure and urban use. There is a strong impetus to better understand spatial pattern of China's anthropogenic land cover (ALC) because china has the largest population and the fastest-growing major economy in the world. In this study we performed a satellite supported survey based on the China Land Cover Database (ChinaCover). We regrouped six land cover types (tree/shrub orchard, human-made wetland, arable land, urban land, rural settlement and mining field) into anthropogenic land cover, according to the Habitats Classification Scheme developed by the International Union for Conservation of Nature and Natural Resources (IUCN). Results indicated that, in 2010, ALC covered 21.7% of the nation's total area and ALC made up more than 80% in coastal provinces. The Hu Line masking a striking difference in the distribution of China's population also divided China into two parts: eastern part with higher ALC percentage and western part with lower ALC ratio. At the provincial level, area ratio of ALC significantly increased with population density and GDP density ($p < 0.05$).

Abstract

This paper analyzed the dynamic spatial pattern, process and mechanism of urban-rural land use transition using land use updating investigation data of 59 villages in Xuanhua district, Hebei province between 1996 and 2012. The results showed that industrialization and urbanization were the basic driving power of urban-rural land use transformation (URLUT). All villages and the Downtown showed significant spatial heterogeneity and positive spatial autocorrelation. Urban rural land use transformation index (URLUTI) linearly decreased when increasing distance to the centroid of the Downtown (DCD). During 4 periods in 1996, 2000, 2005 and 2012, URLUTI increased in central areas and decreased in edge regions, and the gap between core areas and edge areas was accelerating. Moreover, spatial autocorrelation of URLUTI presented accelerating trend and spatial clustering showed periodical change that truing from decentralization to centralization then to decentralization.

Study on Conflict Mechanism and Optimization Strategy of Land Use System in the Desertification Area

Q. Li, X. Q. Wu*, M. M. Wang, L. Wan, R. Wu and Y. S. Li

Beijing Forestry University, Beijing, 100083, P. R. China, wuxq@bjfu.edu.cn

Abstract

With the urbanization gradually shifting to the middle and the west of China, and the implementation of ecological restoration projects in recent years, land use conflict types and stakeholders are experiencing changes. Some regions have undergone conflict intensification. But, this problem has not been paid much attention. To ease land use conflict and realize the efficient use of land in the desertification area, taking Yanchi County of Ningxia Province as typical region of desertification, with the idea of “Identification-Mechanism-Evaluation-Strategy”, following researches are carried out: (1) Combining multi-temporal land use data with stakeholders investigation data to identify land use conflict type, content and subject and to reveal the generation mechanism and the evolution of conflict; (2) Constructing an evaluation index system based on land competitiveness to detect the potential land use conflict; (3) coordinating and resolving conflicts among stakeholders based on the CLUE-S model, with the aim of optimizing the layout of land system which the overall benefit of production, ecology and development is maximized. This research is not only a breakthrough in methods on related issues, but also has practical significance in maintaining ecological safety and sustainable development of the society and economy in desertification area.

Study on Land Use Pattern and Vulnerability of Agro-Forestry Ecotone of Northeast China

LIU Tingxiang, ZHANG Shuwen, YU Lingxue

Northeast Institute of Geography and Agroecology, Chinese Academy of Sciences, Changchun, 130102, P.R. China,

liutingxiang@iga.ac.cn

Abstract

Northeast China is the most important agricultural base and forestry base in China. The agro-forestry ecotone was formed due to the expansion of agricultural land and clear cutting of forest, which distributed between the agricultural region and forestry region. The spatial distribution of agro-forestry ecotone was resulted from geographical environment and agricultural development driven. At present, the agro-forestry ecotone in Northeast China has been basically stable, but the vulnerability of agricultural land in agro-forestry ecotone was becoming significant gradually, which was the loss of soil and water caused by the increase of slope mainly. Taking the Northeast China as an example, this paper extracted the spatial distribution of agro-forestry ecotone based on the land use data and moving window analysis method. The agro-forestry ecotone was classified into two types, edge and inner ecotone. Based on the different spatial scale of these two types, appropriate threshold was selected to extract the corresponding spatial distribution. The spatial and temporal change of agro-forestry ecotone in the past 40 years was analyzed based on land use data of 1975 and 2015. For the vulnerability of agricultural land of agro-forestry ecotone, Revised Universal Soil Loss Equation (RUSLE) and Agro-ecological Zone (AEZ) model were used to study the key limiting effect of slope gradient on the development of agricultural land. The results showed that, although with less area and shorter farming time, the soil erosion was more serious and the output was less in agricultural land of agro-forestry ecotone, indicating significant vulnerability.

Time and Space Differences of Shandong Urban Land Economic Density Analysis

Zou,HX

Shandong Normal University, Jinan,250013, P. R. China,1142692391@qq.com

Abstract

Land economic density is the measure of land use efficiency, an important index of city's economic development. Through the analysis of the land economic density characteristics of time and space, can in order to speed up the regional development, improve the level of regional economy. This article, based on the land of 17 cities in Shandong province economic density data, using the coefficient of variation and the relative development rate analysis method, to 2004-2013 in Shandong province the regional differences of land economic density characteristics and dynamic evolution pattern has carried on the preliminary exploration. The results show that: (1) from city to city in Shandong province's land economic density are present for the rising trend. (2) economic density had higher city land, the land in relative economic development speed is faster, the urban land economic density with different relative growth rate. (3) the growth pole of Jinan and Qingdao effect significantly, drive around the city's economic benefit. (4) the main factors influencing urban land economic density, including city size, urban economy development level, urban land investment, investment in science and technology city, urban traffic, urban industrial structure and so on seven aspects.

Abstract

Land use changes are complex processes affected by both natural and human-induced driving factors. This study demonstrates a combined logistic regression (LR)-Markov chain (MC)-cellular automaton (CA) model when coupled with spatial pattern analysis, is well suitable to analyze temporal change and spatial distribution of land use stressed by environmental and socio-economic factors in Poyang Lake District, China. Firstly, area change and spatial distribution of land use are calculated using GIS technology, and then the logistic evaluation procedure with the specific environmental and socio-economic data is used to identify the driving force and to generate the transition potential maps. Meanwhile, the transition among different land use types is analyzed to obtain the transformation matrices during a period of 2005–2010. Secondly, using the transition potential maps and transition matrices, a cellular automata model is established to simulate spatial distribution of land use in 2010. Finally, the future land use changes during the period of 2015 are forecasted and evaluated by integrating the cellular automata model and the spatial pattern metrics. As a result, in the three zones of Poyang Lake District, the transformation tendency of land use types from 2010 to 2015 appeared an unbalanced tendency of unidirectional-transformation. The study is anticipated to provide an improved understanding of spatial and temporal variations of land use changes and an option to demonstrate land management scenarios for better balancing land use and water environmental conservation.

Analysis of Cold-Hot Pattern of Urban Spatial Expansion Based on Minimum Cumulative Resistance Model: A Case Study of Suzhou-Wuxi-Changzhou Area

YANG Shan

School of Geography Science, Nanjing Normal University, Nanjing 210023, Jiangsu, China; Department of Geography and Environmental Studies, Ryerson University, Toronto, Canada

Abstract

Urban expansion is a procedure that different cities compete to control the space, competing and controlling usually achieved by overcoming resistance. In this paper, We introduce least resistance model (MCR ') which can reflect the multi-center character of a region to simulate the urban expansion in SXC area, combined with Spatial Correlation Index (Getis-Ord G_i^*). The evolution pattern of urban expansion has been quantitatively revealed. The results show that: Integrated resistance surface can reflect comprehensively the resistance for the urban expansion and indicates spatial trends in the urban expansion, and it has some instructive significance in forecasting the land layout of urban construction. In spite of cold-hot pattern, Simulation results of "hot-spots" showing a significant spatial evolution and transition characteristics. Under the thrust-resistance strength, "hot-spots" cluster structure form change from the Circle to the Group-spread. After that, Four different axis line were selected, Shanghai-Nanjing line/along the Yangtze River/along the Shanghai, and the axis alone Taihu Lake. Cold-hot analysis shows that every axis of the four districts have completely different spatial differentiation: Nanjing Shanghai axis has evident stretching expansion trend; Yangtze River axis act as low-density lateral spread; Shanghai alongside area has concentrated and long-lasting urban expansion area; Taihu Lake's limited room suffer greater e pressure. Therefore, different spatial strategy should be proposed, Such as strengthening the opening area between cities, leading the building area transfer to senior subordinated axis, which can build the network of urban space to achieve an orderly and vertical polymerization regional spatial organization.

Abstract

In 2002, 2007 Landsat 5 images and 2013 Landsat 8 images as data sources, By ENVI and ArcGIS basic for remote sensing image processing and extract the sample point soil reflectance salt index, Analysis of 12 years of Liuchengzi reservoir downstream soil salinization spatial-temporal variation characteristics, results show that: ①From 2002 to 2013, the average soil reflectance increases year by year 2013 (0.206) > 2007 (0.164) (0.183) > 2002; ②Within 0 ~ 1200 m soil SI_1 showed 2013 > 2007 > 2002, but in 1200 ~ 2400 m range is small, in each of the salinization tends to be stable; ③2002, 2007, 2013, SI_1 has strong spatial correlation and spatial autocorrelation change scale increases year by year, suggests that regional factors (groundwater) impact on the spatial variation of soil salinization growing and expanding downstream; ④During the study period, due to the increase in reservoirs (capacity of $4 \times 10^6 \text{ m}^3$ by 2002, 2007 after expansion is $6 \times 10^6 \text{ m}^3$), reservoir's impact on downstream soil salinization, leads to the salinization degree aggravate gradually. The soil area of mild and moderate salinization was reduced by 69.44% and 37.57% respectively, while the heavier and severe salinization was increased by 722589.71 m^2 and 1941395.51 m^2 respectively. The situation of soil salinization of Reservoir downstream tends to deteriorate, and the situation is not optimistic.

Analysis on The Evolution of Urban Space form Under the Influence of the Rapid Construction of the Development Zone: A Case Study of Suzhou City

Gong Fu-Hau

School of Geography Science, Nanjing Normal University, Nanjing 210023, Jiangsu, China, 742578612@qq.com

Abstract

Development zone is an important part of the urban construction after our country's reform and opening up, which has a significant impact on urban development and form change. In Suzhou City, Based on the remote sensing image data of 7 phases of 1984-2013, Firstly, extracting the urban construction land with ARCGIS tool, combing the history of the fast development of development zone, then using morphological index to analyze the characteristics and evolution of the urban space, Furthermore, demonstrating the unique role of development zone in the urban space form in different time periods. The results show that: 1) Among thirty years, the construction of the development zone of Suzhou city has a great contribution to the urban space expansion., which greatly influences the area expansion and intensity of the urban area, resulting in significant difference expansion of urban space; 2)The construction of the development zone makes the Suzhou city from the initial single center expansion of space form to the formation of the large urban core shaft complete space structure;3)The impact of development zone in Suzhou city morphological is divided into three stages: low level fluctuation, mutation conversion and high level stable, Each phase of the urban form of the compact and fractal dimension not only reflects the impact of the Development Zone Construction on the urban form, but also shows the development of the Development Zone land use status.. According to the impact of the Development Zone on the shape of the process, the urban planning should be scientific and reasonable layout of the development zone and control development zone size and timely order, to improve the stability of urban form and compact and make urban land intensive.

Abstract

Oasis evolution affects various aspects of arid zone, such as hydrological process, ecological condition, and micro-climate. In this paper, the spatio-temporal evolution of the cultivated oases over the past 2000 years of the Heihe River basin, a typical arid region in China, was assessed using historical documents, ancient sites, maps and remote sensed images. It showed that the large-scale of oasis development was launched in Western Han Dynasty, and then it reduced gradually from Six Dynasties and reached the minimum in Song-Yuan. An abrupt revival occurred from Ming and continued in Qing Dynasty, and to the Republic of China, it reached the peak of the whole historical period. The areas of seven major historical periods, i.e., Han, Six Dynasties, Sui-Tang, Song-Yuan, Ming, Qing, and Republic of China are about 170,274 hm², 111,462 hm², 62,910 hm², 61,432 hm², 96,355 hm², 120,489 hm² and 191,717 hm² respectively. The spatial distribution displayed a trend that the oases moved gradually from downstream to middle even upper stream, in addition to continuous sprawl process. The oases along the main river developed stably in most of the period, while those close to the terminal reaches are susceptible to frequent variation, even being abandoned after initial explorations. Various socio-economic factors are the main factors of oasis evolution and among them the regime stability and military necessity are the fundamental determinants.

Change Patterns of Agricultural Productivity Influenced by Land Consolidation : Evaluation and Prediction

Fan Y T, Jin X B, Xiang X M, Yang X H, Huang X F, Zhou Y K

School of Geographic and Oceanographic Sciences, Nanjing University, Nanjing, 210023, P. R. China,

dg1527012@smail.nju.edu.cn

Abstract

Since 2006, the focuses of land consolidation (LC) in China have been shifted from requisition-compensation balance on farmland to stabilizing and improving the quantity and the quality of national farmland. It is critical to make a comprehensive evaluation on change patterns of agricultural productivity influenced by LC. Based on MODIS NDVI data from 2001 to 2013 and taking 4442 LC projects from 2006 to 2010 as training set, we extracted four parameters as indexes i.e., the level of productivity (PL), the variation of productivity (PV), the potential of productivity (PP) and multiple cropping index(MI). A Support Vector Machine (SVM) model was established to predict change patterns of agricultural productivity in 3603 LC projects implemented between 2011 and 2013. The results are as follows: (1) SVM model is capable of predicting the change of indexes, especially for binary value in this study. The prediction accuracy of PL, PV, PP and MI were 74.32%, 77.33%, 55.68% and 70.21% respectively. (2) During 2011-2013, LC played a positive role in improving agricultural productivity i.e., the positivity proportion effect on PL, PV, PP and MI were 88.18%, 66.41%, 81.55% and 3.59% respectively. (3) The change patterns have significant spatial variation. The regions with significant effectiveness of productivity improving are concentrated on the middle reaches of the Yangtze River plain, hilly region of south Yangtze River, Chiang-nan Hilly Region and Nanlin Hilly Region.

Changes in the extent of surface mining in the Northeast Qinghai-Tibet Plateau by using a 1975-2015 Landsat time series

D W Qian, C Z Yan, L N Xiu

Key Laboratory of Desert and Desertification, Cold and Arid Regions Environmental and Engineering Research Institute, Chinese Academy of Sciences, Lanzhou 730000, P. R. China, qiantawen15@mails.ucas.ac.cn

Abstract

Qinghai-Tibet Plateau has been an ideal place for global research: it is very sensitive and vulnerable to the global change. Land use and land cover change are one of the key topics in the global change research. In recent years, Qinghai-Tibet Plateau has experienced profound land use changes due to the increasing human activities, such as artificial surface sprawl, especially in the north-eastern part. Some studies have been conducted on this theme in this region. However, few are focused on the mine development in different period. In this study, we used Landsat imagery from 1975-2015 to monitor the extent changes of surface mining in the Northeast Qinghai-Tibet Plateau, and employed spatial activity degree and disturbance degree to analyse the activity level and the disturbance level of mining areas. Besides, the cumulative damage degree of each mining regions were mapped. The results showed that, the area of all mining regions showed a growth trend after 2000, in which the mining region A and mining region B were significantly larger than the others. Spatial activity degree experienced a process of "increased then decreased" in most mining regions, especially after 2010 while disturbance degree increased in mining region A, B and F and decreased in mining region C, D and F. In addition to mining region A, spatial distribution of cumulative damage degree was shown a "ring" distribution characteristic, namely the severity of damage increased from outside to inside.

Key words:

surface mining; land use change; remote sensing; landscape pattern

Determining and Estimating Impacts of Farmland Consolidation Projects on the

Regional Carbon Effects

Shan Wei, Jin Xiaobin, Zhang Shu, Zhou Yinkang

School of Geographic and Oceanographic Sciences, Nanjing University, Nanjing 210093, China

Abstract

As a practice relying on engineering measures, farmland consolidation has an important influence on land use such as altering its structures and patterns. Farmland consolidation projects also exert significant effects on regional carbon balances. Here, we analyzed the carbon effect from three aspects: the carbon effect of engineering construction, land structure and land use patterns. We calculated comprehensive carbon effects in the case of farmland consolidation projects in Yixing City, Jiangsu, China. We found that farmland consolidation increased regional carbon sinks, carbon storage increased by 3 718t, but it also remarkably increased carbon emissions. Carbon emissions increased by 6 830t because of engineering construction, and the annual carbon sink increased by 5459t. Farmland carbon stocks increased by 11071t, among which the increase in farmland was a main factor. The increment of soil carbon storage accounted for 87.21% of the total carbon storage increment. Irrigation and drainage engineering were the main reasons affecting carbon emissions, accounting for 70.96% of total carbon emissions during engineering construction. The consumption of construction materials such as cement, steel and diesel were major sources of carbon emissions. The construction of shelterbelts had significant effects on the result. The annual carbon sink increased by 23.64% because of the increased acreage of arable land and improvements in agricultural irrigation.

land consolidation; farmland consolidation; carbon effects; carbon accounting

Ecological Risk Assessment of the Coastal Area of Yancheng, China

He H.Ch,Zhou R.J, Zhang Y.Zh

School of Geographic and Oceanographic Sciences, Nanjing University, Nanjing, 210046, P. R. China,hhc@nju.edu.cn

Abstract

Changes in land use and land cover were pervasive in the coastal area over past decades in China that affect key aspects of Earth System functioning. Tracking the land use change in the coastal area of Yancheng during 2000 to 2010, based on remote sensing imageries and land use dataset with the support of GIS and RS technologies, we quantify the land use changes and landscape structure using Geostatistical Analyst and Spatial Autocorrelation Analysis. An ecological risk assessment model has been set up to evaluate the local ecological risk in spatial distribution and temporal evolution. The average ecological risk value of the whole region was 0.35 in 2000, and increased to 0.36 in 2005, then continuously rose up to 0.39 in 2010. In this study area, the region with a moderate ecological risk level is dominant. The area with extremely low risk or low ecological risk mainly located on the west side of the coastal zone with no apparent change. The regions of high risk and extremely high risk increased significantly from the proportion of 0 in 2000 to 14.89% in 2010, which mainly distributed in coastal zone of Sheyang, Dongtai and Dafeng. The spatial pattern of ecological risk showed a tile structure clearly and the degree of ecological risk increased from West to East. With the economic booming, especially the harbor industry and urbanization in the coastal area, the great changes of land use will promote the ecological risk continuously.

Landscape structure; land use changes; ecological risk assessment; coastal area; Yancheng city

Ecological Risk Pattern of Poyang Lake Basin Based On Land Use

Xu Yu, Feng Xinhua, Zhong Yexi, Xu Liting, Zheng Lin

School of Geography and Environment, Jiangxi Normal University, Nanchang 330022, P. R. China; zhongyexi@126.com

Abstract

In order to explore the impact of land use change on ecological risk, the characteristics of land use changes in Poyang Lake basin were analyzed quantitatively based on land use data during 2005-2013. The spatial-temporal variation of the ecological risk in study area were explored by means of spatial autocorrelation, geostatistics and standard deviation ellipse. The results were as follows: the land use changes showed a remarkable trend of non-agricultural transformation. The average ecological risk index (ERI) increased from 0.237 in 2005 to 0.246 in 2013. The spatial distribution ERI showed a positive autocorrelation and significant local spatial clustering pattern, and the spatial disparity of ERI was obvious, with the north higher than the south. According to the result of spatial interpolation of ERI, the study area can be further divided into five types of area: lowest ERI area ($ERI < 0.15$), lower ERI area ($0.15 \leq ERI < 0.25$), medium ERI area ($0.25 \leq ERI < 0.35$), higher ERI area ($0.35 \leq ERI < 0.45$), highest ERI area ($ERI \geq 0.45$). The spatial distribution of ERI grade was significantly related to topographic features, with the ERI grade increase, the distribution area of ERI showed an obvious topographic directivity.

Key words:

ecological risk; land use; Poyang Lake basin

Evaluation Method: Carrying Capacity of Land Ecological Environment Based on “Two-oriented Society” in Central China

Changchun Feng^{1,2} Xueping Liu^{1,2}

¹ College of Urban and Environmental Sciences, Peking University, Beijing 100871, China, liuxp@pku.edu.cn;

² Laboratory for Land planning and development

Abstract

Keywords: landuse planning, carrying capacity of land ecological environment, two-oriented society, Central China, Xiangjiang New Area, evaluation indicators.

“Two-oriented society” refers to a resource-conserving and environment-friendly society, especially the social formation featured by harmony between man and nature, and sustainable economic and social development. In Central China where the economy is developed and there is a large population yet less land, land resources are very scarce and thus resources compete with the environment, resulting in declining ecological environment. The carrying capacity of ecological environment evaluation system, which is built based on the concept of “two-oriented society”, can be divided into four layers, namely the support, pressure, state and response, or S-P-S-R, with the natural resource endowments of the region as the support indicator, human and natural impact on ecological environment as the pressure indicator, environmental quality of the region as the state indicator, and ecological protection and control as the response indicator. Xiangjiang New Area, the study area of this paper, is located in Changsha of Hunan Province, being the first state-level new area set up in Central China, a new urbanization demonstration area that integrates industry and city development and urban-rural development, and a typical area for studying the land use in Central China. According to the characteristics of the study area, this paper selects indicators that evaluate the ecological carrying capacity of land, forms the data acquisition method, and collects satellite remote sensing imagery and geographic information, before evaluating the ecological carrying capacity of land using the indicator system established. The results show the overall carrying capacity of land ecological environment in Xiangjiang New Area declined gradually between 2000 and 2014, with the rate of decline becoming slower; as for spatial distribution of carrying capacity in Xiangjiang New Area, land in the eastern region has a lower carrying capacity, followed by that in the western region, while that in the central region, which is the conservation area of the entire ecological environment and should be the protected and rationally utilized due to annular distribution of ecological environment along the landscape, has relatively higher the carrying

capacity. This conclusion provides a scientific basis for further spatial planning of land use and planning of rational use of land resources. Thus it can be seen that the “two-oriented society”-based evaluation of land’s ecological environment carrying capacity can provide a useful reference for landuse planning in Central China under the context of constructing a “two-oriented society”.

landuse planning; carrying capacity of land ecological environment; two-oriented society; Central China; Xiangjiang New Area; evaluation indicators

Explore and Analyse the Problems on High-standard Farmland Construction in Hilly Area: A Case Study in Chongqing

Ligen, Yang Qingyuan

Southwest University, Chongqing, 400715, P. R. China, lg666758@163.com

Abstract

High-standard basic farmland project is one of the most important projects for the construction of modernized agriculture in our country, which is also of a great strategic significance for national food security. Therefore, a good quality of the project is accordingly of grave importance. This paper took Chongqing as an example to research the quality problems in high-standard basic farmland projects, which consists of land leveling engineering, Irrigation and drainage engineering, field road projects as well as their appurtenances. There are several methodologies included in this thesis, such as field investigation and case analysis. Through the research, the author found that the factors that result in a dissatisfying engineering quality are chiefly as follows: impractical planning, lack of construction standards, backward construction technology, poor supervision and administration, lack of maintenance, sick public participation mechanism. By taking Chongqing as a typical representative, the quality problems existing in the construction of high-standard basic farmland project are analyzed on the basis of reliable cases, as a result, this paper is expected to provide reference to improve construction quality in the construction of basic farmland in hilly areas.

Impacts of Greenhouse Tillage on Soil Properties in Tibetan Plateau -A Case Study in Lhasa Area

Zhaofeng Wang, Alfred Hartemink, Yili Zhang

Institute of Geographic Sciences and Natural Resources Research, CAS, China, wangzf@igsnrr.ac.cn

Abstract

This study investigated the soil environments in some agricultural greenhouses in Lhasa area on the Tibetan Plateau, and compared them to the farmland soils outside of these greenhouses. In total 92 topsoil (0-10 cm depth) samples including 54 samples in greenhouses and 38 samples in farmland were taken, and soil pH, total salt, electrical conductivity (EC), soil organic matter (SOM), total nitrogen (N), available phosphorus (P) and available potassium (K) were measured. The results indicated: agricultural greenhouses operation has caused the soil acidification, salinization, nutrient imbalance in Lhasa area. Compared to the normal farmland near greenhouses, the average pH decreased by 1.0 unit in greenhouses soil, average total salt increased 82%, and available P increased 1.6 times. Soil organic matter and total nitrogen increased too, and the available K changed slightly. In addition, these soil indexes changed with operational time and vegetable types. The pH kept decreasing with the operational time increasing, and other soil properties indexes reached their maximum value at 9 operational years. The impacts of leaf vegetables planting were relatively slight, and the impacts of fruit vegetables planting were more serious. Compared to other areas in China, the effects of greenhouses in the study area was relative slighter; even so, these effects should be paid more attention for the environment is very sensitive in plateau. These effects mainly due to the chemical fertilizer and irrigation water overuse; the precision agriculture might be an optimum pattern in Lhasa area.

Influence of Urban Land Intensive Utilization on Livability

Bing GENG, Meichen FU

China University of Geosciences (Beijing), Beijing, 100083, P. R. China, gengbing@cugb.edu.cn

Abstract

With the increasing expansion of construction land use, Beijing is under various influences during the social development. In order to study the intricate relations between intensive urban land use pattern and urban livability, in this paper we build a livable and intensive land use dynamic model to seek a new way of urban land use which not only efficiency but sustainability and livability. The model adopts the dynamic system method to analyze the quantitative relationships between the population, economy, ecological environment, residential environment and urban land use. Simulate the intensity of urban land use changes from 1996 to 2014 and predict the tendency from 2015 to 2100 combining with the currency livability. The results illustrate that the intensity of urban land use positive correlates with livability during the early urban development, but will appear the negative correlations after reach a certain level. The maximum value of Beijing constructive land use intensity will appear from around 2020 to 2600 under the current social environment, but the livability level appears low during that period. The research suggests that the livability should be taken into account as a very important influence factor to the land use intensity. And population and constructive land use area should be controlled for ensuring the intensity and livability of Beijing.

Land use prediction based on CLUE-S model under different non-spatial simulation methods: A case study of Qinhuai river watershedBIAN Zi-Hao¹, MA Xiao-Xue¹, GONG Lai-Cun², ZENG Chun-Fen¹, WANG La-Chun^{1,*}¹ School of Geography and Oceanography Sciences, Nanjing University, Nanjing, 210023, China;² Nanjing sub-bureau of Jiangsu Province Hydrology and Water Resources Investigation Bureau, Nanjing, 210008, China, bianzihao@126.com**Abstract**

As the land use plays a more and more important role in the future regional planning and city development, it is very important to choose the suitable method to simulate the land use. Under the background of rapid urbanization in Qinhuai river watershed, we choose CLUE -S model to simulate the land use situation of it in 2020. We used linear regression model, Markov model and the gray GM (1, 1) model respectively to predict the demand for land use which is needed by the non-spatial module of CLUE-S model, then we compared the three forecast results. Two Prediction scenarios were established, one is "natural development" scenario where land use will change according to historical trend and the other is "optimization" scenario which considered the effects of planning policy. We simulated Qinhuai river watershed land use pattern in 2020 under different scenarios, and analyze the landscape pattern of it. The results showed that the rapid urbanization is the important reason of the land use change in Qinhuai river watershed; There exist difference between the predict results of three kinds of land use demand forecasting model, but they all meet the requirement of model accuracy; under the "optimization" scenario, the land use condition can meet the requirement of protection of basic farmland and ecological land, increasing infiltration capacity of rainwater, and alleviating the urban heat island effect, which provide the reference for land use planning in the future.

Landscape Pattern Change and its Effects on Soil Organic Carbon Pool in Qinghai Lake Watershed

Baoliang Lu¹, Kelong Chen², Jianping Wang¹

¹Qinghai Institute of Salt Lake, Chinese Academy of Sciences, Xining, 810008, P. R. China. bllu@isl.ac.cn

²Qinghai Normal University, Xining, 810008, P. R. China.

Abstract

The variation of soil carbon content caused by the Landscape pattern changes is one of the most important factors affecting carbon cycle of terrestrial ecosystem, which is also second significant human activity behind the burning of fossil fuels in increasing concentrations of greenhouse gases in the atmosphere. The soil in Qinghai lake watershed has a great potential in greenhouse gases emissions because of the unique geographical environment it immerse. However, there is huge research gap in terms of the change of the underlaying surface in this region and its effects on soil organic carbon. In this paper, based on the 3 sets of (1987, 2000, 2010) TM image in Qinghai lake watershed, we divided landscape into 16 types through artificial interpretation. Based on the census data and 163 soil profile data collecting in 2010, we determined the content of soil organic carbon density and its distribution features in 9 kinds of landscape. The results illustrate that the amount of soil organic carbon pool of Qinghai lake basin is about 0.296Pg in 2010. The landscape pattern from 1987 to 2010 has significantly changed in Qinghai lake watershed, the area of 7 types of landscape has increased, and the area of 9 types of landscape has reduced. From 1987 to 2010 the index of landscape fragmentation mainly showed an increasing trend with the results of enhancement of landscape heterogeneity. According to the research, the landscape changes in Qinghai lake basin has led to 8.63×10^5 t carbons loss during the research period.

Study on Hydrological Regime Changes during the past 50 years in Kuye River

Jiang Xiao-hui¹, Gu Xiao-wei²

¹ College of Urban and Environmental Sciences, Northwest University, Xi'an 710127, P. R.China, ²Institute of hydraulic research, YRCC, Zhengzhou 450003, P. R.China, jxh3412@163.com

Abstract

Base on the data about hydrology, meteorology, water and soil conservation and exploitation of mineral resources in Kuye River, analyze the trend changes of runoff, rainfall and the relationship of rainstorm and flood in Kuye River, and established SIMHYD Model to quantitative simulate the effect of climate change and human activities. The results show that: since the 1980s, the trend of runoff has reduced significantly, especially since the beginning of this century, runoff dropped shaply; the impact of human activities on the Hydrological regime is becoming more significant, increased from 52.5% to 89.9% from 1980~1990 to 1997~2006. Soil and water conservation is the main reason from 1980 to 1996, however, coal mining is the dominant factor to reduce runoff.

The analysis of Scale Management and Intensive Cultivated Land Use: Spatial-temporal Disparity and Their Relationship

Gao Shan, Jin Gaofeng

Jiangsu Academy of Social Sciences, Nanjing 210013, P.R.China, shgao724@163.com

Abstract

With the progressive development of land institution reform and rural management system, China's scale management enters into a new stage, and its relation with the agricultural land use becomes closer and closer. It is one of the scientific problems to explore the key factors and effect of the intensive arable land use change from the perspective of scale management. This paper takes the precise recognition of the influencing mechanism of scale management on intensive cultivated land use as a basis, and employs the dynamic principal components analysis to discuss the spatial-temporal disparity of scale management and intensive cultivated land use during the period from 2011 to 2015. Moreover, spatial panel econometrics model is used to reveal the relationship between these two variables by employing the panel data on 24 provinces of China during the period 2011-2015. Major conclusions can be drawn as follows: (1) Scale management brings remarkable and positive influence on intensive cultivated land use. (2) The performances of relationship between scale management and intensive cultivated land use are various in eastern, central, western China. The spatial-temporal evolution trend reveals that these two variables show a more apparent similarity and synchronization of cluster evolution trend. Therefore, it is necessary to perfect the process of scale management, which is helpful to optimize rural land use structure as well as to enhance the rural household's income.

The Identification of Importance Ecological Land Uses And Ecological Protection in the Area of Yan-Long-Tu

Li Mingyu*, Tian Fenghao, Gong Xue, Zhao Xiaona

Geography Department, Sciences College of Yanbian University, Yanji Jilin 133002, P. R. China, leemy@ybu.edu.cn

Abstract

In this paper, the evaluation index system of ecological land was constructed of four aspects which were service function, water resources security, landscape spatial pattern, ecological sensitivity. Using AHP to determine the weight factor, applying the sum of weighted index combine with GIS spatial analysis to evaluate the importance of ecological land in the area of Yan-Long-Tu in order to know the importance of ecological land types explicitly and then establish the corresponding protection schemes. The results show that the most important ecological land accounting for 25.88% of the total area, the respectively area is 69.64Km², 934.18Km² and 244.05Km². The cultivated land in the important ecological land is in a trend that is adjacent or mosaic to the forest land, so we should strictly control the development. The total area of the generally important ecological land is 1719.46Km² which is reserved as the urban development land. The main land types are water area, cultivated land and woodland. Finally, according to the evaluation results, we put forward the specific protection plan which can be the significant reference to the sustainable development of the integrated sustainable development and ecological civilization construction for Yan-Long-Tu integration. Abstract

The historical land use and land cover change is one of an important content on LUCC and global change studies. The LUCC in urban areas is very severe and has the most significant impact on global environment change. Based on the data extracted from historical documents, ancient maps and remote sensing, the built-up area changes in the past 200 years in 43 cities in the Chinese historical and cultural cities (including 4 municipalities, 13 capital cities, 20 prefecture-level cities and 6 county-level cities) were studied. We took the year of 1820, 1930, 1970, 1980, 1995, 2000 and 2010 as time sections, and took 5 parameters i.e., expansion rate, expansion intensity, the migration of city's gravity center, shape index and fractal dimension as evaluation indexes to explore the quantitative and spatial dynamic changes in these cities. We obtained the following results: (1) quantitatively, the area of built-up increased significantly in past 200 years, and the average increment is 43.35 times as 1820's; (2) there can be divided into three stages from the process of the quantity changes i.e., the stable phase from 1820 to 1930, the slow-growth phase from 1930 to 1970 and rapid-development phase from 1970 to 2010; (3) with the increasing of the area, the urban morphology becomes more complex, the index of shape compactness have decreased while the fractal dimension have increased; (4) as the migration of city center, it influenced by the terrain and traffic conditions greatly. Most cities in the plain area adopted concentric type expansion.

Vegetation Cover Variation after Ecological Restoration in the Loess Plateau in 2000-2014

Zhang Kun

Research Center for Eco-Environment Science, Chinese Academy of Science, Beijing 100085, P. R. China,

kunzhang_st@rcees.ac.cn

Abstract

Since the Grain to Green Program launched in the Loess Plateau, the process and pattern of ecological transition has become an attractive topic. Using the fractional vegetation cover (FVC) as index, this study examine the spatial and temporal change of vegetation cover in the Loess Plateau over the past 15 years. Furthermore, we analyze the distribution and change trend of climate effect on vegetation cover. The vegetation cover tend to increase from northwest to southeast in this region. Along with the restoration age extension, the vegetation cover exhibit an overall increase trend. The percentages of significant restoration vegetation are 2.08%, 20.99% and 51.97% in 2000-2005, 2000-2010 and 2000-2014, respectively. The restoration rate in north part is higher than south, while the difference between rate of north and south tending to reduce. The vegetation cover variation is the outcome of human activity and climate. Human activity, especially the ecological restoration program, act as the dominant driving factor of vegetation cover increase. As to the effect of climate variables, from southeast to northwest, the effect of precipitation keeps positive and enhancing on vegetation, while the effect of temperature transforming from positive to negative.

180 Years of the Cultural Landscape Development in Czechia (The Czech Republic)

Bičík I, Kupková L

Charles University in Prague, Faculty of Science, Prague, Czechia, bicik@natur.cuni.cz

Abstract

Land use database of Czechia works with land use data in six time horizons (1845-1896-1948-1990-2000-2010), which represent years of key political and socio-economic changes not only in Czechia but throughout Central Europe. Each of many key events influenced Czech landscape. A generalization of this complex development has led to a substantially different system - from simple local into more hierarchical one where larger regions of similar land use structure and their development are present. The overall development of the changes in the land use in Czechia is documented by a series of cartograms and tables describing over eight thousand units covering the whole territory of Czechia.

The regional structure of land use was fundamentally transformed. At higher elevations and in less fertile areas, there has been a decline and demise of arable land and the overall restructuring of agriculture. The opposite type of agriculture is located in lower altitude (up to 400 - 450 m) where crops production and mixed intensive agriculture dominate. There are not only two above mentioned opposite types of landscape and their evolution in the present Czechia. Different types of landscapes corresponding to the new and advanced features/functions, previously almost unknown are also present. As an example we can mention environmental, water management, recreation, mining, etc. functions/landscapes. Each of these functions formed the characteristic structure of landscape use on larger territories characterized by cadastres with similar structure of land use and its development in the last 50-70 years.

A Analysis on the Urban Sprawl and Urban Landscape Pattern Between 1985 and 2000 in the Pearl River Delta, China

Yahui Wang ,Erfu Dai, Zhuo Wu, Xiaodian Du, Daniel G. Brown

Laboratory of Land Surface Pattern and Simulation, Institute of Geographic Sciences and Natural Resources Research, Chinese Academy of Sciences, Beijing ,100101, China, wangyah.15b@igsnrr.ac.cn

Abstract

Urbanization is an irreversible trend worldwide, especially in rapidly developing China. Accelerated urbanization has resulted in rapid urban sprawl and urban landscape pattern changes. Quantifying the spatiotemporal dynamic of urban land use and landscape pattern changes can not only reveal the characteristic of social transfer and economic development but can also provide insights into driving forces of land use changes. In this study, we coupled remote sensing (RS), a geographic information system (GIS), gradient analysis and landscape metrics to quantitatively compare the spatiotemporal dynamics on land use, urban sprawl and landscape pattern for nine cities in the Pearl River Delta from 1985 to 2000. The results show an increase in buildup land and shrinking cropland in the Pearl River Delta. For the whole region, the phenomenon of urbanization was obvious, and for the nine selected cities, there existed a great difference between the sprawling process and the magnitude, both at spatial and temporal dimensions. Guangzhou and Shenzhen are shown as the two most intense examples of urban sprawl. The urban landscape changes could help understand the different stages of urban development and reflect specialty urbanization. The results also provide important implications for future urban planning and land management strategies in China.

Abstract

China's Natural Forest Protection Program (NFPP) and Returning Farmland to Forest Program (RFFP, or called Sloping Land Conversion Program), are two of the world's largest forest conservation programs in terms of both expenditure and spatial extent. Studies of land cover change at national and regional scales find forest cover gains in jurisdictions in which each program was implemented. However, land cover change patterns at smaller scales vary sharply, raising questions about whether these policies or other factors best explain observed patterns. In this study, we attempt to untangle the impacts of these programs and other factors simultaneously impacting land use and land cover at different scales in a county in southwest China. Multi-temporal and multi-source satellite imagery data were used to detect the land cover change at county, township, and community levels, and data from a household survey and focus group discussions informed the analyses. Results indicate overall forest cover gain both in 2000-2010 and in 2010-2014 at all three levels. At the community level, there is no significant difference in forest land cover change in communities with and without RFFP participation. Transition matrix results show that forest gain resulted primarily from shrub succession and avoided deforestation, with cropland retirement playing a secondary role. These findings suggest that over the past three years land cover change processes in this region have been dominated by forest conservation under the NFPP as well as social changes driving retirement of marginal cropland regardless of RFFP participation.

Colonizing Forest and Filling Patches – A Mechanism and Process from a Case of Western Ghats, Karnataka, India

Koichi Kimoto

Kwansei Gakuin University, Nishinomiya, 662-8501, Japan, kx.7.koichi@gmail.com

Abstract

In the last two decades, India has been attracting attention from all over the world as one of the region where while overcoming the deforestation issues. Regarding the rate of forest cover in India, it has been restored from 10% (1980) to 21.23% (2013). Forest Survey of India (FSI) mentioned that "the positive change can be attributed to conservation measures or management interventions such as afforestation activities, participation of locals for better protection measures in plantation areas as well as in traditional forest areas etc." (FSI 2013:18). But, in the aspect of land use cover and change (LUCC), we cannot recognize the any improvement from our field experience apparently. We have done continuous projects, Forest Management as Regional Governance (FMaRG) and Regional Government of Forest and its Fringe (ReGFF), for investigating the mechanism and process of de-forestation, and the effect to the livelihood of region where made by deforestation process. We explore the relationship between distribution pattern (patches) of population increase and de-forestation process by using census data and several maps. In concluding, we will show not the direct effect of population increase, but the structural mechanism of effect of it in regional context.

Abstract

India is an agricultural dependent country and one of the principal wheat producing and consuming countries in the world. Almost two third of the employed class in India are surviving upon agriculture as their means. Agriculture, one of the oldest economic practices, plays an vital role in the context of Indian society. Remote sensing data can also be used for the estimation of crop area. Remote sensing techniques have demonstrated their potential in providing information on the character and distribution of various natural resources. Possible application areas related to agriculture are management of land and water resources, crop acreage and production forecasting, crop condition. The current study is focus on the crop inventory and crop assessment of agricultural field of Madhya Pradesh state, with Taluk as a spatial unit using decision support information product because it gives precise information about condition of crop in any area in terms of healthy or stress condition, biodiversity analysis, helps in monitoring of the crop management activity such as rehabilitation, and abiotic factors like temperature, and rainfall. The aim of this research is to improve methods for quantifying and verifying inventory based carbon pool estimates for the tropical dry deciduous forests. In future, the other method and techniques will be found out to perform the analysis. The current study uses the satellite remote sensing data of LANDSAT-8 and RESOURCESAT-2 to generate the objective and study about Rabi season (November-December to April- May) in the year 2013-14, 2014-15, and 2015-16. The study deals with crop yield estimation, spatial distribution, crop assessment, crop inventory and developing decision support information product in the districts of Madhya Pradesh i.e. Hoshangabad, Crop yield estimation and crop assessment of these districts is studied at village as well as taluk level. The major Rabi season crop took under study is wheat, jowar and mustard. Spectral response based model for identify different crop condition identification of sensitive area.

Determining Potential Best Management Regimes on Plantations at Stand-level: A Case Study of Moshao Forest Farm in Southern China

Erfu Dai, Jianjia Zhu, Du Zheng, Xiaoli Wang, and Silong Wang

Key Laboratory of Land Surface Pattern and Simulation, Institute of Geographic Sciences and Natural Resources Research, Chinese Academy of Sciences, Beijing 100101, China, daief@igsnr.ac.cn

Abstract

A number of problems concerning even-aged forest structure and dwindling ecosystem services existed for plantations in southern China under the traditional forest management. The objective of this study is to determine best management regimes (BMR) aiming at sustainable forest management, with a case study at Moshao forest farm. We propose a framework of BMR modeling, which is characterized by high scheduled timber production (STP), low fluctuations in periodic scheduled timber harvest levels (FPS), and age class structure (ACS) at the end of planning horizon, and a simply paired analysis is conducted among the three indicators to identify a suitable management planning for long-term timber production. Our results suggest that STP, FPS and ACS are correlated to each other, it is possible to control these forest performance indicators in a planning horizon by setting various harvesting intensities. Management regimes with cutting area percentages of 20%-40%, cutting period of 10 years combined with small area clear cutting (≤ 5 ha) may be BMRs for Moshao forest farm in Southern China, and management regime with cutting area percentage of 35% is probably the best one. These findings suggest that applicable management regime could be designed by identifying the best harvesting intensity. The local current harvesting intensity can be increased properly under a balance between timber production and ecological impacts on the plantations.

plantation; harvesting intensity; timber production; management regime; sustainable forest management

Does China's Dual Land Ownership Affect Manufacturing Location Choice? Case from Beijing

Huang Daquan, Ma Pingping, Zhao Xingshuo, Zhang Hua

The Geography department of Beijing Normal University, Beijing 100875, P. R. China, mppmpp513@sina.com

Abstract

China has a unique dual land ownership system, in which there are two kinds of land ownership, state-owned land and collective-owned land. Corresponding to these two land ownership, land is used in different ways, performance in acquisition approach, security of land use system and land transaction. Eventually leads to the difference in enterprises cost, including land cost, transport cost, operating cost and financial cost. So whether there are influences of land ownership on enterprises location choice and to what extent will it influence to different enterprises has received extensive attention of scholars. This paper chose Beijing as an example to examine the influence of land ownership on manufacturing enterprises location choice during 1990 to 2001. We used zero inflated negative binomial regression models and highly detailed data set of Beijing to explain whether there were influences of land ownership on manufacturing enterprises location choice. And then four categories manufacturing enterprises data was used to explain whether there were different influences on different types of manufacturing enterprises. The results indicated that although land property had no effect on integral manufacturing enterprises, after classification, collective-owned land had higher attraction to low technology and medium-low technology enterprises, while medium-high technology and high technology enterprises were more tended to be located on state-owned land with more secure land use policies and environment.

Evaluating Conservation Effectiveness of Mangroves: a Remote Sensing Based Comparison for Two Adjacent Protected Areas in Shenzhen and Hong Kong, China

Jia M., Wang Z.*

Key Laboratory of Wetland Ecology and Environment, Northeast Institute of Geography and Agroecology, Chinese Academy of Sciences, Changchun 130102, China; jiamingming@iga.ac.cn

Abstract

Among various mangrove conservation projects, the Ramsar Convention is the internationally adopted one, and the China's National Nature Reserve Systems (CNNRS) are on the list of priority financial and political supports in China. This study aimed to evaluate and compare mangrove conservation effectiveness of two adjacent protected areas which were under the management policies of Ramsar Convention and CNNRS. To achieve the goal, Landsat images obtained in the year of 1973, 1979, 1988, 1993, 1996, 1999, 2003, 2006, 2009, 2013, and 2015 were chosen and classified, and then three remote sensing based measurements, including areal extent, area-weighted centroids, and landscape metrics were developed. Results showed that, from 1973 to 2015, the area extent of mangrove in both reserves increased, but the net change and increasing rate of the MPMNR (281.43 hm^2 and 6.70 hm^2) were much higher than that of the FMNNR (101.97 hm^2 and 2.43 hm^2). Area-weighted centroids of mangroves in FMNNR moved seaward for about 120 meters, while in MPMNR the centroids moved seaward more farther (410 meters). Although both reserves saw increased integrality and connectivity of mangrove patches. We concluded that mangroves in the MPMNR under the policy of Ramsar Convention were protected with higher effectiveness than the FMNNR under CNNRS. This study may help to formulate generally accepted criteria in evaluating conservation effectiveness and advice on proper mangrove protection and management decisions.

Growth of Urban Encroachments and Non-Agricultural Uses on Agricultural Land in Punjab (India): A Case Study from the Jalandhar District

Singh, Sucha

Assistant Prof. in Geography, University School of Open Learning, Panjab University, Chandigarh-160014, India,

suchasahota@gmail.com

Abstract

The countryside in Punjab state of India has been noticing land use conversions in response to the rapidly growing urbanization, industrialization and network of transportation. Among these, expansion of transportation network has played an important role in the growth of urban encroachments on fertile agricultural land along major roads near urban centers of Punjab. Similar changes have been observed along a bypass road of Jalandhar district of the state.

Thus the proposed research focuses on the spatio-temporal analysis of encroachments of fertile agricultural land in the study area during 2001-2015.

The study is based on both secondary and primary sources of data. Secondary data has been obtained from the concerned Govt. offices. Primary data has been collected by conducting a field survey. Maps showing spatio-temporal changes in the encroachments have been prepared using ArcGis 9.2 software.

The study revealed that agricultural land has predominantly been encroached for housing development projects followed by commercial and industrial projects. Expansion of road network and the less profitable farming activities of small and marginal farmers in comparison to short term high returns from the sale of their holdings are the determining factors for such encroachments. The unplanned and haphazard growth of urban encroachments on agricultural land is a matter of serious concern for the state of Punjab and thus requires attention of policy makers.

Hierarchical Determinants of Winter Wheat Abandonment in the North China Plain: A Case Study of Cangxian County in Hebei Province

Xue Wang, Xiubin Li, Liangjie Xin

Key Laboratory of Land Surface Pattern and Simulation, Institute of Geographic Sciences and Natural Resources

Research, Chinese Academy of Sciences, Beijing100101, China, wangx.12b@igsnrr.ac.cn

Abstract

Since the late 1990s, the North China Plain (NCP) has undergone large-scale shrinkage of area sown to winter wheat, accompanying with traditional double cropping system being replaced by spring corns. However, studies on the underlying determinants are rarely found. The goal of this study is to detect the determinants across land parcel, household and village levels on farmers' cropping system decisions. A case study was carried out in Cangxian County of Hebei Province, and multi-level statistic models were constructed using household survey data. Our study reveals that of the variance in farmers' land use decisions, 50% and 30% could be explained at the land parcel level and village levels, respectively, while the remaining 20% could be explained at the household level. We found that the price of labor, the education level of the agricultural policy makers and the price of irrigation electricity were positively correlated with farmers' tendency to choose the spring maize single cropping system or to abandon winter wheat. We also found that soil quality, irrigation conditions and agricultural labor availability were negatively correlated with farmers' tendency to choose the spring maize single cropping system or to abandon winter wheat. The relationship between the labor age and farmers' land use decisions was non-linear, and the influence of farming distance was not significant. In addition, the plot area, agricultural equipment and land fragmentation all significantly influenced farmers' land use decisions. Households with agricultural equipment and lower land fragmentation were less likely to abandonment winter wheat, especially on larger areas of parcels. Overall, our study provides empirical identification on hierarchical determinants of agricultural land use change in the NCP, and encourages policies aiming at adjustment of cropping systems, integration management of both surface and groundwater, and promotion of land transfer, in order to achieve the twin goals of ecological conservation and food security in water-scarce areas.

Inheritance of Imperial Forestry: Japan's Tropical Forest Development in Southeast Asia

Koji Nakashima

Kanazawa University, Japan, koji331@staff.kanazawa-u.ac.jp

Abstract

In 1980s and 1990s, Japan was severely criticized by environmentalists as a destroyer of the tropical rain forest in Southeast Asia and South Pacific areas. Kuroda and Nectaux (1989), Shimizu (1994) and Dauvergne (1997) argued that great bulk of the tropical timber import during 1960s-1980s by Japanese general trading companies and forestry capitals to Japan has resulted in a large scale of deforestation in these areas. British anthropologist John Knight criticized Japan's antithetical forestry policy as that Japan has imported great bulk of tropical timber and triggered deforestation in Southeast Asia and South Pacific Islands to provide resources for its own demand while it has practiced a nationalistic forest conservation policy of National Land Afforestation Campaign at its own country (Knight 1997). Although these two sides of Japan's forestry policy were not directly connected with each other, they have consequently resulted in the conservation of Japanese domestic forest and the deforestation of tropical rainforest in Southeast Asia and South Pacific areas. This paper attempts to demonstrate that this antithetical forestry policy of postwar Japan originates in imperial forestry policy of wartime Japan that was based on geopolitical strategy of Japanese empire through examining discourses of Japanese forestry experts during the wartime. Furthermore, focusing on the role of the wartime forestry experts in the postwar forest development projects in Southeast Asia conducted by Japanese forestry capitals, this paper illuminates a continuity of forest resource use between wartime and postwar Japanese forestry policies. Postwar tropical forest development in Southeast Asia by Japanese capitals was realized along geopolitical ambitions of wartime imperial forestry. As recent works of environmental history (e.g. Barton 2004; Anker 2001; Mizuno 2006) argue, the concept of environmentalism is deeply embedded in the history of empire. In the history of forest resource use and conservation of modern Japan, we can see specific relationships of forest conservation and deforestation, domestic forest and overseas forest, and environmentalism and imperialism.

Key words:

tropical forest; imperial forestry; Southeast Asia; Japanese empire

Land Cover versus Ecosystems – Two Different Approaches for Mapping Ecosystem Services and Landscape Changes. Consequences for Interpreting Land Cover Changes

Solon J., Degórski M.

Institute of Geography and Spatial Organization, Polish Academy of Sciences, Warsaw, Poland, j.solon@twarda.pan.pl

Abstract

In Poland, at the local scale, at least three groups of policy makers play the decisive role in the process of shaping the space: (a) local government - responsible for spatial planning, (b) nature protection authorities (e.g. a director of a national park) – defining limitations of land cover changes, and (c) forestry managers – deciding of forest spatial and age structure, as well as its utilization.

According to national regulations the planned LC spatial structure and function should take into account preservation and/or enhancement of amount and availability of ecosystem services according to the rules of sustainable development.

We explore the spatial heterogeneity of ecosystem services in three communes in NE Poland (800 km²). We defined ecosystem services in two different ways: as a property of a land cover type and as a feature of ecosystem type. The results show that the adoption of different types of basic units gives different estimations of the scope, amount and availability of services, what, in turn, influence the unlike interpretation of the LC changes during the last 20 years.

We observe three main processes of land cover change, namely: (a) the growth of the built-up areas as well as the growth of areas dedicated to be built-up in the future; (b) the systematic decline of arable lands; (c) the slow, regular growth of newly afforested areas. These changes are interpreted differently by the policy makers, but in our opinion, they may result in deterioration of landscape quality, especially in terms of ecosystem services.

Key words:

Ecosystem services; Land Cover change; landscape heterogeneity; Poland; policy makers

Land Use Changes of Paddy Cultivation Sector in a Rapidly Changing Suburban Regions: a Case Study of Gampaha District in the Colombo Metropolitan Region of Sri Lanka

U.A.Chandrasena

Department of Geography, Kelaniya University, Kelaniya Sri Lanka, uac@kln.ac.lk

Abstract

Land use changes in a region, takes place due to multiplicity of natural and human factors, leading to land use conversion and land fragmentation and tenure changes basically. Sri Lanka, as an island state of about 65,610 sq.Km and with about 20 million population is one of the high population density country in Asia. In Sri Lanka, the agricultural sector contribute about 11% of the GDP, of which 1.2% is provided by paddy cultivation sector. However that sector alone provides mainstay of about 1.8 million people. Although there are about 60 % of paddy lands exists in the dry zone districts in the country, Gampaha , a major wet zone district yet consists of about 1.1% of land allocated for paddy cultivation in the country. The paddy cultivation in Sri Lanka continued under subsidies of government in terms of fertilizer subsidy, and remains at low land and labour productivity level for decades. Being a rapidly urbanizing area, the demand for land for housing, recreation, infrastructure and services increases in a gigantic way, while structural changes take place in most of the highland areas.

However, due to legal, institutional and tenure factors, the paddy land in the area in the district is not being converted to other uses. Instead, the abandoning paddy lands, inappropriate land use conversions and unprofitable paddy cultivation are evident in some areas as symptoms in responses ongoing economic changes. Besides some of the paddy lands remain barren for years due to shortage of family labour, fragmentation of ownership and poor maintenance of irrigation networks etc.

This paper argues that the sustainability of paddy cultivation sector in the area depends only under careful land use planning strategies, that demarcate the most suitable and profitable paddy lands, while converting part of the land into other uses and based on spatial and environmental concerns. The information and data of this study were collected from secondary sources and interviews with selected key informants of the case study areas. The findings of the study revealed that paddy cultivation in the district is preferred to be converted to high value crops, if the suitable strategies were introduced. The experts' views and policy makers'

suggestions for land use changes were disclosed at the survey in order to design an appropriate land use strategy for paddy cultivation sector in the area.

Land Use Changes and Influence on Grain Production from the Perspective of Farmers--A Case Study of Jiangnan Plain, China

Chengwu LIU, Limin HUANG

South-Central University for Nationalities, Wuhan, 430078, P. R. China, liucw@igsnr.ac.cn

Abstract

Recognizing farmers' land use changes and their influence on food production are of great significance to estimate China's food production correctly and formulate relevant policies to ensure food security. Characteristics of farmers' land use changes and their influence on food production since 1981 are analyzed in this thesis based on the data collected from a total of 620 peasant households from 12 village groups in 4 counties-Shishou, Jianli, Honghu and Xiantao-located at Jiangnan Plain which is a traditional commodity grain production base in central China. The following conclusions can be drawn from this thesis. (1) In the past 30 years, traditional land use behaviors of farmer households living in Jiangnan Plain have been substituted remarkably: "labor efficiency" practice gradually replaces traditional ways of farming; (2) Sown area for food crop production decreases continuously, and farmland multi crop index declines dramatically. However, the pesticide and fertilizer use per unit land area increases sharply; (3) Farmers' land use changes have exerted an important influence on regional food production and food security. Due to the decline of sown area since 2001, the average household food production has decreased more than 1,300 kilograms every year, and per capita share of grain has decreased by 23% from 345 kilograms in 1981 to 265 kilograms in 2011. (4) It is of great significance to master change laws of grass-root farmer land use behaviors and grasp the real situation of China's food production for correct estimation of China's food security.

Modelling the Impact of Macro-Scale Determinants of Urban Land-Use on Individual Residential Behaviour

Andreas KOCH

University of Salzburg, Department of Geography and Geology, 5020 Salzburg, Austria, andreas.koch@sbg.ac.at

Abstract

Models of urban residential mobility usually take a bottom-up perspective by emphasising individual (household) decisions on locational preferences. This approach is commonly justified by the investigation of social emergence, i.e., the assumption that social macro phenomena (collective phenomena) derived from micro phenomena cannot be linked causally but have their own independent characteristics. Empirically, individual decisions are evidently framed by social, economic, and political forces such as markets, legal rules, and norms. The contribution therefore presents a preliminary attempt to incorporate macro-scale determinants of land-use, such as housing market mechanisms and urban planning decisions, into an agent-based model (ABM) in order to simulate patterns of residential mobility more comprehensively. The model is developed with NetLogo and focuses on the influence of large housing complexes – as one type of representing urban planning – in two urban districts of the city of Salzburg, Austria.

Key words:

human agency; social forces; land utilisation; urban segregation; agent-based modelling

Monitoring and Mapping of Forest Cover Changes Due To Proposed Satellite Town of Purbachal, Bangladesh

Sharmin Shishir¹, Tanjinul Hoque Mollah², Shiro Tsuyuzaki³

¹Sharmin Shishir, Graduate School of Environmental Earth Science, Hokkaido University, Sapporo, Japan,

shishir38ju@gmail.com;

²Tanjinul Hoque Mollah, Graduate School of Letters, Hokkaido University, Sapporo, Japan;

³ Shiro Tsuyuzaki, Professor, Graduate School of Environmental Earth Science, Hokkaido University, Sapporo, Japan

Abstract

The rapid growing population of Bangladesh (about 1000 persons/km²) creating immense pressure on Dhaka city. At this stage establishing a new satellite town may minimize this massive problem and Purbachal is such a kind of satellite town. However, the urbanization process in Purbachal new town creates enormous impact on its landmass particularly on the basic environmental factors i.e. forest cover, wetland etc. and the topography as well as the natural land surface i.e. lowland, highland, depression, valley etc. has been reduced. The key focus of this research is to monitor and map the disturbances on forest areas and detect the changes due to township development plan of Purbachal by using State of the art technologies like GIS and remote sensing using satellite imageries from 2002 to 2014. This work is based on both primary and secondary data sources where primary data sources are field observation, photograph taking etc. and secondary data sources are time series satellite imagery, feasibility report of Purbachal, journal, etc. Digitizing the disturbed areas of forest and wetland from Google-Earth imagery and then mapping to detect the changes from 2002 to 2014 by using Arc GIS software is the specific methods to conduct this research. Due to the urbanizing activities of PNTP hundreds acres of forested area has been turned into non-vegetated area. In Purbachal, total forest area has been decreased into 742 acres from 2378. 25 acres from the year 2002 to 2014.

Urbanization; Forest cover; Change detection; GIS; Satellite Imagery.

Property Right Difference, Transaction Mode Options and Land Use Efficiency of Industrial Enterprise: the case of Wuxi city, China

Ye Lifang, Huang Xianjin, Chen Zhigang, Zhong Taiyang, Xe Zelin

School of Geographic and Oceanographic Sciences, Nanjing University, 163 Xianlin Avenue, Nanjing, Jiangsu Province, 210046, P. R. China, sunny.juliana@126.com

Abstract

China is experiencing the new normal economic development, contradiction with land demand over supply. The problems of land use efficiency of industrial enterprise raised the government and the public's attention. The Chinese urban-rural land market is dual. The property rights of state-owned land and collective land are not equal. There is significant difference between different property rights. Urban and rural industrial land can be achieved through several transaction modes. This article aims to evaluate the impact of different land property rights and different transaction modes on land use efficiency of industrial enterprise using an econometric model. Based on a preliminary theoretical study and literature review, 297 industrial enterprise questionnaire survey samples from the three towns of Wuxi City, Hudai Town, Qianqiao Town, Xibei Town are used in corresponding empirical study. The results show that different land property rights have significant effect on land use efficiency of industrial enterprise. The state-owned land use efficiency is higher than collective land, while different transaction modes have no significant effect on land use efficiency of industrial enterprise.

Spatial Variation of Forest Resources and the Contribution of Natural and Economic Factors Across China during the early 21st century

Wang J.Y.^{1,2}, Xin L.J.¹

¹ Key Laboratory of Land Surface Pattern and Simulation, Institute of Geographical Sciences and Natural Resources Research, CAS, Beijing, 100101, P. R. China;

² University of Chinese Academy of Sciences, Beijing, 100049, P. R. China, wangjy.14s@igsnrr.ac.cn

Abstract

China has entered a new stage of ecological environment construction during the early 21st century, it's necessary to grasp variable characteristics and influences of forest change. In this paper, we combine statistical regression modelling into spatial analysis to ascertain the spatial variation of the forest resources based on GlobalLand 30 dataset between 2000 and 2010, and to determine the contribution of natural and economic factors of forest change based on statistical data on county level. The results indicate that forest primarily distributed in where the average annual precipitation is above 300mm, the altitude is around 400m and the slope gradient is around 15°. The forest coverage rate showed a slight increase of 1.06% during 2000 to 2010, and the changes mainly concentrated in the southwest of China. Grassland, cultivated land and shrubland are the main sources and directions of the forest change. Natural, policy, economic and society factors significantly influenced forest change in different forestry division, especially viewed from economic factor, along with the increase of per capita GDP, forest change presented an "U" trend, the inflection point was 49731.51yuan/person, and 93.63% counties located in the left of the "U" curve among all samples in 2010.

Urban Construction Land Intensive Use and Urbanization Process in China: A Case Study for Wuhan Urban Agglomeration

Yang J, Huang XJ, Xu GL

School of Geographic and Oceanographic Sciences, Nanjing University, Nanjing, 210023, P. R. China,

jycug_edu@163.com

Abstract

The purpose of this study was to analyze the phase evolution of urban construction land intensive use and relevant policies in every stage based on urbanization in China, and to explore factors that may influence urban construction land intensive use. The study evaluated the intensiveness of urban construction land use in Wuhan urban agglomeration, measured the coupling-coordination degree between urban construction land intensive use and urbanization level, and identified the main factors that influence urban construction land intensive use from county and prefecture city two levels. The FAHP-Composite Evaluation Model and Hierarchical Linear Model were used to conduct this research. The results found that urban construction land utilization presented various characteristics in different urbanization stage. Although the central government made many policies to promote the intensiveness of urban construction land use, there expressed unsatisfactory effects. In Wuhan urban agglomeration, only 11% of counties showed well coordination between urban construction land intensive use and urbanization level, and in over 62% of counties, the intensiveness of urban construction land use lag behind its urbanization level. The intensiveness of urban construction land use at county level was driven not only by financial revenue and population density at county level, but also by the proportion of the second and third industry at prefecture city level. The former contributed 86.7% and the latter contributed 13.3%. Increasing land use costs, promoting population gathering, and optimizing industrial structure are the best ways to effectively improve urban construction land intensive use in developing new urbanization.

urban construction land intensive use; urbanization; land use policies; Driving forces; HLM; China

A Preliminary Carbon Analysis of Wood Product SubstitutionYang, Hong ^{1,2}, Bright, Ryan M.¹, Astrup, Rasmus ¹¹Norwegian Institute of Bioeconomy Research (NIBIO), Postboks 115, 1431, Ås, Norway; hongyanghy@gmail.com²CEES, Department of Biosciences, University of Oslo, Blindern, 0316, Oslo, Norway.**Abstract**

Forests play a very important role of global carbon cycle, while forest management may change species and carbon stock. The recent study found the reduce of forest carbon stock due to the conversion from deciduous to coniferous forest in Europe. However, it is traditionally ignored that wood products are an integral part of the forest sector carbon cycle and contribute through the substitution of energy-intensive products, for example steel and concrete, and fossil fuel to climate warming mitigation. The Conference of the Parties to the Kyoto Protocol in Copenhagen, 2009, for the first time, recognized the importance of including harvested wood products as carbon sinks in national greenhouse-gas reporting. The displacement factors, the efficiency of using forest biomass to reduce net greenhouse gas emission, are mostly between 1.0 and 3.0, with the average of 2.1. The investigation in central Sweden indicated the average accumulated substitution effect of wood products was 0.6 t C ha⁻¹ year⁻¹. In spite of spatial and temporal variations, it is important to integrate the wood product substitution effect into carbon budget for a more comprehensive understanding of carbon cycle of forest sectors.

Assessment of Ecosystem Food Production and its Spatiotemporal Heterogeneity in the Bailong River Watershed, Gansu, China

Yuchu XIE^{1,2}, Jie GONG¹, Shanshan QI¹, Ying Zhang¹, Baoqing HU²

¹Key Laboratory of Western China's Environmental Systems (Ministry of Education), College of Earth and Environmental Sciences, Lanzhou University, Lanzhou 73000, China, xieych12@lzu.edu.cn

² Key Laboratory of Environment Change and Resources Use in Beibu Gulf (Ministry of Education), Guangxi Teachers Education University, Nanning 530001, China

Abstract

Terrestrial ecosystems function to supply food (*e.g.* grains, vegetables, fiber), maintain diversity, and prevent environmental contamination. Thus, the idea that ecosystems are vital assets and are important to human well-being has spread like fire. Food production is vital for the sustainable development of human populations, and its dynamic spatiotemporal factors are closely related to spatial geographical heterogeneity and social development. However, there are only a few studies on the universal dynamic evaluation method for ecosystem function used at the regional scale, especially in the fragile mountains of China. Bailong River Watershed (BRW) is located in the transitional ecotone along the Tibet Plateau, Loess Plateau and Qinba Mountains, and it was selected to analyze the spatiotemporal heterogeneity of ecosystem food production. Based on a field survey employing land use data, model simulations, and GIS spatial analysis, the ecological conditions and socio-economic factors were used to revise the previously held dogma which put forward by Costanza in 1997. Specifically, sources of hazards reflected the differences in ecological conditions. The resource scarcity theory and the willingness to pay were used to revise and calculate the economic developmental coefficient. A dynamic evaluation model was constructed with the above corrections method and applied for ecosystem food production services assessment in the Bailong river watershed during 1990–2010. In addition, spatiotemporal heterogeneity and food production were analyzed by ArcGIS 9.3. The results indicated that the supply of cropland distributed in the river valley and bank area of BRW, hill slopes, low mountain regions and decreased. The area of instable cropland and the index of social progress increased. In the period of 1990–2010, ecosystem food production value increased. The mean value of food production was 1.8674 million Yuan in 2010. In addition, the spatial distribution pattern change of food production value was not obvious. Land accounting for high yield of food production value was 42.4% of the total area, which was mainly distributed in the valleys of BRW between Zhouqu and Hanwang town, the northwestern part of Tanchang County. The low-yield areas of food production distributed in the national nature reserve and forest. Our data change how the value of China's terrestrial ecosystem was previously defined on a national to regional scale. Compared with a previous evaluation model, the change in food production was smaller using our

method, and its spatial pattern was a better fit to the natural system of the Bailong river watershed. These data indicate that natural hazards (such as landslides and debris) and human activities affected food production and its value.

Discussing the System Platform Background of the Rotation-Fallow System in China: Based on the Current Main Cultivated Land Protection System

Tong Xiaorong, Yang Qingyuan, Ma Yinhua

School of Geographical Sciences, Southwest University, Chongqing, 400715, China, tong1112@swu.edu.cn

Abstract

This dissertation aims to study the relationship between the current main cultivated land protection system and the rotation-fallow system as well as the former's influence to the latter. There are three methods in this study, namely literature method, content analysis method, and synthesis and analysis of the specific combination of research method. The main conclusions of the essay are as follows: (1) mutual compensation relationship: The current cultivated land protection system is mainly focus on the farmland quantity while the rotation-fallow system is aimed at the quality and ecological environment protection of arable land, they mutually make the cultivated land protection system be an integrated system; (2) positive effects: The protection of the farmland quantity is the premise for the protection of the farmland quality, so that the content of the current cultivated land protection system itself has positive effects on the rotation-fallow system; (3) negative effects: The enforcement of the current cultivated land protection system is not very satisfying, which will certainly increase the burden of the rotation-fallow system, and put obstacle for the fallow and rotation system's implementation around the country; (4) experience and revelation: By studying the successful experiences and reflecting on the problems of the current cultivated land protection system, valuable experience and profound lesson for developing the content of the rotation-fallow system can be learned.

Dynamic of Land Use Performance in XIANGJIANG River Basin

MO Hong-Wei, TANG Shuang, QUAN Bin, YUAN Kai-Guo, XIE Jin-Ning

Architecture and Urban Planning Institute, Hunan University of Science and Technology, Xiangtan 411201, China,
mhw819@sina.com.cn

Abstract

Based on the interpretation of land use data, used grid as the basic research unit, and from the two aspects of economy and ecology of land use in XIANGJIANG river basin to comprehensive consideration of land use performance of space-time distribution and variation characteristics. The results are as follows: 1) From 2000 to 2010, the cultivated land and unused land area of XIANGJIANG river basin is reduced while right to use construction land; forest land and water area is increasing. Total amount of land use type change is 4757.61 km², accounted for 5.61% of the total area. Land use type change are mainly between cultivated land, grass land and construction land, and one of the biggest changes is cultivated land transformed into construction land, accounted for 27.64% of the total changing area. 2) During the period of 2000 to 2010, the number of output in XIANGJIANG river basin increased by 836.136 billion Yuan; the relative change rate of output is three hundred and ninety-eight percent; the annual increase nearly eighteen percent. The high density of economic output of XIANGJIANG river basin mainly concentrated in the area of CHANGSHA-ZHUZHOU-XIANGTAN urban agglomeration, LOUDI City and LIUYANG City, LILING City and NINGXIANG County area. 3) In the 10 years from 2000 to 2010, ecosystem service value of XIANGJIANG river basin reduces 1.436 billion Yuan; ecological service value decreased by zero point four six percent and the rate is negative zero point zero nine percent in a decade. During these ten years, the biggest declines of ecological service value are CHANGSHA, XIANGTAN, WANGCHENG, XINGSHA and the XIANGXIANG, and ecological value reduction mainly caused by the rapid expansion of city scale. 4) From 2000 to 2010, the performance of land use in XIANGJIANG river basin increased by 8347.33 billion Yuan; the performance of land use change is one hundred and sixty-one point two percent and the annual rate is ten point zero eight percent. In 2000-2005 the annual rate is 161.28%.

Key words:

land-use performance; value of ecosystem services; XIANGJIANG River Basin; land-use change

Trade-offs Between Carbon, Water, Soil and Food in GuanzhongTianshui Economic Region

Jing Li

shaanxi normal university

Abstract

It is important to ensure the efficient supply of multiple ecosystem services from land systems by government and policy when competition for land is increasing. This paper modeled the spatially explicit supply of ecosystem services (carbon sequestration, agricultural production, water interception, and soil conservation) under two scenarios from 2000 – 2050 and explored the tradeoffs among these ecosystem services in Guanzhong-tianshui region's land. Then it assessed the productive efficiency of ecosystem services under the past situations and each two scenarios and compared these to production possibility frontiers (PPFs). We also analysis the optimum allocation through scenario simulation, in order to provide scientific evidence to the development of eco-system. The nature of these trade-offs highlight the potential to sequester carbon in the landscape with very little loss of agricultural production, but much more water is used. Efficient land use arrangements could be identified that meet society's preferences for ecosystem service provision from land by adjusting the metric used to combine multiple services.

Abstract

Extraction of urban land-use information is the fundamental step of urban change detection. However, there are challenges in automatic delineation of urban areas and differentiation of land cover types within the city. Thanks to the heterogeneity nature of urban areas, where coexists of continuous and discrete elements, therefore the accuracy of extraction for built-up area is unsatisfactory. Another reason is the mixed pixel problem or the low resolution, which is particularly serious in an urban environment. The built-up areas in arid areas may confuse with nearby bare soil and stony desert, which present similar spectral characteristics as construction materials like concrete, while they are often surrounded by farmland. This study focuses in improving urban land use and land cover classification approach in typical arid city area of Western China by using multi-sensor data. Pixel-based classification of Maximum Likelihood Classification (MLC) and object-oriented image classification were adopted in this study. The classification dataset from Landsat ETM, CBERS, ZY-3 and GF1 of 2015 and Beijing-1 of 2007 are selected. High-resolution images, aerial photograph and field investigation are the types of data adopts for the accuracy assessment. The aim of this study will compare Object-oriented processing techniques with traditional pixel-based image analysis.

Accuracy Assessment of Approaches to Spatially Explicit Reconstruction of Cropland in the Late Qing Dynasty

Jiang L Q, Zhang L J, Zang S Y, Zhang X Z

Key Laboratory of Remote Sensing Monitoring of Geographic Environment, Harbin Normal University, Harbin 150025, P. R. China, jianglanqi@126.com

Abstract

Based on the historically documented cropland area at county level, we reconstructed the spatially explicit cropland distribution at pixel size of 1 km for the Songnen Plain (SNP) in late Qing Dynasty (1908 AD). The reconstructions were carried out using two methods. One method (hereafter, referred to as method I) allocated the cropland to cells ordered from a high agricultural suitability index (ASI) to a low ASI, but they were all within the domain of potential cropland area. The potential cropland area was created by excluding natural woodland, swamp, water bodies, and mountains from the study area. The other method (hereafter, method II) allocated the cropland to cells in the order from high ASI to low ASI within the domain of cropland area in 1959. This method was based on the hypothesis that the cropland area domain in 1959 resulted from enlargement of the cropland area domain in 1908. We compared these two reconstructions and found that the distributions of cropland by the two methods exhibit a similar spatial distribution pattern. Both reconstructions show that the cropland was mostly found in the southern and eastern parts of the SNP. By spatially comparing the unmatched cropland cells of the two reconstructions with the settlements for each county, we found that unmatched cropland cells from method I are closer to settlements than those from method II. This finding suggests that reconstruction using method I may have less bias than reconstruction with method II.

comparison of reconstruction methods; cropland cover; late Qing Dynasty; Songnen Plain

Analysis on Land Use and Land Cover Change in Coal Mine Area

Li J¹, Zipper C E², Donovan P F², Wynne R H², Oliphant A J², Jiao L P¹

China University of Mining & Technology, Beijing, 100083, P. R. China, lijing@cumtb.edu.cn

Virginia Polytechnic Institute and State University, Blacksburg, VA 24061, USA

Abstract

Coal mining disturbances have attracted attention globally due to serious influence on topography, soil, land use, ecosystems, and human health in both surface mining area and under-ground mining region. On the basis of traditional field surveying work, post-classification method of remote sensing was extensively used in land use and cover change detection. By our observation, post-classification method with only several images in long time period is ineffective in some cases. So we develop several methods to delineate mining disturbance on land use and land cover in three coal mine-areas. Firstly, a method to detect the mining disturbance date and spatial distribution was developed and applied as a three step sequence by Landsat time-series images: vegetation index selection, persistent vegetation identification, and mined-land delineation by year of disturbance. Secondly, surface mining and reclamation trajectory was defined and clustered. Thirdly, we developed coal waste pile delineation method which based on both spectral and geometric shape' character. Our study showed analysis of pixel-scale vegetation index trajectory can reconstruct history and pattern of land use and land cover change by mining and reclamation activities. Method of coal waste distribution mapping was also verified effective. Information generated from the study can be applied to gain further insight concerning mining influences on terrestrial ecosystems, water quality, and other essential environmental features, and provide a scientific basis for land reclamation management and policy decisions. Our future research is to improve the method developed and propose new method for land cover detection in subsided area by underground mining.

Changes of Entropy and Neighborhood of Land Use in Metropolitan Areas Of Poland

Werner P.A.

Faculty of Geography and Regional Studies, University of Warsaw, Warsaw, Poland, peter@uw.edu.pl

Abstract

The aim of the study was identification of detailed land use changes and anthropoppression in the metropolitan areas of Poland since 1990. The metropolitan areas selected for the purpose of the analysis, were mainly the ones that are related to cities identified as metropolitan centres according to Poland's Spatial Development Concept till 2030 (KPZK, 2011) – the policy document elaborated at the Ministry of Regional Development. With regard to spatial extent of metropolitan areas, delineation used for the purpose of Urban Audit project (Eurostat, 2012). In these studies an attempt was made to compare the dynamics of land use using GIS (Geographic Information Systems) – especially map algebra (MA) and cellular automata (CA) and using the entropy coefficients as the main measure of spatial (dis)order. Processes of land use changes are complex, and can only partly be interpreted by resorting to the neoclassical theory of urban land rent. The very detailed studies concerned values of entropy of land use changes using neighborhood coefficients within the geometrical grids. The concept of neighborhood coefficient (NBC) is based on the combination of map algebra with two-dimensional cellular automata. NBCs are calculated on the basis of a mathematical formula.

Maps of neighborhoods of land use of studied metropolitan areas are starting points of further spatial and temporal analyses which, in turn, made possible revealing typical, detailed, repeated schemes of neighborhoods of land use classes and their possible spatial transformations, what is not clearly possible with ordinary maps of land use.

land use dynamics; metropolitan areas; entropy; neighborhood coefficients

Comparisons of Green Space Classification of Town and Village Between Time Series HJ-CCD And Landsat-8 OLI Data

Xu P P, Niu Z G, Wang J

State Key Laboratory of Remote Sensing Science, Institute of Remote Sensing and Digital Earth Chinese Academy of Sciences, Beijing, 100101, China, niuzg@radi.ac.cn

Abstract

Ecological land plays a key role in maintaining ecological environment of towns and villages. However, monitoring based on single-date remote sensing data cannot fulfill the demand of land use mapping with seasonally dynamic land cover types, such as paddy fields, wetlands, forests and dry farmlands. Classification of town/village ecological land using different time-series remote sensing data sources was evaluated. Various data combinations of HJ-CCD images and Landsat-8/OLI images were employed to classify ecological land covers in Changshu city, Yangtze River Delta and evaluated based on the following aspects: (1) comparison between the two medium resolution sensors (HJ-CCD and Landsat-8/OLI); (2) comparison between single date, multi-temporal and time series data; (3) comparison of classification between band reflectance and remote sensing indices (NDVI). The results indicated that while mapping ecological land in villages, image quality of the two sensors had no significant influence on the classification accuracy (overall accuracy of single-date image Landsat-8 OLI / HJ CCD: 67.55% / 66.53%), and time series remote sensing data could improve the accuracy obviously (overall accuracy of synthetic image of 26 HJ CCD images / single-date image of HJ CCD: 75.86% / 66.53%). Furthermore, the classification accuracy of time series image of HJ-NDVI was almost equal to that of time series band reflectance data (overall accuracy of synthetic image of 26 HJ CCD images / time series image of HJ-NDVI: 75.86% / 75.66%). The performance of classification of HJ data is better than that of Landsat 8/OLI in monitoring ecological land, partly due to the limitation of long visit cycle of Landsat 8/OLI, especially under unfavorable cloudy conditions.

Estimating Various Soil Properties Using Visible –Near Infrared Reflectance Spectroscopy in the Sanjiang Yuan Regions of China

Xiaohong Gao, Lingyu Yan, Wei Zhang, Yang Yang

School of Life and Geographical Sciences, Key Laboratory of Physical and Environment Process in Qinghai Province, Key Laboratory of Education Ministry on Environment and Resources in Qinghai-Tibet Plateau, Qinghai Normal University, Xining, 810008, P. R.China, xiaohonggao226@163.com

Abstract

In this study, the potential ability of visible–near infrared reflectance spectroscopy (VNIRS) was evaluated for simultaneously estimating several soil properties in the Sanjiang Yuan Regions of Qinghai, China. Soil surface (0-30cm) samples were collected from 175 locations of five different soil types in 2012. After soil samples being air dried and sieved, soil reflectance spectrums were scanned with ASD FieldSpec 4 spectrometer under laboratory conditions. The concentrations of 17 physical and chemical properties were analyzed in the laboratory. The partial least squares(PLS)regression model with cross validation was used to establish calibration model between the reflectance spectra data and the measured values for the above of soil properties, and validate using an independent set of samples. The results showed that good predictions were obtained for soil organic matter(OM), total nitrogen(TN) and total carbon(TC) from visible-near infrared reflectance spectroscopy ($0.83 < R^2 < 0.90$ and $2.17 < RPD < 3.12$). Several other properties such as pH, carbon to nitrogen ratio(C:N), ferrum(Fe)and Al(aluminium) were moderately well predicted($0.68 < R^2 < 0.77$ and $1.75 < RPD < 2$). The concentrations of common and heavy metal elements including magnesium(Mg), zinc(Zn), plumbum(Pb), chromium(Cr) and cadmium(Cd) were poorly predicted with low accuracies ($R^2=0.54-0.58$, $RPD=1.47-1.68$); whereas silicon(Si), manganese (Mn), arsenic(As), copper(Cu) and hydrargyrum(Hg) could not be predicted using VNIRS and PLSR($R^2 < 0.5$ and $RPD < 1.4$). The results demonstrated that VNIRS could be used as a rapid, timely and inexpensive technology to simultaneously predict some soil properties in a wide range of area.

Forest Study in Mongolia Using Advanced Rs Technologies

A.Munkh-Erdene¹ and M.Ganzorig

Institute of Geography and Geoecology¹, Mongolian Academy of Sciences

Ave.Enkhtaivan-54B, Ulaanbaatar-51, Mongolia; munkherdene@informatic.ac.mn

Abstract

The aim of this study is to conduct a forest resources study using optical and synthetic aperture radar (SAR) satellite images. For this purpose, a Bogd Khan mountain located in central Mongolia is selected. As remote sensing (RS) data sources, panchromatic and multispectral Landsat images as well as ALOS PALSAR L-band HH and HV polarizations data are used. To produce a reliable land cover map from the multisensor images, a novel refined maximum likelihood classification based on the spectral and spatial thresholds are applied and for the accuracy assessment an overall accuracy is used. Overall, the research demonstrates that advanced spatial technologies based on optical and microwave RS are reliable tools for different forest studies.

Land Cover Changes Investigation Using Sentinel 1 And 2: the Project Commons

Mondini A.C., COMMONS Team

CNR - IRPI, Perugia, 06128, Italy, alessandro.mondini@irpi.cnr.it

Abstract

The two ESA Sentinel 1 and Sentinel 2 Satellite constellations offer the opportunity of frequent and regular acquisitions all around the world in different spectral ranges. The measure of the interaction between the incoming active or passive radiation at the earth surface in different wave domains intercepts and investigates different physical land processes offering the unprecedented possibility to detect and monitor land cover changes. In the framework of the ESA SEOM program, the COMMONS project proposes to investigate new approaches for land cover changes mapping, combining the complementary capacities of optical and SAR data. Methods will be tuned to track abrupt changes due to natural hazards such as landslides and floods, and changes in land cover that influence natural hazard occurrence, like snow cover changes and forest changes, and changes in agriculture. The framework consists of: (i) a multi-sensor training library of change signatures trapped by the Sentinels in a set-up phase and caused by landslides, floods, snow cover, deforestation and agricultural operations, and (ii) classifiers that use the elements of the library to recognize, identify, and map new changes. The library represents a knowledge system which takes advantages from the combination of S1 & S2 data and that can be extended to other classes of changes. Here the main goal of the project, the conceptual idea, the selected approach, and key applications preliminary results will be presented.

Land Use/Land Cover Change Assessment of Chunati Wildlife Sanctuary Using Satellite Imagery

Islam, K and Jashimuddin, M

Institute of Forestry and Environmental Sciences, University of Chittagong, Chittagong, Bangladesh,

ksujonifescu@gmail.com

Abstract

Due to inappropriate management and planning, land use change of developing country like Bangladesh is a common phenomenon. Land use change phenomenon will have its tremendous effect on natural habitat area. The prime objectives of this study were to find out land use and land cover change (LULCC) of Chunati Wildlife Sanctuary (CWS) using satellite imagery considering the time period of 2005-2015. LULCC of Chunati Wildlife Sanctuary were assessed using Landsat TM (Thematic Mapper) and Landsat 8 OLI/TIRS (Operational Land Imager/Thermal Infrared Sensor). ArcGIS v10.1 and ERDAS Imagine v14 were used to process satellite imageries. Land cover change of the area was identified using Normalized Difference Vegetation Index (NDVI) technique. Highest NDVI value was found in 2005 (0.71) which denotes presence of moderate-high vegetation cover. After 2005, highest NDVI value was found following a decreasing trend (0.56 in 2010 and 0.4 in 2015) which clearly represents the rapid vegetation cover change. Using supervised land use classification, it is found that almost 256 hectares of degraded forest area increased within 10 years of study period with 25.56 % annual rate of change. About 159 hectares of naturally forested land have been changed to other land uses with an (-) 15.88 % annual rate of change demonstrating an alarming situation for this important habitat area. The overall supervised classification accuracy was found 92.16 % for 2015, 86.15 % for 2010, and 83.96 % for 2005 with Kappa value of 0.8901, 0.8168, and 0.8057 for 2015, 2010, and 2005 respectively which is satisfactory.

Spatial Scale Effect on Mapping Accuracy of Plastic-Mulched Farmland Using Remotely-sensed Imagery in Northwest China

Hasituya^{1,2}, Zhongxin CHEN^{1,2}, Limin WANG^{1,2}, Jia LIU^{1,2}

¹Institute of Agricultural Resources and Regional Planning, Chinese Academy of Agricultural Sciences, No.12, Zhongguancun Nan Dajie, Haidian District, Beijing, 100081, China, chenzhongxin@caas.cn

²Key Laboratory of Agro-informatics, Ministry of Agriculture, No.12, Zhongguancun Nan Dajie, Haidian District, Beijing, 100081, China

Abstract

In recent decades, plastic-mulched farmland has expanded rapidly over the world because it can increase crop production significantly by improving the hydrothermal condition of soil. However, the plastic mulching practice has showed negative impacts on the balance of water, air and soil cycle of the eco-environmental system, as well as on visual quality of rural area and has so far been inadequately investigated. Monitoring and mapping plastic-mulched farmland is crucial for agricultural production, environmental protection and proper management strategies. This article evaluates the spatial scale requirements for timely and accurate mapping of plastic-mulched farmland using GF-1 remotely-sensed imagery, seven different spatial resolution scales: 2 m, 4 m, 8 m, 16 m, 32 m, 64 m and 128 m were designed respectively for mapping the plastic-mulched farmland using Support Vector Machine and Maximum Likelihood Classification in Guyuan, Ningxia Hui Autonomous Region, China. Results show that better accuracies in classification were obtained when high resolution images were used. The optimum spatial scale is 8m for Support Vector Machine, and 4m for Maximum Likelihood Classification. And the overall accuracy (83.20%) from Support Vector Machine using 8 m spatial resolution image is higher than the result (81.11%) from Maximum Likelihood Classification using 4 m spatial resolution images. High resolution satellite images are the essential data sources for mapping the plastic-mulched farmland, but the processing time for classification and data availability should be considered, especially over large area, when using the very high spatial resolution images. Successful mapping plastic-mulched farmland depends largely on the selection of the suitable spatial resolution of remotely-sensed imagery.

Spatio-Temporal Land Use/Land Cover Changes Analysis Using Decision Tree and DEM in the Upper Beas Basin, Western Himalayas

Rani, S. and Sreekesh, S.

Centre for the Study of Regional Development, Jawaharlal Nehru University, New Delhi-110067, India,

seemarani.dse@gmail.com

Abstract

It is essential to understand the dynamics of land use/land cover changes to make any strategy for management of an area. Remote Sensing and GIS provides a significant scope for analyzing the spatial extent and temporal changes of land use/land cover in regional planning. The paper aims to understand the nature, extent and spatial pattern of the land use/land cover of the upper Beas basin in the Western Himalayas during 1972-2015. Pre and post monsoon season Landsat images of 1972, 1980, 1990, 2001, 2010 and 2015 were used. SRTM 30 m data were also acquired for obtaining the topographical details of the area to develop a decision tree. A decision tree classification method was developed for land use/land cover analysis of the area. Band Ratios most suitable for identification of different land use/cover types were identified in conjunction with the field knowledge. Results show that dynamic land use/land cover changes have occurred in the basin. The study found a substantial rise in built up area and cultivated land and a marginal reduction in forest cover and snow cover during the period of study. The land cover transitions are mainly from vegetative to built-up, forest to vegetative. It is also to be noted that vegetated areas are marginally engrossed to higher altitudes. Significant land use/land cover changes have occurred in and around the main Kullu valley of River Beas and lower reaches of other valleys. These may have serious implications on the ecological system of the basin.

Land use/land cover; Decision tree; Band ratio; ecological system

Spatio-Temporal Mapping and Modeling of Flood Inundation Using Optical Remote Sensing

Huang C ^{1*}, Chen Y ², Zhang S ¹, Wu J ³

¹ College of Urban and Environmental Sciences, Northwest University, Shaanxi, 710127, P. R. China,

changh@nwu.edu.cn

² Land & Water, CSIRO, ACT 2601, Australia

³ Key Laboratory of Geographic Information Science, Ministry of Education, East China Normal University, Shanghai 200241, P. R. China

Abstract

Optical remote sensors, such as Landsat TM/ETM+/OLI, MODIS and Suomi NPP-VIIRS, have been widely applied in detecting flood inundation, due to their high availability and efficiency. However, there are still several issues that need to be noticed, such as the limitation of time scale of remote sensing data, and the trade-off between their spatial and temporal resolutions. Long time-series of observed hydrological data were integrated with time-series MODIS data to model the spatio-temporal dynamic of flood inundation over a large river basin. Inundation frequencies and probabilities were calculated, estimated and mapped. It was also noticed from this study that sensors like MODIS cannot map inundation accurately due to their coarse spatial resolution. However, higher resolution sensors such as Landsat have a relatively lower temporal resolution which limits their application in continuous and intensive monitoring of flood inundation. We have been working on two approaches to alleviate this dilemma. The first one is to combine the spectral unmixing model and super-resolution mapping method to refine the detection resolution of coarse sensors. The other one is to blend two categories of sensors based on a spatial and temporal adaptive fusion model. Through case studies in different areas, both approaches have been proven to be effective. Higher spatial resolution of inundation detection can be achieved while keeping the temporal resolution.

³ Jiangxi Provincial Key Laboratory of Poyang Lake Comprehensive Management and Resources Exploitation, Jiangxi Normal of University, Nanchang 330022, P. R. China

Abstract

South of Jiangxi Province, abbreviated as Gannan, takes possession of hilly land resource and climate condition which would profitably benefit to cultivate citrus on a large scale. Since the citrus was planted in 1970s, the local government has put forward a series of policies to support the development of citrus planting industry. And nowadays, citrus planting has been a leading agricultural sector in Gannan.

The distribution of citrus in Gannan was mapping with artificial visual interpretation on Google Earth platform. And the spatial pattern such as clustering characteristics, autocorrelation with road network or resident distribution of citrus orchard were analysed with ArcGIS software as well as DEM, road network, and residents distribution. The results showed that : (1) The total area of citrus orchards was increased to nearly 2.249 million mu, and the top three county in citrus area in Gannan were Xunwu, Xinfeng and Anyuan sequentially; (2) Citrus orchard in Gannan was mainly distributed over the mountains and hills with an altitude ranged from 100m to 500m and slope smaller than 20°. But it presented the high altitude and steep slope planting phenomenon. And the planting area in south and southeast is relatively larger than other directions. (3) Citrus orchard was mainly close to roads with distance less than 3km, and to the residential areas with distance no more than 2km; (4) Moran's I index of citrus planting density was increasing when downscaling. And the density of citrus orchard showed autocorrelation spatially.

Analysis of the Landscape Pattern Of Land Use Change Based On TM Images

Hu Hongbing, Zhan Yulan, Cao Xingguang

Huanggang Normal University, Huanggang, 438000, P. R. China, hihuhb@foxmail.com

Abstract

By use of 1990, 2000, 2000 TM remote sensing images and on the basis of analysis for the parameters such as Normalized Difference Vegetation Index (NDVI), Normalized Difference Water Index & Modified Normalized Difference Water Index (NDWI & MNDWI), Normalized construction Index (NDBI) and Digital Elevation Model (DEM), the rules of classify for several land use types including Water, arable land, forest land, construction land and unused land were established. The quantitative and spatial distribution character of land use types during the three periods of Qichun County, Huanggang City, Hubei Province, China were obtained by using of decision tree classification method. And 7 landscape index were select to calculate the landscape pattern and its change from three levels of landscape fragmentation, landscape dominance index and landscape diversity. The results show that: (1) during the period of 1990 to 2010, the area of water and construction land increased by 44.89 km² and 37.63 km² respectively, and that of cultivated land, woodland and unused land decreased by 53.83 km², 33.80 km², and 5.11 km² respectively; (2) land use landscape fragmentation, diversity and evenness index increased, which reflected the influence of human activities on the land use type change increased; Dominance maximum conversed between cultivated land and forest land, which reflected the change of land use type mainly occurred between the cultivated land and forest land; (3) driving force factors of land use landscape pattern and its change were analyzed from the point of natural and man-made reasons.

Analyzing Multi-temporal Land Cover Change Pattern

Jinmu Choi, Minjun Kim

Geography, Kyung Hee University, Seoul, R.O. Korea, cjm89@khu.ac.kr

Abstract

In General, land cover changes have been conducted through direct comparison between two layers from different time, so-called the binary-land cover change detection. Therefore, investigating multi-temporal land cover data are not easy. In this study, we devised a novel change detection method for multi-temporal data. This method requires four step process. First, multi-temporal data will be merged into one file, in which each data element stores a change pattern. Second, change pattern similarity is measured by a sequence alignment method. Third, similar patterns are grouped. Finally, individual groups are interpreted. This novel change detection method not only allows the interpretation of multi-temporal changes, but also provides a method to find where such changes have been occurring. This approach can be applied any type of spatiotemporal change detections.

Land cover; change detection; sequence alignment; spatial query

Automatic Interpretation of High Resolution Remote Sensing Image Based on eCognition

Xue Bei, Liu Changxing, Lin Xiaohu

Xi'an University of Science and Technology, Xi'an, China, 710000, 657087385@qq.com

Abstract

With a multi-scale segmentation technology, the eCognition software's automatic interpretation of high resolution remote sensing image is unique. This paper discussed the multi-scale segmentation and nearest neighbor classification in the remote sensing image auto-classify process, set different parameters, compared and analyzed the segmented results, we can determined the most appropriate parameters and then applied it to the image's interpretation of the typical Karst region, finally get the region's current land using information.

Cropland Reconstruction for Eastern China and Its Spatial-Temporal Characteristics Analysis over the 10th~13th Century

He F N, Li M J

Institute of Geographical Sciences and Natural Resources Research, Chinese Academy of Sciences, Beijing, 100101, P. R. China,
hefn@igsnrr.ac.cn

Abstract

As a traditional cultivated region, eastern China experienced the rapid population increase and the improvement of cultivation technology in the North-South Song dynasty (AD960~AD1279). As a result, the land use intensified gradually and the land cover changed dramatically here. In this study, first of all, by collecting and compiling traditional historical documents, we analyzed the history of administrative settings, population change, land use policies and taxes-related policies in eastern China for AD960~AD1279. Then a method of estimating cropland area based on taxes-cropland data and population data was created. Subsequently, the datasets of cropland area for AD990, 1078, 1102, 1162 and 1215 were reconstructed at *Lu* or *Dao* (*Lu* and *Dao* are province-level political units in the North-South Song dynasty) levels. Finally, the spatial-temporal characteristics of cropland change were analyzed. Major findings of this study are summarized below: (1) During the 10th~13th century, the areas of cropland in eastern China have shown an increasing trend overall. Cropland area increased from $34.33 \times 10^4 \text{ km}^2$ in AD990 to $70.28 \times 10^4 \text{ km}^2$ in AD1215, and the corresponding land reclamation ratio increased from 7.73% in AD990 to 16.89% in AD1215. However, as the population here increased rapidly, per capita cropland decreased from $8.24 \times 10^{-3} \text{ km}^2$ to $4.73 \times 10^{-3} \text{ km}^2$. (2) In terms of the spatial patterns, cropland mainly distributed in the mid-lower regions of the Yellow River, the Yangtze River, and the Chengdu plains. And the land reclamation ratio of these places had been increased obviously. Besides, the land reclamation of northeast and southwest of China had also been expanded.

Key words:

Cropland; reconstruction quantitatively; spatial-temporal characteristics; eastern China; 10th~13th century

Distribution Characteristics of Soil Particle Size and Some Soil Properties In Alpine Ecosystems On The Northern Tibetan Plateau

xiaojia li

Inner Mongolia Normal University, China, 550215021@qq.com

Abstract

The distribution of soil particle size is an important property both in horizontal and vertical that may affect many other soil properties. However, little is known either about the grain size profile distribution in alpine ecosystems on the northern Tibetan Plateau, or about other soil properties. Little data is available for the study areas due to the high elevation. Here we report the results of an investigation of soil profiles at 37 sampling sites on the northern Tibetan Plateau. We provide a description of variation in soil properties with soil depth including grain size distribution, CaCO_3 , soil organic matter (SOM), total nitrogen (TN), total phosphorus (TP), and total Potassium (TK). Base on all of the analytical data we concluded that gravel content ($>2\text{mm}$) in 0-5 cm, 5-10 cm, 10-20 cm, 20-30 cm and 30-50 cm were significant negative correlation with the content of sand (0.1-0.25) and clay (<0.1) in the same layer respectively at 0.01 level in both sides. It had not significant correlation with the gravel content in the depth of 50-70 cm and 70-100 cm. In addition, the content of TN was significant positive correlation with SOM in all depths above 50cm in both sides ($P<0.01$). Finally, the content of TN was significant negative correlation with CaCO_3 content in both sides at all depths above 50cm. The results suggested that soil properties altered with space. These properties could be considered in ecological models.

Extraction of Urban Impervious Surface Information Based on Remote Sensing Image Segmentation

Li M^{1,2}, Zang SY¹, Wu CS¹, Tian Y¹

¹Key Laboratory of Remote Sensing Monitoring of Geographic Environment, College of Heilongjiang Province;

² School of Geographical Sciences, Harbin Normal University, Harbin 150025, China

Abstract

For traditional linear spectral mixture analysis (LSMA), selecting endmember has some problem. To address this problem, segment-based linear spectral mixture analysis (S-LSMA) was proposed. Vegetation, high albedo, low albedo, soil were selected as endmember. Both of S-LSMA and LSMA were applied to a Landsat TM image acquired in Harbin. According to a contrast and analysis, results indicate that the performance of the developed S-LSMA outperforms traditional LSMA techniques, with a mean average error (MAE) of 14.76 %. In particular, with LSMA, the MAE of %ISA has a value of 19.84%, showing a relatively large estimation error. This model can provide a new way for the extraction of urban impervious surface.

Forested Wetlands Mapping of the Great Zhan River Basin Using Optical, Radar, and topographical data

Xiaodong Na, Shuying Zang

Harbin Normal University, China, naxiaodong_8341@163.com

Abstract

Knowledge of the spatial extent of forested wetlands is essential to many studies including wetland functioning assessment, greenhouse gas flux estimation, and wildlife suitable habitat identification. For discriminating forested wetlands from their adjacent land cover types, researchers have resorted to image analysis techniques applied to numerous remotely sensed data. While with some success, there is still no consensus on the optimal approaches for mapping forested wetlands. To address this problem, we examined two machine learning approaches, random forest (RF) and K-nearest neighbor (KNN) algorithms, and applied these two approaches to the framework of pixelbased and objectbased classifications. The RF and KNN algorithms were constructed using predictors derived from Landsat 8 imagery, Radarsat-2 advanced synthetic aperture radar (SAR), and topographical indices. The results show that the objected-based classifications performed better than per-pixel classifications using the same algorithm (RF) in terms of overall accuracy and the difference of their kappa coefficients are statistically significant ($p < 0.01$). There were noticeably omissions for forested and herbaceous wetlands based on the per-pixel classifications using the RF algorithm. As for the object-based image analysis, there were also statistically significant differences ($p < 0.01$) of Kappa coefficient between results performed based on RF and KNN algorithms. The object-based classification using RF provided a more visually adequate distribution of interested land cover types, while the object classifications based on the KNN algorithm showed noticeably commissions for forested wetlands and omissions for agriculture land. This research proves that the object-based classification with RF using optical, radar, and topographical data improved the mapping accuracy of land covers and provided a feasible approach to discriminate the forested wetlands from the other land cover types in forestry area.

Monitoring Urban Growth And Land Use Change Detection With GIS And Remote Sensing Techniques In Istanbul, Turkey

Mehmet Fatih Döker

Sakarya University Department of Geography, Sakarya, Turkey, fdoker@sakarya.edu.tr

Abstract

Geography that examine the relations between human and natural environment has gained a new dimension due to changes in the science and technology in the 21st century. In particularly, developments occurring in geographic information systems and satellite technology have provided rapid and accurately analysing of required data. Today, these technologies are extensively used in the studies of urban geography as well as in many studies. Some of these studies are production of retrospective land cover/use map and definition of urban development by classification of satellite images. The rapidly increasing urbanization process from day to day is becoming a serious problem that affects people's lives. 54% of the world population approximately lives in cities and this ratio is expected to be 66% in 2050. This process of urbanization also brings about spatial changes in the cities. The spatial changes occurring in the cities to ensure sustainable urban development should be well understood and managed. Determination of urban growth of Istanbul is very important for smart growth urban sprawl. Urban development and land use changes cause many problems such as environmental pollution, depletion of agricultural and forest lands, disordered urbanization and industrialization when they are happened unplanned. Determining the temporal and spatial changes to prevent unplanned development and the direction of these changes are crucial to the sustainable management of the complex urban areas. In this study, the spatial growth of Istanbul in the last 40 years has been detected by using Landsat satellite data and this growth has been demonstrated by figures.

Research on Remote Sensing Images Domain Adaptation Learning for Land Use/Land Cover Change detection

Li Y¹, Shao H², Jiang N¹

¹ Key Laboratory of VGE, Ministry of Education, Nanjing Normal University, Nanjing 210023, China

² School of Geomatics, Nanjing Tech University, Nanjing 211816, China

Abstract

Accurate Land Use/Land Cover Change (LUCC) type is crucial for ecosystem monitoring and environmental change studies, automatic interpretation requires adequate training samples, which makes it hard to automatically update the LUCC data in a large scale. Learning from the process of recognizing change information in remote sensing image by human, this research takes full advantage of the existing remote sensing images and LUCC data, combining the theory and methods in domain adaptive learning. Unlike the other traditional methodologies for detection of changes in Land Use/Land Cover, we get the feature changes among multi-temporal remote sensing images by using the object-based approach. Based on feature mapping, the feature changes and the corresponding semantic changes are modeled by using Latent Dirichlet Allocation model (LDA). Here, the spatial-temporal regulation of the change patterns are analysed, which helps to construct spatial-temporal domain and change information transfer knowledge base. Then the transferring mechanism of change information under cooperative constraint of multiple sources and other priori knowledge is analysed to propose the change information transfer model on multiple sources to multiple targets. The results obtained with LUCC data set and multi-temporal Landsat TM data set from 1980s to 2010 at Jiangsu Province, China, confirm the effectiveness and reliability of the proposed method. Our research can provide feasible technology for automatically LUCC data updating and spatial –temporal data mining techniques may have more potential in change detection.

Key words:

Domain Adaptation Learning; Remote Sensing; Land Use/Land Cover; change detection

Semantic Classification Based on Bag of Visual Words and High-order Conditional Random Fields using High-resolution Imagery

B. Zhang, Y.Y. Liu, J. Gong

Dept. of Regional planning and Geo-information technology, China University of Geoscience, Lumo , Street, Wuhan, China,
zhangbin@cug.edu.cn

Abstract

In this paper, a super-pixel-level semantic classification method based on Bag Of Visual Words (BOVW) and High-order Conditional Random Fields (HCRF) is proposed. After the implementation of the image dense SIFT feature extraction, low-level feature descriptors are achieved. Using the BOVW model for low-level feature descriptor decomposition, and then mid-level dictionary feature descriptors are calculated. Max-pooling method is used for smoothing the mid-level feature descriptors after image segmentation. The HCRF model is constructed by the bottom-up costs and top-down costs. The mid-level feature descriptors are used for constructing unary potential belongs to the bottom-up costs, and the distances between adjacent super-pixels are used for constructing pair-wise potential also belongs to the bottom-up costs. The relationship between the visual dictionary and the object category is established for top-down costs after statistical analysis of histogram of the super-pixels. The parameters of HCRF model is estimated by Max-Margin method using training images, and then testing images is automatic classified. Experimental results show that compared with the BOVW-SVM model, this method can achieve higher classification accuracy, and has better effect on shape and edge exaction.

Spatiotemporal Changes of Urban Land Cover and Land Use based on Grid Cell

Approach: A Case Study of Urumqi City

Maimaitijiang¹, M., Alimujiang², K.

¹College of Management, Xinjiang Agricultural University, Urumqi, Xinjiang, 830052,

P. R. China, mamatjan1982@163.com

²Institute of Geographical Science and Tourism, Xinjiang Normal University, Urumqi, Xinjiang, 830054, P. R. China

Abstract

By using Landsat images from 1990, 2000 and 2011, land cover and land use (LCLU) information of Urumqi city were extracted, then these land classification data were converted to 250m×250m vector square grid cells, and establish land cover and land use vector maps of Urumqi city; Based on these vector maps, the proportion of each land cover category within a grid cell area were calculated. Finally, we analysed the spatiotemporal changing characteristics of land cover and land use of Urumqi city from 1990 to 2011 and its driving factors using the proportional land cover maps. The transforming and replacing relationship between different land cover categories were analysed based on correlation and regression methods. The result shows that: ① from 1990 to 2011, Urumqi city experienced rapid expansion, a large amount of bare land and green space were changed to build up area and it increased continuously, meanwhile due to the reasons such as “Greening Barren Hills” project etc., bare land declined continuously and green space gradually increased; ② Land cover and land use shows different changing trends in different area and direction within the study region due to the impacts of topography, policy, urban planning, and road system etc.; ③ Based on the grid cell approach, we can not only analyse the overall changing characteristics of land use, but precisely quantify the spatiotemporal changing characteristics of different areas and directions within the study region and its driving forces.

Key words:

land cover and land use; grid cell; spatiotemporal change; Urumqi city

The Change of Landscape Pattern in Jilin City and Its Effects on the Climate During 1980 to 2010

Zhang Li, Zhao Dandan, Liu Jiping et al.

College of Tourism and Geography, Jilin Normal University, Siping, 136000, P. R. China, zli_76@163.com

Abstract

Using ArcGIS, ENVI, Excel and FRAGSTATS, the authors make use of the number of patches, patch density, largest patch index, perimeter-area fractal dimension, aggregation index and the Shannon diversity index to analyze the landscape pattern of Jilin City in 1980, 1995 and 2010 respectively. The analysis shows that during 1980 to 2010, the number of patches, patch density, perimeter-area fractal dimension, and Shannon diversity index increased first and then decreased, aggregation index decreased first and then increased, largest patch index has increased in Jilin City. The areas of forest and grassland landscape have been reducing all the time, the area of wetland had increased first but reduced afterwards, and the area of dry landscape had expanded. Under the background of climate change in northeast China, the change of landscape pattern has a certain effect on the climate of the Jilin City. In this area, the temperature increased and rainfall decreased. This study provides a scientific basis for the regional landscape ecological evaluation and landscape planning and management. There has the good relationship between the change of landscape pattern and the spatial distribution patterns of the temperature and rainfall of the Jilin City.

Key words:

The Effects of Gentrification Phenomenon on the Neighboring Areas-Focused on the Hongik University Area-

Hye-won Do, Se-eun Oh, Byung-seol Byun,

Department of Urban Planning, Inha University, Incheon, Korea, qwer13asdf@naver.com

Abstract

Gentrification is a phenomenon in which people in the middle class living in the suburbs return to the deteriorated downtown areas causing the increase in the land price as they are revitalized by the government policies and artists' activities, and as a result, native residents who cannot afford the rising capital leave the revitalized downtown areas while the functions of downtown areas performed by outside capital are commercialized. For example, gentrification appears in the Hongik University area in Korea which has a highly artistic and cultural spatiality. In other words, an expansion of the excessive commercialization of the area boosts the price of rent and land, which in turn forces artists who can ill afford to pay the rent to leave the area.

Thus, this study aims to analyze the changes in the price of land of 16 dongs located in Mapo-gu, Seoul with focus on the Hongik University area where gentrification appears. Through this, this study seeks to determine how much influence the changes of the hike of the land price caused by gentrification have on the increase of land price in the neighboring areas and how extensively such changes are transferred to them. This analysis may present some policy implications for Seoul's urban regeneration projects.

Key words:

gentrification; commercialization; changes in land price; Hongik University

The Relationship between Forest Cover and Water Balance in the Upper Basin of Jiu River, Romania

Moroşanu Gabriela Adina

University of Bucharest, Faculty of Geography, Bucharest, Romania, gabriela-adina.m@gmail.com

Abstract

In the context of natural and man-influenced forest and water changes in the environment, recent research advances in watershed hydrology highlight the strong connections between forest cover dynamics and water balance. In this paper, we intend to examine the influence of the forest management and forest cover extent on the hydrological and hydro-morphological dynamics in the upper part of Jiu River Basin, situated in south-western Romania. The upper basin of Jiu River is located between the Meridional Carpathians and Getic Sub-Carpathians, including Petroşani tectonic depression, a vast coalfield whose planning in the last century meant a series of interventions in terms of pine and beech forests found here, as well as soils and hydrology. On the background of the direct and indirect man-influence, the study focuses on one side, on the institutional aspects in control landscape conservation in the upper part of Jiu Watershed, and on the other side, on the stream – flow processes as a response to the forest practices and management of water resources and extreme phenomena. This interdisciplinary research is sustained by a field study and a cartographic analysis. To achieve this, satellite images and Corine Land Cover database were employed. Overall the study has shown the existence of a relationship between forest cover changes and water balance and humidity content. In most cases where we zoomed in our analysis, we could highlight, therefore, the interplay forest cover dynamics and hydrological processes in the upper basin of Jiu River.

Key words:

Forest changes; catchment hydrologic response; Jiu River

The Use of Land- Surface Parameters extracted from the Digital Elevation Models of Republic of Turkmenistan

Nurgeldi Arbatov¹, Associate Prof. Dr.Akif Karatepe²,

¹Masters in the University of Sakarya, Faculty of Ard and Science, Department of Geography, narbatogly@gmail.com;

²A Member of the University of Sakarya, Faculty of Ard and Science, Department of Geography

Abstract

Geographic Information System (GIS) has an important instrument visualization and analysis of spatially oriented data. Using GIS, we can easily show terrain features of any study areas. Applications of GIS in Physical Geography studies have been rapidly increasing since the 1990s with spreading of the “Desktop GIS” in worldwide. Providing of Digital Elevation Models (DEM) at various resolutions has facilitated this trend. GIS and DEM have enhanced the cartographic representation of any kinds of landforms.

Digital Elevation Models are data files that contain the elevation of the terrain over a specified area, usually at a fixed grid interval over the surface of the earth. Common uses of DEMs include; extracting terrain parameters, modeling water flow, creation of relief maps, rendering of 3D visualizations, surface analysis (slope, aspect etc) and many more.

The aim of this study, to provide the terrain features of the Turkmenistan. In this context, ArcGIS 10.2 software, its 3D and Spatial Analyst extensions have been used to create database and analysis them.

Key words:

DEM; GIS (Geographic Information Systems); Land Surface Parameters; Republic of Turkmenistan District.

Land-Cover Types Classification and Mapping for Irkutsk City in Siberia Region

Martynova, A.E.¹, Solodyankina, S.V.^{1,2}

Irkutsk State University¹, The V.B. Sochava Institute of Geography SB RAS², Irkutsk, Russia, nastyama95@mail.ru

Abstract

Traditional landscape approach is an important part of land-cover mapping in Russia. Since different regions have different landscape's hierarchy, it is impossible to use one classification for all the regions. We tried to analyze the correlation of such concepts as: land cover, landscape, geosystem, habitat. Habitat is terrestrial or aquatic areas distinguished by geographic, abiotic and biotic features, whether entirely natural or semi-natural. Geosystem is a natural system, which accommodates urban elements and affects on their structure. It is a holistic terrestrial unit, integrated by flows of substance, energy and information. Landscape is a part of the Earth's surface, which is shaped by natural conditions and formed by human influences. Since the terms have close meanings, it is necessary to specify which term needs to be taken for certain aim. So, we defined land-cover as the complex of biotic, abiotic and cultural components on the Earth's surface. The aim of this study is to compile the classification of terrestrial units for Irkutsk city urban area which can be used for complex and narrow purposes, for example, for research of soil or vegetation and their changes, as well, for spatial planning. Irkutsk (large regional center) is located on the South of Eastern Siberia near Lake Baikal. Accepted in European Union CORINE Land Cover and EUNIS habitat classification don't have data for the studied area. In our research, we elaborate a synthetic approach with using CORINE and EUNIS database and conception of geosystem to classify the Irkutsk's city terrestrial units.

Land use change detection and prediction in Alexandria, Egypt using satellite images and SLEUTH Model

Azaz, L.K.

Geography Department, Faculty of Arts, Menofya University, Menofya, Egypt, Lotfy_Azaz@yahoo.co.uk

Abstract

In 1905, Alexandria's 370 thousand inhabitants lived in an area of about 4 km². Since that time, the city has expanded rapidly, eastwards and westwards. It presently occupies a built-up area of about 300 km² and has a ten-fold increase in population at 4 million in 1996, and become 4.7 million in 2014. This increase in population leads to significant Land use change. Land use change were detected using Landsat (TM) images of 1984 and 1993. The images were classified using a customised classification scheme with accuracy of 93.82% and 95.27% for 1984 and 1993 images respectively. This high accuracy enabled detecting land use/cover changes with high confidence using a post-classification comparison method. One of the most important findings here is the loss of cultivated land in favour of urban expansion. Prediction of future land use change was implemented using SLEUTH urban growth model. The application of this model in Alexandria of Egypt with its different environmental characteristics is the first attempt outside USA and Europe. If the current loss rates continued, 75% of green lands would be lost by year 2191. The results revealed that future urban growth would continue in the edges of the current urban extent, which means the cultivated lands in the east and the southeast of the city will continue to lose more day by day from their area. These hazardous rates call for an urban growth management policy that can preserve such valuable resources to achieve sustainable urban development.

Key words:

Alexandria; land use change; urban expansion; satellite images; change detection; image classification; Landsat (TM) ; future land use change ; SLEUTH model; urban expansion

Between Discourses, Landscapes and Power Relations: the Invention of Florianópolis as a Tourist City Since the 1970s

Lenzi, Mh

State University of Santa Catarina, Florianópolis, Brazil, prenom.marie@gmail.com

Abstract

Initially considered as an activity that would revive economic and urban growth in Florianópolis, the capital of Santa Catarina state, in south Brazil, tourism became a truth inherent to the city. Beyond the exclusively economic sphere, tourism came to guide a set of rules about the forms of seeing and enunciating the city, orienting meanings about its landscape and its urban and economic guidelines and to compose the socio-environmental conflicts that spread through the city. With the objective of investigating the process of inventing Florianópolis as a tourist city, I analyze the relations of power and the discursive construction about tourism in the city since the 1970s. For these analyses, I establish a dialog with theoretical concepts of Michel Foucault and James Duncan. From this perspective, I explore the historic conditions of the emergence and transformation of practices, institutions and discursive strategies and I analyze media narratives found in newspapers, magazines and advertising, as well as urban and tourist legislation. This set of discursive production, interwoven to the power relations, composes the landscape of Florianópolis and participates in the invention of the tourist city. The landscape, in this study, is understood as a discourse, and is therefore mediated by power relations. In this way, the landscape is analyzed considering political choices and arrangements and tensions between the various social groups that dispute power and the use and signification of space.

Key words:

tourism; discourse; landscape; urban space; power relations

Challenges of Land Use Planning In Metropolitan Areas in Latin America: Experiences From an Applied Case Study in Guadalajara (Mexico).

Pfannenstein B.

University of Passau, Bavaria, Germany, bernd.pfannenstein@uni-passau.de

Abstract

The process of land use planning in Mexico is mainly the local municipality's responsibility. Therefore, it appears to be an isolated task field focused on individual needs and interests. In the case of the metropolitan areas, which consist of more than one municipality in their geographical size, the particular local perspective on land use planning seems to dominate the possible efforts as a community. In these cases, the key challenge is how to achieve an agreement on such a controversial issue like land use planning?

With 4.86 million inhabitants, the Metropolitan Area of Guadalajara is the second biggest city in Mexico and includes nine municipalities. It has served as an experimental area on how to accomplish the unification and standardization of the legal instruments of land use planning on a metropolitan scale. The paper will describe the process, the challenges and the solutions for the creation of the Metropolitan Land Use Plan in Guadalajara. A key step in realizing this goal in collaboration with the local Metropolitan Planning Institute has been the implementation of Geographic Information Systems for the construction of a consultable georeferenced database. A change of paradigm away from isolated local planning towards intermunicipal coordination was needed. The results of this applied case study will serve as a significant experience in the Geography of Latin American Cities and on research in the subject of Metropolitan Land Use Planning.

Key words:

Metropolitan Planning; Land Use Planning; Geographic Information Systems; Guadalajara; Mexico.

Gang Territorial Demarcation in Downtown Belo Horizonte, Brazil: the Role of Graffiti

Diniz, Alexandre Ma; Ferreira, Rodrigo G B; Alcantara, Sergio A

Geography Graduate Program - Pontifical Catholic University of Minas Gerais - Brazil

alexandremadiniz@gmail.com

Abstract

The city of Belo Horizonte, Brazil is home to an intense and ubiquitous competition for its walls, facades and public monuments, in which numerous agents working individually or in gangs tattoo the urban landscape with graffiti interventions demarcating the extent of their territories. Graffiti raises a number of social conflicts as the practice is not understood, let alone, accepted by the local population, being treated by the Brazilian State as environmental crime. This research cataloged and mapped the phenomenon in downtown Belo Horizonte searching for spatial patterns and territorialities. The study was based on primary information gathering, cataloging and data mapping, working with places, styles, instruments and the nature of graffiti. Results demonstrate the presence of several graffiti gangs operating in downtown Belo Horizonte. Nonetheless, the geographical distribution of this urban phenomenon is highly uneven, as certain areas of the city are more sought out than others due to the greater visibility they offer to graffiti interventions, especially around street corners and squares. The top of tall buildings are also highly praised by graffiti gang members as they are perceived by other gang members as acts of great bravery. Conversely, certain public buildings, bohemian zones and more policed areas display far less graffiti.

Paths And Routes of People Matsigenka: from Isolation to Community

Dra. Martha Rodríguez Achung

Pontificia Universidad Católica del Perú. Department of Social Sciences. Av. Universitaria 1801, Lima 32, Perú.

mrodrig@pucp.pe

Abstract

This paper discusses the history of territorial displacement of families Matsigenka

(Etnolingüístico Arawac Group), study paths, trails, rivers and streams that refer to their origins and their family and staff mobility to reach the Lower Urubamba (Cusco) located on the eastern slopes of the Cordillera de los Andes Peru or Amazon. Its high spatial mobility made its territory is broad, covering a space of several watersheds, the Alto Manu east, the Madre de Dios River to the south, west and Apurimac River north Mishagua. Territory characterized as one of the most important biodiversity hotspot in the world where currently the Camisea gas megaproject is developed.

Several studies agree that the Matsigenka village has an ancient history dating back at least five thousand years before our era; that is to say, is an ancient town that was never conquered by the Inca Empire. Today this population lives in population centers and have territorial rights in the form recognized by the Peruvian State Native Communities.

This paper is part of research on access and use of natural resources by indigenous communities, conducted during the last 20 years in Matsigenkas communities.

Key words:

Indigenous rights; occupation of space; employment land; biodiversity

Principal Nuclei, Major Flows and Primary Areas of the Tourism Economy in Central America: A Geographical Interpretation

Sanchez-Crispin, A, Propin-Frejomil, E

Institute of Geography, National Autonomous University of Mexico, Mexico City, Mexico, asc@igg.unam.mx

Abstract

The aim of this presentation is to reveal the territorial arrangement of tourism in the Central American region, nowadays. In the last decade, we have carried out research on the Geography of tourism in this part of the Americas and have come across interesting territorial structures of this type of economy, in each and every one of these countries. In this presentation, we firstly depict the existing natural basis (beaches, volcanoes, lakes, tropical forests) onto which the promotion of tourism has recently occurred. We then examine some of the policies these countries have collectively undertaken, in order to position tourism as a major foreign exchange earner and employer in their own lands. Official tourism statistics as well as data collected during numerous fieldworks in all Central American countries were used to produce thematic cartography concerning this investigation. The presentation of key research findings includes the disclosure of pivotal tourism centers in the region (Panama City, Guatemala City, San Jose); the identification of dominant tourist flows towards Central America (both from the United States and from within the region itself) and the areas that have been fundamental for the growth of tourism in the last years (Atitlan lake, Bay Islands in Honduras, the Central highlands of Costa Rica). We close up with a reflection on how these countries will convene the challenges emerging from the put in practice of the new forms of the tourist economy and how this will originate new territorial arrangements within their own boundaries.

Key words:

Central America; tourism; tourist flows; mapping tourism

Production of Public Space: Citizenship and Access to the City. A Study of The Trajectory of Squares in Florianopolis/Brazil

VAZ, M. J.

Universidade Federal da Fronteira Sul, Erechim, Rio Grande do Sul, Brasil, murad.vaz@uffs.edu.br

Abstract

Seeking to comprehend how the understanding of citizenship and public space can be read and interpreted within the city, this is an study about the public space of Florianopolis, Brazil, focusing on its squares. The implantation process of the studied spaces was analyzed through periodization, location, and understanding of the mentioned spaces by legal plans and laws. This analysis provided the study with a solid base to the discussion about the two factors we are interested in when talking about public space in planning process: the physic condition and its importance as an urban agent that connects people as public sphere, a key theme in Latin American discussions. By the “progressive-regressive” method (H.Lefebvre), every finding for each specific space provided a set of information which composed a broader look at the city’s network of public spaces. This approach allowed to look at the intrinsic connection between public spaces intended for collective use and the dynamic of urban occupation. These variables are directly and reciprocally related to the utilization of public spaces by citizens or their obsolescence. The city is a mediation of a set of factors resulted from socioeconomic and cultural processes associated to its location in the urban environment. This confirms the assertive of the public space not being neutral, assuming that its trajectory is influenced by conflicts and resistance. Through the geographic analysis, the concept of square directs us to different paths to be pursued in future studies, which can elucidate the logic of the urban construction.

Segregation and Spatial Forms in the Last Planned Town of the Twentieth Century: An Analysis of Urban Space in Palmas (Brazil)

Costa, A.S.V, Kraus, L, Oliveira, F.M.A, Souza, S.C

PhD Student in Urban and Regional Planning, University Federal of Rio de Janeiro, Rio de Janeiro, Brazil,

alsvcosta@gmail.com

Abstract

The question of this paper is to understand how the spatial forms within the town, reproduces segregation ratios, even when it comes to a new town, as Palmas. Palmas is the last planned town of the twentieth century in Brazil, it is capital of the province Tocantins, and is located in the northern region of the country. Although being a "planned" in the original design and have a proposal for social integration, there are spatial forms that reproduce old paradigms of production of urban space, and do not provide the right to the city to the whole population town. As spatial forms that help maintain segregation ratios considers the full production of residential condominiums, which is changing the landscape of the town which is becoming more vertical, and turns into a mechanism of social distinction. However, the verticalization as spatial form produces a symbolic structure by creating a distinction, it produces collective imagination that act as a barrier to the full right to the city. On the contrary, what you can see is a fragmentation of the town that can be read through some elements from the spatial distribution of residential quarters to the location of neighborhoods and today real estate investments that are changing the landscape town. At the same time, the fact that attracts attention is that the verticalization in Palmas is an early process, and answer the interests of capital, and its actors, unrelated to the need for the town and the population.

Key words:

production space; residential segregation; verticalization; planned city; Palmas; Brazil

Social And Environmental Transformations in Indigenous Lake Basins; Cases of PÁTzcuaro, Mexico and Atitlán, Guatemala From 1990.

Reséndiz, Tonatiuh

National Autonomous University of Mexico, Mexico City, Mexico. in.teotl.in.yolotl@gmail.com

Abstract

From the 1990s a series of aggressive changes in public policies focused on agricultural development in Latin America began. The speed of this change has brought a number of social conflicts arising from the application of outside indigenous world; migration, spoilage on the geographical environment and failed public policies are a constant. This had a negative effect on local economies, additionally the environment in both regions was affected gradually, and this is reflected in reduced biodiversity in addition to the worrying proliferation of pollution and excessive logging. The factor of intensive tourism also contributes negatively on lake ecosystems as it enters in conflict over water disposal. Cases of ethnic Purépecha in Michoacán, Mexico and Tzutujiles in Sololá, Guatemala will be analyzed.

The Time-Use Survey as a Method to Assess the “Harmonious Society” within the San Juan Metropolitan Area, Puerto Rico

Guilbe, C., Velez M.

College of Social Sciences, University of Puerto Rico, San Juan, PR, 00931 carlos.guilbe@upr.edu

Abstract

Time- Use Surveys (TUS) are becoming an important source of primary data and information about daily activities within a geographical area. TUS provides a more nuance understanding of the population and the existing urban dynamic in the Metropolitan Area of San Juan. This work presents the data obtained by the first TUS done in Puerto Rico. To obtain this data, the subjects were asked to disclose what they have done since they woke up until the time they went to sleep. Each of these activities were coded into different categories which included personal hygiene, shopping, community involvement, and education, etc. Mapping daily activities gave us a broader scope in understanding the urban structure of San Juan and its hinterland. Furthermore, it shows the differences in class, gender, and age in their relationship with time and space, revealing important patterns and its relationship with the physical environment. This paper concludes by discussing methodological and empirical challenges of this work, while also proposing new lines of research and public policy, which could include urban planning, transportation and labor policies, among others. Finally, we propose that a coherent view of the individual in relation with his/her use of time-space can informed better policies towards a greater harmonious society.

Venezuelan Amazon: A Perspective From Environmental And Social Processes Of Indigenous Peoples

Becerra, Melgris José ¹ ; Pirela, Germán ²

¹ Licenciado en Geografía, Facultad de Humanidades y Educación, Universidad Central de Venezuela,

jose.becerra.ruiz@gmail.com

² Licenciado en Antropología Mención Social y Cultural, Facultad Experimental de Ciencias, Universidad del Zulia.

Abstract

The Venezuelan Amazon is a region that accounts for about 417. 528 square kilometers of the total area of the national territory, the territorial space has a vital importance in terms of biodiversity globally. With respect to its geological formation is due to characteristics that correspond to the call Guyanese Shield, in this sense, it has a particular geographic location in which they have ancestrally made life different indigenous peoples of different linguistic-cultural families whose modes life have maintained a dialectical relationship with nature, allowing them to establish an appropriation-meaning and delimitation of this spatiality for the use and exploitation of its territory. This research methodologically built with documentary resources and specific experiences about the everyday processes of grassroots indigenous organizations from the technical support the existence of a vision of the future of the territory which is marked by the right to a defense and preservation then seeks to identify a way to advance research in the midst of these dynamics.

Key words:

Venezuelan Amazon; biodiversity; indigenous peoples.

Women and Agrarian Reform Policies in Brazil

Franco García, M., Lois González, R.C.

Department of Geography, Federal University of Paraíba, João Pessoa, Brazil, mmartillo@gmail.com

Abstract

In Brazil, historically prevented the access to the ownership of land to generations of women farmers and workers.

Until the 2000s the legal obstacle that excluded the peasant women of the agrarian reform policies, was the way the land titles were issued. While these policies consider the family as the beneficiary, the title or land deed was granted on behalf of the 'father' of the family.

Inequality began to be changed from 2003 to Ordinance No. 981 and Normative Instruction No. 38 of the National Institute of Colonization and Agrarian Reform (INCRA), which made it mandatory joint titling of lots in rural settlements.

This mechanism has strengthened in the last fifteen years, the right of women to land, and have allowed access productive credits, participation and development of cooperatives. Our aim in this article is to analyze the implications of changes in recent agrarian laws in the lives of rural women and their communities.

Key words:

agrarian reform policies; women; Brazil

Revanchism in the northern Mexican border: the violent production of a violent city

Santos, M. L. S.

The University Edinburgh, Edinburgh, s1583098@sms.ed.ac.uk

Abstract

Ciudad Juárez, the birthplace of the Maquiladora Industry in the mid-1960s, won the international newspapers' headlines since the 1990s as a spot of endemic violence in the northern Mexican border. The territorial stigmatization of Juárez became even stronger after the unprecedented upsurge of criminality from 2008 to 2010, when it was considered twice the world's most violent city. This violent context is often considered the result of cartels disputes and hence of the 'narcos' (drug traffickers), responsible for degrading the city. The neoliberal politics of representation of these 'undesirables' is the mainstay both of the zero tolerance policing and the gentrification process that has taken place in Juárez since 2011. These two urban policies are claimed by the official discourse as the main reasons for the recovering of the seemingly unending cycle of violence that Juárez faced until 2010. Nevertheless, the narrative of 'rescuing' of the city image from the domain of narco-violence, vocalized by decision-makers and hegemonic journalism, contradictorily mobilizes different levels of violence in its formulation. What connects these different kinds of violence is a legitimization discourse that melds a global and a local revanchism. This paper analyses it by describing how the interactions between four expressions of violence (structural, political, symbolic, and everyday violence) in the zero tolerance policing and gentrification policies has violently produced a new space in Ciudad Juárez during the last five years.

Key words:

revanchism; Ciudad Juárez; gentrification; zero tolerance policing.

Same But Different: the Geography of a Large Brazilian Prison

Ludmila Ribeiro¹, Alexandre Diniz², Victor Oliveira³

¹Sociology Graduate Program - Federal University of Minas Gerais - Brazil. ludmila.ribeiro@gmail.com

²Geography Graduate Program - Pontifical Catholic University of Minas Gerais - Brazil

³Sociology Graduate Program - Federal University of Minas Gerais - Brazil.

Abstract

The purpose of this paper is to present the geography of one of the largest maximum security prisons in Brazil: Nelson Hungria prison (PNH), in the municipality of Contagem, Minas Gerais, Brazil. The PNH houses between 1900 and 2000 prisoners, while its carrying capacity ranges from 1800 to 1850 prisoners. Structurally, PNH is organized in 12 pavilions where convicted prisoners are housed. It is within these pavilions that the geography of arrests happen. Pavilions 1 and 3 are for prisoners associated with a major criminal organization called First Command of the Capital (PCC). Pavilion 2 is for prisoners considered dangerous; pavilions 7,8 and 9 are for prisoners who work inside the unit; whereas pavilions 4, 5, 6, 10, 11 and 12 house the remaining convicts. In addition to these 12 pavilions, PNH relies on a few structural annexes, which rely on a more sophisticated infrastructure, such as, showers with hot water for inmates. Annex 1 is for prisoners of the Federal Police, that is, individuals who have been convicted of transnational crimes, mostly, drug trafficking. Annex 2 is for convicted public security professionals(civil police, prison guards, guards Municipal, Military). Finally, Annexes 3 and 4, function as relocation sites for pre-trial detainees, where more than eight inmates are found within each cell, whose carrying capacity is only four. Behind the Geography of PNH lies a number of special meanings regarding who the prisoners are; how their social networks are built or deconstructed; and about the sources of differentiation in terms of access to goods and services, mainly expressed through the communication channels with prison officers.

The Spatial Impact and Territorial Expansion of Residential Gated Communities in the Metropolitan Area of Guadalajara (Mexico)

Pfannenstein B.

University of Passau, Bavaria, Germany, bernd.pfannenstein@uni-passau.de

Abstract

With 4.86 million inhabitants, the Metropolitan Area of Guadalajara is the second biggest city in Mexico and includes nine municipalities. The social exclusion and the expansion of residential gated communities has evolved in a dynamic and complex way. There is a new reality: the gated and exclusive city.

More than eleven percent of the metropolitan urban area are occupied by these protected urban residential areas. For the municipality of Zapopan the number is more than 17 percent. More than ever, the walls of segregation impact city planning and the concept of public space. The “success” of gated residential areas is promoted by the local housing market and a deficiency of public policies.

A key goal of the research project has been the implementation of Geographic Information Systems for the construction of a consultable georeferenced database of gated urban areas. The conclusions focus on a classification and an evaluation of the social and territorial impact of the gated communities and its influence on urban planning and the urban society.

There is an urgent need for a paradigm shift to a model of urban development based on the needs of the urban community and not the particular benefit of an elite and semi-elite social class. Walls will not solve social issues, they will make them worse. The results of this applied case study serve as a significant input for public decision makers on the combat of residential segregation, its influence of the urban day to day context.

Key words:

Gated City; Segregation; Gated Communities; Social Exclusion; Guadalajara; Zapopan; Mexico.

Environmental Problems of Drag and Hydraulic Extraction of Placer Deposits

Govorushko S.M.

Pacific Geographical Institute, Far Eastern Federal University, Vladivostok, Russia, sgovor@tig.dvo.ru

Abstract

The drag and hydraulic development of placers impacts surface and underground waters, hydrobionts, condemnation of land, atmospheric air, soils, vegetation, and terrestrial animals.

The influences on surface and underground waters are related to the following factors: (1) operations are carried out in the overflow lands and valleys of rivers; (2) technology provided for the displacement of watercourse channels, and their blocking by dams and banks, disturbs the natural hydrological regime; and (3) when rocks are excavated with dredges, water is contaminated, and drainage flows contain heavily precipitable mineral particles.

Impact on hydrobionts related to high concentrations of the suspensions that reduce illumination and the productivity of phytoplankton. Fine suspensions that are deposited in river channels deprive fish of their spawning grounds, and they prevent small aquatic fauna from seeking refuge between stones.

The condemnation of land is great due to creation quarries, dams, dumps of barren rocks and flushing tailings. The atmosphere is polluted mainly during drilling and blasting operations, as well as due to dust from rock dumps. The effects on soils consist of the destruction of the humus layer during construction of structures, blocking with dumps, and contamination of soils with dust.

The effects on vegetation occur when the placer is cleared of trees, and bushes; difficulties in photosynthesis, growth, and development of plants in adjacent territories result from the pollution of plant leaves with dust.

Key words:

Placers; drag and hydraulic extraction; environmental impacts; natural components

A Comparative Study of the Regional Comprehensive Economic Strength

Meng,s

Shandong Normal University, Jinan,250013,P. R. China,1625974924@qq.com

Abstract

The regional comprehensive economic strength is to measure the important symbol of regional economic development level. This article is mainly from the economies of scale and quality, innovation ability, economic strength and economic influence, which the evaluation index system is constituted by the 13 indicators. The comprehensive economic strength of 17 cities in Shandong province comprehensive was ranked. Firstly, the variation coefficient method and the traditional TOPSIS method was united in this article. Secondary indicators in Every city were evaluated. Secondly, the comprehensive economic strength of every city was ranked by the factor analysis and cluster analysis method with the sociological statistics software SPSS 19.0.. Qingdao, Jinan and Yantai were in the top, and the economy comprehensive strength of Weifang, Zibo, Jining, Linyi, Dongying and Weihai is powerful and pull the main force of economic development in Shandong province. The Taian, Binzhou, Dezhou, Heze, Liaocheng and other regions were weaker, which belongs to the underdeveloped areas. The imbalance of economic development in Shandong province have been obtained. Finally, the balance development countermeasures of more developed, developed, potential and underdeveloped regions by the clustering analysis were put forward, which have great significance on the optimization and upgrading of economic structure of Shandong province.

Key words:

the comprehensive economic strength; TOPSIS method; factor analysis; cluster analysis

A Geo-spatial Analysis of The Ski Resort Development Using GIS and Micro-geodata

Daisuke Shiozaki, Yuichi Hashimoto.

Hokkaido Univ, Sapporo, Japan, integra@eis.hokudai.ac.jp

Abstract

This study aimed at clarifying development of ski resort area in Niseko and Kutchan town where ski and snowboard players who come from Australia and Asia put a high value on powder snow. Spatial structure near ski resort is transformed by constructing many buildings. This study analyzed in time series the number and area of the building in the Niseko area since 1995 at first. Analyzed data were following; address of developer, location of buildings, site area, intended purpose, floor number. Second, it analyzed spatial structure transformation using data which were location and site area of buildings. The results are as follows. 1) Although before 2004, development area near station was larger than area near ski resort, ski resort area has developed more than near station since 2004. In 2008, developments near Niseko Grand HIRAFU-Ski Resort were most numerous in Niseko area. 2) Developers promoted land high-level because of limitation on land use. 3) Niseko town completed to equip with network infrastructure as IRU of OPTICAL LINE. Furthermore, it started to equip with wireless network infrastructure as Wi-Fi. This study concluded that Niseko area was seemed to be more evaluated by foreign tourists, and increased developments.

malabikabiswasroy@gmail.com

⁴Associate Professor, School of Water Resources Engineering, Jadavpur University, Kolkata, India

Abstract

Community based forest management (CFM) is a widespread and practised management system in India. But this type of forest management is complex and difficult to apply due to the pluralistic view of different stakeholders. CFM also change its' characteristics based on the different types of forest, climate, and landforms. In this paper the community based forest management of two different forests are analysed through multi criterion analysis (MCA). The man-forest dependency is also studied in this regards. Two different forests, in respect of climate, landforms, species combination and nature, are selected for study. The first one is a dry deciduous forest- Bankadhaha Forest and other one is evergreen forest- Neora Valley Forest. MCA offers an analytical environment where multiple goals, objectives, perspectives can be judged and discussed collectively and holistically. The CFM of these two forests is analyzed comparatively on the basis of a set of indicators. Through the study, it is evident that the better forest management is associated with more involvements of local communities in management system. The participation of local people is necessary to manage the natural resources. Involvement in forest management is more viable and effective approach than restriction of forest.

A New Approach for Planning and Environmental Policies in Regional Development: As a Case Study Southeastern Anatolia Project (GAP) in Turkey

Dr.Bulent Acma

Anadolu University, Department of Economics, Unit of Southeastern Anatolia Project(GAP), Yunusemre Campus

26470 Eskisehir/TURKEY, e.mail:bacma@anadolu.edu.tr

Abstract

The Republic of Turkey has a special place in the Mediterranean Region from the respects of both its social-economic structure and its geo-politic and geo-strategic importance. It is also a model for the Middle East Countries by combining the traditional and modern life styles. The Southeastern Anatolia Project (GAP), one of the most ambitious regional development project, is open to both planning and environmental developments. It has been carried out as a human resources by developing irrigation and energy project. This project is expected to cause important changes and transformations in the region when it is completed. The Southeastern Anatolia Project (GAP), an important project to develop the remarkable natural resources of the world, is accepted as a change for getting benefit from rich water and agricultural resources of the Southeastern Anatolia Region for Turkey and the region. Major reasons of developing such an integrated regional development project can be expressed as follows: The undeveloped social-economic and cultural structure of the region, rich but unvalued natural resources and geo-political situation of the region. Recently important strategic and political changes came into consideration. Especially, the concept of sustainability of the development has become dominant for this project; Beside physical developments, some concepts such as planning and environmental have started to become main topics. The purpose of this study is to make clear the basic components of the project and developments, and to put forward the circumstances of obtaining sustainability of development. It is also aimed to analyse the processes which are being applied. In the first section of this study, the Southeastern Anatolia Region and Southeastern Anatolia Project (GAP) a brief historical development will be introduced. In the second section the concepts of planning and environmental which are being processed in the GAP Project will be explained and its human related and social dimensions will be analyzed. In the last section the basic frame of the structure with which will be changed and developed is going to be analyzed. In this section proposals and approach necessary for the success of the project will be presented within planning and environment concepts.

A New Approach to the Identification of Regional Specialisation. is Space

Important?

Churski P.¹, Kopczewska K.², Ochojski A.³, Polko A.³

¹ Adam Mickiewicz University, Poznań, Poland, chur@amu.edu.pl;

² University of Warsaw, Warsaw, Poland;

³ University of Economics in Katowice, Katowice, Poland

Abstract

In economic and geographical research, regional specialisation is usually identified with a region's unique economic activity affecting its development in a permanent and significant way. Its identification, however, is not systematised, whether in terms of definition or measurement. In the literature three concepts are usually employed here: agglomeration, concentration, and specialisation. They are often used interchangeably, which is unjustified and leads to terminological chaos and loss of clarity concerning the specific nature of those phenomena. This paper seeks to systematise the concepts and measurement methods concerning regional specialisation. The authors propose a systematisation of its definition and measures based on an integrated approach with a complementary use of spatial agglomeration and sectoral concentration notions. Another goal is to systematise measurement methods employed in the literature. A value added is the proposal of a new spatial agglomeration measure, the Spatial Agglomeration Index (SPAG), which allows examining the spatial heterogeneity of firms when measuring regional specialisation, and thus its better identification. Apart from systematising definitions and measures, much attention is also given to interpretation-application challenges involved in the use of the regional specialisation conception in development policy practice (e.g. place-based policy, smart specialisation), emphasising the need for it to accommodate the integrated approach proposed. The paper synthesises final results of the project Statistical models to identify regional specialisation including the spatial heterogeneity component, financed by the Polish National Science Centre as a research project in OPUS 6 call, contract no. UMO-2013/11/B/HS4/01098. Its full results can be found in the monograph *Measuring Regional Specialisation: A New Approach*, published by Palgrave-Macmillan.

Adoption of Integrated Farming System and Sustainable Management of Local Resources: An Experience from Indian Sundarban Delta

Mondal, T.K.

Department of Geography, University of Kalyani, Kalyani-741235, Nadia district, West Bengal, India,
mondaltarunkly@gmail.com

Abstract

Sundarban delta is the largest estuarine delta in the world lying at the confluence of rivers Ganga, Brahmaputra and Meghna. This delta region, identified as one of the worst climate change hotspots, is prone to severe natural calamities i.e. cyclones, tidal surges, floods. Moreover, remote location and economic backwardness have induced extreme poverty and hunger among the inhabitants. However, in spite of adverse agro-ecological conditions, agriculture is the mainstay of rural livelihood in this delta due to limited opportunities for other economic activities. To cope up with these challenges, farmers of this delta have introduced integrated farming system to sustain their livelihood. In this context, an attempt has been made in this paper to analyse the role of integrated farming in the sustainable management of local resources in this delta region. Altogether 200 households practicing integrated farming from eight villages in this delta have been surveyed through structured questionnaire. Eight Focus Group Discussions, one from each village, consisting of eight members have also been conducted. In addition to descriptive statistics, Malmquist Data Envelopment Analyses (Fare et al. 1994) has been adopted to measure technical efficiency change, technological change and total factor productivity change of principal crops under integrated farming system. The study has revealed that integrated farming system is a viable option to utilize local resources in order to maintain sustainability of rural livelihoods in this delta region.

Atlas of Rural Areas in Poland as a research tool for regional and local development study

J. Bański

Institute of Geography and Spatial Organization, Polish Academy of Sciences, Warsaw, Twarda str. 51/55, Poland,
jbanski@twarda.pan.pl

Abstract

As a result of transformation in political system and structure of the economy after 1989 as well as Poland's accession to the EU, spatial structure of rural areas has experienced dynamic changes. These include all forms of social and economic activities that require diagnosis and constant observation. Hence, the idea of establishing the *Atlas of Rural Areas in Poland*, whose primary objective is to present the contemporary image of Poland's countryside spatial structure along with its diversity, by implementing possibly most recent statistical data processed into cartographic form. The *Atlas* has been divided into eight parts: *Natural environment, Spatial arrangement, Demography, Society, Land use, Economic functions, Housing and infrastructure, Planning and management*. The *Atlas* was drafted based on a homogenous set of statistical data. With respect to cartographic methods, the premise was to use basic cartographic methodology, depending on the character of the source data and the purpose of the map. However, consideration was given to the wide audience the product could potentially reach, and therefore it was decided that simple and most perceptually intuitive methodological solutions would be most effective. Maps are usually the basis for deeper analysis but also used for synthetic and conceptual approach. The *Atlas* constitutes a basic reference source for studies and expert reports in the regional and local development and planning. Further, it is the starting point for the work of geographers, rural economists, sociologists and representatives of other scientific fields interested in the topic of rural areas.

Key words:

Atlas; cartography; rural areas; Poland; development

Changes in Formal Institutions and Responses of Local Trade Associations in A Modern Industrial District: the Case of a Pharmaceutical Industrial District in Tokyo, Japan, 1713-1943

AMIJIMA Takashi

The Kyoto University Museum, Kyoto, Japan, amijima.takashi.8x@kyoto-u.ac.jp

Abstract

To clarify what helps an industrial district to thrive for a long time, it is important to pay attention to the local governance structures, such as trade associations, which can foster trust and temper opportunism among traders. However, the lifetime of a trade association, which is fostered by formal institutions such as commercial laws, is usually much shorter than an industrial district's lifetime. This paper exemplifies how traders in an industrial district have responded to changes in formal institutions and modified their trade associations to maintain their district for a long period of time. It uses the example of a pharmaceutical industrial district in Nihonbashi-Honcho, Tokyo, between 1713 and 1943.

In 1713, the first pharmaceutical trade association in Tokyo, *Honcho Yakushudonya Kumiai*, was organized under the strong leadership of the government, although there were already many pharmacies operating in Nihonbashi-Honcho. The association consisted of traders in Nihonbashi-Honcho and they monopolized Tokyo's pharmaceutical trade. Since that time, several trade associations have been dissolved and re-organized, responding to changes in governmental policies and institutions. Among other things, governments have tried to modify and even dissolve pharmaceutical trade associations in Nihonbashi-Honcho to promote the liberalization of the pharmaceutical trade. However, Nihonbashi-Honcho's pharmaceutical traders worked to keep their trade association from changing its style, in order to preserve their exclusive business practices, which were crucial for maintaining the stability of the pharmaceutical trade order. Thanks to the consistency of these business practices, the identity of the industrial district was maintained.

China's Regional Economic Resilience under the 2008 Financial Crisis: A Spatial Analysis at Prefectural-level Regions

Wenxin LIU

Northeast Institute of Geography and Agroecology, Chinese Academy of Sciences, Changchun, 130102, P. R. China,
liuwx@iga.ac.cn

Abstract

Since the 2008 financial crisis, following with the recession and recovery of the global economy, the resilience research has become a hot topic in the academic field. Initially, resilience was applied to the ecological research, which formed the different concepts as ecological resilience and engineering resilience, etc. and then gradually extended to the research field of economic geography and regional development in recent years. Based on the theory of resilience, this paper establishes the regional economic resilience index with Chinese characteristics, analyses the changes track of China's regional economic gravity centres before and after the financial crisis, describes the spatial pattern of the China's regional economic resilience under the financial crisis by using exploratory spatial data analysis (ESDA) method, and identifies the impact factors for the spatial differences of China's regional economic resilience by using geographically weighted regression (GWR) model. The research results show that due to the impact of the financial crisis, economic growth rate for the southeast coastal cities of China dropped significantly, and the regional economic gravity center slightly moved westward and northward. The GWR Model reveals that the areas who have relatively large proportion of foreign investment in the economy, higher degree of dependence on export, and single economic structure are impacted greater; and the technological innovation and fixed assets investment are important impact factors for higher regional economic resilience.

Development And Structural Change In Rural Delhi

Arora, N. and Baraik, V.K.

Indira Gandhi National Open University(IGNOU), New Delhi, India. nidhidse21@gmail.com , vijaybaraik@ignou.ac.in.

Abstract

Development being a multi-dimensional concept includes aspects such as economic growth, level of education, quality of housing, availability of health facilities etc. In a large country like India, there are extreme variations in the levels of development between different regions. Delhi is one of the fastest growing urban centres of India. It has been drastically transformed in terms of infrastructure and facility and also in the beautification emerging as a world class city and these benefits are also extended to the rural areas of Delhi. There has been rapid structural change in the rural areas of Delhi as well. However some of the studies suggest that the rural areas are not receiving the fruits of rapid development of Delhi proportionately even located adjacent to the so called Delhi 'World Class City'.

In this paper, attempt has been made to study the extent and sources of variations in the levels of development in rural Delhi using secondary data. Also the paper examines some of the structural changes in the rural areas of Delhi. The status of development of different districts of Delhi has been estimated with the help of composite index based on combination of developmental indicators related with social aspects, economic aspects, health, education, infrastructure and facilities. The paper attempts to identify the lagging districts in terms of the levels of development and quality of life for the plausible interventions and measures to bring about positive changes in them. The structural changes have also been studied with the help of spatio-temporal data related to various aspects of the rural villages of Delhi.

Dimensions and Drivers of the Youth Unemployment Problem in Africa

Ofori-Amoah B, Oppong, J. R. Otiso, K

Department of Geography, Western Michigan University, Kalamazoo, MI 49008, USA

Abstract

Africa faces a stubborn youth unemployment problem that has triggered major crisis including recent uprisings in North Africa and terrorist activities in other parts of the continent. Despite several country-based and regional-based studies, a comprehensive examination of the complex dimensions of the problem and its drivers is lacking. This paper seeks to fill this void following a comprehensive literature review. We show that youth unemployment varies across countries, regions and in demographic groups. The drivers behind the problem lie in political, economic, and socio-cultural factors that have deep roots in the government policies and public perceptions of colonial, and post-colonial Africa. The paper discusses implications for policy.

Disparities in the Levels of Socio-Economic Development in India during Pre and Post Liberalization Periods: An Inter-State Analysis

Amarjeet, Vijay Kumar Baraik and Mahendra Singh Nathawat

Indira Gandhi National Open University, India, New Delhi, 110068, jeetocean@gmail.com

Abstract

The development programmes have been taken up in India in a planned way through various Five-Years Plans to provide the higher standard of living for the people. The country has followed the mixed-economic structure and adopted the policy of balanced regional development since the Third Five Year Plan to address the regional inequality due to considerable lagging regions during post independence period. Despite balanced development strategies since then, large disparity exists with development in the country. Since the period of liberalization the regional patterns of the levels of development and disparity, however, seems to have some changes than the previous period due to new economic policy and structural changes and also due to the changing political scenario, rapid technological advancements and focus on social sector in various parts of the country. This study is an attempt to make a comparative analysis of the inter-state levels of development in India for the time period ranging from 1991 to 2011. It examines the disparities in the levels of development among the states in the background of overall development of the country. The paper is based on secondary data obtained from various government sources. The development indicators are related to social, economic, infrastructure, health and agriculture sectors. Method followed for the study is simple statistical techniques for the construction of development index and assessing gaps and cartographic techniques for graphic representation.

Key Words:

Development, Disparities, Mixed-Economy, Liberalization, Development Indicators and Composite Index.

Emerging Challenges of Regional Disparities in India

Mohan, Krishna, Mohan, Nishi

Panjab University, Chandigarh, 160014, India, krishnamohan291967@gmail.com

Abstract

The planning era in India ended on Jan1, 2015 when National Institution for Transforming India (NITI) Aayog replaced Planning Commission. The National Food Security Act, 2013 promises food security to 67 per cent or 820 million people of India. Mahatma Gandhi National Rural Employment Guarantee Act, 2005(MGNREGA) ensures work for 100 days in rural areas to adults willing to do unskilled job.

Contrary to it, a national level Backward Regions Grant Fund (BRGF) scheme started in 2007 was discontinued on April 1, 2015. A large number of similar centrally sponsored schemes have been either discontinued or transferred to states or the ratio of centre-state share has been modified. The fourteenth finance commission raised the share of states in divisible pool from 32 per cent to 42 per cent and recommended to do away with special category states.

The reservation for Other Backward Class (OBC) that was implemented in 1993 invited more trouble than solution. The perception of being backward became rampant consequent to which a socio-economic caste census (SECC), 2011 was ordered. The results are not public yet.

In the light of the above developments, the issue of regional disparity has once again emerged on the forefront. The present research paper attempts to find the spatial impacts of national food security act, MGNREGA, increased share of states in divisible pool, Make in India and Smart City initiatives in addressing the issues of regional disparities.

EU Deep Periphery: A Case Study of Mountain Borderlands in Bulgaria

Boian Koulov

National Institute of Geophysics, Geodesy, and Geography, bkoulov@gmail.com

Abstract

Geographic research and constant monitoring of EU periphery and its dynamics are necessary to identify and outline priority areas for regional development policy. This work proposes that “deep” periphery areas form where peripheries of different geographic nature (physical, economic, political) and scale overlap. The investigation applies GIS-aided mapping and comparative scale analysis to the case study of Bulgaria to identify “deep” periphery areas and affirm they are disproportionally situated in the mountain regions along EU external borders. These study results suggest special regional development policy attention to such areas, among which adoption of a Mountain Sustainable Development Strategy for all mountains within the EU geographic space, and, in particular, a Southeast European Convention on Sustainable Development of Mountain Regions.

Key words:

regional development policy; regional development policy; regional development policy; mountains; borders

Evaluating the Development of Strategic Emerging Industry of Henan Province Based on Cloud Theory

Yong Liu ¹, Jianhua Gao ²

¹ the center for yellow river civilization and sustainable development research of henan university, 475001;

² Institute of environment and planning, henan university, 475001, liuyongsp@126.com

Abstract

Development of strategic emerging industries is the key work for local government to upgrade the industrial structure, while the selection of them is the basis and premise for scientific developing the strategic emerging industries. Based on the definition of the connotation and characteristics of the strategic emerging industries, this paper from six aspects construct 13 specific indicators, which contain economic benefits, growth potential, key technology, driving effects, sustainable development, and policy support, and employ the cloud theory to evaluate the current situation and trend of strategic emerging industry of henan province. Results show that the development of strategic emerging industries of henan province should be divided into three gradient: biological industry, and new energy automotive industry should be given the priority to the development; new generation of information technology, new material industry, new energy industry, energy conservation and environmental protection industry are the second gradient, which should be developed as the potential industry ; high equipment manufacturing industry is the third gradient for the lack of industry basis and development space.

Key words:

strategic emerging industry; cloud theory; development strategy

Exploring Four Motors of Knowledge Production in East Asia: Comparing Shenzhen, Taipei, Seoul, and Tokyo

Sonn, J.W.¹, Wang, S.², Wang, Z.², Park, S.³, Choi, Haeok⁴

¹Bartlett School of Planning, University College London, London, United Kingdom j.sonn@ucl.ac.uk;

²Institute of Policy and Management, Chinese Academy of Science;

³Department of Environmental Planning, Seoul National University;

⁴Spatial Information Research Institute, S. Korea

Abstract

A small number of city regions occupy dominant share of knowledge production in global economy. In East Asia, four city regions dominate the landscape of knowledge production. They are Greater Tokyo, Capital Region of South Korea, Taipei/Hsinchu, and Pearl River Delta. Using U.S. patent data, this paper looks at how these four city regions differ. We calculate technological diversity, average size of firms, growth rate, the area's share in the whole nation, and other indices using U.S. patent records from 2000–2013. A number of interesting facts are found. 1) These four city regions are extremely similar in their composition of technological sectors. 2) There is much flow of knowledge among these four. 3) Capital Region of South Korea is highly dependent upon small number of large innovators while Taipei/Hsinchu, and Pearl River Delta are not so. 4) Greater Tokyo is still the biggest knowledge producer although the gap is closing. 5) Pearl River Delta has achieved the fastest growth

Key words:

Knowledge production; patent; East Asia; city region; Pearl River Delta; Seoul; Tokyo; Taipei; Hsinchu

Historical Factors in the Underdevelopment of Regions – Comparative Study of Himachal Pradesh and Uttarakhand

Sen Anjan, Sengupta Soma

Department of Geography, University of Delhi, Delhi – 110007, India, dr.anjansen@gmail.com

Abstract

What factors possibly explain the variations in development in two regions that have similar locational parameters; and fairly identical natural and human resources? The present paper attempts to explore the role of a region's evolving history to its state of under-development.

The study is based on a comparative study of two mountainous states situated in northern India – Himachal Pradesh and Uttarakhand. The two states, situated in the Central Himalayas, share political boundary, and have similar physical and social setting, but display a vast disparity in their levels of development. The research attempts to relate the level of region's development to its administrative autonomy. During the colonial period, both Himachal Pradesh and Uttarkhand were administratively parts of larger provinces – Punjab and United Province respectively. Besides, several districts of Himachal Pradesh being Princely States were then autonomous. Because of this factor, Himachal Pradesh enjoyed a separate identity since 1948, and became a self-governing state in 1971. On the contrary, Uttarakhand remained part of the state of Uttar Pradesh, and became self-governing as late as 2000.

The present study precisely evaluates, whether this element of historical and political autonomy, has a role towards higher level of development, being witnessed in Himachal Pradesh, compared to greater incidences of underdevelopment dogging Uttarkhand. However, the analysis of data neither indicates any specific temporal trend nor signifies any precise spatial pattern. Development is a multi-faceted process; and among the various factors of development, it is difficult to isolate the role of any one factor, least of all historical and political, as its impact gets nullified with the passage of time.

Key words:

Underdevelopment; Historical Factors; Colonialism

Innovations as Tools of Development Aid: Case of Finland and Tanzania

Jauhiainen J

Department of Geography and Geology, University of Turku, FI-20014 Turku, Finland, jusaja@utu.fi

Abstract

Development policy between the Global North and the Global South is changing. Earlier, the emphasis was most often on transferring material aid from well-developed countries to less and least developed countries through projects tackling specified problems in particular areas. Such projects provided immediate help, however, not always having long-term resilience for sustainable development and economic growth.

More recently, in the Global North have emerged development policies, instruments and practices to support the generation of innovations in the Global South. This includes also the transfer of innovation system framework, enhance of ICT and other technology development projects and broader support for innovative entrepreneurship. Furthermore, the aid-providing countries are interested in increasing reciprocity in development policy. This means, for example, enhancing via development projects businesses that support the enterprises of the country the aid is originating from.

The presentation discusses the Finnish development policy that nowadays substantially focuses on supporting innovations. The empirical case regards Africa and more specifically Tanzania that has been for decades a key target for development aid from Finland. In the presentation, specific attention is paid on two broader development policy programs that have used, for example, ICT, technology entrepreneurship, and living labs for promoting innovations in Tanzania in the 21st century. However, the innovation-related development policy, its instruments and their transfer are not without challenges.

Key words:

development; Africa; Finland; Tanzania; Innovation

Local Development in the Fijian Periphery: Stagnation through Adaptation

Sofer M

Department of Geography and Environment, Bar-Ilan University, Ramat-Gan, 5290002, Israel, soferm1@biu.ac.il

Abstract

The outer island of Kadavu is representative for the Fijian periphery, and a major question is how this island has developed and what the resulting changes are in its peripheral status. This paper deals with its physical characteristics, infrastructural conditions, village economic activities and government initiatives with the aim of understanding the changes it has gone from a perspective of three decades. A combination of micro-geographic studies run in two villages in three different periods, and a meso-geographical analysis of the province of Kadavu show that the pattern of development found in Kadavu in the early 1980s has not changed much since. The current pattern of cash crop production and trade has been further entrenched and is almost entirely dependent on the kava beverage crop. Shipping services, provided by core agents, have not improved and local initiatives to tackle this issue are only now beginning. Local infrastructure is underdeveloped, the island suffers from the peripheral penalty phenomenon, and government initiatives aimed at changing the trend are very limited. However, the current form of non-capitalist production and its derived benefit has forced villagers into a strategy of adaptation which might actually be preferable for them under the current conditions of peripheralization.

Key words:

Fiji; Kadavu island; periphery; development; kava; stagnation; strategy of adaptation

Local Development Potential and Its Barriers – The Case of The La Lopé National Park (Gabon)

Jędrusik M, Lisowski A., Mouketou-Tarazewicz D.,

Faculty of Geography and Regional Studies, University of Warsaw, Warsaw, Poland, maciusik1@uw.edu.pl

Abstract.

The present work aims at evaluating the La Lopé National Park's development prospects and indicating the most significant factors hindering the exploitation of this region. The work presents the situation as at the end of 2014. Most of the current data was collected as a part of a field mission organized by Université Omar Bongo in Libreville and the University of Warsaw. The La Lopé National Park (4,913 km²) is located in four provinces (Ogooué-Ivindo, Ogouée-Lolo, Ngounié and Moyen-Ogouée) of central Gabon. Being (since 2002) one of the biggest national parks in Gabon in 2007 it was listed as a UNESCO World Heritage Site. It reveals a significant touristic potential, still insufficiently exploited. The park is one of the oldest protected areas in the country and the most popular among tourists. However, the tourists are few in number, especially if compared to other African national parks. Significant differences regarding the efficiency of management in this area can be noted. Its main focus should be on nature conservation *in situ* and sustainable ecotourism. The La Lopé NP is managed by national authorities which are responsible for ownership supervision, as well as the choice and realization of a development strategy. The activities undertaken in this scope have proven ineffective. Lack of effective nature resource preservation, no investments in infrastructure, non-existent mediation with the locals, and especially lack of their involvement in pro-environmental activities constitute a threat to the existence of the Park and fail to stimulate local development of the area.

Key words:

La Lopé; Gabon; ecotourism; national park

Micro Level Procurement Centers and the Bargaining Power of Mediators: A Comparison of Private and Public Agencies for Lac Production in Rural Jharkhand, India

Ravi, Kr. Joseph

Centre for the Study of Regional Development, School of Social Science, Jawaharlal Nehru University, New Delhi -110067, India, josephkravi@gmail.com

Abstract

The objective of the paper is to highlight the changing role of mediators under private as well as Government trade regimes of 'Lac' collection and its influence on related micro level and household industries. Lac is one of the minor forest products to become a lucrative export good on the virtue of its commercial viability in niche markets abroad. Since the last two decades a stark imbalance in demand and supply of 'Lac' resulted in huge fluctuations in its price resulting in regulatory measures in this sub sector. Our study looks at how the roles of mediator's changes under ex-ante (private) and ex-post (government) regimes and its implication on small manufactures.

The finding of our study reveals that the profit margin of larger manufacturers is higher than the small scale manufacturers resulting in their closure over time. Consequently, the suppliers who used to supply to the small manufacturers shifted their supply to government procurement centers where they had greater bargaining power over the 'lac' farmers than before. This is found that the initiative to protect the famers through price stabilization has a negative impact on small manufacturing units at one hand and loss of bargaining power of the farmers on the other. We believe, our study, based on primary survey of 200 households and 50 traders cum mediators, will have significant implication for the poverty alleviation programs with communities living in forest-fringe hamlets, agriculture and rural development.

Key words:

Price stabilization; Bargaining power of mediators; Household and Small Scale Manufacturing units.

Mining and Energy Territories and Deindustrialization in the Great Eastern

Venezuela

Péné-Annette Anne

University of French West Indies (Université des Antilles), Schoelcher, Martinique-France, apannette@gmail.com

Abstract

The government of Venezuela has envisioned a fundamental change of Venezuelan society, politically and ideologically, but also regarding its organization and territorial dynamics. Especially with the support of the Chinese actors and enterprises, the economical development is focused in mining extraction and heavy industry in the Greater East of Venezuela since ten years. The Greater East is a geographical construction that we propose to enhance the territorial dynamics between *Oriente* (north east Caribbean coast of Venezuela) and the Venezuelan Guayana. The Orinoco Socialist Project (PSO) is the key component of the development plan for the «Orinoco Belt» (FPO), based on the exploitation of heavy petroleum, which occupies the south eastern strip of the Orinoco river basin. In this context, to realize an harmonious development is a strong defite while the deindustrialisation and the difficulties to propose an alternative of “petroleum development” are intensified.

Key words:

deindustrialization; mining; energy; Venezuela; Orinoco Beltenergy, mining, deindustrialization, Venezuela, Orinoco Belt

Multi-Scale Analysis of Evolutionary Mechanisms on Spatial Economic Structure in Henan Province

LI Jing - jing¹, MIAO Chang - hong¹, YE Xin - yue^{1,2}

¹ Center for Yellow River Civilization and Sustainable Development, Henan University, Kaifeng, 475001, Henan, China, lijingzhiqing@qq.com;

² Kent State University, Department of Geography, Kent44242, United States

Abstract

Since the 21st century, China's economic development period turns to the transitional economic and legal economic times from the era of globalization. Under the guidance of integration of Zhengzhou Kaifeng and Luoyang, Central Plains Economic Zone, the Silk Road Economic Belt and other strategies, Henan's economic development type and economic spatial structure is evolving and becoming more stable as the economic enters a new normal stage of development. Following the multi-scale evolutionary mechanisms framework, using the quantitative analysis methods like Theil index, multilevel regression models, etc., this article analyzes the spatial-temporal dynamics and mechanisms of regional space structure in Henan since 1999 to 2014, from the county, municipal and economic zone of the three spatial scales. The study found that Henan economic spatial structure of multi-core-periphery nested structure gradually evolves into single core-periphery structure. On the basis of Theil index decomposition on three zoning types which is prefecture-level city, economic zone and urban-rural, we know regional disparity is sensitive to the geographical scales. It is more pronounced at finer spatial scales. Meanwhile, sizes and contributions to the overall difference of intra-regional and inter-regional disparities are more related to the spatial scales. The result of multi-level regression analysis which analyses the dynamic mechanisms of spatial-temporal variance, shows that regional development in Henan Province is more sensitive to space economic structure and time. Decentralization, marketization and regional development strategies are main driving forces leading to regional economic disparities. Furthermore, social endowment and natural endowment with early agricultural conditions and geographical environment factors as the token are essential for regional development in Henan Province. In addition, inequality between urban and rural areas is also an important aspect of disparity in the development of Henan Province.

Key words:

spatial economic structure; regional economic development; Theil index; multi-level model; endowment

Municipal Emblems as a tool for Local Identity Formation, Representation of a Locality: Case of Municipalities in the Liberec Region (Czechia)

Šifta M, Chromý P

Charles University in Prague, Prague, Czechia, miroslav.sifta@natur.cuni.cz

Abstract

Paper analyzes the role of graphic symbols in the local representation and in process of local identity formation. The extent of graphic symbolism utilization by local development actors in the region, its importance for the image formation of the locality (municipality) from the point of view of local development actors and assessment of the degree of identification with the municipal characteristics among the local population are evaluated, based on the results of the corresponding survey targeted at municipal representatives in the region. Municipal emblems tend to (and also should) have a local representative function. These should emphasize local specificity, uniqueness. Municipal emblems have also a potential to play role of connecting, mediating and activating factors also on higher than local level.

Municipal emblems are still not used enough and in the right way by actors of municipality representations. These are often misunderstood and deemed unimportant for the local development.

Key words:

territorial identity; local development; local symbol; graphical symbol; municipal emblem; the Liberec Region (Czechia)

Organizational Model and Mechanism Exploration of Urban Agglomeration Subregional Space——Taking Hubei Urban Agglomeration as the case

Chong Peng, Ting Li, Chen Zhang

College of Architecture and Urban Planning, HUST, Wuhan, 430000, P. R. China, Aries90725@126.com

Abstract

Urban agglomeration subregional space is a certain area having some function to be guided in an urban agglomeration area, it is an extension of the core area of economic space, the development of its space system has complex and dynamic dual characteristics. Based on the international experience, this article classified the model of the urban agglomeration subregional space organization into four mature ones: Polycentric urban region, Network city, Corridor city, combined metropolitan area. This study selected the Hubei urban agglomeration as the case. It first analyzed the regional backgrounds and features from the urban scale, spatial structure and evolution way of the three subregions in Hubei urban agglomeration, Wuhan city circle, Yi Jing Jing and Xiang Shi Sui, and researched their long-term trends and development paths. Then, it summarized the spatial organization pattern of the three subregions, and revealed the mechanism of these patterns formed from two perspectives, macro(environmental factors) and micro(the main roles of space effect and their behaviors). Finally, it concluded by summarizing three spatial relationships in town cluster: Urban and regional spatial relation, urban and rural spatial relation, human social economic activities and natural ecosystems spatial relation. (This study is supported by The National Natural Science Funds (No: 51178200); The Fundamental Research Funds for the Central Universities, HUST: 2014TS108; Hubei Science and Technology Support Program (2015BDF040).)

Participatory Assessment of Development in Benin: 'PADev+' with a counterfactual and a layered approach

Dietz, A.J.

African Studies Centre Leiden, The Netherlands, dietzaj@asc.leidenuniv.nl

Abstract

During an earlier IGU Congress I presented the results of the PAdDev approach to assess development interventions and social change in local rural environments in Northern Ghana, based on a participatory method (www.padev.nl), that was tested in West Africa. In 2015 an international NGO (The Hunger Project) asked the PAdDev team to do an assessment study in Benin, but to do that by not only doing a PAdDev study in one of their intervention villages, but also compare it with a neighboring non-intervention area, and with a study among the 20% poorest people in the intervention village. This resulted in three datasets, with very revealing comparative conclusions, and it challenged the multi-national NGO with regard to their core principles. This further development of the PAdDev method of 'participatory assessment of development' has now reached a level of sophistication, that makes it credible among those who believe in the gold standard of impact evaluation practices.

Key words:

Impact evaluation; local development; participatory assessment; rural change; Benin

Planting Seeds of Endogenous Development in the State-led Industrial Cluster: the Case of Gumi IT Cluster in Korea

Jong-Ho Lee¹, Chul-Woo Lee²

¹Gyeongsang National University, Jinju, South Korea, jhl@gnu.ac.kr

²Kyungpook National University, Daegu, South Korea

Abstract

It is widely accepted that large industrial complexes, which were established by the central government from 1970's, have played a leading role as a national and regional economic engine in terms of production, exports and employment. However, they show lacks of social infrastructure and superstructure. From the viewpoint of the cluster approach, it is clear that Korea's industrial agglomerations cannot be sustainable in response to an increasing global competition between regions. To resolve these structural problems, the government started to implement so called the cluster policy from 2005. The main focuses of the cluster policy are on building knowledge-based infrastructure and creating the cultural and institutional foundations of spontaneous social interactions between firms, universities and industries. In this paper, the authors attempt to examine the possibilities of endogenous development in the state-led industrial cluster, drawing on the in-depth case study of the Gumi IT cluster, one of the largest industrial complexes in Korea.

Key words:

Cluster; Industrial Complex; Gumi IT Cluster; mini-cluster; working group; self-organizing; learning communities; endogenous development

Privatisation of Municipal Golf Courses in Small Towns in the Western Cape, South Africa

Spocter M

Department of Geography and Environmental Studies, Stellenbosch University, Stellenbosch, South Africa,
mspocter@sun.ac.za

Abstract

There has been a surge of interest by geographers in contemporary South African small towns. This paper reports on the sale of municipal land in small towns from 1974 to 2014 in selected municipalities of the Western Cape. Attention is focussed on the sale of municipal golf courses as an example of privatised municipal land that has not contributed to undoing apartheid spatial legacies or integrating small-town communities. The rate of municipal land sales increased appreciably after the introduction of the neo-liberal Growth Employment and Redistribution macro-economic strategy in South Africa. Neo-liberal processes have adapted to local conditions and morphed into what is known as the Third Way: essentially a marriage between the neo-liberal agenda and postapartheid egalitarian principles. The divisive nature of privatised, once municipally-owned, spaces is supposed to be offset by investment in social development funds for some small towns. It is intended that these funds be managed by municipalities and spent on projects identified in the Integrated Development Plan. Documentation of environmental impact assessments of privatised golf courses provides insights into the logic of the privatisation of small-town municipal golf courses and the addition of residential components to them. It is concluded that the secure, gated and fortified housing spaces of the golf estates are aimed at the monied classes and have become enclaves of wealth within the broader small-town milieu. The developmental dilemma is that while municipalities may benefit from such land sales and their subsequent revenues, socio-spatial integrative opportunities are being sacrificed for monetary gain.

Key words:

golf estates; municipal land; neo-liberalism; privatisation; small towns; South Africa; Western Cape

Production and Export Potential of the Resource-Based Regions of Canada and Russia in Intracontinental Situation

Lomakina A., Bezrukov L.

Institute of Geography, Russian Academy of Sciences, Moscow, 119017, Russian Federation, Lomakina.lomakina@ya.ru

Abstract

Russia and Canada share much in common in terms of geographical location. The situation in high latitudes and interocean position are the more important traits that influence transport-geographical and transport-economic location of both countries. However, a quick look at the map do not always allow to identify the real sources of transport-economic properties of the territories. In our study we propose a method, which yields to estimate continental location in transport-geographic terms.

In the research the estimation of transport-geographical location of Russian and Canadian territories, population and mining industries is considered. Their comparison confirm the constant influence of the northness as well as the level of transport infrastructure of the territories. In both countries continental and ultracontinental zones are leading in share of territories, also in producing and exportation of the large-tonnage raw materials – oil, coal, ironstone. As for population, it concentrates predominantly in maritime zone in Canada on the contrary of continental zone in Russia. Canada and Russia have common and specific traits of their transport-economic and transport-geographic continentality as well as their approaches to compensating its negative influence and overcoming transport-economic challenges.

Ras Al Khaimah in Transition –International Team Project

Izabella Lecka¹, Robert Arthur²

¹Faculty of Geography and Regional Studies University of Warsaw, Poland , ilecka@uw.edu.pl

²Faculty of Arts and Sciences, American University of Ras Al Khaimah, UAE

Abstract

In the presentation we will present Ras al-Khaimah emirate compared to other emirates of the United Arab Emirates and respond primarily to the question:

What is the reason of the authorities to have taken the emirate's policy of "modernization of economic and social space"?

Is Ras al-Khaimah Free Trade Zone competitive compare to other free trade zones in United Arab Emirates? What are the characteristics of foreigners working in Ras al-Khaimah, where they come from and how long immigrants (expats and workers) are staying in; determine their level of satisfaction with staying in the emirate; frequency of contacts with their homeland.

How children (local families and foreigners) evaluate the global world from the perspective of Ras al-Khaimah?

Key words:

local development; modernization; Middle East

Regional Segmentation Based on the Spatial Patterns of Rural Development in Jammu (J&K)

Singh Rajender, Singh Davinder, Mahajan Vivek

Dr. Rajender Singh, P.G Department of Geography University of Jammu, Jammu, India. rajsinghJU@gmail.com

Abstract

Rural development is the process of improving the quality of life and economic well being of people living in relatively isolated and sparsely populated areas. The present study is an attempt to study the pattern of development at village level in three Blocks of Jammu District, varied in term of physiographic divisions. In order to study pattern of development pattern a detailed household survey of three villages selecting one village from each Blocks was conducted. As compared to 12% in Block Bishnan and 11% in Block R.S Pura Block only 3% of the total villages in Block Ahnoor show high levels of development. Block Bishnah and R.S Pura are Agriculturally dominated blocks whereas in most of the population in Akhnoor are involved in Secondary activity. Sanitation scenario of the three villages reveals that 40% of households of village Chak Abtara 57 % of household of village Tutrey and more than 65% of villages Barola do not have Toilet facility and still practices open latrine system. As per the economic status is concerned more than 80% of population of villages Chak Abtara and Tutrey lies above Poverty line whereas less than 32% of population of village Barola lies above poverty line.

Key words:

Rural development; Structure perspective; relational perspective; physiography

Renewable Energy Resources for a Green Development in Belgorod Region (Russia)

Pakina A., Karnaushenko A.

Lomonosov Moscow State University, Moscow, 119991, Leninskie gory, GZ MGU, Faculty of Geography, Department of Environmental Management, allapa@yandex.ru

Abstract

Green development is a significant direction of the Russian economy's modernization. Opportunities to green development on a regional level we have considered on example of Belgorod region. The region is only 0.2% of the total area of the country, however, it ranks 26th in the list of 85 Russian regions. The main sectors of regional economy are mining industry, developing on the resources of Kursk magnetic anomaly, as well as agriculture, based on extremely rich humus soils – chernozem. Current regional development caused a number of environmental problems, and a shortage of energy is also a challenge for future regional development. Belgorod region has sufficient resources to generate energy through renewable sources. The amount of solar radiation varies from 1140 to 1200 kWh/m² per year within its boundaries, which is comparable with the southern regions of Russia, where such stations are widely used. Wind resources are less promising: the wind speed is about 5.2 m/s. However, the biological resources have the greatest potential. Being an agricultural region, Belgorod area has a great potential for use and recycling agricultural production wastes, and especially livestock, for energy purposes. Such facilities are already in operation in some farms of the region. During the research we considered a possibility to produce energy through bio-waste recycling on example of individual farms. Taking into account the region's share in the pork production (now exceeds 28% of the total), it could be a suitable decision to increase energy efficiency and to reduce resource consumption.

Key words:

green development; Belgorod region; renewable energy; bio-waste recycling

Role of Small Sized Towns in the Peripheral Areas, the Case Study of Mazovia Region (Poland)

Czapiewski K.

Institute of Geography and Spatial Organization PAS, Twarda 51/55, 00-818 Warsaw, Poland, konrad@twarda.pan.pl

Abstract

The paper shall explore the role of small towns situated in the periphery in Mazovia region (Poland). Using the concept of the exogenous functions performed by these urban cores, we shall investigate their role with regard to the surrounding areas (with dominant agricultural function). The paper will exploit statistical data on commuting to work from 2006 and 2011 and central functions of small towns in 2005, 2010 and 2014.

Key words:

Small towns; periphery; Poland

Spatial Analysis for Supporting Strategic Environmental Assessment: Implementattion in Indonesia

Triarko N.

Research Center for Applied Geography, University of Indonesia, Depok 16424. Indonesia, triarko@gmail.com

Abstract

Sustainable development in Indonesia has been enhanced by the application of Strategic Environmental Assessment (SEA). SEA is mandatory for development and spatial planning in Indonesia, whether the plans are at the national or local level. One of the method use for SEA is spatial analysis. Spatial analysis has been proven to be effective at assessing complex problems and cross-cutting issues in certain regions. Amongst the region where spatial analysis has been implanted in SEA is in the district of Tapanuli Utara and the province of North Sumatra, both of which will be discussed further in this paper to examine the strengths and weaknesses of spatial analysis in SEA. This study compares the several roles that spatial analysis plays in SEA, specifically in how spatial analysis utilizes sustainable development principles. Although spatial analysis has proven to be useful in analyzing complex problems in planning and predicting future demand, it has remained underused and difficult due to the lack of high quality spatial data.

Key words:

SEA; sustainable development; spatial analysis

Spatial Evolution and Driving Mechanisms of County Urban-Rural Association to The Major Grain-Producing Areas of Central Jilin Province of the Northeast China

Zhao Hong-Bo

Henan University, Key Research Institute of Yellow River Civilization and Sustainable Development & Collaborative Innovation Center on Yellow River Civilization of Henan Province, College of Environment and Planning, Henan, Kaifeng 475001, China, zhaohbhhwm@163.com

Abstract

Taking the major grain-producing areas of central Jilin Province as a case, in this paper the indicators system of quantitative assessment and evaluation model were established based on the system framework of urban-rural association, then, we explore spatial-temporal evolution of the county urban-rural association degrees and its driving mechanisms in 2004-2010 with the methods of multifactor overall evaluation, GIS spatial analysis and principal component analysis. The results are shown as follows. First, the urban-rural association level of central Jilin Province had been fluctuating up, but, the spatial difference of urban-rural association is obvious, the circle-type spatial pattern of the urban-rural association level that reduces gradually from Changchun and Jilin to outside had been emerged, meanwhile, Chang-Ji area and Songyuan which were better economic development had high urban-rural association level. Second, and the associativity of prefecture-level municipal districts were significantly superior to county-level cities, reflected the urban and rural development was still at the stage of polarization relative. Third, the driving mechanisms were identified as the following aspects: level of economic development, urbanization, adjustment of industrial structure, complete infrastructures and policies on regional development.

Key words:

urban-rural association; temporal evolution; driving mechanisms; the major grain-producing areas of central Jilin Province

Spatial Indicators to Compare the Development Conditions of Siberian and Arctic Regions Of Russia

Myadzelets A.V.

V.B. Sochava Institute of Geography SB RAS, Irkutsk, Russia, anastasia@irigs.irk.ru

Abstract

Regional development is analyzed depending on local specificity using the variety of economic, social and geographical characteristics. The goal of the research is to study associations of socio-economic parameters to compare the territorial development conditions of Siberian and Arctic regions of Russia. Such investigations are the basis for effective regional policy of peripheral territories. Mathematical models and statistic methods are used for the processing of time series of investment and gross regional product of industry and agriculture for 2000-2014 and the comparative analysis.

Indication model of generalized integral parameters is worked out. It is a bilinear function of economic or social factors such as production volume or others and sensitivity characteristics which are accelerators of economic processes. Different socio-economic macrocharacteristics are considered as spatial indicators which fully describe the territorial economy. For example, it is gross production volume, resources, production and finances, investment, employed in the economy, population income, etc. In the research the algorithm is realized for the functional dependence of gross domestic investment from gross production and agriculture volume (million rubles per year) in the studied regions. Calculation of current values of the accelerators, conditional characteristics and indicators is fulfilled with regression methods using factual data. Qualitative methods are used to compare the results of integral index evaluation in the regions.

Typifying of the regions is carried out according to the similarity criterion of the spatial indicators; territories of different investment efficient level are determined; assessment of the regional economic reaction on the crisis of 2008-2009 is given. (Research was done with financial support of the Russian Humanitarian Foundation (16-02-00570(a)))

Key words:

socio-economic parameters; regional development; spatial indicators; regional efficiency and similarity

Spatial Patterns and Determinants of the Manufacturing Industries' Transformation Across Regions of The Russian Federation in the 1990-2010s

Pilipenko Igor V.

European Bank for Reconstruction and Development, London, United Kingdom, igor_pilipenko@yahoo.com

Abstract

Having lost ca. 6 million jobs during the period of 1991-1998, while a number of science-intensive industries such as manufacture of machinery went into decline, the Russian industrial sector turned one of the biggest winners from the 1998 financial crisis due to the sharp national currency devaluation that improved price competitiveness of manufacturing industries. The mining sector, low and later medium-tech manufacturing were among key driving forces behind the Russia's economic revival during 1999-2007. However, the structural adjustment resulted in an additional loss of more than 3.2 million manufacturing jobs over this period. Contrary to 1998, the 2008-2009 economic crisis hit the manufacturing sector hard triggering a 15% contraction and new massive job cuts exceeding 800 thousand only in 2009. Despite some positive effects from this crisis, which pushed companies for further optimization, the lack of high-tech manufacturing and a huge decline in manufacturing employment posed recently a question about the need for a new industrialization as a pre-requisite for the modernization of the Russian economy. This paper seeks to explore and map spatial patterns in the transformation of manufacturing industries at different levels of the Russian Classification of Economic Activities across regions of Russia from the end of the 1990s to the 2010s. We reveal trends in specialization, (de)concentration, and productivity of manufacturing activities using several geographical and economic analysis techniques. Further, we employ multiple regression analysis to study determinants of these trends and the impact of agglomeration effects on the manufacturing industries' development.

Key words:

Russia; manufacturing; regions; spatial concentration

Spatiotemporal Development of Natives in the Czech Republic Since 1989

Šerý M

Department of Geography, Palacký University Olomouc, Olomouc, Czech Republic, serymilos@gmail.com

Abstract

The main objective of the proposed contribution is to introduce the most significant outcomes of current research on natives in the Czech Republic. The natives are understood as one of the essential aspects of regions. The proportion of natives to entire population can crucially affect such processes as identification of residents with their region, susceptibility to emigration from region or regional development generally. In spite of this importance, it is possible to conclude that knowledge concerning spatiotemporal patterns of natives in the Czech Republic remains insufficient. Thus, we attempt to analyse above mentioned phenomenon. Being aware of its limitation, data collected during censuses (1991, 2001, 2011) was used for this purpose. The analysis has been focused on development during the so called transitional era which commenced in 1989 with the fall of Communist regime. The main findings identified in the conducted analysis are applicable in further research on regional transformation as well as in processes of regional planning.

Key words:

natives; Czech Republic; regional development; spatiotemporal patterns

Spatio-temporal Difference of the Economic System Coevolution of Chang Zhu Tan

“3+5” Urban Agglomeration

Huang Yu-xing, Chen Zhong-nuan*

School of Geography Science, South China Normal University, Guangzhou 510631, China, hyxjason@126.com

Abstract

Based on the differences of economic function, the economic system of the Chang Zhu Tan “3+5” Urban Agglomeration was divided to the production subsystem, the circulation subsystem, the investment subsystem and the consumption subsystem. Then, the study, using the system entropy, the coupling degree and the coupling coordinative degree and constructing the order parameter, depicted the spatio-temporal differentiations of the urban agglomeration’s economic system, and analyzed the rationality of this evolution to provide some theory evidences to improve the economic competitiveness. The results showed: firstly, the development and extension of the consumer market leaded the economic system of the Chang Zhu Tan “3+5” Urban Agglomeration to the synergic way. Secondly, those high level transport nets, such as high rails, strengthened the whole region’s negotiability. For each city, the core region’s circulation subsystem tended to rationalize, the north was surplus, and the burden of the south was increased. Thirdly, the development of the urban agglomeration was not balanced. The economic system of Chang Sha was the most synergic, but those neighboring cities, such as Xiang Tan, Zhu Zhou and Yi Yang, were smothered.

Key words:

economic system; coevolution; Chang Zhu Tan “3+5” urban agglomeration; complex science

Spatiotemporal Distribution of Border Ports in China and their Spatial Impacts

Zhouying Song, Shuyun Che, Jiaoe Wang, Lei Zheng

Institute of Geographic Sciences and Natural Resources Research, CAS, Beijing, 100101, P. R. China, cheshuyun@163.com

Abstract

Border ports play a substantial role in socioeconomic exchanges that reflect diplomatic relations between neighboring countries and the development of border areas. As a platform for cooperation and opening-up, the Belt and Road Initiative will boost the development of border ports. This article maps and analyzes the evolution process of border ports in China since the 1930s regarding to their spatial distributions, transport modes, and flows of cargo and people. Based on the relative concentration index (RCI), five function types of border ports are summarized according to the functions and development levels of border ports and cities. The results of the spatiotemporal distribution analysis show that there have been three stages and two peak periods for the opening of border ports in China since the beginning of the 1950s. The opening of border ports is closely related to the bilateral relations with neighboring countries, complementarities of natural resources and economic development, as well as foreign policies. Nearly half of the border ports in China have limited urban functions, which means most border ports have quite limited impacts on the development of border areas, as a result of the adverse natural environment and small population size. The findings of this study may help to understand the development of the border port system and their impacts on border areas, which is an important part of the Belt and Road Initiative of China.

Key words:

border ports; spatio-temporal distribution; Relative Concentration Index (RCI); border areas; China

Strategic Planning of Local and Regional Development in Bulgaria

Naydenov Kl., P. Slaveykov

Sofia University 'St. Kliment Ohridski', Sofia 1000, Bulgaria, kl.naydenov@gmail.com

Abstract

Strategic and integrated approach to planning for economic development of Bulgarian regions and municipalities continue to be on the agenda in modern conditions. In the context of the current objectives, principles, rules and procedures for the conduct of regional policy within the EU and in Bulgaria this approach is crucial. Broader and deeper use of strategic tools in the planning of regional and local development after 2013 has increasing role even more important for the future development of regional policy for sustainable integrated regional development. Strategies and plans as existing strategic documents and currently have fundamental importance for demonstrating the will and readiness of Bulgaria for effective participation in regional policy and the use of EU structural instruments. The new EU strategy "Europe 2020", adopted in 2010, calls for improved coordination and linkage of various policies and national strategies, including policies and strategies for balanced and sustainable regional development within the EU in order to achieve smart, sustainable and inclusive economic growth to meet today's global challenges for countries and regions. New approach and method of planning and programming of regional development with particular emphasis on territorial cohesion is dictated by the development and implementation of macro-regional strategies for integrated development within the EU.

Key words:

Economic development; regional policy; macro-regional strategies; integrated development

Strategies for Regional Development in Higher Education: An Evaluation of Policies for Marginalized Groups in India

Sahab Deen

Jawaharlal Nehru University, New Delhi-110067, India, sahabjnu@gmail.com

Abstract

In the context of Indian society which is based on hierarchal social order; access to higher educational opportunities endures the multiple dimensions of inequalities characterized by gender, caste, class, religion and region. Gross enrolment ratio (GER) in higher education among the social groups not only varies among the regions but also among the social groups. India has significant increase in GER from 1.5 % in 1960-61 to 10% in 2000 and subsequently increased to 21.1% by 2012-2013(MHRD, 2013) through affirmative action. However, significant inequalities in GER persist across the regions and social groups. Thus, the key objectives of the paper are: a) to evaluate the policies for educational development for marginalized groups and, b) to measure the spatial and social disparity in access to higher education. The present study is a quantitative and qualitative work based on primary data collected from 40 districts of 9 Indian states. Sopher's index has been exercised to capture the disparity in higher education among the regions and social groups. Logistic regression analysis (LRA) has been used for individual level data analysis. The analysis of the study reveals that there are large gap in accessibility and attainment in higher education between privileged section and marginal groups. The scheduled population are still facing caste based discrimination in education system. On the other hand, government policies and programmes have not been properly implemented and functions in the educational institutions. Thus, the failure of policy has negative consequences on balance regional development in higher education of the country.

Key words:

Gross Enrolment Ratio (GER); Higher Education; Marginalized Groups; Policies; Regional Development; Scheduled population

Structural Transformations in Territorial Socio-Economic Systems, and Methods for Their Study

Baklanov Petr

Pacific Geographical Institute FEBRAS, Vladivostok, Russia, pbaklanov@tig.dvo.ru

Abstract

Territorial socio-economic systems (TSES) are combinations of population groups, economic objects and infrastructure facilities within a certain territory together with their various relationships with each other and conjugations with the territory (Baklanov, 2013 *et al.*). The basic structural unit of TSES is a discrete settlement. Any discrete settlement can be considered as a "starting point" of TSES structure (Baklanov, 2007, 2013), followed by defining all the structural units of the 1-st order. These units form all individual settlements directly tied with the central ("starting point") units by transport links.

Structural transformations include the whole combination of changes in the structural units of the 1-st order under certain changes in the central settlement: changes in the population number, in scale and assortment of production of goods and services. The structural units of the 2-nd and higher orders can be defined in TSES to assess their structural changes.

We propose a method of assessment of possible calculated structural transformations in TSES, by inclusion or exclusion of discrete components in the structure of TSES like separate existing or potential enterprises, their combination, and up to settlements as a whole.

Calculations of structural transformations in TSES should be carried out using the proposed matrix models of TSES.

The paper gives the examples of various types of TSES allocated in Pacific Russia, and assessment of their structural transformations through variants of inclusion of new and exclusion of discrete components among the existing ones.

Key words:

territorial socio-economic systems; structural transformations; matrix models

Sustainable Roots-driven Rural Change through Community Asset Mapping

Nicolau, MD

University of South Africa, Florida, South Africa, nicolmd@unisa.ac.za

Abstract

Despite more than two decades of democracy, South Africa still has high levels of poverty and inequality. The paper presents a tool called "Community Asset Mapping Programme (CAMP)" that was developed from experiences within rural communities in South Africa. The tool is designed to achieve sustainable and responsible high impact social change, by enabling community members to map cognitive and physical assets and empower themselves to use these assets sustainably to create a better life for themselves. Unlike similar tools, CAMP advocates that the success of roots-driven change depends on the inclusion of processes that will provide a variety of cognitive changes to ensure sustainable change in communities. The post development methodology can be used by researchers to collect valuable data for any research related to roots-driven sustainable socio-economic change in rural communities. The tool also provides the opportunity for external partners who would be willing to stand aside and allow communities to establish their own priorities to improve their quality of lives, but would still be willing to provide funding; mentorship; skills; and a continuous monitoring process over the medium to long term.

Key words:

Poverty, roots-driven sustainable change, asset mapping, quality of life, post development methodology

Territorial Regionalisation In Tunisia

Ali Bennisr

Professor of Geography, SYFACTE Laboratory, University of Sfax, Tunisia, abennasr@hotmail.fr

Abstract

The Advent of independence in Tunisia in 1956 raised the question of administrative cutting and territorial planning. The country launched a territorial restructuring project work (refinement of the cutting, a new hierarchical territorial mesh). The objective of such restructuring consists in breaking opposing tribal powers and seating the state authority.

However, in addition to the observed dysfunctions, it has become clear and evident for the state that governorates do not have the sufficient professional knowledge to conduct territorial planning effectively.

The necessity of larger territorial units to form governorates was recognized in 1985. But the question of regionalization has always posed the problem of the central power which has always opposed the institution of a regional echelon that provides governorates with the power of decision making. Such echelon would play the role of an intermediary between the central administration and governorates.

After the Tunisian uprising, the topic of regional development has become the central theme of national debate and concern. The issue consists in rethinking the topic of regionalization and reducing imbalances.

Key words:

Economic region; regional disparities; regionalization; territorial mesh; territorial planning

The Development Patterns and Evolution of Regional Cooperation in the Yangtze River Delta

Lei WANG, Xuejun DUAN

Key Laboratory of Watershed Geographic Sciences, Nanjing Institute of Geography & Limnology,
The Chinese Academy of Sciences, Nanjing China, wanglei@niglas.ac.cn

Abstract

Based on the framework of political-economy analysis, this paper sorts out the changing context and the structure of major administrative bodies at horizontal and vertical levels in the Yangtze Economic Belt, and evaluates the development levels of regional cooperation. The most developed subjects of regional cooperation among the 11 province-level units are located in the flood control, customs clearance policies, and quarantine. However the necessitated regional cooperation in the water resources and environment management, waterfront and port management, infrastructure construction and management, and ecological compensation and relevant platform of information-sharing are still under developed. Comparatively, regional cooperation is at the highest level of development among Shanghai, Jiangsu and Zhejiang in the lower reaches, and multi-level coordination mechanisms have been established to fulfill their agreements on many subjects, such as tourism and transpiration building, etc. The development level of regional cooperation in the upper reaches is higher than that in the middle reaches. In the upper reaches, regional cooperation is concentrated between Chongqing and Sichuan and several regional projects have been co-built because of their rooted similarities in cultural and historical background, as well as the promotion of central government. Last, regional cooperation is hampered among the four provinces in the middle reaches because there is lack of a strong economic center to drive the cooperation as in the lower reaches, and they also have more incentives to compete for attracting industrial transfer from Eastern China than to cooperate for regional affairs.

Key words:

The Yangtze Economic Belt; regional cooperation; political-economic context; patterns; evolution

Institutions and Development of Foreign Tncs in Russia: Regional Aspect

Mironova M.N., Alborova A.D.

People Friendship University of Russia, Moscow, Russia, 117198, 6, Miklukho-Maklaya str., mirmar@yandex.ru

Abstract

Foreign transnational companies (TNCs) accounted for 30% of 500 large business companies in Russia in 2014. Consumer services and extraction of natural resources were the most important sectors of foreign TNCs functioning in 2000-2014, while their share in banking sector decreased and their share in high added value branches grew. More than 70% among the largest Russian companies in production of electronics, consumer goods, alcohol and tobacco are foreign. The institutional factor played a significant role in foreign TNCs development and in foreign direct investment (FDI) in Russia in 2000-2015. Legislative reforms on simplification of doing business in Russia, adopted in 2005, led to a sharp increase in FDI inflows into its economy and industry in 2006-2013. Privileges in payment of customs duties in the implementation of economic activities, which are foreground for the Russian Federation, by foreign investors influenced rapid development of import substitution in the automotive and food industries, pharmaceuticals, telecommunications, etc. Branch interests of foreign TNCs and the laws of the Russian Federation on the establishment of special industrial economic zones had identified the regional priorities of TNCs development and FDI inflows. The largest companies in a number of economic branches in many Russian regions (Tatarstan, Tula, Kaluga, Lipetsk, Vladimir Oblasts, etc.). Types of Russian regions by the scale of FDI inflows and territorial peculiarities of regional disparities in Russia were identified. Institutional barriers (introduction of sanctions against the Russian Federation in 2014) had sharply reduced the FDI inflow, and a number of foreign TNCs left the country's market.

Key words:

Foreign transnational companies; institutional factor; foreign direct investment; regional priorities

The Positive Role of Local Economic Enterprises in Efficient Urban-Rural Linkages

Reihaneh soltani Moqadas

Assistant Professor , Payam Noor university ,Iran, Tehran, r.soltani@pnu.ac.ir.

Abstract

The interplay of rural and regional networks helps develop the positive role of regional network, in which spatial behaviors of rural people and their decisions have a substantial effect on development of such interactions. In developing countries, villagers have a small share due to market mechanisms and economic powers of urban dealers that determine prices, which diminishes reciprocal and positive role of villagers in the marketplace. The information flow can affect bargaining powers and participation of villagers, enhance efficacy of urban-rural relationships, and boost rural income and investment, which will increase rural-urban interactions due to purchase of new commodities from cities. Generally, there is no purchasing power in villages resulting from simple interactions, and relationships based on local practices do not enhance villagers' role in capital flow and added value. Accordingly, increased information power and participation in social networks, and knowledge of market information will provide the underlying factors for development of positive personal practices in rural social organization and positive urban-rural links, which will have a major impact on diversification of sources of rural income and rational investment and increased market share and added value. These can result in formation of a positive and dynamic local economy through increased interaction and participation in a spatial network.

Key words:

economic enterprises; Urban-rural linkages; regional network.

The Promotion of Bio-Energy Production as Instrument of Rural Development in Germany – A Critical Analysis

Schumacher, K.P.

University of Hannover, Institute of Economic and Cultural Geography, 30167 Hannover, Germany,

schumacher@kusogeo.uni-hannover.de

Abstract

Progress in German governments have in the last 15 years decided to transform the energy system from fossil and nuclear energy towards a system based on renewable energy, mainly wind power, solar power and biomass. This development has initiated a new interest in rural areas as locations for energy production. In the case of biomass based energy production an additional opportunity for regional development with new opportunities for regional added value, new business opportunities for farmers and firms as well as the stimulation of new actor and stakeholder cooperation within the regions have been proposed. Several funding schemes, subsidy programs and support programs have been set up to contribute to these goals, especially a 'bioenergy-regions' program. Since 2012 severe cuts of the subsidies and programs regarding biomass based energy production due to rising costs were observed.

The aim of this paper is to discuss these developments and their impacts on the regional level of rural regions in Germany. The paper is based on literature and document analysis and particularly on the empirical insights from a case study dealing with one of the bioenergy regions in north-western Germany. Findings show that in some regions at least a small number of stakeholders have benefited from these programs whereas the promotion of bioenergy production has had negative impacts in other regions, e.g. the case study region. Especially the regional agri-business has been affected and many conflicts of objectives regarding sustainability have developed. The paper concludes with lessons learned and recommendations.

Key words:

Policy analysis; renewable energy; regional development; Germany

The Research on Local Industrial Cluster Formation and Development Mechanism Based on the Co-Evolution Theory

Lv Kewen, Miaochanghong, Dinghuan

The Research Center of Yellow River civilization and Sustainable Development of Henan University, kewenlv@163.com

Abstract

By combing industrial clusters and co-evolution theory literature, the paper analyzed the history and current situation combing Yuzhou Jun Porcelain development of industrial clusters, found the various aspects of local resources, historical traditions, institutional arrangements, market development and technological innovation were the cause of the the Yuzhou Jun porcelain industry cluster formation, and multi-factor co-evolution mechanism led to the further developing of the cluster, such as the basis of history and resource conditions provide initial impetus was the original force of the formation of industrial clusters Jun Porcelain provided initial impetus to the formation of Jun Porcelain industrial clusters, reform and market demand was the important force to the industrial cluster growth, the effective institutional environment and institutional arrangements provided a suitable atmosphere for the growth and macroeconomic environment, technology and process innovation was the core factor of the development Jun Porcelain industrial clusters.

Clusters; co-evolution

The Role of University in Transnational Triple Helix System: Towards A Conceptual Framework

Cui Liu, Yuzhuo Cai

College of Civil Engineering and Architecture, Zhejiang University, Hangzhou, P. R. China, cui_liu@zju.edu.cn;

School of Management, University of Tampere, Finland

Abstract

It has been commonly perceived that the university plays a crucial role in the national/regional innovation system through production, transmission and application of knowledge. However, there are few attempts to understand the role of university in the transnational context. This paper proposes a conceptual framework to examine the role of university in transnational innovation system by combining the factors at the node level, the dyad level and the structural level. At the node level, we inherit the Triple Helix model and consider the government, university and industry as crucial actors in transnational Triple Helix system. At the dyad level, we use spatial proximity and institutional proximity between the actors in various Triple Helix systems to understand the contexts of transnational innovation. At the structural level, we focus on both social networks and knowledge networks to discuss the dynamics of transnational innovation. As transnational industrial (I-I) networks are the most vibrant in the existing transnational Triple Helix system, we approach to the role of university by examining its linkages with the industry. We categorize the I-I networks into four types according to the different combination of spatial and institutional proximity. In each type, we discuss the features of I-I networks and their challenges to transnational Triple Helix system. Then we examine the transnational university (U-U) networks and explore the role of U-U in collaborating with I-I to promote the development of transnational Triple Helix system.

Key words:

Transnational innovation system; Triple Helix; university engagement; university-industry collaboration; proximity; networks

The Study of Land Scale Operation in the County as a Unit in Gullied Rolling Loess Area: The Case of Liulin County, Shanxi Province

ge zhang

nanjing university, China, 1490285972@qq.com

Abstract

The content is based on the case of Liulin County, Shanxi Province whose economy develops rapidly and industry supports agriculture remarkably, due to the study of farmers' willingness of land transfer, through studying the various land scale operating models, to explore the effective models of land scale operation in modern agriculture. The results indicated four major factors which impact the farmers' willingness of land transfer, including gender, per capita income, agriculture proportion of total revenue and status que of land transfer, by the method of Binary Logistic Regression model. Though a variety of large-scale land operation model case study, the conclusions are as follows: 1. Corporatization operating model has solid financial and high mechanization utilization. As long as the company maintaining good economic performance and interests of all parties achieving moral self-discipline, honesty and trustworthiness this model can achieve efficient allocation of resources. 2. Large farming and family farm operation model who transfer land spontaneously can improve the efficiency of resource use and make the interests of all parties to reach a Pareto equilibrium. 3. Land Cooperatives operating model primarily serving the public, local economic development and prosperity based, but because of its inherent flaws make farmers who have fewer arable land and no other skills into a new poverty. 4. Although Agricultural Services Team operating model mechanized land operation of modern agriculture, farmers decentralized management is not conducive to the promotion of production, application and development of modern agricultural technology. And the content proposed land operation models which are suitable for case area to provide a useful supplement for traditional land scale management theory.

Key words:

Land Transfer; Binary Logistic Regression model

The Study of Space-Time Evolution to District Economic Coordinating Developing of Henan Province in New Time

Shang Gao, Dongqian Xue, Jiajun Qiao, Jiantao Yang, Jianhua Gao

Major in human geography in the College of tourism and environmental , Shaanxi Normal University, Shaanxi Xi'an , 710119,the college of environmental and planning, Henan university,the insitution of economic developing in Henan province, pindegaoshang808@126.com

Abstract

Base on the concepts and intensions which to define the Chinese region economic coordinate developing in new time by this article, to survey the structure of space-time to district economic coordinate developing of Henan province by ArcGIS and SPSS. It is to find that a tendency have appeared in space that much closeness is between districts, district economic coordinate developing is independent on the promoting and pushing by economic developing quantify and efficiency. It is highly coordinating effect between the space of economic improving and people's living level, there are still many problems in district economic coordinate developing of Henan province. The highly increase of financial revenue to prove the source of dynamic and the guarantee of coming developing. To analysis to region economic coordinate developing of space-time structure, it is to find that the district economic coordinate developing of Henan province level is higher than the whole nation, no matter what the aspect of time or space, there is obvious difference in district economic coordinate developing of each city.

The Variation of the Regional Competitiveness Discrepancy of Guangdong Manufacturing Industry in Recent 20 Years

qinglan qian

guangzhou university, China, qianlynn@21cn.com

Abstract

Guangdong province, located in Southeast China, is famous for its manufacturing industry both in China and in the world. In recent years, particularly since 1978 based on the open door policy, Guangdong's economy has grown rapidly led to the national's economic growth. The manufacturing industry plays an important role in Guangdong's economic development. However, Comparing with developed countries, Guangdong manufacturing is characterized by inferior infrastructure, low value-added products and lack of overall competitiveness. The rise of the Guangdong as a promising workshop of the "world factory" in China has attributed to the export-oriented industrialization drive by foreign direct investment. Since the world financial crisis in 2008, Guangdong's manufacturing industry faced huge challenge, external demand declining, prices of raw material rising, international markets fluctuating ,which make the traditional development model difficult to sustain. Guangdong's manufacturing is in a critical period of restructuring and transformation of development mode. Does Guangdong's manufacturing industry still have competitiveness? Regional manufacturing industry competitiveness is an important aspect of the study of the theory of regional economic development, as well as it is a new field which need us to make further efforts to explore. This paper on the basis of the overall evaluation of the competitiveness of manufacturing industry in Guangdong Province, revealing its manufacturing competitiveness characteristics of spatial-temporal variation, this research provides the theoretical basis and reference to promote the development of manufacturing industry in Guangdong Province and enhance the manufacturing industry competitiveness.

Traditional Skill and Handicrafts of India: Case Study of Madul-kathi Craft

Sao, S., Sarkar, K.

The Geographical Society of China, Beijing, 100101, P. R. China, igc2016@igsnrr.ac.cn

University of North Bengal, Raja Rammohunpur, India

Abstract

In Indian traditional society, various skills were acquired by generations of people. Some of these traditional technology expressed in various handicrafts have stood the test of time and remain popular even today. In fact modern means of development in rural areas has led to a gradual decay of the symbiotic functional system of rural society. Subsistence agriculture economy of the rural areas continues to displace part of its working force due to over dependence on land which leads to out migration of work force to urban areas. Thus development of handicrafts which follow traditional technology in production process and rely on traditional skill which are relatively simple seems a rational solution. Madul-kathi is an important handicraft of Harirampur block of South Dinajpur District of West Bengal. Objective of the present study which is based on a sample consisting of 40 units is to identify the role of traditional skill in the production process of Madul-kathi craft and to formulate strategies for the development of the said sector. Presently though the sector attracts skilled artisans and continues the industry's tradition moderately, units suffer from the problems like low productivity, monopoly of middlemen in marketing system, lack of credit facilities, and low diversification in production system. Attempt has been made to estimate the relevant objective variables by regression analysis and to interpret the co-efficient associated with different policy variables associated with madul kathi. Based on optimal values of policy variables strategies for the development of madul-kathi craft has been put forward.

Achievements of the Kingdom of Saudi Arabia in the Field of Toponymy (2014-2016)

Abdullah Alwelaie

King Abdulaziz Foundation for Research and Archives, alwelaie@hotmail.com

Abstract

Due to a growing worldwide interest in, and concern with, place names in general, and in the Kingdom of Saudi Arabia (KSA) in particular, the Royal Decree no. 36072 dated 28-91434H was issued for the purpose of establishing the National Committee on Geographical Names (NCGN) to incorporate all governmental agencies with related interests, with its headquarter at King Abdulaziz Foundation for Research and Archives (KAFRA). The general aim of the NCGN is to promote interest in, and verification of, place names in the Kingdom, and it also aims mainly at unifying all efforts pertaining to place names in the KSA in terms of their writing, orthography, spelling and all that is compatible with relevant national standards and data bases; as well as performing all works that will assist in representing the Kingdom in international conferences and symposiums. All of which will eventually make the NCGN the only competent authority for such an activity. The NCGN enjoys the membership of fifteen governmental authorities. We will highlight the achievements of some of them during the last two years as in this paper.

Agricultural Labor Productivity and Rural Residents' Income Gap

Wang Yahui, Li Xiubin, Xin Liangjie, Tan Minghong, Li Wei

Key Laboratory of Land Surface Pattern and Simulation, Institute of Geographic Sciences and Natural Resources Research, CAS, Beijing P. R. China China wangyhui.15b@igsnrr.ac.cn

Abstract

Using the panel threshold model proposed by Hansen, this paper empirically studies the nonlinear relationship between agricultural labor productivity and the rural residents' income gap based on panel data of 29 provincial units from 2000 to 2012. The results show that, there is the distinctive characteristic of the threshold between agricultural labor productivity and rural residents' income gap, rather than a simple linear relationship. Among different regimes divided by the threshold value, the influence of agricultural labor productivity on rural residents' income gap is different. When the agricultural labor productivity is less than 8.383, the improvement of agricultural labor productivity can effectively alleviate the rural residents' income gap; when the agricultural labor productivity across the first threshold value of 8.383, its effects of alleviating the rural residents' income gap is weakened; while it leaped over the second threshold value of 8.703 (i.e. the inflection point), it would exacerbate the rural residents' income gap. In addition, the current agricultural labor productivity has crossed the second threshold value, the expansion of rural residents' income gap should be concerned by all parties.

Characteristics of indirect energy consumption and carbon emissions and the influence factors of indirect carbon emissions: A case study of Jilin Province

Li Guozhu, Dai Ailin, Sun Jinxin

College of Tourism and Geographic, Jilin Normal University, Siping 136000, China, jlnulgz@126.com

Abstract

With the improvement of residents' living standards and the upgrade of consumption structure, energy consumption and carbon emissions caused by residents' living consumption increase day by day. This paper accounted the energy consumption and carbon emissions due to Jilin Province residents' expenditure during the period 2004-2013, and analyzed their variation features, which proved that living, education and entertainment, and food were the main aspects contribute to energy consumption and the carbon emission. Based on the STIRPAT model, a multivariate linear model fitted by a ridge regression to examine the relationship between carbon emissions and a list of human activity indices including carbon emission intensity, population of Jilin Province, per capita consumption expenditure, urbanization rate, was built. It was found that for 1% increase in carbon emission intensity, population and urbanization rate, there was 0.831%, 0.184% and 0.055% increase in carbon emission caused by residents' living consumption in Jilin Province. Carbon emission intensity was the most aspect contribute to the carbon emission. However, every 1% increase in the per capita consumption expenditure led to 0.309% carbon emission reduction.

Key words:

Indirect energy Consumption; Carbon emissions; Residents' living expenditure; Jilin Province

Competitiveness, Cohesion and Sustainability in the Urban Development. EU Vs. Non-EU Romania's Border Areas

Bianca Mitrică¹, Costin Dumitrașcu², Irena Mocanu¹, Ines Grigorescu¹, Monica Dumitrașcu¹,

¹Institute of Geography, Romanian Academy, Bucharest, Romania, biancadumitrescu78@yahoo.com

²Spiru Haret University, Faculty of Geography, Bucharest, Romania,

Abstract

The Romanian border areas include 898 Local Administrative Units 2 (LAU2), of which 88 urban. Romania has border line with the following countries: Bulgaria, Republic of Moldova, Serbia, Ukraine and Hungary, of which 63.5% is Non-European Union boundary. According to the population structure, 51.6% of the total population is urban. Identifying territorial disparities in terms of competitiveness, territorial cohesion and sustainability in the urban space of Romania's border areas implies several research stages: selecting relevant statistical indicators, analyzing their territorial disparities, standardizing the absolute values of the selected 15 indicators; grouping the elementary indicators by three secondary indexes (competitiveness, cohesion and sustainable development), stressing out the main socio-economic development aspects: 1 – *competitiveness* (general employment rate, unemployment rate, number of higher education graduates/total population over 20 years old, variation rate in the number of employed population between 2002 – 2012, physiological density); 2 – *territorial cohesion* (population migration rate, average rate of population growth, total population, dynamic of finished dwellings (1990 - 2014), living floor m²/inhabitant; the demographic dependency index, the physicians/1,000 inhabitants); 3 – *sustainable development* (% of dwellings with access to sewerage system, forest-covered area, green space area/inhabitant, the consumption of natural gas for domestic use). The final index of territorial development is assessed using the relative distances ranking method, adapted to the objective of the current study, in order to measure simultaneously the territorial disparities between the towns of the Romania's border areas and the urban space of each border areas (EU and Non-EU) on the one hand, and between the mentioned towns and the national urban space on the other hand.

Key words:

competitiveness; cohesion; sustainability; urban development; EU and Non-EU Romania's border areas

Density, Distance, Division and Rural Poverty in Guizhou Province, China

Wang Y M, Wu D T

Beijing Normal University, Beijing, 100875, P. R. China, wym85727@163.com

Abstract

This paper introduces and evaluates the relevance of a 3D framework from the 2009 World Development Report, which is designed to analyze the determinants of spatial disparities in rural poverty in Guizhou Province, China. The results show that this framework is effective for understanding varieties of rural poverty. Density was seen to have a negative effect on poverty level, while the distance to a local city center and the socio-cultural divisions had positive effects. The distance effect was significant for distance to a local city center, but was not significant for distance to a provincial capital. These results have important policy implications for poverty- alleviation, both on a provincial and national scale.

Key words:

China; Guizhou; rural poverty; new economic geography

Ecological Civilization Construction of Nanlijiang River Basin, Southern China

Qin Lishuang, Hu Baoqing

Key Laboratory of Environment Change and Resources Use in Beibu Gulf (Ministry of Education, School of Geography and Planning, Guangxi Teachers Education University, Nanning 530001, China, 541371396@qq.com)

Abstract

In little more than a decade, the idea that ecological civilization is vital assets has spread like fire. especially, under the background of green development in the planning of China's 13th Five-Year, the construction of regional ecological civilization is the inevitable choice to promote China's beautiful construction. Nanlijiang River basin belongs to the densely populated areas in Guangxi, and its ecological civilization construction is the key to solve the contradictory of regional economic development, environment and population. According to the south stream resource environmental bearing capacity of river basin and the principle of land layout optimization, this paper selected per capita annual consumption per capita, land for construction, such as the proportion of the tertiary industry, industrial effluent 10 index as the index evaluation system of ecological civilization construction of Nanlijiang River basin based on production, living and ecological analysis. and then, their spatial layout were quantitatively analysis. the result showed that: contradiction between ecological civilization construction of Nanlijiang River basin is irrational economic structure, low resource utilization, industrial distribution, poor production, living contradiction results. and then, proposed development path and ecological industrialization model were put forward based on combining with the development of the thirteenth Five-Year Plan requirements and the sustainable development in the Nanlijiang River basin.

Key words:

Nanlijiang River basin; ecological civilization construction; index evaluation system; basin ecological industrialization model

European Union's Cohesion Policy in Poland: Chances and Threats for Regional Development

Paweł Churski

Adam Mickiewicz University, Poznań, Poland, chur@amu.edu.pl

Abstract

Poland is the largest new member of the European Union very much relying on assistance because of its level of socio-economic development being lower than in the 'old' Community states. The most important assistance instrument, both in terms of the scope and value of the support given, is the cohesion policy. The 10th anniversary of Poland's EU membership celebrated in 2014 and the end in 2015 of the second financial perspective in which it participated as a member state are a good occasion for summing up and assessing the effects of this momentous event and changes it has brought about. They have affected various spheres of life (institutional, economic, social) and various levels of authority and territorial administration (national, regional, local). The goal of this poster is to present the most significant consequences of the EU cohesion policy in Poland, especially changes it has produced in the level of regional development and differences in it at a regional and a subregional level. Apart from presenting objectively positive effects of the support received, a critical assessment is also made of programming assumptions, barriers to and limitations of the absorption process as well as of adverse consequences of assistance not always used properly. The results provide a basis for recommendations concerning further development-oriented measures. Their significance grows especially in the light of the ever stronger position of Poland and its regions on the changing European map of differences in development. This means ever greater challenges in the programming and implementation of a future development policy in Poland after 2020.

Key words:

cohesion policy; European Union; Poland; region; regional development; convergence vs. divergence; supply and demand effects

Hydroclimatic Research of the Baikal Natural Territory as a Part of a Significant Transboundary Catchment

Olga Gagarinova

Sochava Institute of Geography SB RAS ,whydro@irigs.irk.ru

Abstract

The Baikal Natural Territory (BNT) is the natural environment of Lake Baikal on the Russian territory. Global climate changes, the increasing human impact on the environment modify natural landscapes and have a significant influence on the formation of water resources. Conservation and management of natural waters is one of the strategic objectives of sustainable development of the BNT and the whole region. We made multi-method investigations of long-term hydroclimatic and landscape- hydrological patterns of the BNT. We estimated the intensity of changes in the basic hydrological characteristics against the background of climate change. We noted annual distribution of the river flow of the BNT on a background of multidirectional vibrations of the totals. A significant influence of air temperature variations on the dynamics of river flow in the months of temperature transition through the 0° C (April and October), and on the flow increase in the cold period (October to March) is revealed. In other periods of the year we tracked the influenced by the rainfall dynamics. As a result of model calculations and landscape-hydrological analysis, we determined the magnitude of water loss of the landscapes of the BNT in specific hydrological seasons, as well as substantiated and revealed the areas with different contribution to the formation of water-resource and hydro-ecological potentials of the territory, showed the areas with different degrees of sensitivity to human impacts and natural changes, and finally, assessed the environmental situation and extreme hydrological conditions of the catchments.

Evolving Geography of Auto Industry in Hubei Province

Juncheng Zhu

School of Resource Environment Science and Engineering, Hubei University of Science and Technology;
Xianning, 437100; Research Center of Urban and Regional Development, Hubei University of Science and Technology;
Xianning, 437100, P. R. China, hbzhuu@163.com

Abstract

Instead of drawing upon China's abundant labor resources, auto manufacturing represents a newly emerging industry that requires high capital investment and intensive technology. The growth and expansion of auto industry is considered to be imperative to China's manufacturing upgrading, economic restructuring, urban production network development and city network. The growth and spatial configuration of China's auto industry in the past experienced both dispersion and concentration in geographic space but has recently evolved into noticeable clustering patterns centered in several major metropolitan regions. During the process of spatial evolution of auto industry, machinery manufacturing, industrial upgrading & development policies and institutions, FDI, and technological innovation are argued to have played significant roles. However, knowledge is still limited on how these factors interact with each other and with geographic contexts in the path-dependent evolutionary process of auto manufacturing. This study adopts a theoretical framework grounded in evolutionary global production network to understand spatial and temporal trajectory of auto industry in Hubei Province. Using published statistics, government documents, and firm interviews, this study attempts to identify evolving mechanisms that shape the spatial process of changes in auto industry and explain its regional development paths. It also tries to explain its production networks structure and to analyze the auto industry development path on density, extensity, accessibility and spillover. And it also tries to analyze changing urban landscape based on production networks.

Key Words:

auto industry; evolving; evolutionary economic geography; production network; Hubei Province

Implementation of Socioeconomic Development Strategy at Local Level. Concept, Principles and Methodology. The case of Bistrița-Năsăud County, Romania

Zotic V., Alexandru D.E., Puiu V, Surd V.

Babeș-Bolyai University, Centre for research on Settlements and Urbanism, Cluj-Napoca, Romania,

zoticv@geografie.ubbcluj.ro

Abstract

Current territorial development needs do no longer fit the traditional development patterns. The new development challenges triggered by energy crisis, environmental pollution, resource depletion, depopulation, or globalization make territories that were once in a certain balance, now devolve to disequilibrium. This is associated with an increasing territorial disorder although resources are continuously invested to stabilize the development process. Romania fits this context, demonstrated by many development indicators. Apart from objective factors that impede the correct and suitable territorial development (corruption, lack of professionalism of the decision-making factors, lack of coherent development plans) we add subjective factors, namely the quality of elaboration and implementation of development strategies. Most of them only reflect territorial dysfunctions without providing solutions and development patterns to be followed by the local communities. This paper presents an approach of local development strategies from the results perspective, which is not only a list of proposed programs, measures and projects on local development, but also a proposal of how to interrelate and integrate them into strategic projects. Thus, we changed the conceptual approach, we introduced the concepts of informational pyramid and logical scheme on information management, and threshold values to help answering appropriately to the ways proposed to solve dysfunctions after and during the implementation of strategy. The result is the implementation of the development strategy at county level, in which the novelty was to identify a series of representative strategic projects, to further represent the backbone of development in the analyzed territory for the period of 2016-2020.

Key words:

integrated management of territory; development strategy; strategic planning; smart development; informational ranking; threshold values; development patterns.

Integrate Construction Research of Urban Agglomeration in the Middle Reach of Yangtze river - based on Generic ERE and Mr PRED System

Wang Wei

Central China Normal University, Wuhan, 430079, Wang Wei. China, 976410969@qq.com

Abstract

Site is our ancestors created material and spiritual heritages and recorded the history of the vicissitudes of life, depict the picture in the development of the Chinese nation. But, with the rapid development of our country's economy, the spread of city scale, the urban environment deteriorating, for site protection work has brought the huge challenge. In the process of rapid urbanization, large sites with more attention paid to the protection and utilization, park planning and design arises at the historic moment, become great site protection and utilization of the reality of the carrier. Based on the analysis of site protection and utilization at home and abroad, based on the research of international and domestic city ruins protection by use of different methods. Jing Zhou Chu chariots and horses array of national archaeological site park planning and design case study, the combination of theory and practice for extraction of individuality and commonness, summed up the ruins park planning and design principles, considering the influence factors of the content and level. Research results including the present situation analysis in the process of planning and design, scope definition, value evaluation, planning theory, and the protection and display multiple aspects, such as work content, the stages and put forward the planning content and solution, so as to the future park planning and design at home and abroad to provide reference for reference.

Necessities to Develop Clusters in Mongolia

Luvsanjantsan Erdenebayar, Dashkhuu Batmunkh, Surenjav Davaanyam

Mongolian State University of Education, Ulaanbaatar, Mongolia, welcome_erka@yahoo.com

Abstract

Clusters are considered globally a key tool for strengthening competitiveness, implementing innovation policies and enhancing national export capacities and promoting economic development. In addition, clusters are regarded as a powerful mechanism for regional development.

Cluster approach based regional development models are now believed to be the optimal way of economic integration. Regional clusters are fast becoming leaders of economic development in their respective countries. Mongolia's neighbours, Russia and China, are undertaking active measures to develop their own clusters.

Mongolia faces an urgent need to enhance its economic competitiveness, implement innovation policies, modernize the structure of the economy, strengthen public private collaboration, develop appropriate national and regional level production and service industries and reduce unemployment and poverty.

International experience shows that clusters create conditions favorable for developing small and medium production and service enterprises, generating employment and reducing poverty. Cluster development will be an important part of Mongolian economic development policy in near future.

Key words:

Cluster development; economic development policy; competitiveness; innovation policies

People Climate and City-Regional Competitiveness in Finland

Kotavaara, N¹, Muilu, T²

¹University of Oulu, Oulu, Finland, niina.kotavaara@oulu.fi

²Natural Resources Institute Finland (Luke), Oulu, Finland, toivo.muilu@luke.fi

Abstract

This study approaches city-regional policymaking and fostering of international competitiveness of city-regions in Finland in the context of people climate –concept and attractiveness of city-regions to talented people. In the predominant knowledge-based economy cities' competitiveness relies on their ability to attract talented employees. In 2002 Richard Florida proposed that regional economic growth is driven by the location choices of creative people who are attracted to places that are diverse, tolerant and open to new ideas. Florida considers that having an effective people climate is even more essential than having a solid business climate. Florida's ideas and policy recommendations have gained interest around the world and they have been widely applied in regional development policies. At the same time his ideas have provoked a critical scientific discussion concerning whether they can be applied to different regional context from USA where they were originally developed. Finland has succeeded excellently in international comparison of global competitiveness indexes (e.g. World Economic Forum). However, competition for talented people has become tighter and structural change of economy has cut investments in education and research. To keep up with international competition, Finnish city regions, together with state administration, have launched several political acts which aim at strengthening their international competitiveness. This study is interested in the political objectives that Finnish city-regions have set in the political documents to attract talented people: To what extent they are based on Florida's ideas, and on other hand, to what extent they are based on specific regional contexts?

Key words:

regional competitiveness; people climate; city-regions; Finland

Abstract

Area Studies have two genealogies, namely one is with origins in the colonial survey and another is with the field survey in geography traditionally. Historically both were often overlapped each other, and it was sometimes called into question the academic significance. However, for the geography to profess itself “knowledge of the relationship between human being and nature”, regional field survey which bury in inquiring “relationship” in region, has been the academic *raison d’être*. In Japan, area studies to target many areas around the world, especially Asia, have been thriving not only during World War II but also throughout the post-war. In Hiroshima University, since 1967, geography studies of Indian villages have carried out continuously. The research approach was unique in that based on collection of all common data of village from whole aspect, which can do comparative studies between target villages in deferent regional conditions. Studies were divided into 2 phases, the North India Project (1967-73) and the South India Project (1978-82), during each phase, intensive field survey (2 weeks to 3 month) has been carried out. In addition, following up survey have done in 1991-93 about these study areas. In result, a detailed and continuous research data is accumulated. Recently, area studies in a broad sense, by innovation of research methods and technique, and development of data, have been divided into two poles of, the macro-level analysis of data and micro-level case study. In this study, we will try, 1) to verify the results of the Hiroshima University project, 2) to present a new field work framework and methodology, which is based on the "regional" concept.

Reflection on poverty alleviation in the eastern Tibet of Kham and Amdo

Xie Yang

Ochanoizu University, Tokyo, Japan, syayo55xy@yahoo.co.jp

Abstract

In western china, ecologically fragile areas and poverty areas are geographically overlapped, and the poverty alleviation projects were designed to ecological protection and income increase. However, almost of these projects were proved to be not effective. Most researches attributed the reason to religious influence in Tibet but ignored the locality. This research based on a literature review on previous studies on poverty alleviation in Tibet and Inner Mongolia area, summarizes the recent progress in the research, analyzes the biases in present researches, and illustrates different characters and results according to different regions. According to the post-2015 millennium development goal, this research indicates how to adjust our research direction and discusses the new positionality of researchers. Especially with respect to the eastern Tibet of Kham and Amdo, this research is expected to inspire new reflection into poverty alleviation.

Poverty alleviation; pastoral areas; Tibet

Regional Dual-Nuclei Structure Theory

Lu YQ

College of Geographical Science, Nanjing Normal University, Nanjing, 210023, P. R. China, luyuqi@njnu.edu.cn

Abstract

The dual-nuclei structure is a special, highly efficient spatial structure that contains a regional central city, a gateway city and their relations, thus having both the centered nature of a regional city and the fringe nature of a gateway city. Dr. Lu Yuqi first observed this phenomenon in 1996 and, shortly thereafter, finished the whole process of pattern detection, mechanism analysis, reason deduction and mathematical derivation.

There are three types of regions: natural regions, which mainly include river valleys; economic regions, which mainly indicate urban economic regions; and administrative regions. In China, the dual-nuclei structure appears to be that of the administrative unit at different spatial scales. Generally, the national-, metropolitan-, provincial-, municipal- and county-level spatial scales are 1000, 500, 200, 100 and 50 kilometers, respectively.

There are two types of gateway cities: port cities and inland gateway cities. The spatial efficiency and development potential of the former are much greater than those of the latter, so the apparent dual-nuclei structure mainly refers to one that comprises a central city and a port city. Further, port cities include harbor cities and river port cities. Therefore, basins are the ideal region for nurturing the dual-nuclei structure, especially for rivers such as the Yangtze River in China, the Mississippi River in the United States, and the Nile in Africa.

The dual-nuclei structure phenomenon is widespread in the world. This is true in Chinese coastal and river areas but also in Chinese border regions. Worldwide, this phenomenon is also quite common.

Key words:

regional dual-nuclei structure; regional central city; gateway city

Regional Inequality and Evolvement Mechanism of Industry Output with Different System of Ownership base on Institution Aspect: A Case Study of Jiangsu Province

Liu Shuai-bin

School of Geography Science, Nanjing Normal University, Nanjing 210023, China, liushuaibin312@163.com

Abstract

The industrial development is closely related to economic institution in a country or region. Base on the aspect of economic institution, the paper divide the industry output into state-owned, private-owned and foreign-owned, examine regional inequality of industrial output with different system of ownership in Jiangsu province from 1995 to 2013 by the method of Theil index and spatial analysis, and analyses the influence mechanism of economic institution. The result shows: (1) the regional inequality of state-owned and foreign-owned industry output increased from 1995 to 2001, decreased from 2001 to 2013. While, the regional inequality of private-owned industry output decreased all the time. (2) The standard deviation ellipses of different ownership's industry output present northwest-southeast pattern, but the evolution trend is different. The range of state-owned industry output's standard deviation ellipse was stable. The range of private-owned industry output's standard deviation ellipse was expanding all the time. The range of foreign-owned industry output's standard deviation ellipse varied obviously after 2005. (3) The different effects of institution variables on state-owned, private-owned and foreign-owned industry output in time and space, reflect the short-acting of decentralization's effluence and the progressive of marketization, indicate that the enterprise of private-owned and foreign-owned would be the main agent of decreasing regional Inequality for Jiangsu province.

Key words:

economic institution; industry output; regional inequality; influence mechanism; Jiangsu province

Regional Spillovers of Transport Investment on Economic Growth In China

Zhengbing Liu, Teqi Dai

Beijing normal university, Beijing, 100101, P. R. China, 731721726@qq.com

Abstract

The paper main studies the spillovers of transport investment on economy from all the provinces in China, transport infrastructure investment has indirect and direct effect on economy, and transport endowment on regional economy receive local effect and other regions' investment effect, which had been assumed and proved by many preview literatures. Moreover, infrastructure investment on economy has time lag character, but it lacks relevant studies on spillovers, so this study uses panel data analyze lag spillovers on economy base on production function from 1988 to 2013. The result shows that it has significant spillovers on economy, 1 lag time has more positive on spillovers of transport investment, it has significant time effect and release with longer lag year. Consider to East regions, West regions and Central regions divided by China, which have different spillovers on their own economy, and they also have significant lag effect, mobility of factors play an important role on sub-regions effect of transport investment.

Key words:

Transport investment; economy growth; spillovers; Lag time.

Research on New Regional Spatial Division of Labor Based on Cross-regional Industrial Spatial Organization Change - A Case Study of Foshan Ceramics Industry

Jin Lixia, Zhang Hong'Ou, Wang Yang, Huang Gengzhi, Wu Qitao, Xi Wenkai

Guangdong Public Laboratory of Geospatial Information Technology and Application, Guangdong Academy of Innovation Development, Guangzhou Institute of Geography, Guangzhou 510070, China, jlx906@qq.com

Abstract

After 30 years of growth, China is facing an important transition. Regional economic activities are showing a complex trend of agglomeration and diffusion. In this process, the cross-regional industrial spatial organization change and its dynamic mechanism have been produced and concerned widespread. But regional relations evolution has been neglected. Based on the theoretical basis of Spatial Division of Labor, from the micro perspective of industrial spatial organization, this paper studies new models, new mechanisms and new effects of the regional spatial division of labor under the background of the new round of industrial spatial restructuring in Guangdong Province. This article takes inter-regional production space organization of ceramic enterprises between Foshan and Qingyuan as a case. The study shows that ceramic industry of Foshan has undergone two rounds of space restructuring, and the production space organization of ceramic enterprises has changed significantly, multi plants and multi locations production space structure and cross regional production network are being formed. With the separation and concentration of space of different functional departments in the process of labor, regional spatial divisions of labor evolves to regional functional division of the 'core-periphery' pattern. In this process, in addition to the market-driven mechanism, institutional mechanisms become an important driving force of the current regional spatial division of labor. Especially, the forced mechanism of environmental regulation and the promotion mechanism of industrial transfer system arrangement have become the most important driving mechanisms under the new round of industrial restructuring. This new model of spatial division of labor presents a balanced networking trend, promotes the development of regional industrial integration, and greatly improves the form of spatial inequality. But essentially new forms of inequality are being reproduced which have further strengthened the 'core-periphery' trend.

Key words:

Industrial Spatial Organization; Spatial Divisions of Labor; the 'Core-Periphery' Pattern; Regional Functional Division; Ceramic Industry; Foshan and Qingyuan

Research on Regional Development Status and Coordination Study in Henan

Province Based on the Five Development Concepts

Tian Guanghui^{1,2}, Miao Changhong^{1,2*}

¹Key Research Institute of Yellow River Civilization and Sustainable Development & Collaborative Innovation Center on Yellow River Civilization of Henan Province, Henan University, Kaifeng 475001, China; 327535018@qq.com

²College of Environment and Planning, Henan University, Kaifeng 475004, China

Abstract

The five development concepts provide us a new road, direction and important breakthrough point about Chinese regional development in the period of 13th Five-Year Plan. Meanwhile, it's a further supplement to the Objectivity of social and economic development. Based on the connotation and connection of five development concepts, we set up an evaluation index system of regional development status from five aspects including innovation, coordination, green development, opening up, and sharing respectively, take Henan province as the example for quantitative analysis. Then, Measure the regional development status and the coordination level of the subsystems of 18 cities in Henan province by use Fuzzy Discriminating Model and Model of Coordinating Degree. The results show that the comprehensive development of Henan City is in the low state of development, and the city level differences are obvious, present the core-edge space structure. Four major economic zones have different levels of development; Central Henan Urban Agglomeration has obvious advantage. Green index is higher than other indexes, innovation and opening up have become an important obstacle of regional development. City development status has a significant positive correlation with the level of economic development, the higher the economic development of the city, the higher the regional development status. Coordinated development of the system is in the stage of weak coordination, the overall level of the system needs to be improved. Meanwhile, there is no correlation between the level of coordination and the level of economic development. Finally, the status of the development of Henan is divided into five types according to the cluster analysis, and relevant suggestions are put forward.

Key words:

five development concepts; coordinated degree; fuzzy Comprehensive Evaluation Model ; henan province

Research on the Optimization of Regional Land Development in the Yangtze River Economic Zone

Zhang. RW, Yang. QY

Southwest University, Chongqing, 400715, P.R.China, 543704392@qq.com

Abstract

The Yangtze River economic belt is an important part of the strategic layout of the "T" spatial structure, which is also an important part of the strategic layout of the country's urbanization. By the moving population and industrial chain changes, this paper constructs land expansion theoretical analysis framework of regional spatial development based on the relations among the population, industry and construction, thus constructing the regional scale economy of the Yangtze River with urban network contact model. Moreover, it also investigates the coordinated relationship between the coupling of various provinces and cities and demonstrates the area value of spatial variability so as to put forward optimized regional value chain, form a reasonable division of region and upgrade the Yangtze River economic belt land and space development.

Key words:

spatial development; Coupling and coordination; the Yangtze River economic belt

Spatialtemporal Evolution of New Pattern Industrialization, Urbanization, Informatization, Agricultural Modernization, Greenization Coordination Development in Shandong Province

Hou Chunguang, Cheng Yu, Ren Jianlan

School of geography and environment, Shandong Normal University, Jinan 250014, Shandong, China,

renjianlan@sina.com

Abstract

The new industrialization, urbanization, informatization, agricultural modernization and greenization (hereinafter referred to as the “new five modernization”) has received extensive attention of the society from all walks of life and value and it is the basic path to achieve regional sustainable development. Taking the new industrialization, urbanization, informatization, agricultural modernization and greenization as the measuring indicator, this paper analyses the spatialtemporal evolution of the “new five modernization” coordination development in Shandong Province from 2000 to 2013 by using the mathematical model, quantitative analysis and spatial analysis method. The results show as following. ①The “new five modernization” comprehensive development level rise faster. New industrialization, urbanization and informatization development momentum growing rapidly. The level of agricultural modernization and greenization development is low. ②The degree of coupling of “new five modernization” each subsystem between 0.703 to 0.986, but it is a low level of highly coupled. The coordinated development level of the “new five modernization” between 0.301 to 0.823, most of the year “new five modernization” coordinated development level is not high in Shandong Province. ③The coupling degree and coordination degree of the “new five modernization” are higher in Jinan, Zibo, Qingdao, Weihai and other Ludong area in Shandong Province, the coupling degree and coordination degree are low in Heze, Liaocheng, Linyi, Rizhao and other Lunan region in Shandong Province from the perspective of the spatial pattern of the “new five modernization” coordinated development. According to the above study, put forward: Promote the simultaneous development of the “new five modernization”.

“new five modernization”; coupling degree; coordination degree; Spatialtemporal evolution

Spatiotemporal Characteristics and Dynamic Mechanisms of Agricultural Development in China's Intensively Urbanized Areas: The Case of Pearl River Delta

Rongjun Long, Xun Li, Chengguo Zhang

School of geography and planning, Sun Yat-sen University, Guangzhou, 510275 China, LongRongJun2006@126.com

Abstract

The spatial patterns and contributing factors of agricultural development have long been a core concern for geographical research conducted on the regional scale in China. Until recently, however, few attempts have been made to investigate the evolution of agricultural development in intensively urbanized areas. Using the weighted regression model (GTWR), this research explores the spatiotemporal characteristics and dynamic mechanisms of agricultural development in the Pearl River Delta in southern China over the past twenty-five years. Based on county-level data, significant spatiotemporal heterogeneity in the pattern of agricultural production was revealed by the findings. The results of analysis indicate that in the study area: firstly, the gravitational centre of agricultural production has moved both from south to north, as well as from east to west; secondly, while effects of the amount of cultivated land and the quantity of agricultural labor on agricultural GDP have been less significant across time, an increasingly strong correlation has been found between the figure of agricultural GDP and (1) the amount of machinery and (2) a composite index on the fragmentation of cultivated land, respectively. With the development in agricultural technology and its scale management, this research offers fresh understanding of the important role played by agricultural modernization in an intensively urbanized area such as the Pearl River Delta, and lends support to more scientifically-informed policy-making for the development of agriculture in this region.

Agricultural development; Pearl River Delta; spatiotemporal characteristics; mechanisms; geographical weighted regression

Study on the Institutional Arrangement for Optimizing Territorial Spatial Development In Yangtze River Economic Zone

Yang. QY

School of Geographical Sciences, Southwest University, Chongqing 400715, P. R. China, yizyang@swu.edu.cn

Abstract

The Yangtze River Economic Zone is an important part of the "Three longitudinal and Two- horizontal" distribution of country's urbanization. How to optimize the functional composition of the Yangtze River Economic Zone and make it work synergistically are two main problems needed to be solved. This article explores the Institution arrangements and the operating mechanism of the optimization of the territorial spatial in Yangtze River Economic Zone. Concrete institutional arrangements include: (1) A mechanism of population and land resources connection should be built in terms of in-flow areas and out-flow areas. As land and labor linked by price mechanism, the key elements of production could be allocated effectively. (2) A market-based mechanismshould be built in order to configure the national construction land indexes. Setting up a trade market of land development right could optimize the allocation of critical resources, such as land resources. (3) A strategic resources compensation mechanism should be built, plus a land resources tax reform at the Yangtze River economic belt. There are alternative approaches: combining the farmland occupation tax, economic development and urban sprawl, or taking progressive "ad valorem" path. (4) A balanced development mechanism should be built, which can prevent the industry homogenization and establish collaborative mechanism between industrial transferring and financial transferring payment. (5) A mechanism of Multiple-planning coordination and integration should be built, land use planning, and the territorial planning of Yangtze River Economic Belt. Moreover, the Institutional friction caused by the differences of use control mechanism design should be avoided.

The Innovation from the Airport Economy Development of ZAEA to the Regional Development Mode

Zhang Zhancang Chen Ping Peng Junjie

The Henan Academy of Social Sciences, Zhengzhou, 450002, P. R. China, zzcang09@126.com

Abstract

As the growth pole of regional economic development, the pathway that airport economy leads the development of regional economy includes: changing the regional elements endowment in micro scale, coupling with the industries in the hinterland in the medium scale, accelerating the tax revenue increase and employment growth in the macro scale. As a representative of Chinese airport economy, Zhengzhou Airport Economic Comprehensive Experimentation Area (ZAEA) plays a significant leading and demonstrating role in the following fields: deepening the reforms in an all-round way, promoting the “synchronization of five modernizations”, building “one carrier and four systems”, constructing “four Henan”, supply-side structural reform and integrating the resources of Henan airport. The article concludes: supply-side structural reform in China needs to accelerate the airport economy development and to integrate into the international frontiers under the Economic New Normal. Airport economy will play a crucial part in the “One belt and one road” strategy. The innovation of ZAEA development promotes the regional development pattern, which shows the tendency of future regional new “four modernizations”. The airport economy may change the traditional development pattern that the regional development center locates in the coastal areas usually since the Industrial Revolution, and open up a new era that the regional development center will return to the inland regions.

Key words:

Airport Economy; Supply-side Structural Reform; Zhengzhou Airport Economic Comprehensive Experimentation Area; Regional Development Model; Inland Era

The Spatial Characteristics of Producer Service Agglomeration in Jinan Metropolitan Region and Its Influencing Factors: Analysis Based on both Industry Level and Regional Level

Ren Mei, Cheng Yu, Ren Jian-Lan, Huang Cai-Hong

College of Geography and Environment, Shandong Normal University, Jinan, 250014, Shandong, China, 738697828@qq.com

Abstract

The word industrial structure presents a general trend that the industry economy is transforming to service economy, promote the coordinated development of producer service agglomeration in Jinan metropolitan region can optimize the industrial structure of Jinan metropolitan region. It has been an important way to improve the overall strength of the region. Mainly based on number of employees of Jinan metropolitan from 2003-2014, using the Gini-coefficient, the Concentration Ratio to measure the overall situation, industry characteristics, cities average concentration ratio of Jinan metropolitan and then find its influencing factors. The results showed that: ① The degree of spatial characteristics of producer service agglomeration in Jinan metropolitan region is low and the fluctuation characteristics is obvious. The curve is inverted "U" type.; ② From the industry level, the producer services agglomeration degree is higher than the manufacturing industry, the agglomeration of capital-intensive industries or technology-intensive industries is higher than other industries. From the regional level, different cities have different concentration of producer services, the center-periphery model is very obvious; ③ Demand structure, human capital and the level of opening can promote the agglomeration of the Jinan metropolitan producer services, but the government policy can inhibit the agglomeration of the Jinan metropolitan producer services.

Key words:

producer service; spatial agglomeration; industry; region; Jinan metropolitan region

The Spatial Differentiation and Influencing Factors of the Service Quality Of C2C Stores In Central China: A Case Study of Five Types of Taobao online stores

Ding Zhiwei, Zhou Kaiyue, Kang Jiangjiang, Wang Fazeng, Zhang Gaisu

The College of Environment and Planning in Henan University, Kaifeng, Henan, 475004, P. R. China,

dingzhiwei1216@163.com

Abstract

The C2C e-commerce, such as clothing, hand bags, foods, cosmetics, personal electronics and household appliances, has played a major role in consumer market. Five types of stores on Taobao, one of the biggest online C2C shopping websites in China, are selected in this study. The location, type and service quality for each store in 88 city regions are collected from the website. The comprehensive service quality at provincial and prefectural levels is evaluated. The results show that the spatial differentiation of service quality is evident at provincial scale. The comprehensive service quality in the capital cities, the core cities of urban agglomeration and the economically developed cities is higher, while it is lower in peripheral area. At prefectural level, it shows a weak negative spatial autocorrelation, for example, Wuhan city and Chang-Zhu-Tan Urban Agglomeration is in the HL region with strong polarization effects. As for the characteristics of complex network, the provincial capital cities and the economically developed cities have high degree of centrality and form a “core - periphery” spatial layout structure with the core cities and a few strong comprehensive strength cities. At the same time, the centrality degree and agglomeration coefficient does not match and even shows an inversion phenomenon, which suggests that the agglomeration of service quality of C2C stores in central China is not strong and the trickle-down effect is not obvious.

Key words:

C2C E-commerce; online stores; Taobao website; spatial difference; Central China.

The Spatial Pattern and Influence Factors of Specialized Villages and Towns in China

Shao Liuchang¹, Qiao Jiajun^{1,2}, Mayu Ling¹

¹ College of Environment & Planning;

² Key Research Institute of Yellow River Civilization and Sustainable Development & Collaborative Innovation Center on Yellow River Civilization of Henan Province, Kaifeng, 475004, Henan, China, 919907117@qq.com

Abstract

Based on these data of 1605 specialized villages and towns named One Village One Product (OVOP) in China, this paper makes analyses of spatial point pattern with methods of kernel density estimation and K function and analyses of spatial surface pattern with methods of spatial autocorrelation analysis and hot spot analysis and gets the following results: (1) The distribution of specialized villages and towns has an obvious spatial inequality. Especially, there were different kinds of specialized villages and towns, and most of them belonged to the planting-oriented, and so the proportion of nonagricultural-oriented was usually lower than others. (2) These regions with higher density are distributed around the Beijing-Tianjin region and these regions of Jiangsu, Zhejiang and Shanghai. The spatial structure showed a gradually decreasing trend from the center to its periphery. The result of quantitative measure with Ripley's K function shows the significant agglomeration of specialized villages and towns in spatial distribution. (3) The spatial autocorrelation analysis showed that the administrative region distribution of specialized villages and towns has an obvious characteristic of spatial cluster, and the distribution from the city-level administration is further analyzed. The result of GWR for the influence factors (the terrain, road, economic development) of agglomeration showed that the regression coefficient of each factor had significant spatial variation. The relevant government departments should improve the development environment for the specialized villages and towns in the existing resource endowments, and continue to make efforts to promote the OVOP specialized villages and towns.

Keywords:

One Village One Product; specialized villages and towns; point pattern analysis; surface pattern analysis; agglomeration

The Temporal-Spatial Analysis on Urban Office Space Functional Patterns in Beijing City

Qi Yingxi¹, Zhang Jingqiu²

¹ College of Resource, Environment and Tourism, Capital Normal University, Beijing 100048, China;

² College of Arts and Science of Beijing Union University, Beijing 100191, China

Abstract

This paper based on the 2009 and 2014 Beijing's office buildings point data and enterprises data that from Data Information Company as the study samples. Using statistical analysis and spatial autocorrelation analysis methods, discusses the present situation of the office space patterns and temporal-spatial evolution characteristics. The research shows that (1) The density distribution of urban office location gradually reduced from the inside to the outside, thus the location selection of the office activities is still in a centripetal force mainly. (2) Analyzing the changing characteristics of the industry in the four major office clusters, find that the four major office clusters play the different roles in the development of the city. (3) Urban office activities overall performance of clustering effect. High-high type is mainly located in the edge of the core area of the capital function; Low-low type is mainly distributed in the edge of development district of the capital function. (4) 2009-2014, Beijing office space is mainly on radiation pattern, continuously extended outward from the gathering area, thereby expanding the scope. (5) From the urban functions, the financial industry, technology services and the social services industry developed rapidly. But construction industry and transportation industry developed relatively slow in these five years.

Key words:

Office clusters; Urban functional patterns; Spatial analysis; Temporal-spatial evolution; Beijing City

Abrupt Structural Change Areas in the Finnish Regional Policy

Muilu, T

Natural Resources Institute Finland (Luke), Oulu, Finland, toivo.muilu@luke.fi

Abstract

The paper deals with problems caused by abrupt structural change to local labor markets and policy measures aiming to ease these problems in Finland. The areas in question have met region-specific employment shocks due to major job reductions or closure of a company. Major cause for these shocks has been problems in forest industry. In 2005–2013 nearly 20 paper mills and pulp factories were closed in Finland. This resulted one third cut down in production capacity and dismissal of about 8000 employees. Major part of these areas are small or medium-sized rural sub-regions or provincial centres in Eastern and Northern parts of the country. A common feature is dependence on one or a few large companies and public sector jobs. The Finnish government may classify such an area as an abrupt structural change area. Prior to naming the area(s) consequences and effects of problems are evaluated in terms of employment, production and economic structure. A plan to solve the crisis is jointly drawn up by the area's municipalities, the business community, the employment authorities and the regional council. In 2007-2014 more than 30 sub-regions or cities were named as areas of abrupt structural change. In the context of local labor markets regional differences were found in spatial mobility, where migration appeared more common than commuting between regions. In general, spatial mobility seemed to be more important in smaller labor markets. Results of the government policy on abrupt structural change are varying and region-specific, as are the effects of shocks.

Key words:

abrupt structural change; local labor markets; regional policy; Finland

Can landscape empower rural minorities? Eco-ethnicity in highlands of India, China and Vietnam

⁵AgroParisTech, France

Abstract

Can rural landscape empower rural mountain dwellers? This paper provides an answer by asking two other questions. Why is rural tourism growing in some « marginal » Asian highlands and not in all of them? And why, in the regions with growing rural tourism, are « local people » impacted variously, from harsh detriments to diverse levels of benefits in terms of income and socio-political empowerment? Based on qualitative fieldwork research within the framework of the AQAPA international project *To Whom Landscape Belongs in Asia?*, this paper addresses these issues through the comparison of three case studies in India (Kumaon), China (Guizhou) and Vietnam (Lam Duong) mountains. Among others, it tests the following hypothesis: what we call eco-ethnicity - the double visibility of ethnic and environmental identity of a group - explains to a large extent the various levels of involvement in tourism growth and the empowerment of local groups. Their identity may be recognized or not by dominant actors such as governments at various administrative levels or private companies, instrumentalized or not in tourism policies and corporate strategies. Identity can also be used by some local people themselves in order to get benefits from tourism by promoting some specific landscape, possibly at the expense of other local stakeholders, activities, or landscapes.

Key words:

landscape; eco-ethnicity; India; China; Vietnam

Development of Tourism in Mountain Areas and Representations of Landscape: A Comparative Analysis with case studies in India, Nepal and China

Gauché E., Dérioz P.

University of Tours, UMR CITERES 7324 CNRS / IPAPE team – Leader of the AQAPA program – Tours, France,
evelyne.gauche@9online.fr

Abstract

This paper is focused on the contemporary evolution brought by tourism in the cultural representations of landscapes (common landscape vs landscapes of exception) within the local people, through a compared analysis between three Asian mountain areas which have in common to be involved in a tourism growth process, and to be inhabited by ethnic minorities, Shuis (Guizhou, south-west China), Bhotiyas (Kumaon, Uttarakhand, India), Gurungs, Tamangs and Magars (Annapurna massif, Nepal). Based on interviews and direct observation of landscapes, this comparative study first aims to characterize these different tourist systems (key stakeholders, strategies, importance of tourism within the local economy...). A special attention is also paid to the type of landscapes which are used as resources by the tourist activities, and to the current transformations of these landscapes, some brought by tourism, and some due to other factors (urbanization, new roads, agricultural or pastoral decline...). All these territorial dynamics – including tourism – are studied for themselves but also for what they reveal of the traditional representations of the landscape (what is valuable in the landscape, and for what reason? Which part of the territory deserves to be shown to the tourists, and which are not worth it – or have to be kept only for local use?). As tourism is here considered as a “social transaction” between local “hosts”, operators (local vs outsider) and “guests” (clients), our work also tries to understand what part tourism business and tourism cultural exchanges take in the change in these representations, among other possible factors.

Diversification Économique Des CoopÉRatives De PÊche Dans La Zone Pacifique Nord, Reserve De La BiosphÈre El VizcaíNo (Basse-Californie Du Sud, Mexique)

Crespo-Guerrero, José-Manuel

Instituto de Geografía, Universidad Nacional Autónoma de México, Ciudad de México, Estados Unidos Mexicanos,

jcrespo@igg.unam.mx

Résumé

La Réserve mondiale de la Biosphère « El Vizcaíno » dans la commune de Mulegé, État de Basse-Californie du Sud est l'espace naturel protégé le plus étendu du Mexique. La Réserve a été créée en 1988 par Décret présidentiel. En 2000, l'Institut National de l'Écologie publia le Programme de Gestion pour contrôler les usages des ressources naturelles pour obtenir le développement durable. Parmi les ressources à gérer, le secteur de la pêche compte sur plusieurs coopératives localisées dans ce secteur, nommé « Pacifique nord ». Les huit coopératives en activité dans la zone sont groupées dans une fédération, ce qui leur permet d'agir comme une unité coordonnée, dynamique, compétitive et professionnalisée. Un des principes de la fédération est donner réponse aux besoins élémentaires de leurs travailleurs au moyen de la couverture sociale, sanitaire et, en plus, cultural et sportive. Les transformations instituées par le Programme de gestion ont permis la certification des coopératives par une « éco-étiquette bleue » qui reconnaît la « pêche durable certifiée », sur la base de la responsabilité sociale et l'engagement environnemental des coopératives. En plus de la pêche artisanale de base communautaire, ces dernières années, les coopératives ont commencé à prospecter dans d'autres secteurs économiques : industrie de conserve de poissons, aquaculture et tourisme. Par une approche multiscalaire, cette communication vise à contribuer à montrer comment l'implication d'acteurs variés (public, privés, coopératifs, locaux, nationaux, internationaux) a permis une diversification économique locale, permettant aux pêcheurs de conserver un grand pouvoir de décision.

Economic Impacts on the Survival of Alpine Marginal Villages – A Comparative Case Study of Vrin and Vals in Switzerland

Wei S.

School of Architecture, Tsinghua University, Beijing, 100084, China, weisy07@mails.tsinghua.edu.cn

Abstract

From 1950, Swiss economics has been irreversibly centralizing - regional centres keep growing while marginal villages are in continuous degradation. Vrin and Vals, located in the deep alpine valley and close to each other, are categorized as the smallest and weakest villages in “social-economic map” of Graubünden. In the past, due to the lack of tourism and other profitable industries, they only depended on traditional agriculture and few subsidies from the federal government and local organizations. The economic troubles then caused a mass exodus of local residents, which exacerbated the degradation in turn.

The first part of this paper explains the economic activities involved respectively in Vrin and Vals when they were faced with social and economic difficulties. In 1979, “Stiftung Pro Vrin” was founded and developed a specific economic model to improve agricultural efficiency. Meanwhile, Vals brought in new industries through construction and export activities. Detailed history research combined with site investigation is made to clearly understand the process. Based on statistic analysis, the second part of this paper tries to describe and predict the trends of population, employment and spatial quality in Vrin and Vals from 1845 to 2045, revealing the distinct differences of economic impacts in the transformation of these two villages - Vrin is dying while Vals starts to thrive. The last part of this paper explores the reasons. It proposes the key roles of new economic activities and industries in periphery’s revitalization, and inspires on a new survival pattern for marginal regions in urbanization.

Key words:

alpine marginal villages in Switzerland; Vrin; Vals; economic impacts; statistic analysis; population and employment trends; spatial quality

Farmers and Skills – Statistical Analysis of Spatial and Temporal Changes

Czapiewski K.

Institute of Geography and Spatial Organization PAS, Twarda 51/55, 00-818 Warsaw, Poland, konrad@twarda.pan.pl

Abstract

Human resources, and in a particular manner their quality, play the key role in regional development. Depending on the quantity and quality of these resources, they can constitute either an essential barrier to or a stimulator of development. It is held that one of the most important factors, allowing for the achievement of success by the territorial units and sectors of economy (i.e. agriculture), particularly within the multifunctional rural development concept.

Taking into account the above mentioned the main objective of the presentation is: analysis of structural changes in the level of farmers' education in Poland in spatial terms during the period 1986-2010. For this purpose, the spatial econometric models will be used, i.e. one form of spatial regression model: SLM (Spatial Lag Model) - models with spatially offset variable (variable spatial autocorrelation) or SEM (Spatial Error Model) - models with spatial autocorrelation of the random component. The results will be presented with using a cartographic method.

Key words:

educational level; farmers; statistical methods; cartographic methods; Poland

Intermediate space is Marginal

Hugo Capellà Miterique

Dept. Geografia, Universitat Illes Balears; Palma de Mallorca, Spain, hugo.capella@uib.eu

Abstract

The concept of intermediate space has been hidden by the discussion of dependence. The interdependence from center and periphery makes invisible all the intermediate process. From this perspective, the concept of intermediate it is revealed to be the true element of marginality. Its omission ends to a lack of entity unlike even worse than the sense of negation from center in periphery.

What is intermediate? What does mean? What role has played and plays today? Those ones are some of the questions we will try to answer, from a plural perspective, but focused on mainly geographical and spatial perspective. Behind this unknown and anonymous space will see a land of freedom and diversity ready to be discovered and understood, as the real connector, or center.

Key words:

Intermediate; margin; connector; diversity.

Job Creation through Environmental Management in South Africa's Marginal Areas: A Critical Evaluation of the 'Working for Water' Programme

Tony Binns and Etienne Nel;

University of Otago, New Zealand & David Bek; Coventry University, UK, jab@geography.otago.ac.nz

Abstract

Following the demise of apartheid in 1994, South Africa in 1995 embarked on an ambitious alien vegetation clearance and job creation strategy called the 'Working for Water' programme. The programme sought to marry the desperate need to create employment for unskilled and unemployed people in post-apartheid South Africa, with the parallel need to remove alien vegetation from catchment areas suffering from water-poverty, in an effort to increase available stream flow which had reduced over decades as a result of infestation by alien plants. The programme met with mixed success in terms of achieving its original objectives, but has persisted for 21 years, and has been recognised internationally as one of the most significant state interventions of its kind in the world. Significantly, the programme has evolved in recent years to draw on the inputs of NGOs and the commercial farming sector. This paper will examine the evolution of the programme and critically evaluates the impacts and possible outcomes of the new programme interventions, with particular reference to South Africa's Western Cape province.

Key words:

Water; Poverty alleviation; Invasive vegetation

Les Technologies De l'Information Et De La Communication Au Service De L'Insertion Efficace De l'Afrique Dans La Globalisation

Loukou A F

Université de Bouaké , Côte d'Ivoire, alain_loukou@hotmail.com

Résumé

En dépit des ressources naturelles abondantes dont dispose l'Afrique, sa part dans les échanges économiques mondiaux est extrêmement faible, se situant autour de 3% (Organisation Mondiale du Commerce, 2014), alors qu'elle regroupe environ 15,5% de la population mondiale (Institut national d'études démographiques, 2013). Ce constat souligne que l'Afrique est assez mal intégrée au système des échanges internationaux. Certes, la faiblesse de production de biens et services à valeur ajoutée est l'une des raisons fondamentales de cette marginalisation. Cependant, il importe aussi de questionner la façon dont ce continent a jusqu'ici essayé de s'atteler à la globalisation. Il ne suffit pas de disposer de ressources naturelles abondantes pour occuper une place importante dans les échanges mondiaux. La disponibilité de moyens divers de communication pour se connecter au reste du monde est aussi une condition primordiale. Dans le contexte d'économie de l'information qui gouverne en partie la globalisation, les Technologies de l'Information et de la Communication (TIC) se révèlent de plus en plus être un facteur capital de l'insertion des États et des continents dans ce processus. Or comparativement au secteur des moyens classiques de communication où l'Afrique est beaucoup sous équipée, celui des TIC est relativement bien développé sur l'ensemble du continent malgré une fracture numérique évidente par rapport aux autres continents. A partir de ce constat, le postulat est que cet acquis constitue un facteur pour mieux insérer le continent dans la globalisation, considérant que ce processus serait fortement lié aux TIC.

Mots clés :

Globalisation; Technologies de l'Information et de la Communication; Afrique; marginalisation; insertion

Likahka In La Moskitia: Jellyfish as the Next Miskitu Boom Industry

Fahrenbruch M.L., and Herlihy, P.H.

The University of Kansas, Dept. Geography & Atmo. Sci., Lawrence, United States, mlfahrenbruch@ku.edu

Abstract

The indigenous Miskitu of Honduras and Nicaragua have existed on the periphery of the region's dominant Spanish hegemony since colonial times, yet at the center of a series of boom and bust commodity markets that have periodically connected them to the global economy via western markets. Since colonial times, the Miskitu have worked as wage-laborers and traders in various export economies including bananas, lumber, minerals, sea turtles, and lobster. While traditional subsistence activities still pervade their culture, cash income and commercial goods have come to define the Miskitu way of life. Life is good while the resources are flowing, but when the market busts the companies move out, leaving socioeconomic depression. In recent years, the traditional western orientation of the Miskitu has shifted towards East-Asia as markets have developed for edible jellyfish and other specialty seafood products. Jellyfish has been exploited in East-Asia for at least 1700 years as food and traditional medicine, however, high demand and fishery degradation has resulted in a commodity shortage and the entrance of non-traditional producers. We report here on the emerging industry among the Miskitu. Like many non-traditional producers, the Miskitu are not consumers of jellyfish and it does not figure prominently into their moral economy, however, it may be the next chapter in the boom and bust history of the local region, and a microcosm of a larger trend of East-Asian commodity chain development in peripheral regions of the world.

Key words:

Marginal Areas In Romania: A Study on the Accessibility to High School Educational Infrastructure

Rusu R., Hărănguș I., Man T., Moldovan C., Ionescu-Heroiu M., Dezsi Șt., Rusu D., Matei L.

“Babeș-Bolyai” University of Cluj-Napoca, Faculty of Geography, 400006, Romania, rrusu@geografie.ubbcluj.ro

Abstract

Access to free education is a fundamental right all over the world. In Romania, education is compulsory for the first 11 years of school, for children aged approximately 6 to 16 years old. This means that children have to go to the primary school (the first 5 years, from 6 to 10 years old), the gymnasium (the next four years, from 11 to 14 years old) and the first two years of high school. While primary and gymnasium education is usually provided within the same elementary schools, which are rather evenly distributed throughout the country, high schools are mainly located in the cities and few of them in large villages. It comes out that many teenagers living in the rural areas must commute to the nearest high school in order to continue their (compulsory) studies. This paper assesses the accessibility issues faced by high school pupils, taking into account the Romanian network of high schools and the existing road and railway infrastructure. The analysis is focused on the marginal areas, located at distance from any high school, where public transportation is also poor. While education is theoretically free, the authorities must also take measures to make it accessible to everyone.

Key words

Marginal areas; Romania; education; high schools; accessibility; infrastructure

Politics of Marginality Among the Kurdish Youth in Turkey

Kaya I

Yildiz Technical University, Istanbul, Turkey, ilhankaya@gmail.com

Abstract

In this paper, I look at the marginalization of the Kurdish youth in Turkey and their resistance to the politics of the state. I argue that people involved in violent terrorist activities are often portrayed irrational beings without any sense of integrity for human life. This mindset dehumanizes people involving in the terrorist events and often views them something to be exterminated to secure the life of ordinary people. This view shadows the real reasons behind long term disagreements resulting in violent conflicts among different groups and ignores the deep sense of alienation, discrimination and otherness, and the frustrations that those with lack of power face. Based on the interviews conducted, I argue that when one looks at the involvement of the Kurdish youth, she or he will see that they are not irrational beings designed for killing and terrorizing other people. They are real people with real feelings suffering from long-term institutional discriminations, injustices and alienation and feeling desperate to change the existing order.

Key words:

Ethnic conflicts; marginalization; institutional discrimination; Kurdish youth

Rich Country – ‘Poor’ Regions: Fighting Regional Disparities In Switzerland

Walter Leimgruber, Emeritus Professor

University of Fribourg/CH, Department of Geosciences, Geography, walter.leimgruber@unifr.ch

Abstract

Regional disparities are common situations across the world, in countries rich and poor, and occur at all scales. It is the goal of regional policy to reduce them to an acceptable level (whatever this means). Switzerland, one of the richest countries in the world, has developed various instruments to reduce regional inequality. The political system, however, faces severe challenges given the difficulties of the public budgets (threatening deficits, rising debts) and the influence of the neoliberal market economy philosophy. The state is reviewing its position in this field, trying to reduce its engagement and reorganize redistribution without negatively influencing the aim of disparity reduction.

The paper looks at the current situation of regional policy in Switzerland, the domestic factors of inequality, and the role global economic uncertainties (economic stagnation, floating currencies, political instabilities) play with respect to a small (and yet big) country, both nationally and regionally. It focuses on the fiscal equalization scheme, a regional policy instrument to reduce the financial disparities between the Swiss cantons that appeals to the solidarity between regions.

Key words:

regional disparities; regional policy

Minerals out, E-Waste in: the Role of Ghana in the Contemporary International Labor Division

Lopes Dos Santos, Kaue

University of Sao Paulo, Sao Paulo, Brazil, kauegeo@gmail.com

Abstract

The Ghanaian territory has a rich variety of mineral resources – such as gold, manganese, bauxite and diamonds – which have been exploited since the late twentieth century by large foreign corporations, when the country executed neoliberal reforms. Export of minerals is a key component of the country's international, bringing substantial foreign exchange to the state. At the same time, due to the lack of industrialization in its economy, Ghana has also become highly dependent on secondhand manufactured goods e.g. electronic goods (but also vehicles and clothes) imported from Europe and North America. Often these goods cannot be reused for their original function and become electronic waste (e-waste) accumulated in Accra neighborhood of Agbogbloshie. Thus, this presentation seeks to analyze the role of contemporary Ghana in the International Labor Division.

Key words:

Ghana; Mining; E-waste; international Labour Division; Capitalism

The Geopolitics of the European Union for overseas territories: Assimilation, fragmentation and the role of French Guiana in the regional context

Gutemberg de Vilhena SILVA

Professor to Political Geography in Federal University of Amapa (UNIFAP), bgeografo@gmail.com

Abstract

Located in the north of South America, French Guiana in its outermost condition, is part of an important geographical position for the European Union (EU). From the analysis of documents about the outermost regions (OR's), reports concerning the results of recent European fundings for the regional integration of French Guiana; as well as analysis of the importance of Kourou spaceport for the EU, it is possible to indicate the following guiding question of this article: What are the reticular-territorial joint strategies adopted by the European Union in the specific case of French Guiana? In the first section, we discuss the construction of priorities and investments for the OR's in general, however, we established more detailed analysis of French Guiana. In the second section we analyze two subjects: a) the European strategies and the impact on the Guiana when using the Kourou spaceport; b) some of the results of the first edition of POAmazonia (2007-2013), attempting to assess accurately and updated the regional geopolitics in which French Guiana is inserted through the European guidelines.

Key Words:

Geopolitics; Outermost Regions; POAmazonia; French Guiana.

Renewing the “Marco Polo’s” way: The increasing role of the North Adriatic ports within the Eurasian transportation system

Bufon, M., Koderman, M.

Department of Geography/Institute for Social Studies, University of Primorska, Koper, Slovenia, milan.bufon@upr.si;

miha.koderman@fhs.upr.si

Abstract

The paper will discuss the increasing role of the North Adriatic ports within the Eurasian transportation system. The North Adriatic thus not only represent the shortest maritime gateway in traffic communication between the EU heartland and the most dynamic economic areas of Eastern and South-Eastern Asia, but it also re-acquiring its historical role in strengthening the Eurasian macroregional economic system. The paper will provide the development stages and the different development perspectives given by the renewal of the “Marco Polo’s” way, but will also discuss some hindrances present in the North Adriatic region, represented by its quite complex political geographical structure and therefore a more fragmented and not sufficiently integrated port and logistic system. These development obstacles also derive from the difficult implementation of an integrated cross-border vision within the North Adriatic EU members. The paper will show how the discussed case-study opens the need for a more appropriate governance of different horizontal (spatial and sectorial) as well as vertical (hierarchical) policies in planning cross-border cooperation or social and spatial (re)integration of borderlands and population, especially if we try to create a more sustainable and “long-lasting” development plan for our increasingly globalized and co-dependent future European “common home”.

Eurasian maritime connections; North Adriatic; Port of Koper; Slovenia; Geopolitics; Geography of transportation

Sustainability as an Institution..With Emphasis on the Mediterranean Countries

Lefebvre O

Olivier Lefebvre Consultant, Paris, France, o.lefebvreparis05@orange.fr

Abstract

Even in case of dire emergency (like wars) a society achieves tasks through institutions. Hence the interest of studying sustainability as an institution (according to the French sociologist Mauss a word can be an institution). Paramount is the working of a “neutral terrain” (according to the French anthropologist Van Gennep) or a communication terrain where experts and the Opinion use the same words even if their meaning is very different for each party. For instance the famous “black swan” is a high normalized kurtosis for experts and ... a rare animal for Opinion. Other examples are (1) the precautionary principle (2) the “Christmas Turkey” (metaphor of carelessness) (3) the ecocide (in this case the dialogue is in its infancy (4) etc. Experts bank on scientific knowledge and the Opinion is sensitive to images (the Blue Planet seen from satellites, black oil on beaches ...) and metaphors (“we sleep when our beds are burning”). The “neutral terrain” of Van Gennep is awkward and should be full of rites. It is occupied by “passeurs” (a French word uneasily translated into “mediators”). They have to have tact.

In the Mediterranean countries the need for this dialogue is exaggerated. These countries need efficient States and a middle class “aware” of the environmental stakes. At least, when researchers study the topic, it strengthens the hopes.

Key words:

Sustainability; Mediterranean countries

The Mediterranean: Bridging, Bordering and Cross-bordering in a Global Mobile Reality

PARADISO Maria

University of Sannio, Benevento, ITALY paradiso@unisannio.it

Abstract

If we look at the Mediterranean only as a space, a dissonant geography is obvious. Its diversity is mistakenly reduced in a process of 'diorthosis', a cognitive and operational approach that starts from assuming the nature of things and functionality modes rather than arriving at a proper image via actual analysis. The study of flows, of networks – i.e. the circulation of ideas, people, finances, and so on – challenges the continuous representation of the Mediterranean between homogeneity and otherness, and re-positions it as both a post-colonial imbricate site of encounters and currents and as a site of new hegemonic and counter-power discourse(s) and alliances. This presentations explores the 'mobility' paradigm as an initial approach to contemporary geographies of the Mediterranean. The latter are being created not only by the media, powers and ideologies, but also by everyday people's inter-ethnic, inter-cultural, and emotional interactions in places and digital communication channels. Such interactions are often characterized by blockages of inter-ethnic or inter-cultural exchanges, as well as by inequalities. It seems to me that the internet and people's spatial mobility underline a deep process of change for the Mediterranean. A dialectic of diaspora politics, circuits of funds, weapons, empowerments, and emotions, challenge the boundaries of political communities in transformation. The Mediterranean thus appears as a global space of confrontation, emulation, opposition, dialectics, and change. Places, flows, wires and digital TV are the loci for all this. There is no assumption of 'Mediterranean as a bridge of cultures'; instead, we all are actors in networking communities.

Key words:

Mediterranean; global space; mobility

The Practice of LGBT Sports in Mediterranean Countries: from Closed Networks to Political Statement

LE BLANC A.

TVES / Université du Littoral, Lille / Dunkerque, France, alb@univ-littoral.fr

Abstract

In most Mediterranean countries, lesbian and gay sports clubs are rare, and their spatial practices indicate a high risk perception and management, in response to hostile contexts for LGBT (lesbian, gay, bi, transgender) communities. Their analysis is very revealing about social, cultural and spatial standards and norms in these countries. The creation of alternative sports places, designed or chosen by specific groups in order to challenge the dominantly heterosexual and masculine norm, highlights the violence and the gendered nature of ordinary social and spatial patterns, by setting up different standards, at various scales: creation of secured and temporarily isolated territories, strong local and international networks, high mobility and flexibility, setting up symbolic territorial markers... This paper uses the risk management approach to understand these patterns, since this perspective can bring light on the motivations of individuals choosing to refer to specific communities: the paradoxical process of marginalization chosen by a group of people in an attempt to reach more safety, but combined with a non-consensual objective of de-marginalization, can be analyzed more broadly as a social, cultural and political marker, and the evolution of LGBT sports clubs and tournaments in Mediterranean countries is quite revealing as to the more general trends and changes in this particular region. These adaptations to certain political and social contexts may even entail original forms of collaborations; for instance the LAT41 LGBT sports tournament is a joint Spanish and Italian organization.

Key words:

Sports, associations, gender, LGBT, risks, Mediterranean

University Development and Urban Change in the Town of Sousse Erriadh District in Tunisia

Zaag imen, Bennasr ali

Research laboratory Syfacte, Sfax, Tunisia imengeomatique@yahoo.fr

Abstract

The redistribution of consecutive Tunisian academic institutions to the rapid growth in student numbers has allowed medium-sized cities such as Sousse to gradually give this new feature gradually university cities. Also, the infrastructures of higher education seem to have a powerful authority involved in the dynamics of the territories where they are located and help to increase the resilience of regions.

locating a " Campus" university that extends from the east side and south of Erriadh city, which is a new suburb of the city of Sousse, is part of the new urban development policies that looking to create some socio-economic and urban dynamics through geographical redistribution of academic institutions in the Tunisian cities. This corresponds in principle to a major societal challenge that despite this university location has not been set in the PAU urban development plan of the district. This location will undoubtedly bring new joints in local activities and entertainment to the urban life of the city, but on the other hand and as this localization was not programmed, it gave negative effects such as overload housing following the increased demand due to the presence of large number of students.

Through this work we will present the changes in the city following the implementation of this unplanned equipment in the planning of the area documents.

Key words:

University; urban planning/development; city; transformation.

Abstract

Air pollution in cities has become an environmental hazard with serious health implications. It is particularly an important issue under climate change. Obtaining an accurate spatial and temporal profile of air pollutant distribution is crucial to the mitigation of air pollution in the urban environment. Spatial temporal interpolation techniques analyze the correlation of the data in the spatio-temporal space, and then estimate and predict the air pollution concentration of the un-sampled locations. Because of the relatively undesirable performance of the conventional interpolation methods, we propose a flexible Bayesian framework for the prediction of air pollution concentration that integrates the prior information obtained from mobile human and other sensors through spatio-temporal kriging, and derive the posterior distribution of the air pollution profile. In order to overcome the non-existence of an analytic formulation of the posterior distribution, we draw the samples from the posterior distribution with the Markov Chain Monte Carlo (MCMC) method, and approximate the population characteristics with the sample characteristics. The estimation problem of the target distribution is thus effectively solved. We evaluate the proposed method by applying it to the air pollution data in Hong Kong. The experiment shows that our algorithm outperforms the state-of-the-art algorithms in terms of efficiency, accuracy and robustness.

A GIS Based-Index Model for Predicting High Risk Tuberculosis Occurrences in Malaysia: A Case Study in Selangor

Abdul Rasam A.R.^{1,2}, Mohd Shariff N¹, Dony J.F.³

¹Geography Programme, School of Distance Education, Universiti Sains Malaysia, raufarasam@yahoo.com

²Centre of Studies for Surveying Science and Geomatics, Universiti Teknologi MARA, Malaysia

³Ministry of Health Malaysia

Abstract

The state of Selangor in Malaysia was reported to have more than 4000 cases in 2015, where 31 percent of the cases occurred in the district of Petaling, thus it needs an intervention method to boost the existing TB detection and performance. A geographical information system (GIS) based index model is an alternative method developed for estimating potential high risk areas of local TB. It is a multi-criteria decision making (MCDM) method utilized for ranking common environmental risk factors of the global TB using a five score scale and selection criteria. The score values are then combined with an expert weight value to determine the total score for each of the factors and their overall index values. A ranked map of predictive risk areas are produced and validated using historical TB cases in 2015 for the model accuracy. It is revealed that the potential high risk areas in Section 17 and Section U19 are 34.85% and 71.43% respectively, covering from medium to very high class. Section U19 shows higher risk spots than Section 17 and this predicted result is also consistent with the findings gained from visual comparison with the cases in 2015. However, the model accuracy for Section 17 (80%) is more accurate than Section U19 (76%) because the majority of the cases in Section 17 are located in the potential risk areas. The tuberculosis infection would be easily transmitted in urban and crowded environments in Petaling. A GIS-based index model has capabilities to be applied in TB screening and vulnerability monitoring of high risk groups in Selangor.

A GIS-Multicriteria Approach for Urban Rain Gauge Siting Selection

Changfeng Jing, Yanli Fu

School of Geomatics and Urban Spatial Information of Beijing University of Civil Engineering and Architecture, Beijing, 100044, P.R.China, jingcf@bucea.edu.cn

Abstract

In light of conventional sitting selection methods do not take into consideration of geographic surroundings and spatial-temporal scale for the urban rain gauge site selection, this paper primarily focus on finding the appropriate sitting selection rules and methods for rain gauge in urban areas, taking Beijing for study case. In urban small area, the rainfall precise estimation is influenced by distribution and density of rain gauges. Therefore, an approach for rain gauge siting based on GIS and multicriteria is proposed to optimize location. The detailed step is depicted as below: using spatial kernel density could take into account the aforementioned problem on the aspect of rain gauge site selection; GIS buffer analysis is used to optimize the location with the rain gauge signal transmission character. Additionally, the reasonability of the results is validated by cross-validate method with the three-time rainfall real data. Experiment results show that the rules and the proposed method are proper for the rain site selection in urban areas, which is significant for the sitting selection of urban hydrological facilities and infrastructure, such as water gauge.

Abstract

The bottom-up approach in geo-simulation, especially agent-based modelling (ABM), is commonly used to simulate urban land growth. A key challenge of ABM for the simulation of urban land-use dynamics in support of sustainable urban management is to understand and model how human individuals make and improve their location decisions that then shape urban land-use patterns. To investigate this issue, we focus on modelling the agent learning behavior in residential location decision-making process, to represent individuals' experience and learning from one another during their decision-making. We have constructed an extended reinforcement learning model to represent the human agents' learning characteristics when they make location decisions. Consequently, we propose and have developed a new agent-based procedure for residential land growth simulation that incorporates an agent learning model, an agent decision-making model, a land use transformation model, and the impacts of urban land zoning. The proposed procedure was first tested by using hypothetical data. Then the model was used for a simulation of the urban residential land growth in the city of Nanjing, China. By validating the model against empirical data, the results showed that the procedure we proposed is an improvement to the existing ABMs for urban growth simulation. In addition, adding agent learning made the simulation more realistic and contributed to the representation of the agent's adaptive locational behavior.

Abstract

Search engine query data, such as Google trend and Baidu index, have been used to track the diseases happening around the world. The most typical example is the Google flu trend, which is also a typical application of Big Data in public health. Due to different socio economic status, different regions may have different quality of search engine data. In this article, we will address a novel spatial sampling technique named Biased Sentinel Hospital-based Area Disease Estimation (B-SHADE) to find the bias of search engine data in space and minimize them. By combining the revised search engine data and the historical cases obtained from the China CDC, we were able to improve the predicting accuracy of the Hand, Foot and Mouth diseases in Guangdong province, China.

Abstract

Winter wheat powdery mildew (WWPM) is currently a major crop disease for winter wheat in North China. Its mushroom growth in recent years is commonly recognized as climate warming and enhanced field crop productions. Many studies have illustrated that it is closely correlated with wet and warm weather or field condition. There were also researches in which WWPM being well predicted by Northern Pacific Sea Surface Temperature (SST) and Atmospheric Circulation Characteristics (ACCs). But all existed researches could not reach a good-enough prediction for farming management. We speculate one of the most important reason for that is because the ordinary prediction models can not take into account of the disease management, like effectiveness of pesticide application. Furthermore, all the existing models cannot deal with all the related factors influencing WWPM, as there are both continuous and uncontinuous variables influencing WWPM. In this research, we utilized the Bayesian Networks to scope all these potential factors based on probability relationships. This is expected to reach a complete consideration of the weather condition, remote climate index (like SST and ACCs), as well as field management strategy, to improve the WWPM prediction in North China.

Data Enrichment Approach for Automatic Generalization Implementation of *Rupa Bumi Indonesia (RBI)* Maps

M. Warizmi Wafiq, Noorhadi Rahardjo

Geographical Information Science Departement, Faculty of Geography, Universitas Gadjah Mada, Bulaksumur, Yogyakarta, Indonesia, m.warizmi.w@mail.ugm.ac.id

Abstract

Automatic generalization method has experienced significant growth in recent years. To generalize automatically, the addition of spatial data in order to process geographic data abstraction of a larger scale digital cartographic model into a smaller digital cartographic model scale is required so it can be carried out in accordance with cartographic context. This study propose the model of data enrichment of digital landscape model according to specifications of some generalization algorithms. Data enrichment is done in order to generalize points, networks, and area features automatically with satisfactory results. This study was conducted on a *Rupa Bumi Indonesia* Maps (topographical map of Indonesia) data created by Indonesia's national mapping agencies. The enrichment data model can be used to describe the relationship of geographical object like AGENT approach and the data constraints accordance to the specifications Indonesia's topographic map.

Defining Korean Mountainous Areas on the Basis of Agent-Based Modelling

Hyesop Shin¹, Woojin Shim², Soo Jin Park³, Hakgi Sohn⁴

¹Research Assistant, Dept. of Geography, Seoul National University, tlasang1@gmail.com;

²Ph.D Candidate, Dept. of Geography, Seoul National University;

³Professor, Dept. of Geography, Seoul National University;

⁴Research Fellow, Korea Rural Economic Institute

Abstract

The Korean Peninsula is covered with a high percentage of mountainous regions of diverse heights and with complex tectonics. However, it is difficult to define their boundaries with precise figures. Regarding this aspect, sufficient criteria that reflect their diversity and complexity are required. Furthermore, applying people's decisions about mountain defining is imperative for delineating mountainous areas, because people normally define mountains by their physical barriers including slope, altitude, convexness and concaveness. Toward this end, this study attempts to export the extent of mountainous areas in Korea by applying individuals' perspectives on the basis of agent-based modelling (ABM). Two regional basins are used in this study: Seomgang basin, observed as steep and rocky; and Namhangang basin in which there are mostly plains. After 50 iterations of mountain export for each basin, 64.8% mountainous areas were identified in Seomgang basin, and 56.4% in Namhangang basin. Comparative work based on GIS showed 70% mountainous areas for Seomgang, about 5% higher than the ABM result, and 43.5% for Namhangang, which was 13% lower. To the best of our knowledge, the ABM results seem to be more appropriate than GIS, due to including individual decision making. In adopting this approach to define mountainous areas, this study can give insight to measuring regional-scale regions as well as places that contain complex topography.

Mountainous area; Regional-scale regions; Agent-Based Model

Developing and Testing the New Nitrogen Index in Chao River basin, North China

Pang Shujiang, Wang Xiaoyan

College of Resources, Environment and Tourism, Capital Normal University, Beijing 100048, China,

1083284324@qq.com

Abstract

Nitrogen loss from land to receiving water has been identified as the important trigger factor of eutrophication worldwide. The identification of critical source areas (CSAs) is crucial to prioritization of various agricultural conservation practices for controlling nitrogen loss. In this study, a revised nitrogen index was proposed by introducing the runoff generation index and landscape interception index in the Chao river basin, North China. The runoff generation index was established using the topography index, precipitation, and soil attributes including soil profile thickness and hydraulic conductivity. And the landscape interception index was constructed by considering the slope, width and manning coefficient of different landscape units. The results showed that this nitrogen index can predict the nitrogen loss potential and distribution in more precise after the validation of field water quality data. The CSAs have mainly located at the midstream of Chao river as a result of the intensive human activities and excessive fertilization on arable land accounting for about 5% of the total watershed area. Moreover, the population distribution, livestock scale, and agricultural activities were the predominant reasons for nitrogen loss in this watershed.

Evaluating Service Coverage of Evacuation Facilities based on Mobile Phone Data

Kamyoung Kim and Gunhak Lee

Kyungpook National University, Daegu, 41566, Republic of Korea, kamyoungkim@knu.ac.kr;

Seoul National University, Seoul, 08826, Republic of Korea

Abstract

Many civil defence evacuation facilities have been designated for disaster preparedness in Korea. They are served as an evacuation place to people who are in the geographical area when catastrophes have occurred. Population count data from censuses infrequently surveyed has some severe limits to provide timely information in disaster situations. This means that demand of the facilities should be measured in terms of de facto population rather than de jure population. Mobile phone data is a promising new source of real-time measure of population. In addition, civil defence evacuation facilities can accommodate restricted people due to their capacity constraint and the service coverage of each facility is spatially limited. In this research, service coverage of civil defence evacuation facilities is evaluated using a coverage-based optimization model considering distance and capacity constraints. Spatio-temporal demand for the facilities is represented by using mobile phone data. The developed model is applied to the civil defence evacuation facilities in Daegu Metropolitan Area. The capacity of the facilities fully covers *dejure* population. The computational results clearly show that when considering service distance and capacity, some demand could not be covered by near civil defence evacuation facilities. This means that it is necessary to increase the capacity of the existing facilities or additionally to designate new facilities where much demand is uncovered.

Evolution of Regional Differentiation in Mainland China

Zheng Wang¹, Haibin Xia²

¹Institute of Policy and Management, Chinese Academy of Sciences

²Key Laboratory of Geo-Information Science, East China Normal University, wangzheng@casipm.ac.cn

Abstract

In this paper, Chinese spatial heterogeneity is discussed on the basis of three geographical natures with ideal of two nature of Krugman's theory; furthermore, an analysis about the role of the three Natures on the regional development and evolution is discussed in the view of evolutionary economic geography. First Nature plays the leading role in agriculture society and causes Chinese agriculture spatial lock. In industrial society, factors of Second Nature such as transportation and infrastructure play the key role on the regional economic development. The spatial distribution of the industry shifts from dispersion to agglomeration and Central-Hinterland structure ultimately emerges. Third Nature promotes regional structural change. Hub-Network structure is finally created.

GIS in Developing a Grid-based Distributed Hydrologic Model for Urban Storm-inundation Simulation

Chakrabarty A

Dept. of Remote sensing & GIS, Vidyasagar University- Midnapore, W.B.-721102, India,

abhisek@mail.vidyasagar.ac.in

Abstract

Natural disaster like flood and water logging is a worldwide phenomenon. In India, during intense monsoon, not only the rural areas but the urban areas are also badly affected by water logging. Midnapore Kharagpur Development Authority (MKDA) planning region of West Bengal is not an exception. This research is a fundamental step to assess flood inundation and water logging vulnerability of MKDA and their real time display on map, which can aid the prioritization process of MKDA authority in their emergency sewerage clearance and mechanical water ejection during heavy downpour. FLO-2D is a rainfall runoff modeling Software widely used for early flood warning. Using FLO-2D a two-dimensional flood routing model has been generated and used to simulate runoff over complex topography. Spatial information on land use land cover, elevation, slope magnitude, slope direction, soil condition, and sewerage condition were incorporated in the model design; finally rainfall duration and amount were used as input to get the inundated areas as output. Most of the maps have been displayed as either grid element plots, line contour maps and shaded contour maps. By importing the DTM ground elevation points into Mapper and subtracting the ground elevation from the FLO-2D predicted maximum grid element water surface elevation, flow depths are computed for every DTM point. Model generated inundated areas of a real storm have been compared with actual inundated area extracted from microwave imagery (RADAR SAT-1) of the same date and with primary field survey map, for validation of the model.

HSAR: An R Package for Integrated Spatial Econometric and Multilevel Modelling

Dong G, Harris R, Mimis A

Sheffield Methods Institute, The University of Sheffield, 219 Portobello, Sheffield, S1 4DP, UK. guanpengdong@gmail.com

Abstract

With the increasing availability of geographical data and their wide use in social science research, we need an analytical approach that can take into account both the spatial nature of the data and the multiple, often nested scales for which the data are collected – what Dong and Harris (2015) have described as horizontal and vertical effects. In the horizontal dimension, units may be correlated with each other because of their geographical proximity. The vertical dimension refers to hierarchical or multilevel data structures, with the possibility of within-group dependence or a between-group heterogeneity effect based on group membership structures. An innovative hierarchical spatial autoregressive (HSAR) modelling approach has been developed, offering an integration of spatial econometric and multilevel modelling and seeking to capture the two types of dependence effect simultaneously. The model is implemented using the Bayesian Markov Chain Monte Carlo (MCMC) approach. This study presents how this methodology can be implemented in the developed R package HSAR, which is coded using matrix algebra operations from the Armadillo C++ library. We demonstrate the package by modelling the housing market in Beijing, finding that there are statistically significant horizontal and vertical dependence effects in housing prices.

Indication of Archaeological Site Locations in the Region of Ukok Plateau (Altai Mountains) based on GIS-analysis

Glebova A. B., Sergeev I. S.

St. Petersburg State University, St. Petersburg, Russia, a_glebova@mail.ru, a.glebova@spbu.ru

Abstract

The Ukok Plateau is located at the junction of state borders of Mongolia, China, Kazakhstan, and Russia, to the south of the Altai Mountains on the heights 2200-2500 meters above sea level. Despite the severe climatic conditions, the territory was mastered by the representatives of many cultures, and traces of them can be found now in the form of numerous archaeological sites. The locations for the most of these sites are well characterized by the archaeologists. However, it can be stated with a high probability that there are still monuments with unknown location in this region. Based on GIS analysis of archaeological data and digital elevation model areas of possible archaeological site locations were identified. For this purpose a comparison of already known 405 site locations (Molodin, 2004) with the parameters obtained via the digital elevation model (earthexplorer.usgs.gov/.). The resolution of Digital Elevation Model is 60 meters. This research was done in the format of ArcGIS 10.1. Taking into account the statistical regularities (Miller, Kan, 1965) the criteria for identification of undiscovered locations in this area were identified. These criteria include: the absolute height 2080-2300 m; the distance from watercourses about 1 km; slopes up to 6°; slope exposure, in order of occurrence: southern, eastern; the amount of solar radiation for mid-spring (April) from 131000 to 158000 W/m² per month and for mid-summer (July) of 196000 to 209000 W/m² per month. The highest probability of new archaeological sites detection is associated with the central and southern parts of the plateau.

Key words:

digital elevation model; indication of archaeological site locations; GIS-analysis

Minimum Spanning Tree in Landscape Mosaic

Pomianowski W., Solon J.

Institute of Geography and Spatial Organization, Polish Academy of Sciences, Warsaw, Poland. wpo@twarda.pan.pl

Abstract

We approach a problem of building a landscape connectivity model with very limited assumptions and input data. A landscape is provided as a classified patch mosaic in vector-based format. A mobile agent (an entity moving in a landscape, like a species) is characterized by two parameters only: 1) patch resistance – the cost of passing through the patch and 2) transfer resistance – the cost to negotiate between adjacent patches. The former may be tied to patch suitability, size or shape metrics. The latter can be derived from ecological similarity of patch types. We do not demand data nor make assumptions about agent's flow, spatial distribution, dispersal range or population dynamics. Mobility is defined in a symmetric way, so direction of movement is unspecified. Within this restricted framework, we are still able to build a undirected, weighted graph structure and find least-cost paths between a specified set of key patches (e.g. important habitats, protected areas). Next, we build a Minimum Spanning Tree (MST) on reduced graph composed of key patches and l-c paths. Resulting MST is an optimum transportation network for key patch set and may be used as an ecological corridor system. The system maximizes functional connectivity and minimizes resource consumption (number of patches, area).

Our model is implemented as a standalone software package, capable of building graph topology from ordinary shapefile map. MST is presented on the background of the original map, and in listings and statistics. We give examples for artificial mosaics and actual vegetation coverages for north-eastern Poland.

Simulation of Agricultural Land Transitions at City Fringes

Wadduwage S, Millington A C,

School of Environment, Flinders University, Sturt Road, Bedford Park, SA 5042, Australia.

suranga.wadduwage@flinders.edu.au

Abstract

Contemporary urbanization accelerates agricultural land transitions mainly at the urban fringes. Emergent socio-economic and distant land connections adjust the configuration of land qualities and functions differently in these diverse areas. The complex nature of these land systems create significant implications among planners and policy setters for sustainable land governance and development. This study examines land use decision making behaviour of agricultural land-agent profiles in this complex land system, concerning their properties and interactions in a city scale. Questionnaires and interviews were used to collect information on land agents' profiles; their different expectations, strategies and motivations based on the factors affecting their land use decisions, internally and externally. Bottom to top agent-based modelling techniques were integrated with the attributed socio-spatial data sets for simulating the land transition processes while adjusting the model environment for possible scenarios. The results indicate that agent profiles have unique trade-offs for the factors that affect their land use decisions while demonstrating distinct land transitional spatial patterns in land use transition simulations. Furthermore, the Agent-based model environment changes show significantly different spatial pattern variations of land-agent profiles in the studied land system. This explains the causality effect among the land-agent profiles and path dependencies of these non-linear land transitional processes at the city fringes. In conclusion, this socio-spatial integrated method explains the complexities of this land system which otherwise could not be describe by separate social or spatial methods.

Key words:

Spatial-temporal Evolution Analysis of Per Capita GDP in Jiangsu Province Based On ESDA-GWR

Cheng Xin, Zhang Yunpeng

College of Geomatics Science and Technology Nanjing Tech University, 210000, Nanjing, Jiangsu

Abstract

Taking Jiangsu Province as the research object, this article explores the spatial and temporal evolution characteristics of Per capita GDP in Jiangsu province from 2003 to 2012, based on the spatial econometric methods of ESDA and GWR. This paper discusses the spatial correlation between fixed-asset investment, total industrial output value, population density and permanent resident population and the per capita GDP of Jiangsu province, in terms of which we analysis the structure characteristics of GDP spatial structure in Jiangsu province. The results show that: ①The Per capita GDP in Jiangsu province demonstrates a strong agglomeration in space, and the heterogeneity and differences of spatial distribution between regions are notable. ②The impact degrees of the four driving factors for the Per capita GDP is permanent resident population>population density>total industrial output value>fixed assets investment, among which, permanent resident population and population density have a bigger influence on the development of the Per capita GDP of Jiangsu province, and the effect intensity increases from northwest regions to southeast regions. Based on the research results, the development policy of Jiangsu province in the future should put an emphasis on strengthening the regional cooperation, actively promoting the industrial transfer of the South and North, and integrating all kinds of regional factors and spatial structure, so as to realize the coordinated development of regional economy.

The changes and the Structure Decomposition Analysis of the carbon emissions embodied in trade of China from 2002 to 2010

Leying Wu¹, Zhangqi Zhong¹, Guanqun Ding¹, Zheng Wang^{1,2}

¹Key Laboratory of Geographic Information Science, East China Normal University, Ministry of Education, Shanghai 200241, China, wuleying614@126.com;

²Institute of Policy and Management, Chinese Academy of Sciences, Beijing 100080, China, wangzheng@casipm.ac.cn

Abstract

The carbon emissions embodied in trade have significant effect on the regional responsibility on carbon reduction. Based on the multi-regional Input-Output model, we calculated the carbon emissions embodied in trade for 30 provinces in China in 2002, 2007 and 2010. During this period, China has always been the net international exporter of the carbon emissions embodied in trade. The emissions embodied in export went down a little from 2007 to 2010, while the emissions embodied in import was stable. The ratio between emissions embodied in provincial trade (*EEPT*) and the carbon emissions based on production has been increasing all the time, which was 40.24% in 2010. For its crucial role in carbon emissions, we analyzed the factors attribute to *EEPT* by structure decomposition analysis. The results showed that the final demand and the carbon emission intensity are the two major factors for *EEPT* , and the structure of trade is the major reason for the differences between *EEPT* in the east province and the other provinces. At last, we analyze the feasibility and the cost of the regional collaborate on carbon reduction based on the data in 2010. The results showed that the regional collaborate on carbon reduction can obviously decrease the effect of the trade on the provincial responsibility of carbon reduction, and it's more beneficial than the reduction by single province. To make sure the regional collaborate gets more effective, there need to be some compensation mechanism in collaborators.

The Spatial Distribution and Change of Chinese Population Constrained by the Natural Endowments in Agent-based GIS

Xia Haibin¹, Wang Zheng^{1,2, *}

¹ Key Laboratory of GIS, East China Normal University, Shanghai, China, xiahaibin@163.com;

² Institute of Policy and Management, Chinese Academy of Sciences, Beijing, China

Abstract

The use of the related terms “agent-based”, “multi-agent” have witnessed significant growth in the Geographic Information Science (GIScience) literature in the past decade. These terms usually refer to both artificial life agents that simulate human and animal behavior and software agents that support human-computer interactions. In this paper, a method of combining GIS and Agent technology is used to simulate the population growth and migration process from the early Qing Dynasty (1676) to modern times (2009). Natural endowment and agricultural potential productivity have decided spatial distribution of population which depicts spatial pattern of ancient Chinese agrarian society. And this spatial distribution is still effective for farming in China until now.

Key words:

Natural endowment; agricultural potential productivity; agent-based GIS

Theoretical and Methodological Perspectives of CA-Based Urban Expansion Model in the era of big data

Xia C., Wang H.J.

Wuhan University, Wuhan, 430079, P. R. China, xia2016@whu.edu.cn

Abstract

Researches of urban model in the big data era has two inevitable trends: research unit by rough unit to fine-scale, and the study area by a single city to urban agglomeration, the nation and even the global. But there are still more difficulties in establishing fine-scale urban simulation models for a large geographic area, and taking into account the large geographic scale and basic spatial unit. The current geo-simulation computing power, data quality and the theory and method are facing new requirements. In this background, the recent breakthrough progresses had made were summarized in this paper, and the system theory and key technology for China's large area and fine-scale urbanization model are put forward to meet requirements of urban model in the future on large data volume and high precision. Results of this study show: 1. Geographical parallel cellular automata based on GPU cluster can provide efficient tools for geographical simulation in the era of big data; 2. Integrating the swarm intelligence evolution algorithm and geographical cellular automata model can automatically and quickly extract transformation rules and improve the simulation precision; 3. Study on the sensitivity of urban cellular automata will effectively reduce model's complexity and the data processing workload; 4. Exploring the reliability theory of the massive geographic data and geographic modeling process, makes it possible to identify data's availability, methods' applicability and results' authenticity.

Urban Expansion Simulation Based on the Combination of Dynamic Association Rules and Cellular Automata

Peng Xie

School of Resource and Environment Science, Wuhan University, China, xiepenggis@163.com

Abstract

Using cellular automata model combined with association rules method, an urban growth simulation model with dynamic update cellular transformation rules was constructed. In the model a set of association rules of cellular automata for transition probability were tapped first. The cells could select corresponding rules to change their types according to their geographical locations and environmental conditions. After a cell's state changes, transition probabilities of the corresponding rules respond to feedback. With dynamic transition rules simulation for real land-use changes were performed. This paper takes Dongxihu district of Wuhan City as study area, simulating the expansion process of the district from 2010 to 2015 and predict the urban scale of the city in 2020. By comparing the simulated landuse data of Wuhan Dongxihu district in 2015 with real data, the result that Kappa coefficient of average values is above 0.75, shows this model have high credibility. We take this model to forecast the landuse state of Dongxihu district in 2020 and the result shows that the expansion of urban land along the Dongxihu Avenue to the West, and the Northwest Hunjiang Lake to Linkonggang Avenue is most evident.

Abstract

The spatial pattern of soil heavy metal is important to control the pollution of soil heavy metal. The methods of traditional interpolation based on the distance of sampling points or spatial statistic are superior while the sampling points are sufficient and research areas are small. But, the process of sampling is time-consuming and laborious while study area is huge, the accuracy of traditional interpolation are not good enough. For instance, the wide of surrounding areas of the point is abnormal, if the soil heavy metal concentration of the point is excessive. Obviously, the methods of traditional interpolation are low accuracy if study area is huge and sampling points is few. This study was based on the Rule-Based model, Cd concentrations of soil in Guangdong Province as the research object, used 36 influencing factors included both natural and anthropogenic affected Cd concentrations, the model of Cd concentrations and factors was built. The spatial distribution of Cd concentration of Guangdong Province was predicted. Simultaneously, several methods of traditional interpolation were introduced to predict the spatial distribution of Cd concentration. The accuracy of all prediction results were tested and verified using the reserved 100 sampling points in different raster resolutions. The result shows that the accuracy of Rule-Based model is higher no matter the raster resolutions. In addition, the landscape pattern indices of spatial distribution were analyzed.

Water Balance of Selected Fluvial Lakes in the Upper Benue Valley Adamawa State, Nigeria

Tukur L. A.¹, Yonnana E.², and Mubi A. M.¹

¹Department of Geography, Modibbo Adama University of Technology Yola, Adamawa State Nigeria

²Department of Geography, Adamawa State University Mubi, Adamawa State, Nigeria

Contacts: altukur80@gmail.com

Abstract

Water Balance Evaluation is an important inventory activity used for continual assessment of water gains and losses in a hydrological basin or water body for the purpose of sustainable uses. In this paper, groundbreaking attempts have been made to present the Water Budget of Lakes Gwakra and Geriyo in the Upper Benue Valley of Adamawa State, Nigeria. The study aimed at determining the gains and losses of the lakes in 2013, 2014 and 2015 Hydrological Years. The studied lakes were selected on the basis of situation on the river banks, size and relevance in terms of usage. The Derived Water Balance Model used in the study incorporated Direct Precipitation, Evaporation, Surface Inflow, Abstraction, Surface Outflow and Groundwater flux as Net Residual Flux (NRF). Values of the components were computed using data obtained by standard methods of measurement and appropriate formulae. The results showed high values of Surface Inflows, Direct Precipitation and Evaporation. Changes in Storages were generally low and successive gradual decline NRFs of the lakes over the years were observed owing to yearly decline in the other surface variables. NRFs for Lake Geriyo were very low in comparison to those of the other lakes owing to excessive abstractions of water from the lake for various uses. The study provides baseline information for further Water budget studies on the lakes.

A Geospatial Query Mode Based on Geographical Entity Natural-Language

Chen Wan Peng, Yang Fei, Li Bing, Bao Shi Liang, Yao Qiang Qiang

Information Engineering University, Zhengzhou, China, 867557181@qq.com

Abstract

Traditional geospatial data query is based on data and rules selected to complete. There are two kinds of query methods in geospatial relation: ① retrieving only those geography entities what meet the TR(topological relation: disjoint, meet etc) between target files and reference documents, eg: which rivers stream across ZhengZhou; ② TR queried between given geography objects, eg: whether ZhengZhou is adjacent with AnYang. Traditional implementation must have to load two different UI query modes, and operators need to invoke different modes depending on different query requirements. Operator is prone to confused who lacks of the basic knowledge of data loading methods and topology regulation in the process of spatial query.

The paper present a geospatial query mode based on geospatial entity natural-language. Researching on the existing natural language segmentation system and data transfer mode of spatial geography query in the current open source operating system QGIS, incorporating the study of Deng Min etc's approach for spatial query based on natural-language spatial relations and topological expressions of different types of geographical entity: point, line and surface. The establishment of spatial entity natural language query function calling pattern based on geographic data has finished in this study, the same time, geographical entities natural language spatial relations of function matching dictionary(FMD) is constructed due to the diversity in characteristics of spatial geographical information, FMD provides a new means of natural language function-matching invocation instead of conventional method. Finally, a basic framework is designed for spatial entity natural language query function calling pattern based on geographical natural-language.

Key words:

geospatial data query; UI query mode; geospatial entities natural language; operating system QGIS; function matching dictionary(FMD); natural language function-matching invocation

A New Method for Extraction of Alluvial Fans from Digital Elevation Model (DEM)

Abolghasem goorabi

University of Tehran, Iran, goorabi@ut.ac.ir

Abstract

Alluvial fans have received great attention in all aspects. They have played important roles in the human societies, especially in arid regions. Many early civilizations and cities are built on alluvial fans. Alluvial fans are provided ground water and good soils for human activities. They are commonly associated with tectonically active mountain ranges. Therefore, recognition of alluvial fans border is significance to environmental management. Many researchers have used DEM in different fields. They have employed DEM use for obtaining the drainage networks, extraction of lineaments or linear features, and analyzing of longitudinal and transverse characteristics of watersheds. Notwithstanding its many uses, DEM has not been used for extraction of alluvial fans directly and automatically method so far . In the beginning and the early stages, the methods are used for extraction of alluvial fans have been based on topography maps or aerial photography observations and drawing manually them borders. The purpose of the present research is to demonstrate the utility the new technique to extraction of alluvial fans by using DEM (SRTM). In general, the methods used for extraction of alluvial fans can be classified in three general categories: (1) manual methods; (2) semi-automatic method; and (3) the new method or automatically methods. The purpose of this study is providing an efficient method to extract rapidly, accurately, low cost, and using the minimum data requirements to extraction of alluvial fan boundaries from DEM. For this purpose, with using the DEM and the method in which this study is presented for the first time (symmetrical model of DEM), with symmetry of the alluvial fan elevation data, and GIS ability, alluvial fan is introduced as a catchment and then its boundary is extracted. To assess the accuracy of this method, the extracted boundary is overlapped on satellite imageries (ASTER, QuickBird ...), topographic maps and drainage networks of region. The Results show this method gave good results in extracting alluvial fan and requires only DEM as an input data. Furthermore, the characteristics of final alluvial fans show that the "symmetric model DEM» as regards accuracy, simplicity, speed and performance using minimal data takes precedence over to other methods.

Key words:

Alluvial fans; DEM; symmetrical model DEM

A Review of Employment Location Models for Metropolitan Areas Abroad

Shuo Yang

Institute of Architectural and Urban Studies, Tsinghua University, Beijing, 100084, P. R. China, ys125ys@163.com

Abstract

For long, the choices of the household location and the employment location in mega city-regions have been concentrated in the field of city planning and city economic all the time. In China, under the influence of market economic, globalization, transportation and information technology, to strengthen the scientific study on employment location will bring about improves and even revolution of city planning in China. To this end, this paper introduces current research on employment location models abroad to China, focusing on three approaches to simulate: employment by zones, employment by individuals, and employment by firms. This paper is composed of four parts: the tendency of employment location models, the history of employment location models, the variables and theories in establishing models, the enlightenment on China's urban planning.

Crime Mapping and Hotspot Analysis for Predictive Modelling: A Case Study of Shimla City

Chauhan Ritvik, Vijay Kumar Baraik

PhD Scholar, Discipline of Geography, School of Sciences, Indira Gandhi National Open University, New Delhi-110068, India, ritvik7@gmail.com

Abstract

Crime is a serious threat to a society and handicaps it in its normal functioning. It also hinders development in the society. It is, therefore, required to tackle the crime properly for its control. Associated with human society with its very existence time, it has been evolving with passage of time. Especially during the contemporary time of rapid technological and societal change, crime has got new types and forms with the advent of the processes of globalization since the 1990s. The new technologies have made it global to be committed. However, the spatial studies on crimes are recent ones despite place plays an important role in understanding and tackling crimes. The sophisticated tools like Remote Sensing, Geographical Information System and GPS have provided vast scope to map and study crime in relation to space and other aspects of crime. This study focuses on the crime mapping for the year 2001, 2006, and 2012 covering aspects of crimes like changing pattern and trends and zonation with identification of hot-spots using the latest tools. The data used for this study is obtained from the Police Department (Shimla), National Crime Record Bureau (NCRB), Govt. of India, Census of India, Municipal Corporation of Shimla for tabular/textual information and bhuvan.nrsc.gov.in for spatial data. The study is expected to help in crime modelling for tackling/management of crime and predictive analysis.

Key words:

Crime mapping; hotspot analysis; crime trend and zonation; predictive modelling

Distinction of 2D and 3D Digital Geomorphometry in Earth Sciences Researches

Abolghasem goorabi, Ataollah Abdollahi kakroodi

University of Tehran, Iran, goorabi@ut.ac.ir

Abstract

Now with advancement of knowledge in remote sensing, digital geomorphometry plays very important role in earth science researches. Digital Geomorphometry is provided a rapid, accurate and basic for data mining in the natural sciences. Parameters, elements and features of landforms can be extracted from digital elevation models (DEMs) to form of continuously (slope, aspect, etc.) and discontinuous (point, line, and polygon) in 2 groups D2 (planimetric) and D3 (topographic) data. A review of previous articles show that despite high accuracy and low cost of this systematic approach, so far, the distinction were not performed between D2 and D3 surfaces. Despite, dramatic differences between planimetrics and topographic data, by mistake 2d data are used instead of 3d data in the analysis and molding of earth sciences researches. Therefore it would have had incorrect results. This study, by using digital elevation models (DEMs) of five central Alborz basins have established and specified distinctions and differences of D2 and 3d measurements to provide the correct usage of digital geomorphometry. The results show by increasing of slope, a significant quantity difference exist between the parameters of planimetrics and topographic of landforms.

Key words:

Geomorphometry; 2d and 3d morphometry

Improvement and Evaluation of K-Nearest Neighbor Supervised Classification

Method for High Resolution Remote Sensing Image Based on Geostatistical Models

Yingxia Pu, Xinyi Zhao, Zhibin Jin, Jingsong Ma, Gang Chen

School of Geographic and Oceanographic Sciences, Nanjing University, Nanjing, PO Box 210093, P. R. China,

yingxiapu@yahoo.com.cn

Abstract

This paper attempts to incorporate a conditional probability function and two geostatistical models (exponential model and Gaussian model) into a supervised k-nearest neighbor (k-NN) classifier to improve the accuracy of land cover classification. A subregion of Nanjing city (multispectral Quick Bird satellite image, 2.4m spatial resolution) is taken as an example to illustrate the validation of this geographical weighted k-NN (gk-NN) classifier. Its overall classification accuracy can be up to 98.54% and that of k-NN classifier. In order to further verify the good performance of this gk-NN, we compare it one three widely used classification which was greater than that of ML, NN and SVM classifiers. Furthermore, the gk-NN classifier has significantly outstanding performance compared with the other classifiers through McNemar's test. Besides, the noise produced in gk-NN classifier has been greatly reduced or almost disappeared, which could be best used in land cover classification than the other classifiers. The geographical weighted k-NN (gk-NN) classifier decrease the "salt and pepper" noise and misclassified classes and is compared with traditional maximum likelihood (ML), neural network (NN) and support vector machine.

Key words:

k-NN classifier; Geostatistical models; Geographical weighted k-NN classifier (gk-NN); Accuracy evaluation

Measuring Spatial Segregation with R

Hong SY

Department of Geography, Kyung Hee University, Seoul, 02447, Republic of Korea, syhong@khu.ac.kr

Abstract

Despite theoretical advantages of recently developed spatial segregation measures, they have not been widely used in the geography and sociology literature. One possible reason for this under-use of potentially more reliable methods is their computational difficulties: the calculation procedure of spatial indices tends to be more sophisticated than the traditional counterparts, and it often involves complex spatial data processing. Although considerable efforts have been made in recent years to implement some of the newly proposed spatial approaches, either it does not incorporate important improvements in the field, or it requires commercial software to run. In this work, I present a software package for measuring spatial segregation. The package, called 'seg' provides greater flexibility and control over the calculation procedure for advanced users, while ensuring that less experienced users can still use the functions without too much difficulty. Further, as it runs in R, open source statistical software, it is accessible to a wide group of people. The use of this package will not only facilitate the application of spatial segregation measures but also shed some light on their strengths and limitations in empirical research.

Minimal Runoff and Hydrological Droughts in Basins Transcarpathian Rivers in the Condition of Climate Change

V.Ovcharuk, I.Semenova, V.Tonkoshkura

Hydrometeorology Institute, Odessa State Environmental University, Odessa, Lvovskaya str.15, 65016, Ukraine, valeri.o@mail.ru e

Abstract

The climate changes have an impact on the water regime of rivers as a whole and on its individual components. In particular, in recent years, is increasing frequency of extreme events such as floods and droughts. Formation of minimum river runoff is closely linked with the previous climatic conditions, and the advent different type of drought reduces the supply of ground and surface alimentation rivers.

To analyze the formation conditions of minimum flow in the investigated territory used drought index SPEI on different time scales. Overall SPEI time series on the scale of 12, 18 and 24 months show that in all points observed from 12 to 16 episodes of drought durations more than one year. Another objective of this work was to study the relationship between values SPEI for different time intervals and minimum values of runoff Transcarpathia rivers. Thus, for the winter time, the largest value of the correlation coefficients obtained for March and April, and for summer low flow - for August, September and October.

Besides using the drought index, in the work was estimated change in the average temperature and precipitation from 2011 to 2050 for the weather station Uzhgorod on scenarios RCP 4.5 and RCP 8.5. Forecasted average temperature in both scenarios show a positive trend with significant correlation coefficients, with regard to rainfall, the correlation coefficients here is not significant. So with increases in temperature and no variability of precipitation, the minimum river runoff will decrease and the probability of extreme drought - will increase.

Key words:

minimal runoff; hydrological drought; climate change; modelling

Modeling of the Forming Spring Flood Runoff on Plain Rivers of Ukraine

Ovcharuk V.A., Gopchenko E.D.

Hydrometeorology Institute, Odessa State Environmental University, Odessa, Lvovskaya str.15, 65016, Ukraine,
valeri.o@mail.ru

Abstract

In this study are considered the results of modeling the spring flood water content changes depending on the forecast values of mean annual air temperature for different scenarios of climate change. The authors proposed method considering possible climate change as part of genetic model of maximum flood flow and flood operator type. The model proposed makes it possible to introduce "climate amendment" directly to the maximum snow supplies and precipitation during the flood, as well as runoff coefficients.

Comparing the results for different scenarios for the model CCSM3, we can mention that for the period 2039 three scenarios (A1B, B1, A2) give more or less similar results - no significant decrease in runoff spring flood in northern areas, and significant - in the southern of Ukraine.

Analyzing the forecasting period from 2069 to 2099, it should be noted that the results differ significantly for different scenarios. So scenarios A1B and A2 on 2099 are predicting practical disappearance spring flood (water content decrease from 100 to 80%) on the rivers zone insufficient moisture, and to areas of sufficient moisture - reducing runoff by more than 50%.

As already noted, the calculations of "climate amendments" were held in two models - CCSM3 and HADCM3. Simulation results for HADCM3 very different from model of CCSM3. Almost in all scenarios are projected sharp increase in water content (2.5-3 times) for the period until 2039, and then the same sharp decrease (especially for scenarios A2 and A1B) water content spring flood.

Key words:

maximal runoff; spring floods; Ukraine plain rivers; climate amendments

Soil Mapping Classification in Urban Areas in Presidente Prudente - São Paulo-Brazil

Janaina Natali Antonio

UNSW, Australia, janaina51@gmail.com

Abstract

The purpose of this study is to develop a predictive mapping of soils in the municipality of Presidente Prudente – São Paulo - Brazil, using the classification methodology by Artificial Neural Networks (ANN), to contribute to the integrated landscape analysis, in areas classified as Technosols. Whereas the landscape is made up of physical elements, biological and man-made, that relate dialectically, and the change in one of these elements will lead to consequences in all others. Thus it is considered that the possible physical changes in soil composition can be directly related to their type of use, as especially in the case urban areas, which have a high degree of transformation of landscapes. The municipality of Presidente Prudente is located in western São Paulo, has 562.795 km² land area, and does not have detailed soil surveys in the region. The preparation of soil maps is a time-consuming and costly task, so few surveys are conducted at detailed levels. The use of new techniques such as the use of geospatial data and remote sensing products, has shown efficacy in the results of digital soil mapping. The predictive mapping will be carried out with use of artificial neural networks (ANN), which is a technique capable of performing pattern recognition and classification of digital images associated with parametrics data. After the scores obtained with the use of Artificial Neural Networks (ANN) will be held an evaluation of the influence of the variables and architecture that present the best results for this type of study and can therefore be applied in other areas. The realization of predictive mapping of soils in the municipality may be used for purposes of planning and land use planning as well as for other activities and studies.

Key words:

predictive mapping; soils; artificial neural networks; landscape; remote sensing; Technosols.

Spatial Agent-base Simulation for Dengue Fever—A Case Study of Guangdong Province, China

Shengyin Wang¹, Zedong Chen¹, Yu Liu², *

¹College of Resource Environment and Tourism, Capital Normal University, Beijing, PRChina;

²Institute of Remote Sensing & Geographical Information Systems, Peking University, Beijing, PR China,
liuyu@urban.pku.edu.cn

Abstract

Dengue fever was broken out in Guangdong province of China, 2014, which had brought to an extensive public attention. For the better understanding of the dengue fever spreading rules, computer modeling and simulating have been served as an effective approach. Instead of neglecting spatial elements in the previous modeling processes, the objective of this study is to take two spatial elements into account while creating the dengue fever's propagation model. These include the mobility of people between different villages and towns, and the spatial heterogeneity of the regional infectious rates which was influenced by the local environment, the population density and the epidemic prevention policy. For this reason, an agent-base model can be an appropriate method to represent the process of dengue fever's transmission for the better considering and describing of the randomness of agents' movement and the spatial heterogeneity. Finally, this model is implemented with combination of three datasets to some extent to restore the spatiotemporal prevalence of dengue fever's diffusion in given units in Guangdong Province, 2014. These spatially explicit datasets include the dengue fever Prevalence information, the mobile phone data where users' mobility can be extracted, and the census information. These simulation results which have good coherence to observed data suggest the proposed model depicting the diseases progression well. Through modifying proposed model, the influence of human's movements in dengue fever's diffusion is defined, and it will provide a basis for making prediction and taking steps towards prevention and control of the dengue fever.

Key words:

dengue fever; agent-base model ; human mobility; spatial heterogeneity

Spatial and Temporal Variability of Macronutrients at Two Conventionally Paddy Cultivation

Hasliana.K¹, N. Aizam.A², M. Radzali.M², A. Athirah.A²

Abstract

Paddy cultivation requires large space area as compared to the others plantation. In Malaysia the granary area involved large scale irrigation systems of exceeding 4,000 hectares and the area is recognized by the Malaysia government in policy state agriculture as main paddy production area. Therefore, one of the study area used in this study is a granary area located in FELCRA Seberang Perak and managed by the Integrated Agriculture Development Area (IADA). The second study area for paddy cultivation is Sedaka, Yan Kedah, Malaysia which is managed by the individual local based farmers. Therefore, in this study, 2 different conditions and period of soil sampling were acquired for soil nutrient. The first sampling is before paddy cultivation which is land preparation stage by the farmer. Secondly, soil sampling before the harvesting time approximately 100 days of paddy cultivations with soil fertilization has taken place. In this study GIS analysis was used to derive nutrient content of N, P, and K classification. In comparison of soil nutrients in this research will adopt optimum values of soil nutrients for paddy planting as recommended by Malaysian Agriculture Research and Development Institute (MARDI). This study examined the spatial variability of macronutrient soil that N, P, and K contents indicated varies result for both conditions of before and after fertilization as well as two different places using geostatistical analysis in GIS software.

The Current Situation and Potential Evaluation of Sino German Bilateral Trade Based on Gravity Mode

Zhang Junling , Zhang Yuze , Zhang Xiaoqing

Shandong Normal University, Jinan, 250014, 18353118913@163.com

Abstract

Germany is the largest trading partner in Europe for China, so researching bilateral trade potential on Sino German has important theoretical value and practical significance to timely adjust foreign trade strategy, and promote the construction of "The Belt and Road". First, The paper use of bilateral trade data and trade integration index analysis of Sino German bilateral trade situation, and then use the 2014 trade data in 37 major countries, from the two country's GDP, per capita GDP, two capital distance, whether to join the WTO and APEC five aspect, using EViews software to establish the trade gravity model to forecast the Sino German trade development potential. The conclusions are as follows: ① bilateral trade is in large scale, rapid growth rate, and the Sino German trade gradually deepening; ② Sino German commodity structure has a greater complementarity; ③ Germany on Chinese trade integration is from weak to strong, but Chinese of German trade is decreasing; ④ Sino German bilateral trade potential value increases in fluctuation and, more than 1.2, which belongs to the "potential to form", thus the trade potential has been brought into full play, rise in narrow space.

Tropical Forest Change Detection in last 25 years in Xishuangbanna, China, Based on CLASlite Model

Chaparro R, Wang J, Li J.

College of Tourism & Geographic Sciences, Yunnan Normal University, Kunming, 650500, P. R. China,

chapas22chan@yahoo.com

Abstract

The development of sophisticated and accessible approaches to monitoring deforestation and forest degradation is central to assessing changes in ecological processes such as carbon storage, biodiversity, biomass and many others in tropical regions. CLASlite is an automated satellite mapping model used to identify deforestation and forest degradation, especially in tropical forest regions. In this paper, we used the CLASlite model to analyze deforestation and forest disturbance from 1990 to 2015 in Xishuangbanna, situated in the southern part of Yunnan Province. We found that largest forest change rate was 23% between 1995-2000, followed by 1990-1995 (0.64%) and 2000-2005 (2.81%), in last five years the change was 2.18%. By means of geographic information system processes, the forest changes detected were compared with the land uses and protected areas of the study area. Most of the change to forest area corresponds to crops and plantations, mosaics of vegetation, and natural forest. The deforestation within environmentally protected areas was 285.2 km², 6.53% of total protected area. Xishuangbanna is one of the few regions in China with a significant tropical forest area, but, as the results illustrate, these areas are at serious risk of disappearing. We consider it important to continue the conscientious monitoring of this region, especially in sectors such as the protected areas. The advanced remote sensing approaches occupy an important role in attaining the objective.

An Experiment in Order to Develop Sustainability of Wakhi People Crossed the Border

Mizushima, Kazuo, Ochiai, Yasuhiro

Nihon University, Tokyo, Japan, mizushima@chs.nihon-u.ac.jp

Abstract

Currently the Wakhi people (as follows the people) live separately on the border areas of Pakistan, Afghanistan, Tajikistan, and China, although the people have been one ethnic group at one time. The people who inhabit around the junction of mountain ranges of Karakorum, Hindukush and Pamir are also called the people who are living on roof of the world.

In the early Twentieth Century, globalization, and the growth of market economies have penetrated even the geographically mountainous frontier regions where the people live. These changes have significantly influenced not only their traditional form of agricultural system and livelihood but also ways of life they had been practicing for centuries. Against such backdrop, not only the history, tradition and culture of the people have been affected but at some degree endangered to be forgotten both nationally and internationally. One could go as far as to say that the once proud and peace loving ethnic identity of the people in facing a crisis of identity and there growing risk of disappearing from the social ethnic map of the world. According to a workable idea, the committee of GMF(Global mountain Forum) had the international symposium as [Wakhi Summit] of 2015—towards the sustainable development of the people. The committee made a plant for a report and discussion about a few of theme for the symposium.

Differences in the Current Status of Lifestyles between Two Inhabited Areas of Wakhi in Pakistan and Tajikistan

Ochiai, Yasuhiro, Mizushima, Kazuo

Nihon University, Tokyo, Japan, ochiai.yasuhiro@nihon-u.ac.jp

Abstract

Nowadays, as the Wakhi people separately inhabit four countries around the Pamirs, their original culture and lifestyles depend on peculiar agro-pastoralism has become different in each area. In Gojal district, Gilgit-Baltistan Province of Pakistan, since the opening of the Karakoram Highway (KKH) in the 1980s, the traffic of persons and goods has been increasing and NGO-enabled development has advanced. Cultivation of crops as a commodity has been extended, and transhumant pastoralism has been relatively reduced. Although tourism opportunities have also been increasing, responses that would allow an economy based on commodities to progress are different in each of the villages, which have different conditions. On the other hand, as the Ishkashim region – Gorno-Badakhshan Autonomous Oblast of Tajikistan – is located in a remote area away the trunk road, helps from the government and the NGOs are restricted. Thus, agro-pastoralism has not changed from its old self-sufficient form, and there are few opportunities to be concerned with tourism or other industries. However, since the independence of Tajikistan in 1991, local society has shifted to a market economy and the expenditures of its inhabitants have also been increasing; many young people have to emigrate to the cities in other areas of Tajikistan or Russia to get jobs.

“Nomadic” Pastoralism in Kara-kul, Northern Part of the Pamirs, Central Asia

Shigeru Shirasaka, Teiji Watanabe

Tokyo Gakugei University, 2Hokkaido University, vanshira@rikkyo.ac.jp

Abstract

The northern part of the Pamirs in the central Asia is situated in high altitudes, under particularly severe natural conditions. The local inhabitants can only do livestock farming for their subsistence. Sheep, goat, cow, yak, and donkey are their major domestic animals and also horse in some areas. Kara-kul is a village in the northern part of Republic of Tajikistan at 3,953m above sea level. Until the beginning of 1900's, these local people had kept nomadism. The central Asia was incorporated in the Soviet Union politically in 1920's and these local nomads were incorporated in sovkhos by the Soviet Union, being forced to settle down in Kara-kul. Farming is not suitable in Kara-kul. From the viewpoint of the difference of altitude, most families of Kara-kul run ascending transhumance mainly, but some families do horizontal transhumance. Generally speaking, many families in Kara-kul graze at their mountain pastures (jailoo) higher than 4,500 meters in summer, and put it out to pasture around the village (kyshtoo) in winter. They make a group for pasturage with several families in jailoo and also in kyshtoo. Each group pastures their livestock every day. They call this way as “novad.” However, they also practice two more concepts of transhumance: küzdöö for spring pasture; and bäärlöö for autumn pasture in addition to jailoo and kyshtoo. After all, they continue to keep four concepts from the age of nomadism. This is why we describe their transhumance “nomadic.”

Key words:

nomadism; pastoralism; subsistence; Kara-kul; Tajikistan; the Pamirs; central Asia

Over Sea Migration and Village based Animal Husbandry, Changing Agro-Pastoralism of East Nepal

Watanabe, K.

Hannan University, Osaka, Japan, watanabe.kazuyuki@gmail.com

Abstract

Himalayan farmers have taken care of their livestock in order to complement mountain agriculture. There are some kinds of pastoralism. Mountain nomadism and transhumance are famous for their long distance of migration, on the other hand, village based animal husbandry, where farmers keep animals on a shed in their house yard and sometimes they take it for daily grazing at forest or grassland around the village, is also popular among Himalayan farmers. However, in recent years, as overseas migration for jobs in Middle East countries increases, mountain agro-pastoralism is also changing. Shortage of labor is the most difficult problem. In the absence of male population, women, children, and elderly persons who remain in their village can't keep agro-pastoralism in the same size as before.

This paper aims to analyze changes of village based animal husbandry from three points; 1) kinds of animal, 2) size of animal, and 3) extent of mobility. The most important factor is collecting of grass. Farmers who are available for more labor input can raise more profitable kinds of animals and increase the size of the animals in intensive methods. On the other hand, however, farmers who are short of labor also seek more easy methods such as lazy grazing, which saves the cost of labor for grazing, or selection of some kind of animals which need less care and less grass in small size. Sustainability for Himalayan agro-pastoralism faces the problem of how to save the cost of labor input.

Key words:

shortage of labor; collecting of grass; mobility of grazing; lazy grazing

marek.ewertowski@gmail.com

Abstract

Protected natural areas (PNAs) such as national parks often constitute highly valuable regions that are rich in bio- and geodiversity with beautiful scenery. Visitor pressure in PNAs is focused mainly on recreational trails, which facilitate activities such as hiking, cycling, horse riding and wildlife observation. Trails prepared for hikers are among the most common types of recreational trails. High visitor pressure can lead to increases in trail width and a concomitant increase in soil erosion. In case of extensive protected areas, the performing of regular geodetic monitoring is expensive and therefore park managers often face a problem in selecting sites for impact monitoring. However, recent advances in technology enables the development of low-cost alternatives for traditional surveys. Consumer-grade cameras can be used to rapid acquire of photographs. The ground-based photographs can be subsequently processed through the structure-from-motion approach to generate detailed mosaics and digital elevation models of trail surfaces. It is possible to apply such models to study, monitor and quantify processes like soil erosion and vegetation trampling. In this study we present methodological framework for monitoring of trail impact with the use of structure-from-motion approach and demonstrate its application based on examples from Gorce National Park, Poland. The proposed methodological framework can enhance the ability of Park managers to prioritise their trail management activities, enhancing trail conditions and visitor safety, while minimising adverse impacts on the conservation value of the ecosystem.

Estimating Future Erosion on Hiking Trails in Shei-Pa National Park, Taiwan

Lee Y-L, Watanabe T

Hokkaido University, Sapporo, 060-0810, Japan, teiwata@ymail.com

Abstract

This study examined the trail erosion rates at 51 sites on the 10.9 km trail in Shei-Pa National Park, Taiwan from December 2007 to November 2008. Traditional, repeat cross-sectional measurements were conducted for the purpose. Then, this study estimated the depth of soil (unconsolidated materials) from the trail surface to be potentially eroded in the future by a hand-held dynamic cone penetrometer (PANDA 2), originally designed to measure soil compaction. The repeat measurements of the cross sections showed that erosion dominated at 28 sites (in total 28,854 cm² of soil was eroded in one year) and deposition dominated at 23 sites (in total 7,897 cm² of soil was deposited in one year). The sounding by the dynamic cone penetrometer showed that the depth of the soil ranged from 4 to 271 cm (average: 98 cm). Assuming that the erosion rates in the past will be constant, the soil depth to be eroded provides the future prediction of further soil erosion at the erosion-dominated sites. For example, at the 9.35 km site from the trailhead, the average erosion rate was 13.8 cm/year, and the estimated soil thickness was 72 cm. Therefore, the 72 cm deep soil would be eroded away by 2014. The dynamic cone penetrometer is a non-destructive sounding machine. It would be helpful for national-park managers to utilize the combined methods of soil erosion rates in the past and soil depth to be eroded in the future.

Key words:

Trail degradation; trail erosion rate; future erosion depth; soil compaction; dynamic cone penetrometer (PANDA 2); Shei-Pa National Park; Taiwan China

Monitoring Soil Erosion from Recreational Trails Using Repetitive Topographic Surveys

Tomczyk A.M., Ewertowski M.W.

Adam Mickiewicz University, Faculty of Geographical and Geological Sciences, Poznan, Poland, alto@amu.edu.pl

Abstract

This study applied a new method for detailed monitoring of soil loss from surface of recreational trails. The main objectives of this study were: (1) to analyze the spatial aspect of surface changes in microscale; (2) to quantify precisely the short-term rate of soil loss and deposition. Measurements were taken in 12 test sites, located in mountains within two protected natural areas in the south of Poland: the Gorce National Park and Poprad Landscape Park. The studied sites were located on trails characterized by different slopes, types of vegetation, and types of use. The use of precise elevation data provided by the electronic total station and laser scanning allowed us to assess the sediment budget of the surface changes. In such a way, the spatial and temporal dynamics of soil loss influencing the trail tread could be studied. During a six-year period (2008–2014), soil loss dominated within 10 test fields, while a predominance of deposition was recorded for the remaining two. The average net volumetric change of the trail surface elevation varied from -3,5 cm +0,5 cm per year. The short-term dynamics was high and several test fields had a positive balance (predominance of deposition) in one period and negative balance (predominance of soil loss) in the next period. Local geomorphic conditions, morphology of the trail tread and soil properties seemed to be the most important factors contributing to the amount of soil loss or deposition.

Key words:

Soil loss monitoring; Erosion; Recreational trail; Trail impact; mountain areas; Footpath erosion

Monitoring Trail Degradation in Daisetsuzan National Park, Japan since 1989: from 2-dimensional Studies to 3-dimensional Studies

Watanabe T

Hokkaido University, Sapporo, 060-0810, Japan, teiwata@mac.com

Abstract

This study reviewed the progress in the studies on monitoring trail degradation (erosion and deposition) conducted in Daisetsuzan National Park, northern Japan since 1989. The first monitoring started in 1989 (Yoda 1991; Gotoh 1993). Those studies have used 2-dimensional (cross-sectional) repeat measurements, which have led to the long-term studies in two areas within the park: Kuro-dake Ishimuro area (e.g., Yoda and Watanabe 2000), and Susoai-daira area (e.g., Watanabe et al. 2004). Although the number of continuous monitoring sites nowadays has been decreasing due to the difficulty in the maintenance of the fixed site-identification poles, several sites have been monitored more than 20 years (from 1989/1990 to 2013/2016). In 2004 and 2005, a simple digital camera was used to take photographs to make 3-dimensional mapping in and around the Susoai-daira area (Ota and Watanabe 2005). The study became possible by adapting easy-use 3D software (*Kuraves*), but the method was not widespread because the software is available only in Japanese. This method, however, demonstrated the effectiveness and importance of 3-dimensional studies. The most recent direction of the trail monitoring is to use either a UAV (drone) or a hand-held digital camera and Structure from Motion (SfM). In addition to monitor the past trail erosion, estimates of soil depth to be eroded in the future are attempted by geophysical sounding methods. The combination of the monitoring of the past erosion rate and the detection of the future erosion contributes to better management of trail degradation in national parks.

Key words:

Trail erosion; cross-sectional measurement; long-term monitoring; 3D mapping; future prediction; national park management

Study of Trail Erosion in Daisetsuzan National Park in Hokkaido, Japan, Based on Construction of Digital Surface Model with Drone

Kobayashi Y, Watanabe T

Hokkaido University, Sapporo, 060-0810, Japan, ykobayashi48@icloud.com

Abstract

Trail erosion has been investigated near Mt. Hokkai-dake in Daisetsuzan National Park, Hokkaido, northern Japan, with a drone (UAV) from 2014 to 2016. Although mountain trail erosion has been studied by surveying cross-sectional changes at certain sites in the national-park area, this traditional method does not provide the eroded/deposited volume in the entire area. Drones have been recently used to make Digital Surface Models (DSMs) to understand geomorphological phenomena. This study has two objectives: (1) to estimate changes of the eroded volume of mountain trails from 2014 to 2016 by making DSMs, and (2) to understand a relationship between the trail erosion and micro-topography. In this study six segments from starting site to ending site of trail erosion were selected. Before flying a drone, GCPs were set and distances between these GCPs were measured by a total station. About 300 to 500 photographs were taken in each of the trail segments. DSMs and Orthophotographs were made with these photographs by Agisoft, which is Structure from Motion (SfM) software.

The eroded volume in the segment with the largest value attained 274.67 m³.

Key words:

Mountain trail; trail erosion; national-park management; Daisetsuzan National Park; Drone; Japan

Integrated Typology of the Municipalities in the Rhodope Mountain Region in Bulgaria with a View to Regional Development and Management

Ilieva, N., Kazakov, B., Soultanova, M.

National Institute of Geophysics, Geodesy and Geography – Bulgarian Academy of Sciences, Sofia, Bulgaria,

msoultanova@abv.bg

Abstract

Mountainous areas in Bulgaria are characterized by deteriorated social and economic indicators compared to other parts of the country. These areas require specific policies and development plans, which aim at stabilizing them and retaining the depopulation processes. The Rhodope mountain region stands out with its wide variety of ethnic and religious structure of the population - on one hand, it is home to the majority of the Bulgarian Muslims (the Pomaks), while on the other – areas with a high concentration of Bulgarian Turks are formed here as well, together with relatively compact areas inhabited by Christian Orthodox Bulgarians. The diverse ethno-religious structure of the population determines spatial disparities in the course of the demographic processes in the region and makes it unique among other mountain regions. The Rhodope mountain region could be an example of transnational region with diverse ethnic and cultural identity. Based on the analysis of the trends in the demographic, urban and socio-economic development, as well as the impact of various factors, the current study attempts to typologies the municipalities (LAU 2) in this mountainous, border region of Bulgaria. For this purpose, by applying methods of the multivariate statistical analysis (hierarchical clustering), based on demographic, urban, social, economic, infrastructural etc. indicators, different types of municipalities have been defined. Each of the separate types has their own specific characteristics and problems and therefore requires a differentiated approach to designing regional plans and development strategies.

Key words:

integrated typology; Rhodope region; Bulgaria; regional development; regional management

Advances and Challenges of Public Security Policy in Areas of Brazilian Border

Alex Jorge das Neves¹, Adriana Dorfman²

¹National Security Secretariat Publishes, Brazil, alex.j.neves@gmail.com

²Federal University of Rio Grande do Sul, Brazil

Abstract

Brazil is a country whose borders are of continental dimensions, corresponding to 27% of the territory. This colossal size, reflects the problems and the potential of these regions, and to address one of these issues in the case, the Public Security, the Brazilian government instituted a Strategic Border Plan in 2011, which provides for a series of measures to strengthen integration, coordination, cooperation and the structure for the control and monitoring of this extensive border region, which after 05 years shows progress and challenges.

As advances we can list the considerable increase in investments, beginning of various programs and projects, such as the National Strategy for Public Security Border (ENAFRON), the Surveillance System for Borders (SISFRON), rigging of more than 600 police units in the range border, in-depth diagnosis of the problems in Brazilian borders and mapping initiatives in China, Russia, India, United States, Mexico and the European Union, in addition to the exponential increase in gun and drug seizures (cocaine and marijuana).

While there have been advances, there are still numerous challenges, such as the complex task of improving the mechanisms of cooperation and integration between the Brazilian agencies with neighboring countries as well as maintain this policy as a priority, especially in the current context of financial crisis and policy.

The work in question seeks demonstrate state of the art of this policy as important for Brazil as well as to South America and many other countries, as well as demonstrate the strategic importance of coordination and exchange of knowledge on the subject among the countries of the BRICS

Abstract

The border was not a line that circumscribed or delineated a territory. Instead, the border was multiple; it was found, practiced and enacted in a multitude of sites beyond and within the territory it was intended to secure. Border as Method, it considers the diverse operations of the border in producing landscapes and subjectivities. Hotel as the border of metaphor, consumers around the world need to provide the effective certificate such as a passport to check in. Besides, consumers that does not locate the ability to act politically in the traditional figure of the citizen, but rather, sees the struggles, contestations and negotiations of non-citizens as intrinsic to the enactment of citizenship and political subjectivity. The study selected 10 luxury hotel in Guangzhou as a case, and used the in-situ observation, depth interview, experience and other research methods. It found that: (1) Consumers through check-in, produce and inspection certificates and other forms of ritualization showed an acute manifestation of the “spectacle of the border”, citizen or non-citizen, resulted in the process of the ritualization of similar border checks are fuzzy. (2) The hotel through language, material products, cultural construction and so on produced blurred border landscape, rendering the multinational national contestations and negotiations. (3) In the process of the interaction of hotel producers and consumers, citizenship is a bordering practice that operates through exclusion and claiming. The study enriched the border related theory, also provides a new perspective for the research of the hotel.

Borders in Development

Novak P.

SOAS, University of London, Russell Square, United Kingdom, pn4@soas.ac.uk

Abstract

Development is inextricably related to the state-centred cartography of world spaces defined by borders, both in its historical trajectory and contemporary entanglements. Yet the multiplicity of channels and directions characterising their articulation is scarcely explored, and this article is a first attempt to fill this analytical void. More specifically, the paper places borders in development in two ways. First, it places borders in Development Studies. Examining contemporary development's theories, policies and practices through the prism of scale, it identifies borders as a useful analytical vantage point that lay at the intersection between state- and non-state centred geographies of development. Second, it places Border Studies in development. Focusing on the tension between borders, understood as linear markers of territorial jurisdictions, and bordering, understood as fluid, situated and dynamic social process, it interrogates economic growth- and poverty-related policies. Three contributions arising from placing borders in development in this way are highlighted. At its broadest, the discussion dis-entangles the multiplicity of scales and directions in which borders, bordering and the development process intersect. It is precisely at this scalar intersection that the force of development, and the potentials for engaging, opposing, avoiding, or subverting it, lay.

Development Studies; geographies of development; borders and development nexus; border management; scale; economic integration; Good Governance

Geopolitics in Guiana Shield

Gutemberg de Vilhena SILVA

Professor to Political Geography in Federal University of Amapa (UNIFAP), bgeografo@gmail.com

Abstract

International limits and borders are relevant issues in geopolitical studies, whether past or nowadays. The land and sea borders, as well as the limits that constitute them, are, from a diplomatic perspective, interconnected. This connection has a layer of complexity in the negotiation of international limits, which is relevant in several countries that comprise the Guiana Shield. This article analyzes important aspects of the still unresolved maritime and territorial disputes in the Guiana Shield from the angle of geohistory and geopolitics. The key problematic is: how occurred and still occur geopolitical arrangements of still active border disputes in the Guiana Shield? The methodological basis was document analysis, literature, field work and updating of thematic cartography. The work takes, even in terms of procedures, an integrated and comparative approach, when possible, of the disputes focused, allowing analyze several important components of geopolitics and geohistory Plateau of Shield that eventually would go unnoticed if an integrated approach was not made. The research concludes that all shield countries mentioned, except Brazil, are involved in territorial disputes and the political dimension of three rivers-limits - Oiapoque, Maroni and Corantyne - are put into relevance. The article also points out that economic interests are put in evidence in the settlement of territorial disputes as the disputed areas are rich of minerals such as gold, oil and bauxite, which sharpens the interest and the participation of multinationals in the regional geopolitical arrangement.

Geopolitics; Geohistory; International limits; Maritime-Territorial claims; Guyana Shield

Grass Roots Non-State Actors, Border Interactions and Regional Integration: The Case of the Southern African Region and SADC

Dr Innocent Moyo

Geography Department, University of South Africa, minnoxa@yahoo.com

Abstract

The volume and traffic of economic activities in time and space across the Ramokgwebana and Beitbridge border posts which 'separates' Botswana and Zimbabwe and South Africa and Zimbabwe respectively, suggests that markets have the potential of exploiting the economic and social inequalities of people, resulting in the movement of people and goods to where there is potential for gain and economic and personal advancement. Therefore, based on a qualitative study of cross border activities between Botswana and Zimbabwe and South Africa and Zimbabwe, this paper argues that such activities undermine the effect of the border. This suggests that, there is a *de facto* connection and integration on the basis of the activities of grass roots non-state actors between Zimbabwean shops and the border towns of Francistown in Botswana and Messina in South Africa. In a region like the SADC, which aim to integrate among others the economic activities, such an interface, is a grassroots activity which can be harnessed to achieve such an aim.

Key words:

Cross border social and economic activities; regional integration; SADC

Marginal, Situated and Emergent: Border Studies in Brazil

Dorfman, A, França, L.B.C., Muller, K.M., Rocha, R.P. da, Grimberg, D. de S.; Strassburger, T., Dalalibera, G.

Universidade Federal do Rio Grande do Sul, Porto Alegre, Brazil, adriana.dorfman@ufrgs.br

Abstract

This paper resorts to quantitative and qualitative methods to analyze researchers and researches dealing with contemporary (since the 1990's) border studies in Brazil. The information was collected while building the database "Unbral Fronteiras - Open Access Portal of the Brazilian Universities on Borders and Limits". In the process, border researchers were listed and answered a questionnaire. Through these, we drew the spatial distribution of scholars and studies (in Southern in Central borders, mostly) and identified the main topics (integration; cross-border culture; infrastructure and its limits; fronts) and emerging themes (non-state and non-administrative borders). We conclude that there is no consensual methodology or theory. Still, this is a growing field of research, with a defined community and a solid understanding of its object (the international borders). There are paradigmatic concepts (border, limit, twin-city) and regionalization (border strip, 3 arches, dyads). We conclude that, in Brazil, border studies are a marginal field of research, much like its object. In addition, we found a strong link between researches and public policies aimed at borderlands, more frequently as comments than as formulation. Finally, we conclude that border scholars tend to be politically engaged with the object, which is expressed in situated research.

Key words:

Scientific production; Border Studies; Brazil; Domain analysis

On the Geographic Thoughts of Edward Said

ShixiuWeng

School of Geography and Planning, Sun Yat-sen University, Guangzhou, 510275, P. R. China, wengshx8@mail.sysu.edu.cn

Abstract

By rethinking the contradictions of Edward Said's thoughts, this article argues that the contradictions are Said's strategies of resistance, and they're very important to research Said's geographic thoughts. Thus, this article explores the features of 'imaginative geographies' and develops a new concept 'contrapuntal geographies'. To imaginative geographies, this article argues that, we should analysis the relative 'structures of attitude and reference' and the relative discourse, then read them in worldly cosmopolitanism humanism. To the concept 'contrapuntal geographies', this article explored the basic features of this concept. First, a geographic space is related to different communities, and has discrepant experiences and representations which competing each other. Second, the representations are possible to reconcile. Third, the results of the reconciliation may be a hybrid co-existence. Last, it's hard to get this co-existence, it need the negotiations of different cultures, the escapes of the secessionism nationalism, and pursues of the worldly cosmopolitanism humanism.

Key words:

Edward Said; imaginative geographies; contrapuntal geographies

Resilience Nodes: Mapping Survival-Cum-Livelihood Interactions among Informal Cross-Border Actors in the COMESA-EAC-SADC Tripartite Region

Chris Nshimbi

Centre for the Study of Governance Innovation (GovInn), Department of Political Sciences, University of Pretoria, South Africa, chris.nshimbi@governanceinnovation.org

Abstract

This paper attempts to map informal cross-border interactions at and across contiguous borders of countries participating in the Tripartite free trade area (TFTA) including the Common Market for Eastern and Southern Africa (COMESA), East African Community (EAC), and Southern African Development Community (otherwise, COMESA-EAC-SADC). It sketches the interactions across specific border crossings and their spread in the TFTA by mainly focusing on the activities of informal cross-border traders (ICBTs). The paper thereby fulfils two methodological and theoretical objectives. Firstly, it reviews and discusses livelihood and sustainability issues concerning and, therefore, brings to the fore the resilience of grassroots non-state actors (including ICBTs) across/in the borderlands and communities of selected participating countries in the COMESA-EAC-SADC TFTA. This theoretically locates the paper in the study of borders, boundaries, frontiers and borderlands. Secondly, it integrates empirical information from personal interviews, focus group discussions and participant observations conducted in selected border locations of TFTA participating countries, and discusses the socio-economic dynamics in these borderlands. Informal cross-border trade serves, for the actors in such areas and those from beyond, as the next best alternative and coping strategy given prevailing unemployment and the socioeconomic neglect of the borderlands by respective governments. The socioeconomic challenges and low levels of development experienced in these marginal outlying border communities are compounded by the neoliberal reforms adopted by most TFTA countries in the late 1980s and early 1990s that removed many economically active people from formal employment. Despite this, the motivations behind the socioeconomic activities of non-state actors in the border communities are seldom deeply and properly articulated, except that their cross-border activities are illegal. If well nurtured, TFTA border towns and borderlands could become bustling nodes of socioeconomic and cultural activity spreading TFTA's success and development in participating countries.

Key words:

livelihood; borders; informal cross-border trade; COMESA-EAC-SADC Tripartite FTA

Smugglers X State? Territoriality, Sovereignty, Illegality

Dorfman, A, França, L.B.C., França, R.F.

Universidade Federal do Rio Grande do Sul, Porto Alegre, Brazil, adriana.dorfman@ufrgs.br

Abstract

This paper discusses the territoriality of cigarette smugglers at the Southern Cone borders of sovereign South American states, as experienced in Southern Brazil. It confronts the discussion of State sovereignty with analyses of (il)legalities in order to better understand existing borders and territories. It examines the distinct policies in the national territories of Brazil and Paraguay and at their borders, and the territoriality of the local population engaging in illegal activities. Cigarette production and consumption, the market and its regulation, actors, routes and networks, smuggling territories and state borders permeability are mapped and analyzed under the tensions that bind legality and legitimacy. We conclude that tobacco production and trade and cigarette smuggling are connected through agents who use the border to build the legal market and, consequently, to increase the trade value of national tobacco. Cigarette smuggling also represents a resource that translates as informal labor inclusion and legal exclusion. Smuggling at borders combines verticalities and horizontalities, networks and places, hierarchy and confidence in such a way as to be totally integrated to the legal economy, international markets and national territories and does not defy state's sovereignty. It is better explained as integrated to national economy through illegalities management

Key words:

Smuggling; Sovereignty; Illegalities; Borders; Territories; Cigarettes; Southern Cone

The EU's Bordering Dilemma - Prospects for Neighbourhood

James W. Scott and Jussi P. Laine

Karelian Institute, University of Eastern Finland, Finland, james.scott@uef.fi

Abstract

As part of the wider debate interrogating ethical consequences of managing mobility through borders, questions related to everyday ontological security (i.e. the identity of the self) and disruptions of self-referential ways of seeing the world need to be taken seriously (Mitzen 2006, Rumelili 2015). Identity bordering within the EU is not only fed by social media and populist discourses but is also part of intellectual and philosophical arguments that, for example interpret liberal, humanitarian understandings of migration and idealistic notions of regional neighbourhood (e.g. with Ukraine, Russia and the South Mediterranean) as naïve and misguided. At the same time, despite all proclaimed intentions of re-setting its Neighbourhood agenda the EU appears to insist on 'asymmetric conditionality' and maintenance of the basic policy architecture that so far has failed to promote genuine partnerships. One reason for this is related to the maintenance of an EU identity and the fact that the EU's ontological security is bound up in the continuity and perceived coherence of its policy frameworks (Natorski 2015). In order to transcend the 'coherence trap' and the selective visibility of social issues that it engenders, alternative understandings of Neighbourhood as a context for societal interaction – and not a merely an 'objective' policy – are required. While cross-border migration has become a fact of life in much of the EU, the discursive and practical securitisation of labour migration and other forms of cross-border mobility challenges basic principles of and prospects for regional cooperation. Understanding the EU as an integral part of any neighbourhood idea, joint engagement with socio-economic, cultural and group-specific concerns could help create a new self-narrative of EU actorness and contribute to a more tolerant and humane border policy.

Key words:

geopolitics; bordering; European Neighbourhood

Understanding the Trajectory of Bordering through Literary Discourse: A Popular Geopolitical Study of *Midnight's Children*

Shubhi Misra

Jawaharlal Nehru University, India, shubhiddiva@gmail.com

Abstract

Borders are physical/geographical as well as symbolic and representational. They are lived, created, crossed, resisted, hardened or dissolved at various levels and at varied spaces. Borders no longer refer only to physical/geographical lines demarcating set physical spaces called nation-state; rather they have eventually assumed a hybridized form. The drawing and redrawing of maps brought about by the historical processes of nationalism, imperialism and decolonisation made evident that borders are not natural phenomena but man-made demarcations which are integral to the exercise of power in physical and mental forms. They also show how borders are highly dynamic entity. This has thrown up questions related as much to colonial subjection as to class, race, gender, language and epistemology. Within the current contexts of accelerated globalization and the development of communication and information technologies, which aim to create a 'borderless world' but in reality have 'globalised' the very borders they claimed to dissolve, and with simultaneous shifts in thinking in the social sciences and cultural studies, under which the borders between various disciplines have become increasingly permeable, the concept of 'borders' has been opened to new reflections and debates. Seen against the recent backdrop of accelerating migration, not infrequently burgeoning into distressing crises, the rethinking and debates have taken on certain urgency.

The present paper attempts to retrace the changing nature of the India- Pakistan border by analysing Salman Rushdie's classic novel '*Midnight's Children*'. It attempts to establish a link between literary discourse and the ongoing process of bordering.

Geopolitical Pivots and Blue National Soil –The Difficulties of Free-Flowing Territory

Boyle, Edward Kieran

Center of Asia-Pacific Future Studies, Kyushu University, Fukuoka, Japan, tedkboyle@gmail.com

Abstract

The much-vaunted “pivot” of the United States self-evidently draws upon the rhetoric of Harald Mackinder, often proclaimed the founding father of geopolitics. Mackinder considered the Eurasian heartland as the “pivot of history”, control of which would guarantee hegemony in the twentieth century. As we enter the twenty-first, America’s “pivot” is being undertaken by what remains the hegemonic power of the era, signaling the journey of this metaphor from noun to verb. This grammatical transition is itself representative of the transformation in geopolitical imagery, as an early twentieth century that fetishized control over blocks of territory has given way in the twenty-first to a focus on the facilitation, administration, and control of flows of men and material.

Yet while this suggests the aptness of the oft-drawn contrast between spaces of places and space of flows, the state effects these flows through the facilitation and management of the latter. Therefore, while there is no contradiction between territories and networks, the former is required in order to enable the latter to be made visible. The rhetoric of territorial control visible in Asia-Pacific disputes centers upon this claim to order the world of flows, in a manner that both recalls and draws upon an era of high imperial competition. Nevertheless, the claims to novelty for this shift in political rhetoric disguises the inherent continuity of the state, where what has altered is the conception of territory over which it seeks to proclaim its authority.

Geopolitics; pivot; state; territory; islands; Asia; maritime disputes

Northeast Asia Institutional Gap: Geographical Analysis

Krechetova V.

Beijing, 100027, P. R. China, k_v_s@mail.ru

Abstract

Northeast Asia (NEA), region comprising China, Democratic People's Republic of Korea, Japan, Republic of Korea (ROK), Mongolia and Russia, puzzles with lack of institutionalised regional integration. There are multiple local and central governments initiatives seeking promote peace or foster economic development, the most recent is Northeast Asia Peace and Cooperation Initiative. However, despite the close and intense economic and, in particular, trade ties, common security concerns, NEA did not reached level of integration of NAFTA, Mercosur or European Union. The reasons are numerous; the most important are history of the region, deep involvement of non-regional players in political and military affairs, lack of mutual trust. The paper analyses existing institutional gap in several aspects. Firstly, paper shows how the evolution of international cooperation in NEA at bilateral and multilateral level determines the gap. Then, it presents and analyses the economic landscape of the NEA countries by provinces in different dimensions (measured in Gross Regional Product normalised by population, area, per capita by country average), population distribution, and measures how different it is in areas close to NEA state borders. Lastly, the paper outlines efforts of the regions of China, Russia, ROK, Mongolia and Japan facing inner NEA state borders and motivated by economic challenges, to close the gap via the Greater Tumen Initiative, the Association of North East Asia Regional Governments and similar groupings.

Russia's Cross-Border Cooperation in the Far East: Towards a Distinctive Strategy?

Golunov, S.V.

Kyushu University, Japan, sergei.golunov@gmail.com

Abstract

Russia is the largest country in the world. It borders with more than a dozen of recognized and non-recognized states and faces very different security and cooperation agendas in various regions. Among all, Russia deals with neighbour countries offering distinctive cooperation strategies varied from the EU's cross-border regionalism to the Chinese model of empowering selected regions and even to the North Korean approach of solving almost any regional cooperation problem by representatives of the central government. In these circumstances it is not easy for Russia to elaborate an efficient nationwide framework approach towards cross-border cooperation.

Recent Russian conflict with Western countries led to dramatic curtailing of the Russia-EU cross-border cooperation. At the same time Russia proclaimed "turn to the East" that largely means an attempt to substitute its ties to the West by ties with the most economically developed Far Eastern countries. Among all this can imply empower Russia's Far Eastern regions to cooperate with its foreign neighbours.

Are there distinctive signs of Russia's attempts to elaborate a distinctive cross-border cooperation strategy for its Far Eastern regions? What are opportunities and limitations for developing such a strategy? What are particular features of Russian cross-border cooperation with its neighbour countries? These questions to be focused in the presentation.

Key words:

The Eurasian Pacific: The Unfulfilled Promise of an Energy Pivot?

HOU S.

UMR 5600, Université de Lyon / UMR 8586, Université Paris 1-Panthéon-Sorbonne, Lyon, France,
sophie.hou.cr@gmail.com

Abstract

Discourses about the Asian Pacific pivot have increased for several decades. Russian leaders have also highlighted the strategic role of Russian Eastern territories and of Russian partnership with Asian Pacific countries for developing the whole country and reaffirming its place on the international arena (Fortescue, 2015). In the energy area, projects have been discussed for a long time between Russia and its Asian neighbours (Jaffe, 2001). However, limited progress has been made, although it should be noted that great gas agreements have been concluded between Russia and China in 2014. This paper aims to suggest some explanations to understand the significant gap between Russian political discourses and concrete realisations in the energy field. Many factors come into play here. Russian Eastern regions are economically disadvantaged and low-populated in comparison with other Eurasian Pacific regions. In many of these regions, energy infrastructures are almost non-existent and energy resources are expensive to develop and are not yet exploited. Moreover, disagreements between companies exist. Furthermore, the relations between Russia and the other Asian Pacific countries suffer from many inherited tensions and misunderstandings. Is Eurasian Pacific region becoming an “energy pivot” or does the area remain marginalised? Why is the promise of an energy centre formed by Russia and North Eastern Asia still unfulfilled, and why is this issue still significant in Russian official discourse?

Key words:

Eastern Russia; energy; oil and gas; Eurasian Pacific

The Russian Geopolitical Views on Asia Pacific: Changing Role in World Politics

Konyshev, V.

Professor, Saint-Petersburg State University, Russia, konyshev06@mail.ru

Abstract

This paper aims at examining how different Russian geopolitical schools view Asia Pacific's place and role in the globalizing world as well as Moscow's future relations with the regional actors. Various versions of the present-day Russian geopolitics, such as 'classical' geopolitics, neo-Eurasianism, 'resource' geopolitics, 'spiritual' geopolitics, 'special path'/exceptionalist theory, 'civilizational' geopolitics, critical geopolitics are studied.

This study reflects on how the above geopolitical schools theoretically interpret socio-economic, political and strategic processes in Asia Pacific as well as the impact of these processes on the world developments. These schools seek to find out whether the shift of the 'geopolitical pivot' to Asia Pacific is conducive to the global transformation of the international relations system toward the multi-polar structure. They also try to understand how the coming of the 'Asia Pacific age' will affect the nature of power in the present-day world politics, regional and global governance and alliance systems as well as the emerging security architecture in the region. The above schools' views on Russia's bilateral relations with the major Asia Pacific countries and multilateral institutions are analyzed.

Key words:

Russian geopolitical schools; Asia Pacific region; security; global transformation

Theorizing Russia's Policies towards BRICS

Sergunin, A.

St. Petersburg State University, St. Petersburg, Russia, sergunin60@mail.ru

Abstract

Moscow's policy motives regarding BRICS are examined. The Russian policies towards and within BRICS represent a combination of ideational and material motives. On the one hand, BRICS is important for the Kremlin in terms of status seeking: with the BRICS' help Russia tries to return its status of a great power, shape the future world order and to make the West abide by the rules of that order. On the other hand, Moscow values its economic and strategic partnerships with the BRICS states which are important for Russia's well-being and for counter-balancing the West in the global geopolitical and geoeconomic game. In case of BRICS, Russia's foreign policy behavior does not fall into the classical categorization of the power transition theory which distinguished between revisionist and status quo powers. Rather, Russia (similar to other BRICS countries) is a reformist state differing from the two ideal types of international actors by its motivation and methods. It prefers to act on the basis of existing international rules and norms rather than to challenge or keep them intact. Russia aims at reforming these rules to adapt them to new global realities and make them acceptable for all the members of the world community.

Russia; BRICS; theory

TPP and Economic Containment: A Comparison of China and Vietnam

MA Teng

School of Geography, Beijing Normal University, Beijing 100875, China, mateng0119@163.com

Abstract

The Trans-Pacific Partnership Agreement (TPP) has been actively promoted by the United States since 2010. TPP is likely to establish a new international economic and trade order. In order to dominate regional economic cooperation in the Asia-Pacific region, the United States has led TPP negotiations, China was excluded. On October 5, 2015, twelve members of the TPP reached an agreement on trade. What is the impact of the agreement on China's export trade? Is there a trade diversion effect? Will the agreement have an impact on China's foreign trade and its geo-economic relationships in the Pacific Rim? This paper selects the major beneficiary country of TPP, Vietnam as a comparison to China and examines foreign-trade data for China and Vietnam from 2005 to 2014. First, we analyze the export structure of commodities between these two countries. Using the relative revealed comparative trade advantage (RTA) index, a modified index of revealed comparative advantage (RCA), we analyze the comparative advantages and the changing trends of the main export commodities. Second, the trade diversion effect of the export commodities is examined by establishing a dynamic data model. Finally, we investigate the degree of spatial agglomeration and its trend for China's foreign trade in the Pacific Rim by a spatial analysis. The results show that China and Vietnam have similarities and substitutability in textiles, apparel and footwear in terms of commodity structure. We therefore conclude that the TPP trade agreement has not yet had a significant impact on China's foreign trade between China and that Vietnam and there has been no trade diversion effect between the two countries until now; from a geographic perspective, China's geo-economy and foreign trade in the Pacific Rim present an increasing dispersion trend.

Key words:

TPP; geo-economic

Analysing the Impacts of Climate Change in the Himalayas: A Critique of the IPCC and Politics of Knowledge

Dr. Sonali Narang

Research Scholar Centre for the study of Geopolitics, Panjab University, Chandigarh India

The Geographical Society of China, Beijing, 100101, P. R. China, igc2016@igsnr.ac.cn Panjab University, Chandigarh, India and snarang68@gmail.com

Abstract

The Himalayas 'roof of the world' the major source of precious water resources for Asia, particularly South Asia is going to be at the receiving end due to the most adverse effects of climate change in numerous ways. The IPCC has observed that "Glaciers melt in the Himalayas is projected to increase flooding, and rock avalanches from destabilized slopes, and to affect water resources within the next two to three decades. This will be followed by decreased river flows as the glaciers recede" (IPCC 2007, Working Group II: 13). The problem of fresh water availability due to sharp decrease in the Himalayan river flows, and floods in coastal area are no doubt going to pose enormously complex problems before communities and governments throughout South Asia in the years and decades to follow. It is difficult to deny that with each passing day the growing 'consensus' among policy makers, academics, media and even common people appears to be that climate science is more or less 'certain' on this complex subject of climate change which would be inevitable. IPCC which is regarded as the dominant actor and most authoritative voice in climate change debate, critics have pointed out a number of shortcomings in its reports and related research process and methodology. This paper will examine at length the impacts of anthropogenic climate change in the Himalaya regions as offered and outlined by various scientific committees/reports, especially the IPCC and its five assessment reports and secondly, to critique various attempts aimed at climate change scenario building by IPCC and their fallouts, intentional or not, for the securitization of climate change in general and climate migration in particular.

Public Trust in Institutions in China: A Case Study of Water Supply in Shanghai

Zhen, N. H., Webber, M., Barnett, J.

The School of Geography, University of Melbourne, Victoria, Australia, nzhen@student.unimelb.edu.au

Abstract

The relationship between demographic factors and political trust has been well documented. However, in the Chinese context, empirical evidence about the factors that affect political trust is limited, so our understanding of potential changes in trust is poor. Using data from statistical bureaus and a mass survey in Shanghai, we find that residential status and educational attainment are the most influential factors in stratifying public trust in institutions. More educated people and urban hukou groups show lower propensities to trust. Other demographic characteristics do not matter much for shaping political trust. Because the population is becoming more educated and urban hukou people are becoming a higher proportion of the population, institutions in the future will feel challenged to maintain or gain public trust. They therefore need to be more cautious of their performance, especially in terms of transparency and fairness.

Key words:

public trust; demographic factors; hukou; education; water supply

Farmer's Resistance to Conservation at the (Trans) Frontier

Sinthumule, N.I.

University of Venda, School of Environmental Science, Department of Ecology and Resource Management, Thohoyandou, South Africa, innocent.sinthumule@univen.ac.za

Abstract

The need to increase the amount of land under nature conservation at the national and global levels has gained attention over the past three decades. However, some stakeholders are resistant to the idea of nature conservation projects. The purpose of this paper is to identify historical and contemporary reasons for farmer's resistance to conservation and to analyze the consequences arising from that resistance towards the creation of cross-border nature conservation scheme. The paper argues that resistance to conservation is magnified in transfrontier conservation areas where land parcels under different forms of tenure (state, private and communal) are brought together into a common nature conservation project. The study draws on fieldwork material from Greater Mapungubwe Transfrontier Conservation Area spanning Botswana, South Africa and Zimbabwe. The study concludes that the assumption that various pieces of land often under different forms of tenure can be neatly integrated needs rethinking.

Key words:

Resistance; Transfrontier Conservation Areas; Mapungubwe; Borders; Farmers

How Do We Shape Our Harmonious World? A Suggested Holistic approach for Our Common Safe Future

Azaz, L.K.

Geography Department, Faculty of Arts, Menofya University, Menofya, Egypt, Lotfy_Azaz@yahoo.co.uk

Abstract

Sustainable development requires meeting the basic needs of all and extending to all the opportunity to fulfil their aspirations for a better life. A world in which poverty is endemic will always be prone to ecological and other catastrophes, Our Common Future ('Brundtland report') (1987). In 2012, 12.7 % (896 million) of the world's population lived at or below \$1.90 a day. Moreover, Sustainable development cannot be achieved in the world that misses security and peace. Nowadays, there are many wars and conflicts. Wars, conflict and persecution have forced more people than at any other time since records began to flee their homes and seek refuge and safety elsewhere, according to UNHCR's annual Global Trends Report: World at War, (2015). The number of people forcibly displaced at the end of 2014 had risen to 59.5 million. It is believed that conflict on various resources is the main cause of most of these wars. Therefore, there is a need to move from "conflict" to "cooperation" and from "enemies" to "neighbours" as we ALL live in ONE earth. To achieve that, ALL must believe that world resources are for all. Each person has to have his/her equal share of it. This paper may illustrate the different aspects of inequalities in the world. A proposed holistic approach for a common management of world's resources to achieve Sustainable development may be presented, and how to distribute it equally on the world's population to eradicate poverty and achieve security and peace in the world.

Key words:

Sustainable development; poverty eradication; inequalities; resources; common safe future; security; peace; Wars; conflict; Harmonious World

Inter-State Water Conflicts: An Indian Scenario

Imtiyaz Ahmad Malik

Centre of Central Asian Studies, University of Kashmir, Srinagar, 190006, India, ahmedimtiyaz@live.in

Abstract

Although India occupies only 3.29 million km² geographical area, which forms 2.4% of the world's land area, it supports over 15% of the world's population. With a population of more than 1.21 billion people, India supports about 1/6th of world population but has got only 1/25th of world's water resources. Besides, India also caters a livestock population of more than 500 million, which is about 20% of world's total. Provided this huge gap between supply and demand of water in India, its sustainable use and management becomes an inevitable task.

India is gifted with a river system comprising more than 20 major rivers with several tributaries. Many of these rivers are rivers flowing through different states (Inter-state Rivers), and this geographical reality has become a bone of contention between different states of India. There are many inter-state rivers in India. The regulation and development of these river valleys continues to be a source of inter-state friction. India is a federal democracy, and most of its rivers cross state boundaries, as such constructing efficient and equitable mechanisms for allocating river flows has long been an important legal and constitutional issue. Since independence, numerous inter-state river water disputes have erupted in India. In this paper, I will try to highlight how regional politics and ineffective administration has led to the mismanagement of this precious natural resource.

Key words:

Inter-state; Federal democracy; Mismanagement

Natural Disaster and State Polity

Md Rezwan Siddiqui

King's College London, Bangladesh, rezsidi@gmail.com

Abstract

This research revisits history up to 1970 to explore the synergies between disaster and national politics. This paper studies pressure points created by disasters on state polity, and the way different regimes interact differently with natural disasters. This discussion is not aimed to present any collective theory of relationship between disaster and politics, rather to shed light on an unexplored area based on indicator based analysis. Natural disaster occurs in political space. It can set motion for political changes. It also creates pressure on political system by increasing demand and by empowering new or existing political group. On the contrary, natural disaster can also dampen conflict and strengthen social bond. Preexisting national condition has been found to be one of the defining factors of disaster vulnerability in politics. Disaster can create both opportunity and challenge for political parties and for interested stakeholders. Bhola cyclone of 1970 is considered as one of the triggering factors that set momentum for 1971 liberation war of Bangladesh. Later on, the very first change in government occurred in 1975 with a military coup, when Mujib government lost its popularity due to nationwide famine after two years (1973 - 74) of consequent flood and drought. Inexperience, corruption and oppressive policy to tackle situation appropriately led to this regime change. Devastating floods and cyclones of 1987 and 1988 created pressure on military government to make way for fair election. Since 1991, democratic governments are showing better performance in reducing vulnerability, disaster warning and relief programs. Disasters sometimes work as diversion from burning issues, create pause in active protest against incumbent. Oppositions use this as opportunity by engaging in relief, highlighting governments' weakness and preparing for protest.

Key words:

Bangladesh; state polity

Securefood for Mountain people: Case Study in Upper Mekong RiverWANG Wen-ling^{1,2}FENG Yan^{1,2}¹Asian International Rivers Center at Yunnan University, Kunming 650091, China²Key Laboratory of International River and Cross-Border Ecological Security, Kunming 650091, China**Abstract**

Food security status has changing dramatic over last 12 in upper Mekong river, particular in Deqin county. In order to understand the process, 36 years data of “rural annual per capita net income” and “rural annual per capita grain” based on the relevant agricultural economic statistics of Deqin county in 1978-2013 along with 53 household interviews were analyzed. The main results are: (1) Until 2002, the food security status turned in to due to the reliable grain and cash incomes, mainly impacted by the grain yield increase, planting structure adjustment, net income increase and with its multiple channels. (2) The relative official policies were important factors to affect the states and the changes of the regional food security, and many kinds of subsidies from governments became key component of farmers’ net income. (3) The innovation in 3 levels is critical for the local people turn into food secure status. On the macro level, the expanded scope of the farmer’s food security situation no longer only emphasizes the temporary food or cash remedy measures, but also the social well-being as a whole; On the meso scale, farmer’s participation is valued as an important factor during policy implementation; On the micro scale, the villagers are much more willing to take risks to try new things.

Key words:

food security; changes; Mekong

The Transformation of Anti-Growth Coalition in China's Urban Waterscape -A Case Study of Chengdu

Lei Gu¹, Gina Chen², Yali Zeng³, Hugh Batty⁴

¹Lanzhou University, Lanzhou, China, billygoo_lol@hotmail.com; ²Northwestern University, Chicago, USA; ³Chengdu Urban River Association, Chengdu, China; ⁴The London School of Economics and Political Science, London, UK

Abstract

Since the 1980s, the gradual regime reform has affected the politics and economy in China, making city as a space controlled and intertwined by different powers and capital. In this context, local growth coalition has been formed by both public and private sectors in many fields: not only in urban land resources and urban infrastructures, but also related to urban waterscape, such as river exploration, river reclamation, waterfront regeneration, urban water supply and so on. These projects are often adopted as pro-growth strategies in order to enhance economic development; yet lead to many negative effects and conflicts meanwhile. As a result, anti-growth coalition occurs and often makes a difference recently.

Based on a case study of Chengdu (a city with long tradition of water culture in China), this paper analyses the features, reasons and mechanism of anti-growth coalition in urban waterscape transformation since the 1990s. From limited influence in early river regulation project in the 1990s to considerable impact during a series of river exploration and reclamation projects in the 2000s, the role of anti-growth coalition in Chengdu's waterscape has experienced a dramatic change. After 2005, many urban environmental movements indeed affected the decision-making process, which is from elite-dominated too grassroots-initiated, with wider cooperation among NGOs, local communities, experts, media, even actors from previous growth coalition and trans-scaled powers. However, after 2010, the voice of anti-growth coalition became lower than before, because local growth coalition took a new type of liquid-green governmentality, for instance, with large-scaled lakes and wetland parks reconstructed, on one hand as a method of pro-growth, on the other hand as a strategy to smooth the conflicts with previous anti-growth coalition; yet some of these cases seemed to cause a struggle again, with new dilemma and anti-growth coalition left.

Key words:

Anti-growth Coalition; urban Waterscape

The Influence Elements Analysis of the Geostrategic Location Selection

Gong Maoyu, Liu Jianzhong, Zhang Jing, Zheng Shulei

The Information Engineering University, Zhengzhou, 450052, P.R. China, commander_6@126.com, NSFC ID: 41301125

Abstract

Geostrategy is the policy to make use of the geographical relations and their interactions to obtain and protect national interest. The location selection is the important problem of the geostrategy formulation. Geostrategic location selection is affected by three elements: the strategic environment, the strategic intention and the strategic interaction.

The strategic environment is the fundamental condition of the geostrategic location selection. It is the internal environment and the external environment including many geopolitical entities in the geographical environment. The strategic environment consists of the international environment, the national environment and the host country internal environment.

The strategic intention is the guiding of the geostrategic location selection. Under the influence of the strategic environment, the nation forms the strategic purpose based on different subjective wishes. The strategic intention includes the natural resources seeking intention based on energy safety, the pivot seeking intention based on transportation safety, the strategic assets seeking intention improving the national competitive superiority.

The nation shall make other strategic decisions besides the location selection under the influence of the strategic environment and the strategic intention. The approaches for cooperation and the mode of access will result in the strategic interaction among the geopolitical entities and is closely connected with the location selection. So, the strategic interaction is the other influence element of geostrategic location selection.

Key words:

Geostrategic Location Selection; Influence Elements; Strategic environment; Strategic intention; Strategic interaction

Beyond The Borderline: Rescaling Cross-Border Linkages in a Globalizing Asia

Boyle, Edward Kieran

Faculty of Law and Center of Asia-Pacific Future Studies, Kyushu University, Fukuoka, Japan, tedkboyle@gmail.com

Abstract

Perceptions of borders in Asia have been dramatically reconfigured over the past 20 years. While continuing to be seen by their central governments through the prism of security, national borders throughout the region have come to be simultaneously interpreted as zones of opportunity. This emphasis on the possibilities for transborder growth stems from the obvious benefits accruable to states and their personnel from economic development, most notably through China's vast OBOR initiative. Nowhere is this more apparent than in rhetoric surrounding economic growth in India's northeastern states. Long marginalized and dominated by security concerns, in recent years the region has seen a flurry of projects that place their emphasis on the region's connectivity and potential for crossborder linkages.

Nevertheless, it has proved challenging to get initiatives like BCIM, India's Look East Policy, or Yunnan's Southern Silk Road Project to exist in anything more than rhetorical form. While states' are cognisant of the advantages accruable to them through increasing economic development, their prioritization on securing an ability to control any resultant largesse results in the conceptual prioritization of their borderline. However, the state's continued fixation on its sovereign limits provides a limited tool for scholars seeking to understand these broader border dynamics. This paper argues that greater attention paid to issues of border scale shall not only enable us to gain a better grasp of what is actually occurring in such border regions, but also allow us to contribute positively towards policies better able to promote regional welfare.

Key words:

State borders; scale; cross-border linkages; OBOR; Indian northeast

Challenges in Fostering Local Governance in Post-Socialist Countries: Some Territorial Evidences from the Romanian Case

Iațu C.¹, Eva M.^{1,2}, Alupului C.¹

¹Alexandru Ioan Cuza University of Iasi, 700505, Romania, corneliu.iatu@gmail.com

²François-Rabelais University of Tours, 37200, France

Abstract

The rescaling of territories is evolving at a pace faster than ever, accelerated by globalisation and processes of regional integration and/or reconfiguration. While some of the geographical scales gain momentum (such as the global, the regional or the local ones), others seem to go into the background (such as the national one losing the forefront). European Union countries of Central and Eastern Europe are a good place for observing these changes, as they are encouraged - and sometimes forced by circumstances - to burn stages in rescaling territories and foster good governance at the appropriate levels. Taking these into consideration our study presents an overview of the challenges the concerned countries are facing in building good governance at local levels. Special attention is paid to the Romanian case, on issues such as the role of local financial autonomy, new forms of horizontal cooperation at local level and the challenges facing public-private partnership. Furthermore, the role of European financial instruments and that of the national programmes and development plans are being presented and discussed.

Key words:

Local governance; post-socialist countries; public-private partnership; financial autonomy; local cooperation; European financial instruments

Competing Institutionalizations of the Region: Re-Scaling, Structured Coherence and Condensations

Belina, Bernd

Goethe University, Frankfurt, Germany, belina@em.uni-frankfurt.de

Abstract

Many commentators lack state theory in David Harvey's work on the spatial economy of capitalism. Just as Harvey constantly reminds us, following Marx, that capital is a social relation, Nicos Poulantzas argued that the state, too, is a social relation; or, more precisely: "the *specific material condensation* of a relationship of forces among classes and class fractions" (Poulantzas 1978: 129, original emphasis). Different classes and class fractions as well as other social groups are able to inscribe their – often antagonistic – interests into the state apparatus in varying – and systematically uneven – ways. The talk applies this idea to Harvey's notion of the region as a "structured coherence" and its institutionalization. Using the example of the different institutions in charge of the regional promotion of economic development in the global city Frankfurt am Main, Germany, and its surrounding region, the Rhein-Main region, it suggests that the variety of competing institutional attempts to institutionalize the scale of the region is a result of different condensations of the relationship of forces.

Abstract

This study examines the meanings of emerging formal community governance and its networks across Japan, with particular attention to Unnan, a rural city in Shimane Prefecture. During the last few decades, devolution has become an important term in broader government restructuring in many countries. Generally, devolution means the transfer of power from the central government to a local government; however, it has increasingly started including a shift from local governments to communities. Japan has experienced this process. According to a questionnaire by the author, 38.8% of local governments ($n = 908$) have (semi-)formal institutions concerning community governance, of which 72.1% has been established since 2001. These have been introduced by local governments, with words such as ‘partnerships’ or ‘participation’, to encourage community activities, build a more direct form of democracy, or maintain social and economic functions. Focusing on the case of Unnan, devolved communities have assumed various roles such as welfare services, transport services or management of retail shops. And, most recently, a network based on the experience of communities in Unnan has been established with the leadership of the Unnan city office. This network consists of approximately 200 local governments and voluntary groups across the country, in both urban and rural areas, and has an influence on many places. Finally, this study suggests that while this devolved community can be understood as ‘governing at a distance’—a technique explained by Foucauldian theory—, the network centred on these communities may alter centre–periphery or urban–rural relationships in Japan.

Key words:

devolution; community governance; rural area; Unnan; Japan

From Ungoverned Territory to De Facto State: A Quick Guide

Author Popov F.A.

Institute of Geography of the Russian Academy of Sciences, Moscow, Russian Federation, fpopov15@gmail.com

Abstract

Spatial distribution of governmental power within any state borders is principally unequal. The territory of every sovereign state includes numerous zones of different size where it's replaced by illegal control by some non-state actors (so-called *de facto secession*). Although such zones attract traditional interest from political geographers, their study remains methodologically problematic.

This paper aims to systematize basic notions and terms used for describing different kinds of non-sovereign political-geographic entities (both territories and polities) which emerge as a result of *de facto* secession. Although being in heavy demand they actually don't form a universal system of definitions: every author uses his/her own set of terms with his/her own defined or implied meanings according to his/her own needs.

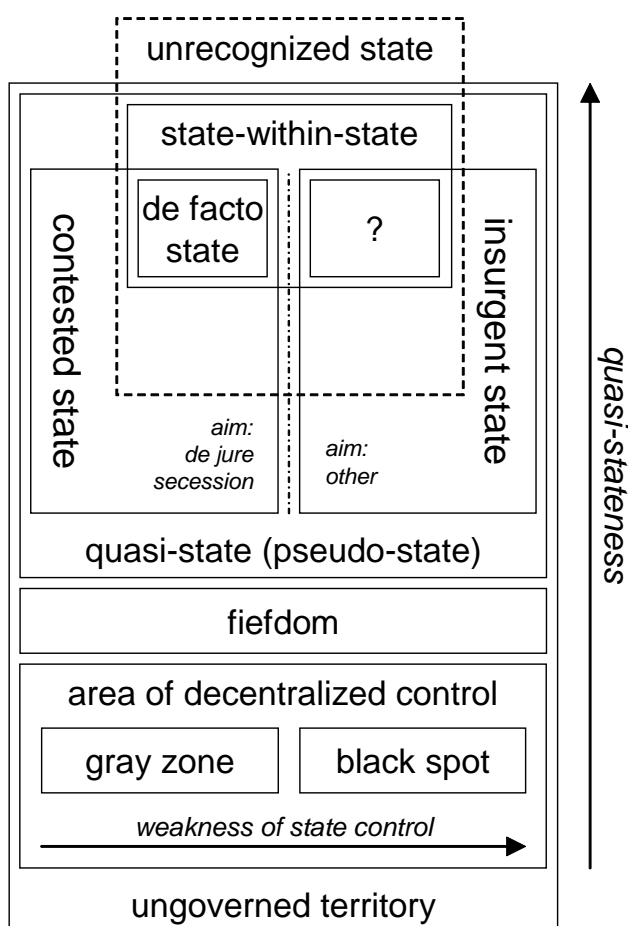

Among such terms there are "ungoverned area", "gray zone", "fiefdom", "quasi-state", "insurgent state", "de facto state" and so on. Each of them has its own semantic features, which in general determine the context of use even within an original concept. Thus it seems essential to work out some broad consensual definitions of all these terms and present them as components of a single conceptual scheme. Basic differentiation attributes include:

- level of quasi-stateness inherent to the entity;
- extent of state control over the area;
- aim the non-state actors pursue.

The working draft of the scheme is shown below:

Key words:

control over the territory; *de facto* secession; ungoverned territory; gray zone: quasi-state; insurgent state; *de facto* state; notions and terms

Geographical and Geopolitical Aspects of the Development of the Great Silk Zone and the Tea Road

Tulokhonov Arnold K.

The Baikal Institute of Nature Management SB RAS, Ulan-Ude, 670047, Russia, AKTulohonov@binm.ru

Abstract

The report is devoted to the problems of the political geography of the Northern Asian states, including Russia, China, Mongolia and Kazakhstan, within the territory of the merged historical and geographical term “the Great Steppe”. Special attention is given to the theory and practice of the systemic geographical studies of politics, economy and society development of the Asian Russia, in close connection with the social processes taking place on the territory of neighboring countries in the context of globalization. For the first time geographic periodization of the recent economic history of Russia was performed, and it focuses on the territorial state integrity, determined by the ratio to the economic priorities, structural reforms of society, private ownership and rational use of natural resources.

At the economic and geographical zoning of Russia it is proposed to allocate special strategic significant marginal territories adjacent to the borders of the states. As a result of geographic expertise of various social phenomena, the “hot” spots in the development of Russian society are identified, recommendations for improving the political image of Russia and improvement of the program of economic development of Siberia and the Far East are given.

The report is intended for geographers, economists, politicians and historians, interested in the problems of Asian Russia development and its adjacent territories – China, Mongolia and Kazakhstan, and also for the students of geographical and economic departments of universities.

Key words:

Great Silk zone; Tea Road; political geography

How *Our* City Should Be Dissolved: Osaka Metropolis Plan as a Politics of Rescaling

Yamazaki, T.

Osaka City University, Osaka, Japan, yamataka@lit.osaka-cu.ac.jp

Abstract

This paper first overviews the literature on “state rescaling” in the field of geography and conceptualize “the politics of rescaling” as a framework to understand the dynamism of “the politics of scale” in an era of globalization. This framework is then employed to explain patterns of the development of rescaling in Japan and demonstrate that state rescaling is basically understood as a neoliberal reform of local government. In order to verify this thesis, examined are the cases of political confrontation between and local election results in the Osaka Prefecture and City governments for the past several years. Through such an examination, this paper points out that discourses for the reform of “local governance” need to be critically scrutinized. Major points of discussion are how the attempt of state rescaling can create political conflict and dissolve and reconstruct the existing local autonomy.

Key words:

geographical scale; rescaling; governance; Osaka Metropolis Plan

Identities, Sovereignty and Legitimacy: Examining Support for Break-Away Republics in the Post-Soviet Space

Vladimir Kolosov¹, John O'Loughlin², Gerard Toal³

¹Institute of Geography, Russian Academy of Sciences, Russian Fed, vladimirkolossov@gmail.com

²University of Colorado at Boulder, United States

³Virginia Polytechnic, United States

Abstract

The authors examine the identities and the geopolitical imaginations in three non-recognized (or partly recognized) republics in the post-Soviet space – Transnistria, Abkhazia and South Ossetia. They pay particular attention to the changes in the citizens' attitude to the legitimacy of ruling regimes, the "parent" states and the role of external stakeholders (Russia, the EU and USA) occurred after the beginning of the geopolitical crisis provoked by the events in Ukraine. They consider the people's views on national sovereignty and possible conflict resolution. The paper is based on an analysis of the original representative surveys conducted by the authors in 2009-2010 and in December 2014, and on the results of field studies. It is shown that the crisis has not only seriously aggravated economic and international perspectives of non-recognized republics but also contributed to toughening of public opinion regarding their relations with respectively Moldova and Georgia. The crisis can weaken the solidarity of purpose between major ethnic groups in non-recognized republics – the basis of their vitality.

Key words:

Non-recognized republics; sovereignty; legitimacy; identities; post-Soviet space

Live House for Political Subjectivization: The Guerrilla Model in Chinese Cities

Wang, June; Chen, L

Department of Public Policy, City University of Hong Kong, Hong Kong, China, june.wang@cityu.edu.hk

Abstract

With its oppositional ideological standing premised on an identity of dissenters, Chinese rock is excluded from mainstream music production while deliberately distinguishing itself from such productions. It is therefore no wonder that Chinese rock has always been underground, symbolically and literally, as a result of a lack of spatial base in the city. The introduction of Live-house to China in the 2000s seems to offer a space for political subjectivization of the excluded or marginalized group. In China, these “cramped, smoky, nondescript concrete boxes” of live houses take up multiple whilst sometimes contradictory functions. Live houses serve as material base for the underground musicians to challenge prevailing social and political norms, escape state-run censorship, foster conjunctions between producer and audience, and perhaps assert alternative order within the established regime of aesthetics.

Widely scattered across the entire country, this guerrilla model of politicization is always in close interactions with state-run urban policing programs through flagship projects, assisted by the allies of state-owned developers and cultural elites. The two antagonistic actions in Chinese cities - one of politicization in a guerrilla pattern and one of de-politicization in a monumental manner - offers a valuable site to reflect on recent scholarly arguments on post-political and post-democratic forms of urban governance in China. Following a contingent reading of aesthetics of art regime, we call for attention to the territorial strategies deployed by both sides in the continuous interplay of politicization and policing.

Key words:

Ranciere; politics of aesthetics; creative cities; underground music; China

On Globalization, Borders and Nation-States: some historical musings

Widdis, RW

Department of Geography, University of Regina, Regina, SK, Canada S4S 0A2, randy.widdis@uregina.ca

Abstract

Globalization in varied forms has existed for centuries, albeit in a less intense and pervasive state than that which exists at present. The implementation of laissez-faire trade policies following the repeal of the Corn Laws (1846) resulted in a rapid internationalization of the world economy even in the midst of certain protectionist policies implemented by the United States. Despite two world wars, a global depression and the rise of Keynesian liberalism, international trade and investment continued during the 20th century. The move towards laissez-faire liberalism that took place during the latter part of the century occurred within an international environment transformed by quantum-shifting transportation and communication technologies and increasing global competition. Current globalization, facilitated by space- and time-adjusting technologies and neoliberal ideology, is viewed by many as threatening the particularity of places, borders, and territoriality. But while deterritorializing influences are felt everywhere, so are reterritorializing forces which attempt to cope with the impacts of globalization and its associated spatialities and temporalities. The devolution of some powers to and the support of transnational regions, along with the greater support for cross-border cooperation, is evidence that governments at all levels and business groups recognize that the bordered territorial state is struggling to meet the requirements of a world of flows and networks. While a “spatial fix” recognizing other types of territorial organizations besides nation-states is needed, the nation-state is not dying. The state will continue to direct development, manage networks, and interpret and provide essential context for the new political, economic and cultural realities of globalization.

Political Spaces as Influence Analysis: Reconstructing Power Relations in

Development Priorities in Chile

Román, Á.

Centre for Sustainable Urban Development, Santiago de Chile, and Alberto Hurtado University,
Santiago de Chile, ajroman@uc.cl.

Abstract

Chile has experienced a fast and intense economic growth since the adoption of a neoliberal economic setting after the military coup in 1973. Two of its main productive activities are salmon farming and forestry, both based on raising exotic species in places that traditionally were sterile and unproductive. These sectors have benefited from the deregulation processes from the dictatorship, which didn't allow any criticism. They were continued by democratic governments from 1990 until now. Thus, the configuration of the discourses related to development as based on economic growth is strongly dominated by the acceptance of this neoliberal model. This paper poses an approach whose main component is the understanding of political spaces as relations and structures that shape proximity groups, which contain a variety of actors –limited to one or several scales, with more or less skills and resources, coming from traditional structures such as the State or from transnational corporations, to emergent blocks as local communities– linked by specific interests. The analysis involves characterising the paradigms behind decision-making processes and its translation into discourses regarding development in the provinces where salmon farming and forestry activities are located. This allows us to identify practices, relations and structures that are confronted in order to legitimate some discourses and to delegitimise others. With this in mind, we identify the five development priorities related with Chilean forestry and salmon farming that have gained the consent of the actors involved in these political spaces, and also the discourses that collide or confront them.

Key words:

Chile; decision-making process; discourse; forestry; influence; political spaces; power relations; salmon farming

Positioning of Ukraine in the Geospatial Dimensions of Dynamic World System

Yatsenko

Kyiv National Taras Shevchenko University, Kyiv, Ukraine, e-mail: boris.yatsenko@gmail.com

Abstract

August of 2016 marked the 25th anniversary of Ukraine's independence. On its path to statehood, the country had to overcome interior conflicts while withstanding exterior pressure from foreign powers. The young state remains subjected to geopolitical games, which makes positioning of Ukraine in the geospatial dimension of Dynamic World System a matter of priority.

National Dimension. Ukrainian nation has ancient history and deep culture, while possessing strong science and technology skillset. The defining years of revolutions (Orange Revolution of 2004 and Revolution of Dignity of 2013-2014) affirmed Ukraine as a geospatially unified nation. Now it has to find its "place under the sun".

Macroregional Dimension. Ukraine is located in Central Europe, a territory subjected to clashes of immense geopolitical powers throughout its history. At the turn of last century, this territory experienced pivotal events: defeat in the "Cold War" and collapse of the Soviet Union. During this time, people of independent Ukraine chose the path to democracy and European integration, despite immense pressure from Russia. Russia's efforts to force Ukrainians to "love the Russian Way" backfired and made the Ukraine's path towards European integration irreversible. Ukraine's economy, however, remains a broken piece of the former Soviet "empire" and needs to be rebuilt.

Global Dimension. Recent worldwide trends towards globalization and information society create favorable conditions for Ukraine's development. However, in order to benefit from the opportunities presented by the Dynamic World, Ukraine must be open to the new realities of such World.

Key words:

Positioning of Ukraine; Geospatial Dimensions; Revolution of Dignity

Territoriality and Borders: Contemporary Changes and Possible Perspectives

Vladimir KOLOSOV

Institute of Geography, Russian Academy of Sciences, Russian Fed, vladimirkolossov@gmail.com

Abstract

The multiplication of polities, the proliferation of new identities and the salient attempts to redraw border lines on the ground or at sea make contemporary processes of bordering more intense and diverse. They are closely related with globalization deepening social inequality and the gaps along existing state and regional borders, and setting international norms, rules and standards undermining traditional notions of sovereignty and national interests. It intensifies migrations and leads to the creation of transition zones and borderland spaces in the territorial heart of “other” polities, contributes to the fragmentation of political space and increases the importance of internal, local and especially reticular and quasi-political borders. The creation of the Islamic state and the increasing number of failed states is a result of global inequality and a sign of systemic malfunctions of the state system. The post-modern reality is characterized by the interpenetration of legitimate and non-legitimate political units. The boundaries between them are often transparent and the circulation of people, goods and capital is fluid. It blurs the very notion of the state boundary which becomes vague and loose. Some regions look as the archipelagos of “sovereign” domains divided by the boundaries delineating “sovereignty” in different fields. Paradoxically, the ongoing geopolitical changes increase the role of the state which integrates the territory and multiple identities and is the only institute which legitimates political power.

Key words:

territoriality; borders; sovereignty; state; migrations; globalization; political fragmentation; perspectives

Territory, Sovereignty, and Political Geometry in the Pacific Ocean

Sammler, K G.

California State University Maritime Academy, Vallejo, California, USA, ksammler@gmail.com

Abstract

This paper will examine how the physical factors of the ocean are entangled with legal discourses mutually constituting state performances of expanding offshore territoriality. While emerging spatial theories have been pushing political geography away from limiting territorial thinking to two-dimensional, planar areas, it is becoming increasingly important that we extend theoretical and empirical inquiry, to include the third, vertical spatial dimension, to explicitly identify volume as an important aspect of political, social, and cultural spheres. Thinking through the depths of ocean territories and their impacts on legal designations and practices untaken at various vertical layers reveals the continual (re)negotiations that are occurring between broad international treaty language and the implementation of jurisdictions and actions in the ocean, on the seabed, and in the airspace above offshore jurisdictions.

Political spatial arrangements that configure state spaces which are not maintained by conventional borders delimiting internally sovereign areas, new geopolitical and geometric imaginaries are created to justify new interpretations and performances of territory and sovereignty. Applying Weizman's rationale that, "departure from a planar division of a territory to the creation of three-dimensional boundaries across sovereign bulks redefines the relationship between sovereignty and space" (2002), this research inquires: How do emerging laws and regulations, investments and pursuits in ocean space serve to destabilize previous land-biased definitions, understandings, and practices of sovereignty and territory? What might submerged oceanic spaces offer to theoretical understandings of vertical sovereignty and territory?

Key words:

Boundaries; geopolitics; Pacific Ocean; political geography; seabed; sovereignty; United Nations Law of the Sea; territory; volume

The Construction of National Identity through the Production of Ritual and Spectacle: An Analysis of “9.3 Commemoration” in China

LI Yanhui

Hengyang Normal University, China, liyanhui2011@qq.com

Abstract

In this paper, we adopt the view that ‘nation’ and ‘national identity’ are social constructions, created to serve ideological ends. We discuss this in the specific empirical context of China’s “9.3 Commemoration”. By drawing on officially produced TV programmes and magazines, newspaper reports, and interviews with participants and spectators, we analyse the memorial ceremony on 3, Sep.2015, showing how, as a special ritual and landscape spectacle, the ceremony succeeded to a large extent in creating a sense of national identity. Discussion focuses on four aspects of the ceremony: the site of the ceremony, the sonic landscape of the ceremony, the veterans of the ceremony and the participants of the ceremony. We find that, the Tian'anmen Square, the spectacle and sonic landscape of the parade and the group of the veterans are the central elements in arousing people's affection of national identity.

Key words:

national identity; ceremony

The Making of Olympic City and the Signs of Crisis in the Globalitarian Model

gilmar mascarenhas

Rio de Janeiro State University, Brazil, gil.mascarenhas@globo.com

Abstract

Over the past three or four decades, olympic urbanism have become large-scale expensive projects, with highly visible impacts on social and environmental issues in each host city. However, the last five years have show an increasing global consciousness against high public cost of these events, the violence in large-scale evictions of poor people under gentrification interests and the building of the so-called white elephants. The olympic system has perceived the crisis and decided change its "globalitarian" rules, through Agenda 2020. We aim to examine this new scenery of global transition and verify how Rio de Janeiro 2016 may be the last edition of the worldwide contested urbanism olympic.

Key words:

Olympic city; legacy; globalitarianism; Rio de Janeiro; global transition

The Migrants' Common Space as a Transnational Threshold: The Cases of Greek Borderscapes in Mytilene and Idomene

Petropoulou Ch., Tsavdaroglou Ch., Alexiou X.

Department of Geography, University of the Aegean, Greece, christy.p@geo.aegean.gr

Abstract

The ongoing refugee streams that derive from the recent conflict in the Middle East are a central issue to the growing socio-political debate about the different facets of contemporary crises. The human flows that cross boundaries and territories heading to the European North, destabilize both territorial certainties and established governance politics. The moving populations challenge the role of the nation-state and its borderlines and bring into question the notion of free movement and citizenship. While borders, in the era of globalization, constitute porous passages for capital goods and labor market, at the same time they function as new enclosures and racialised spaces of exclusion for migrant and refugee populations. Nevertheless, these human flows contest border regimes and exclusionary policies and create a nexus of emerging common spaces of resistance and co-existence.

Following the recent spatial approaches on commons (Blomley, 2008; Harvey, 2012; Stavrides, 2013) this paper focuses on the production of the migrants' common space as a contested transnational threshold. Specifically we examine the case of Greece, a country that is situated in between Global North and Global South, West and East; hence it is in the epicentre of the current refugee crisis. In particular, we pinpoint in Greek borderscapes in Mytilene and Idomene i.e. the main entrance and exit points. Based on this context, we explore how the newcomers as a new political and social agent in collaboration with NGO and local solidarity movements challenge the existing socio-spatial power relations and produce unique, unpredictable and misfitting common spaces.

Key words:

Common space; borderscape; transnational migration; Greece

Water Sharing in Eastern-Nile River Basin: A Geopolitical Perspective of Conflict to Cooperation

Meena, Muraree Lal

Assistant Professor, Department of Geography, Institute of Science, Banaras Hindu University, Varanasi, UP, INDIA-221005, muraree.meena@gmail.com

Abstract

Water is an indispensable natural resource that the countries of the Nile river basin possess. Its efficient and optimal use would not only help countries of the Nile river basin to build a strong economy but also substantially contribute to the growing water requirements of the countries, as water is becoming an increasingly scarce resource in the contemporary period. Distribution of river water is a complicated issue especially when a river passes through a number of countries. This study has investigated the resolving (win-win situation) of water-sharing conflict among the four riparian countries of the Eastern-Nile basin: Ethiopia, South Sudan, Sudan and Egypt.

The study is based on the analytical method, evaluation of the observable trends in river water sharing principles and methods as applicable in the case of the Nile river basin in general and Eastern-Nile in particular. Governmental policy stands of riparian countries on water sharing of Nile river basin will be compared with the countries of upstream and downstream Nile river basin through case study method. For this study, primary and secondary data is collected and processed to give them meaning and extract quality information through the statistical diagrams and cartographic techniques.

This study has been an attempt to probe the problems and prospects of cooperation between these countries over the complex issue of Nile water sharing. Thereby, paper has attempted to analyze the role of geographical determinants that influence the negotiations between the four riparian countries that have impeded implementation of *equitable* water sharing scheme, and the policy issues of the upstream and downstream riparian countries, in this case study, mainly Ethiopia, South Sudan, Sudan and Egypt dictated by their domestic compulsions. This research paper unpacks the comparative advantages of the four riparian countries: it emphasises that Sudan and South Sudan should engage in developments of irrigation, agricultural engagements and biodiversity conservation; Ethiopia in small and medium scale hydro-power generation and water conservation; while Egypt in industry and capacity building know how.

Key words:

Eastern-Nile Basin; Water sharing; Conflict; Geopolitics; Need and opportunities

Behaviour and Electoral Patterns of 2011 Assembly election in West Bengal (India): A Case Study in Electoral Geography

Md Motibur Rahman

Research Scholar Department of Geography, Aligarh Muslim University, Aligarh (India), m.rahman.amu@gmail.com

Abstract

The present paper explains the voting behavior and electoral patterns of 2011 assembly election in West Bengal (India). Electoral geography is a new and emerging branch of political geography which analysis the methods, behavior, and result of elections in the context of geographical space. The field of electoral geography studies with the identification and explanation of spatial patterns in relation to voting all elections. Voting behavior is a form of political psychology which played a great role in political decision-making process. The main purpose of the present study to identify and analyze the socio-economic factors responsible for voting behavior. In the battle of 2011 Assembly election in West Bengal the two major parties were Left Front and Trinomool Congress. This election witnessed the remarkable successes of Trinomool Congress and decline of 34 years' longest ruler party that is Left Front. Trinomool Congress won a majority of seats that 227 out of 294 but Left Front won only 62 seats out of 294 seats. It also showed highest voter turnout nearly 85%. The present study is based on secondary source of data and data taken from Election Commission of India, New Delhi and Centre for the Study of Developing Societies (CSDS). The most important significance of the study is that it gives an electoral map which clearly identifies those political units where people favour a specific candidates or party.

Key words:

Political Geography; Electoral Geography; Assembly Election; Voting Behaviour; Electoral pattern; voter turnout

Consumption of Globalization in Tehran (Case Study: District 1 And 2, Municipality of Tehran)

Ghurchi, Safaei Mehr

Shahid Beheshti University, Tehran, Iran, Mahboobe_safaei@live.com

Abstract

Larg commercial complexes, Cities brands significant connects with Global production processes and Creates links towns with each other on a global scale. Therefore, formed a new political geography of the local-Global processes in the global production and consumption. Today, Cities are defined by the possibilities they provide for consumers. Mass consumer, On the one hand changed the urban fabric of the mushrooming of shopping complexes, On the other hand, The city has its own consumer design encourages residents to use extreme. In Iran, urbanization has always been subject to changes that occur under the influence of economic and political conditions. One of the key issues in the political geography of Iran, The mechanism of urban development in the context of Global processes in general and particularly of the urban economy and its vectors. During human life, has changed with the emergence of the living environment and thinking always special. In the other word, the human environment is somehow indicative of the prevailing thoughts of the community. There are shopping centers, stores and Modern and large malls, Cities around The economic life story and A symbol of cultural relations and Social relations in the city; so we cannot have a look one-dimensional and simple to the shop, vendor, customer and companies in the city. We believe Tehran has new experience of consumption of Globalization these days.

Key words:

consumption; Globalization; consumption of Globalization; shopping complexes; Tehran

Research on Type and Feature of Geoborderunity

Zhang Jing, Liu Jianzhong, Han Zhijun, Zheng Shulei

The Information Engineering University, Zhengzhou, 450052, P.R. China, gybzj@163.com

Abstract

At the end of 20th century and the beginning of 21st century, with the rapid development of information technology and the deep promotion of globalization and economic integration, the research content of the world pattern became much richer. Consequently, geo-economics, geo-culture, geo-resources, geo-technologic etc. related areas appeared accordingly. Research in these areas needs the geoborder theory as a guide. Thus we can define geoborderunity as the basic object of geoborder theory, and also, carry out researches on its types, characteristics, relationships, change rules and others. The geoborderunity types can be analysed from two points of view: spatial scale and attributive character. From spatial scale point of view, continent and ocean are the geoborderunity of global scale; country and regional organization are the geoborderunity of regional scale; administrative, economic and cultural district of a country are the geoborderunity of lower scale. From the perspective of attributive character, it can be divided into political geoborderunity, economical geoborderunity, cultural geoborderunity, and so on. Different geoborderunity has its own characteristics and rules. Spatial feature reflects the feature of the spatial distribution of geoborderunity by analysing its geographical position, appearance, range and other aspects; different geoborderunity has different description indicators on its property, which makes attributive feature as the intension and essence of it; time feature means that the spatial and attributive features could be changed over time.

The definition, types, characteristics and other aspects of the geoborderunity are the basic work of the research and the construction of the geoborder theory.

Key words:

geoborderunity; geoborder theory; geoborderunity type; geoborderunity feature

A Preliminary GIS Analysis on the Settlement Geography under the Garrison and Military Cultivation System in Ming and Qing South China Mountain Area

Xie Shi

Centre for Historical Geography, Sun Yat-sen University, Guangzhou, 510275, P. R. China, hssxs@139.com

Abstract

Over the past 1000 years, the relations between the ethnic groups in Nanling (South China mountains) mountainous areas and each dynasty in imperial China has been in a state of constant change. The Nanling Mountain also serves as an important passage in the communication between inland China and the coastal areas as well as the surrounding areas of the South China Sea. Along with the expanding transportation and market, each dynasty in history has adopted different governance patterns over the Nanling Mountain, such as punitive expedition, pacification and other means. The empires of Ming and Qing Dynasties exercised territory management system over Nanling Mountain, which has exerted substantial bearings on the reform of military garrison system, accommodation form of the Yao nationalities in Nanling Mountain and the social structure. By taking the southern mountainous areas in Lanshan County, Hunan Province as an example, this paper mainly focuses on the guard and garrison system set in Ming Dynasty (1368-1644) and the military cultivation system, their transformations and effect on the change of the settlement pattern and offers a preliminary analysis of the people-land relationship in Nanling mountainous region from the 14th to 19th century.

Key words:

Cultural Practices against Militarization: The Resilience of Okinawan Culture

Yamazaki, T.

Osaka City University, Osaka, Japan, yamataka@lit.osaka-cu.ac.jp

Abstract

War and occupation destroy and transform the lives and cultures of the occupied. However, the substratum of the destroyed and transformed culture leaves its trail in the memories and landscapes of the occupied. Culture is not unchangeable in time and space but can have the power of resistance and recovery or “resilience.” It is not the power of culture itself but the power of human agency that attempts to engrave lost cultures into and extract them from the memories and landscapes of the occupied. This paper focuses on “Okinawan culture.” Okinawa is a group of islands in Japan which became the stage of a fierce ground battle near the end of WWII and remained under the US military administration until 1972. 20% of the main island is still occupied by vast military bases and installations. Confiscated villages, sacred places, and cultural landscapes have been destroyed, buried, or left unpreserved within military bases. The ground battle and subsequent oppressive military administration have left deep scars in the memories and landscapes of the islanders. Based on this geo-historical context, this paper illuminates the significance of “regional history” studies that emerged after the 1972 reversion as activities of municipal historians and archivists and the value of cultural landscapes that are to be restored in the site of a military base planned to be closed.

Key words:

cultural practice; militarization; Okinawa

Evaluating the Occupation of Xinjiang by the People's Republic of China in the Early 1950s

Guo, Q

San Francisco State University, San Francisco, CA 94132 qguo@sfsu.edu

Abstract

This paper examines the effects of occupation of Xinjiang by the People's Republic of China (PRC) before Xinjiang Uighur Autonomous Region was established (fall 1949-fall 1955). In the absence of a civilian provincial government, the People's Liberation Army (PLA) exerted military governance in Xinjiang, suppressing ethnic resistance, initiating development projects and setting up Han Chinese settlements. Most importantly, the PLA created an institutional legacy, Xinjiang Production and Construction Corps (XPCC, 1954), a quasi-military state enterprise that inherited much of the military economy-settlement complex. The legacy of XPCC is indeed multifaceted. While having helped solidifying the PRC's control over Xinjiang, XPCC may have also prolonged the perception of occupation among the local Muslim groups with its low-grade militarization and may have hindered the transition from "effective sovereignty" to "absolute sovereignty." The analyses of the PRC's "occupation" of Xinjiang may, on the one hand, benefit from theoretical conceptualizations in political geography, and, on the other hand, inform academic discourses and borderland policies, as Xinjiang remains a restive frontier for China.

Key words:

occupation; militarization; Xinjiang; Xinjiang Production and Construction Corps

Gaza Strip and the West Bank – provisional Military Occupied Areas Which May Become an Independent State

Biger G.

Professor emeritus, Department of Geography and Human Environment, Tel Aviv University, Israel.

bigergideon@gmail.com

Abstract

Gaza strip and the West Bank are two parts of the area know today as Palestinian Authority, which, in the future, will become the indepent state of Palestine (Filistin). The areas of those two parts are about 20% of the area of the former British Mandate of Palestine 1920-1948.

In November 1947, the United Nation decided to present a partition plan for British Palestine, in which about 55% would became the Jewish State, about 44% would become the Arab State, and about 1% , which included mainly the cities of Jerusalem and Bethlehem, would to be under the UN.

This decision brought about the first Arab –Israeli war of 1948-9, in which Israel occupied and ruled about 80% of British Palestine, while the Jordanian Army (with the help of the Iraqi army), occupied some areas west of the Jordan River in Palestine, know later as The West Bank, The Egyptean army occupied area in south-western Palestine, later know as Gaza Strip. Those two areas, being occupied provisionally, are now became the area designated to become the Palestinian State, without any connection to any historical or geographical meaning.

Key words:

Gaza Strip; West Bank; 1948 Arabs - Israeli war; Palestinian authority

“Lines of Contact” Between Parent States and Secessionist Entities: Linking Past, Present and Future in the War Zones

Berg, E.

University of Tartu, Tartu 50090, Estonia, eiki.berg@ut.ee

Abstract

De facto states result from strong secessionist bids and the unwillingness of the international community to condone secession. Whereas international law is strongly on the side of parent states' claims to restore status quo ante situation, secessionist entities nevertheless carry on their nation-building and state-formation practices. Most of them exist only for the sake of great power rivalry, thus being entirely dependent on security guarantees and economic benefits provided by patron states. They live in the constant threat of being exterminated and forcefully reintegrated to the parent state. Yet these political entities with unclear legal status may desire to be integrated into the global system of communications and flows and have open border regimes with the rest of the world.

This article examines the extent to which de facto states have surrounded themselves with impermeable separation lines, have built fences and limited even the minimal contact with their previous masters in the embryonic stage of their emergent statehood. It questions whether several attempts to regulate these conflicts have intensified cross-border movements between parent states and their secessionist entities or vice versa, brought along self-perpetuating isolation. What factors do explain booming cross-strait relations between Mainland China and Taiwan, transparent Security Zone in Moldova, relative openness of Green Line regulations in Cyprus, highly restrictive Administrative Boundary Lines in Georgia or intact Line of Contact in Azerbaijan?

Key words:

war zones; secessionist conflicts; de facto states; borders; conflict management

Occupation Using a Sophisticated Matrix of Control; Israeli Occupation of Palestinian Territory

Rassem Khamaisi

Department of Geography and Environmental Studies, University of Haifa, Israel, Khamaisir@gmail.com.

Abstract

Since 1967, Israel has occupied Palestinian territory. This is one of the longest occupations of the last century. During this occupation, Israel developed and used a sophisticated matrix of control which has hard and soft components. Parallel to managing the daily life of the indigenous urban and rural Palestinians, the Israeli occupation has created an Israeli system of urban and rural settlements. Despite the rhetoric of looking to end the occupation, including signing an Interim peace agreement between the Israeli government and Palestinian National Authority in 1994, the conflict is still hot. These interim agreements create at least three statuses of Palestinian people living in occupied territory, which is divided into four subareas, governed and managed by at least three systems of national and municipal governors. This division of the territory and the Palestinian people into different statutes enables implementation of the matrix of control by the occupiers. This paper will display and discuss the roots of the deep geopolitical conflict, and present the hard and soft components of the sophisticated matrix of control used by the Israelis to secure domination, a creeping system of apartheid and territorial fragmentation and annexation to Israel. The paper will concentrate on the dual land and restrictive spatial planning domination of the matrix of control.

Key words:

Matrix of Control; occupation, Israeli; Palestinians; spatial planning

Unbounded Territoriality: Territorial Control in the Occupied West Bank

Sara Hughes

UCLA Geography Department, Los Angeles, USA, saranhughes@ucla.edu

Abstract

The “temporary” Israeli occupation of the West Bank, Gaza Strip, and East Jerusalem began in 1967. In the nearly five decades since, the settler population in the occupied territories has reached an estimated half million Israeli Jews. Excepting East Jerusalem, Israel has made no move to formally annex the territories. Neither are they withdrawing, which is made clear by continuous settlement growth. By what territorial logic does the occupation function, such that it can continue indefinitely but call itself a “temporary” military occupation? In *Human Territoriality: Its Theory and History*, Robert David Sack defines territoriality as “the attempt by an individual or group to affect, influence, or control people, phenomena, and relationships, by delimiting and asserting control over a geographic area” (Sack, 1986, p. 19). One of the three requirements of territoriality is delimiting the area under control. In stark contrast to this, I suggest the territorial logic of the Israeli occupation of the West Bank and Gaza Strip represents what I term *unbounded territoriality*, a form of territorial control best exercised by *not* delimiting boundaries. This form of territoriality complicates the connection between sovereignty and territory in the nation-state system. This is not because Israel is incapable of exercising territorial control as traditionally conceived, but is rather proof of Israel’s overwhelming power to control territory in a fuzzy, piecemeal fashion. This project expands on efforts by scholars such as Israeli philosopher Adi Ophir to rethink familiar facts and the existing discourse about the Israel-Palestine conflict (Azoulay & Ophir, 2012).

Key words:

territoriality; sovereignty; occupation; Israel; occupied Palestinian Territories

Evolving Regional Order in East Asia

Won Bae Kim

former Senior Fellow, Korea Research Institute for Human Settlements, Republic of Korea, winter9641@gmail.com

Abstract

This paper discusses the evolution of regional order in East Asia. Following Mark Seldon, three periods of East Asia's regional order are briefly examined. They are Pax Sinica before the late 19th century, Pax Nipponica/Pax Americana in the 20th century, and the 'bifurcated' regional order since the 1990s. The paper focuses on the recent period of bifurcated regional order where the rise of China began to make substantial impacts on its neighbors via its strengthened economic centrality in East Asia, while many of East Asian countries depend on their security on the United States. Given the geopolitical and geoeconomic fluidities such as North Korea's provocations, China's assertive policies in the South China Sea, and the Sino-Russian strategic cooperation, the paper speculates alternative scenarios of regional order in East Asia such as Pax Sinica, Sino-American co-management, and Pax Americana. Finally, the implications of these alternative scenarios for regional development in Northeast Asia will be discussed.

Key words:

regional order; East Asia; pax Sinica; pax Americana; Sino-American co-management; regional development

Revival of Silk Route and Its Geopolitics

Sharma Geetanjali, Dr Ajay Kumar Sharma, Raihan Ahmed

Department of Geography, Samrat Prithviraj Chauhan Government College {affiliated Maharshi Dayanand Saraswati University}, Ajmer, Rajasthan, geetashrina@gmail.com

Abstract

There are always provincial variations which deserve more detailed treatment. Before the arrival of modern era, geography and cultural homogeneity were determining factors of human habitat and migration. Boundaries as if we see them, did not exist earlier. The reinforcement of the silk route will improve economic cooperation and connectivity between Asian countries, but obviously it is designed to improve China's geopolitical and geostrategic position in the world. The paper begins with an explanation of the historical background of the Silk Road, its origin and development, trailed by an analysis of latest declarations by the Chinese leaders to revive it. It also discusses the impacts of its revival on India's economy and cultural exchange between silk route associated regions. Lastly, the paper sums up the findings and suggestions for keeping balance between the security and economic relationship between the two countries. It concludes that the Silk Road is an effort in commencing a 'grand strategy' for global trade and cooperation. The Silk Road revival could be very helpful in reinforcing cooperation and raising it to a new level of economic establishments. However, China has yet to promote the much-needed political and strategic trust.

Key words:

Silk Route; geopolitics; economic relation and security concerns

The Analysis of the Central Asian Geo-Cultural Setting Under the “One Belt and One Road Initiative”

Ma H

The Information Engineering University, Zhengzhou, 450001, P. R. China, williamma119@163.com

Abstract

September 7th 2013, the chairman of the P.R.C XI Jinping proposed the “One Belt and One Road Initiative” in Kazakhstan. There exists an analogy about the initiative that is “passing through the heartland and embracing the world island”. In this sense, the Central Asia plays a core region role. Not only is it the central zone in the concept of the Eurasian geography, but it is also the hub of land transportation and the intersection of the diversiform cultures. The geo-cultural setting consists of the geo-cultural entities, the geo-relations between the geo-cultural entities and the geo-structure between the geo-cultural entities. Consequently, it is reasonable to dissect the temporal and spatial evolution of the Central Asian culture and the space distribution of the Central Asian cultural conflicts from the standpoint of geo-cultural setting, hence interpreting the impacts of its geo-cultural setting towards the “One Belt and One Road Initiative”.

Key words:

Central Asia; One Belt and One Road Initiative; geo-cultural setting; cultural evolution; cultural conflict

The Planning and Reconstruction of Roads in Shantou Port in Late Qing Dynasty and the Republic of China

Ouyang Linhao, Xie Shi, Yu Wei, Wu Tao

Sun Yat-sen University, Guangzhou, 510275, P. R. China, 9687493@qq.com

Abstract

At the beginning of the nineteenth century, even though Shantou was not officially opened to the outside world, it has played a more and more important role in commercial activities. Since 1860, when Treaty of Tientsin was signed, this city has been officially opened to foreign ports in modern China. And with the rapid development of the steamship industry, Shantou entered into a new phase of development and it served as the only port which can berth ships in Hanjiang river basin. As a new important chapter in the modern development of urban areas, the evolution of Shantou's pattern, the construction of its roads and the political power, social organizations and economic profits behind it have presented the world a charming and unique dynamic scene. Thanks to historical files, newspaper, journals and books, the thesis has discussed the establishment of municipal systems and laws and regulations with the background of the evolution of the city's pattern and its history. And the analysis of the construction of roads can also be seen in the thesis, which aims to reveal the interaction of the government and merchants and how merchants pursued their profits through the municipal systems in the urban renewal.

Key words:

Shantou; Modern times; The reconstruction of city; The planning of road

US Pivot to Asia: Geopolitical Re-production of Indo-Pacific

Meena, KRISHNENDRA

Centre for International Politics, Organization and Disarmament, School of International Studies, Jawaharlal Nehru University, New Delhi, India, meena.krishnendra@gmail.com

Abstract

Geographical names are embedded, reinforced and established by their continuous use and proliferation by geopolitical actors again located within the three registers of critical geopolitics (practical, formal or popular). Often, these geopolitical categories may not have valid geographical basis, but such terms take root through production of geographical knowledge which promotes the interest of certain dominant producers who hold the resources to create these knowledges. The re-imagination of the space extending from the eastern coast of Africa in the Indian Ocean to the western littorals of the Pacific as 'Indo-Pacific' displays such biases associated with the re-production of international space. The paper will examine the term from its origin in bio-geography in the nineteenth century to its contemporary usage by the main geopolitical actors in the 'Indo-Pacific'. The major promoter states using the term in their political and academic discourse are Japan, Australia and India. China's emergence as an economic power as well its maritime disputes in the South and East China Seas play a critical role in such formulation of the Indo-Pacific space by the two states which could indicate an encirclement strategy by Japan, Australia and India. On the other hand, the paper will also try to engage with the validity of the term through the climatic classification proposed by Wladimir Koeppen in 1936.

Key words:

Geopolitics; Re-imagination; Indo-Pacific

War memorial in space politics

——East Asian geopolitical relations reflected in China's 9.3 parade

Qiqi LIU, Xiang KONG

East China Normal University, Shanghai, 200241, P. R. China, 1792583662@qq.com

Abstract

Research in new cultural geography focuses on the space politics interpreted in the context of cultural landscape, and the influence of memorial activities on collective memory and cultural identity specifically. This article studies the feasibility to interpret space politics and geopolitical relations reflected in memorial activities. Based on the analyses of the significance of war memorial activities and the mechanism of emotion, the study discusses the east Asian geopolitical relations reflected in the war memorial activities with text analyses of East Asian media reports, along with interviews of the staff in the Institute of Global Chinese Language Teacher Education at East China Normal University. The study shows competition for space that exists in war memorial activities is embedded with meaning that varies between areas due to local values. Historically, different positions and costs of east Asian countries during the WWII have played into the interest structure hitherto, which is vividly reflected in the current geopolitical relations in the east Asia as their different attitudes toward 9.3 parade. In spite of the common interest and perception of Chinese culture, staff in the Institute of Global Chinese Language Teacher Education at East China Normal University bear different attitudes toward the memorial activities. This shows the imagination of east Asia is still closely related to the history of war, which would risk the mutual trust and stable relationship between east Asian countries if not handled appropriately.

Key words:

memorial activities; East Asian; collective memory; cultural identity; 9.3 parade

Wars of 'Keyboard Men': The Online Geopolitics in Chinese Cyberspace

Ning, An

South China Normal University, 510631, China, University of Glasgow, Glasgow, G12 8QQ, UK,
n.an.1@research.gla.ac.uk

Abstract

Spaces of geopolitics have gradually moved from the materialized spaces, such as lands, seas, and mountains, into the virtual spaces, such as printed media, films, comics, and video games during past decades. Along with the rapid expansion of the Internet and Internet-based social media, however, these 'Keyboard Men' who stay in front of computers all the time and angrily shout patriotic slogans fighting with their dissenters are often neglected by current geopolitics research. In the meantime, the vast majority of current imaginary geographies studies have focused empirically on the Anglophone geographical imaginations of the non-Anglophone, the non-Western, the Oriental, or the Global South, while there are less studies paying attention to the non-Anglophone imaginaries of the Anglophone. In this paper, I focus on Chinese geopolitical imagination of the US from the special perspective of online users' discussion of terrorism through the investigation of Chinese Internet-based social media, *Sina Weibo*, under the framework of 'critical geopolitics'. The results illustrate that, the '*Five Dimes Party*' which is in close relation to the radical Chinese nationalism and the '*US Cent Party*' which is linked to the radical Chinese populism are two major and conflicting opinions on the geopolitical imagination of the US in current Chinese society. Based on the discussion of Chinese imaginary of the US in Chinese cyberspace, I believe this research will have significant implications for both non-Anglophone geopolitics research and the discussion of spaces of geopolitics.

Key words:

critical geopolitics; non-Anglophone geopolitics; Chinese geopolitics; online geopolitics; social media; terrorism; *Sina Weibo*; 'Keyboard Men'

dbdu@re.ecnu.edu.cn

Abstract

Based on the theory of economic interdependence, this paper constructs the Expanding Potential Index of Power Space (EPIPS) through analyzing the sensitivity and vulnerability of the world's countries to China's Global trade by adopting the trade data between China and the rest countries of world in 2013 and 2002, so as to study the power space expanding pattern following the steps of China's rise. From 2002 to 2013, China's global trade patterns had developed from the tripartite confrontation pattern dominated by East Asia, Western Europe and North America to Multi-polar pattern. However, the dependence spatial pattern of world trade and economy to China global trade has presented the other scene, showing a good spatial and temporal inertia that is highly concentrated in Asia, Africa and Latin America near the equator. From 2002 to 2013, the distribution of the areas sensitive to China's global trade showed an advancing trend from Asia-Pacific to Africa, Latin America, but the distribution of the areas vulnerable to China's global trade had evolved from point spread to contiguous growth. From 2002 to 2013, China's power space has been expanded from peripheral to the world, and to the developed countries and regions, while the United States in the same period, showed significant contraction trend.

Key words:

Sensitivity; vulnerability; power space; expanding potential; China's rise

Chinese Geopolitical Imagination of The US: A Perspective from Terrorism

Ning, An

South China Normal University, 510631, China, n.an.1@research.gla.ac.uk

University of Glasgow, Glasgow, G12 8QQ, UK, n.an.1@research.gla.ac.uk

Abstract

Geographical imagination plays significant role in both international relations and diplomacy. However, the vast majority of current imaginary geographies studies have focused empirically on the Anglophone geographical imaginations of the non-Anglophone, the non-Western, the Oriental, or the Global South, while few studies have paid attention to the non-Anglophone, non-western, Oriental and Global South's imaginaries of the Anglophone. In this paper, I focus on Chinese geopolitical imagination of the US from the special perspective of terrorism. Under the theoretical framework of 'critical geopolitics', I examine the narratives of both terrorism and the image of the US in Chinese newspapers, *People's Daily* and *South Weekend*. Drawing on the archival data about terrorism and the US in *People's Daily* and *South Weekend*, 2001-2014, I display a Chinese geopolitical imagination of the US. The results show that, the term terrorism has been endowed with different meanings when it is put into different languages and socio-political context; and moreover, the US, especially its war and hegemonic behaviour, has been gazed under the magnifying glass of Chinese Confucianism which still influence on current Chinese political ideologies. Based on the analyses of Chinese discourses of terrorism and the US, I believe this research will have significant implications for both non-Anglophone geopolitics and critical geopolitics research, particularly from the perspectives of 'translating political geographies' and 'Chinese Confucian geopolitics'.

Key words:

critical geopolitics; non-Anglophone geopolitics; Chinese geopolitics; geopolitical imagination; terrorism; imaginaries of the US; Confucianism; *People's Daily*; *South Weekend*

Critical Geopolitics, Chinese Exceptionalism and the (Ab)uses of History: Towards a Contingent Conception of China's 'Rise'

Chih Yuan Woon

Department of Geography, Singapore, National University of Singapore, geowcy@nus.edu.sg

Abstract

This paper examines the intimate association between narratives emanating from China and their discussions about Chinese history, and how such perspectives inform the way a 'stronger' China may relate to the rest of the world. Taking inspiration from the deconstructive impetus of critical geopolitics, I contend that these historical claims to China's rise constitute deterministic accounts, hinging on the notion of Chinese exceptionalism to provide discursive backing for a Sinocentric geopolitical order in the coming decades. This in turn downplays 'alternative' historiographies that can shed light on how the nature of China's rise may be more dependent on and shaped by the external environment than previously acknowledged. Building on geographical expositions related to the idea of contingency, I demonstrate how China (whether it be in the past or present) cannot be seen as operating in a vacuum but has to constantly negotiate and adjust its strategy of engagements/interactions based on the specific demands imposed by world politics. As such, a contingent conception of China's rise can raise important questions for us to critically appreciate the contextual actors, processes and relationships that differentially impact on China's engagements in the world.

Key words:

Critical Geopolitics; Chinese Exceptionalism; History; China's 'Rise'; Contingency

Disaggregating China's foreign policy in Africa

Marcus Power

Department of Geography, Durham University, UK, marcus.power@durham.ac.uk

Abstract

In its quest for a closer strategic partnership with Africa, China has developed increasingly dynamic economic, political and cultural activities on the continent, attracting considerable attention and controversy in the process. This paper examines the geopolitical imaginaries that have been utilised by Chinese leaders and strategists in an attempt to show that China's historical experience and vision of development resonates powerfully with African counterparts and that its history of friendly political linkages and development co-operation offers a durable foundation for future partnership. Exploring China's use of soft power and the different forms of economic and cultural diplomacy that have been deployed, the paper considers the implications of China's rise for African geopolitical landscapes and the ways in which an increasingly internationalised Chinese state is reshaping geopolitical and developmental spaces on the continent. In so doing it examines the transformation and disaggregation of Chinese statehood under globalisation, the diversification and proliferation of foreign policy actors it has produced and the internal differences it has consequently generated over external relations. The paper argues that China's fragmented and decentralised state apparatuses and quasi-market actors are increasingly pursuing their own independent interests and agendas overseas, generating conflict-ridden, incoherent policy output, often mistakenly interpreted as a single 'national' position or 'grand strategy'. Rather than highlighting one strand of Chinese relations with African states (such as aid or governance) the paper argues that a wider critical geopolitics of China-Africa relations is necessary in order to adequately comprehend how interactions with China are reshaping Africa's political geographies.

Key words:

China; Africa; geopolitics; foreign policy; development

Economic & Trade Exchanges of Port Cities and the Border Region Cooperation between CHINA and DPRK

YING NAN, HUA LI, KUN LI

Yanbian University, China, nanying@ybu.edu.cn

Abstract

Along with the rapid development of economy, the Chinese government actively promote aiming at development of northeast three provinces of northeast China. Via the border ports of China and the DPRK, exchange of goods and travelers between two countries are more and more active. On the basis of geographical proximity and complementarity, the network between China-DPRK border cities gradually become closer together. From the view of northeast China, Changjitu(长吉图) diagram development, and even northeast Asia regional cooperation strategy perspective, stability and development of border area is of great significance to the Korea Peninsula and northeast Asia.

On the border area, as the center of cross-border exchange space of the Korean nation, Koreans Chinese, Chinese in North Korea and Koreans is forming a close link in economy and society. Conditions of border cities have played a key role in the regional development. When equipped with the conditions of the resources and economic complementarity on the both sides, border cooperation has far reaching possibilities. Cross-border trade is the main form of communication on the border areas. The border cities maintain a close link to economic trade and human exchanges via road ports and railway ports.

Key words:

Border Cities of China and DPRK; Economic and Trade Exchanges; Human Exchanges

Narrating Territory and Security in Remote Border Places: The Kokang Dispute and the Evolving Borderlands between China and Myanmar

Hu Z., Konrad V.

Carleton University, Ottawa, Canada, K7H3C5, victor.konrad@carleton.ca

Abstract

In 2015, the remote border region of Kokang in Myanmar experienced armed conflict that was reported around the world. Many of the estimated 100,000 refugees from the conflict crossed the border to China while hostilities continued from February through August with temporary truces punctuating the fighting. Unlike the other ethnic minorities fighting the Myanmar government forces all along the extensive, mountainous border with China, the Kokang are Han Chinese with a well-established and nurtured relationship with China. Based on more than 400 interviews of Chinese and Kokang, media reports, and official government releases, this paper explores the varying imaginaries of territory and security in remote Kokang, by the residents of the cross-border region as well as the analysts viewing the conflict from afar. The study offers a lens through which border studies may view the multi-scalar and extended geopolitics of nation states and their peripheral sub-national components. Specifically, the study addresses the changing role of the border under conditions of conflict and security enhancement, and the malleable definition of borderlands territory. The study reveals how borders are utilized creatively by territorial inhabitants, their neighbors and their governments, how borders work in remote places, and how cross-border culture operates even in conflict situations to mediate borders. The study enlarges our understanding of evolving borders in simultaneous globalization and localization.

Key words:

territory; remote border; Kokang; China; Myanmar; border security narrative; evolving borderlands

Progress of Geopolitics of Chinese Geography since the 1990s

DU Debin, DUAN Dezhong, LIU Chengliang, MA Yahua

Institute for Innovation and Strategic Studies, East China Normal University, Shanghai, 20062, P. R. China,
dbdu@re.ecnu.edu.cn

Abstract

Nowadays, the world is undergoing profound changes and re-constructing, the shifting of world power center and the restructuring of the international order, which are bound to put forward a new theoretic demand for geopolitical research in China and bring new opportunities for the geography development due to Chinese development. This paper summarized the achievements and analyzed the deficiencies of Chinese geographers in the fields of geopolitics in the past half a century. For example, Chinese geopolitics has made great progress in team building and academic achievements and some breakthroughs in some aspects recently, however, some problems still exist in Chinese geopolitical research. Firstly, the theoretical system is not complete and the academic community is disunited yet. Secondly, the disciplinary position is not clear, resulting in limited academic development potential. Thirdly, compared with other subjects, Chinese geography, the basic subjects of geopolitics and geo-economic study, is in an obvious weak position. So there is a serious shortage of outstanding achievements. Fourthly, the current research mainly focuses on the phenomenon description, and the mechanism examination is insufficient. Lastly, Chinese geographers excessively relied on western thoughts, lacking independent value judgments. On the basis of the above points, the authors suggest an action plan of strengthening Chinese geopolitical research, including the studies of geopolitical philosophy and methodology, geopolitics basic theory, global geopolitical situation and the major geostrategic powers, and the analysis of China's surrounding geopolitical environment.

Key words:

geopolitics; geo-strategy; world geography; Chinese geography; research progress

The Domestic Significance of the Belt and Road

Ye Kaizhen

The PLA Information Engineering University, China, 727851968@qq.com

Abstract

In this competitive world it is essential for our Chinese people to know how to peaceful rise in order to revive our country. The belt and road which has epoch-making significance is proposed in this background. Until now, this plan has begun to take shape, and in an orderly way. Hereon base, I brief discuss the significance of the plan in China's domestic.

On the one hand, our country has the world's best technology of infrastructure construction. But surplus of capital and overcapacity trouble our economy. It's Capital, technology, productivity that is what those lack. The belt and road strategy can help us get rid of the problem of overcapacity and promote capital expansion.

On the other hand, because of the great gap between eastern region and western region, the western region needs a lot of support from government. The new silk road strengthens the western region's cooperation with foreign country in energy, trade and transportation. It will balance domestic development strategy and promote the development in the Midwest. Meanwhile eastern region can accomplish Industrial transition and structure upgrading.

OBOR like a landmark in our country. Its future development will be more striking.

Key words:

domestic significance; the belt and road

The Planning and Reconstruction of Roads in Shantou Port in Late Qing Dynasty and the Republic of China

Ouyang Linhao, Xie Shi, Yu Wei, Wu Tao

Sun Yat-sen University, Guangzhou, 510275, P. R. China, 9687493@qq.com

Abstract

At the beginning of the nineteenth century, even though Shantou was not officially opened to the outside world, it has played a more and more important role in commercial activities. Since 1860, when Treaty of Tientsin was signed, this city has been officially opened to foreign ports in modern China. And with the rapid development of the steamship industry, Shantou entered into a new phase of development and it served as the only port which can berth ships in Hanjiang river basin. As a new important chapter in the modern development of urban areas, the evolution of Shantou's pattern, the construction of its roads and the political power, social organizations and economic profits behind it have presented the world a charming and unique dynamic scene. Thanks to historical files, newspaper, journals and books, the thesis has discussed the establishment of municipal systems and laws and regulations with the background of the evolution of the city's pattern and its history. And the analysis of the construction of roads can also be seen in the thesis, which aims to reveal the interaction of the government and merchants and how merchants pursued their profits through the municipal systems in the urban renewal.

Abstract

Geopolitics, which researches on the international relations in view of geographies, exerts powerful influences on the course of economic and political development in the world. In the tide of globalization and information technology, the geopolitics has become an important subject of global pattern interpretation and policy making. It is important to have a scientific and systematic review of international geopolitics' latest development to promote the development of this discipline. Based on the bibliometric statistics, the paper reviews the research development of geopolitics on the Web of Science since 1996 to 2015. The history, journals, papers and key research areas of geopolitics have been revealed in the paper. By the analysis of bibliometric statistics, the number of papers recently published in the journals of political geography and related geography continues to increase. The key areas of geopolitical papers which are global highly cited include geopolitical interpretation of the countries and the borders, critical geopolitics, emotional geopolitics, feminism geopolitics and other topics. Before the year of 2000, the state and the borders are hot topics of the geopolitical research. Since 2000, it is of great significance that the geopolitics should be placed in the context of geographical implications. At the same time, critical geopolitics appears to be the main area of geopolitical research, especially the shifts from traditional geopolitics to the humanism (such as emotional geopolitics, feminism geopolitics). The paper then systematically reviewed the branch trends of geopolitical research, including the borders and the territory, global geo-culture and geo-economics, Chinese models of geopolitics, resource conflicts and ecological politics, emotional geopolitics. Finally, it puts forward that Chinese geopolitical studies should reinforce the importance of geographical space and scale, use the process of description and multiple methods, as well as integrate humanistic thoughts, to further enrich the theories and practices of geopolitical research.

The Trans-Political Nature of Southwest China's Energy Conduit, Yunnan Province

Ptak, T¹, Laine, J²

¹Department of Geography, University of Oregon, Eugene, OR, tptak@uoregon.edu

²Karelian Institute, University of Eastern Finland, Joensuu

Abstract

Transboundary flows of energy across Yunnan Province in China and to Southeast Asian states provide insight into the changing nature of borders and border areas. Rather than monolithic symbols of state sovereignty, China's southwest borders in Yunnan can be more accurately characterized as zones of connectivity and exchange, serving a range of local, national and regional objectives. Energy production and distribution in and across Yunnan can be understood as functioning in a set of dynamic transnational processes that serve as economic and political bridges—increasing interaction and deepening regional integration—while also working to mitigate risk to China's energy demands. In this paper, energy projects in Yunnan and Southeast Asia demonstrate the ways border regions can respond to increasing globalization, simultaneously strengthening national energy security while promoting regional interconnection and diplomacy. Thus, connections to and through a once peripheral region present an apparent contradiction: once rigid territorial borders are increasingly characterized by transboundary infrastructure development and exchanges of energy, capital and diplomacy, while promoting broader, diversified national energy security objectives—essentially strengthening national security through transnational energy projects. This paper investigates how energy development works to shape Yunnan's role as an "energy conduit," while advancing both transnational and geopolitical objectives, and thus, suggesting these projects as components of broader objectives can be understood as trans-political in nature.

Using China's Stamp Issues to Document Economic and Political Transitions

Stanley D. Brunn, Juncheng Dai

University of Kentucky, Lexington, KY 40506 and Central University of Finance and Economics, Beijing 100091, China,
Brunn@uky.edu

Abstract

Stamps are visual products of the state that present information to those inside and outside the state's boundaries about events, personalities and subjects it considers important. States issues stamps that reflect events from the past and present that it wishes to depict about changes. Political geographers and others in recent years have undertaken a number of studies about stamp themes, issues and changes. In this study we seek to answer stamps that were issued in China's recent transition periods. We examine the topics, themes and subjects of stamps in three periods: the years before and after the Cultural Revolution (1966-69), the years before and after Mao's death (1976) and the years before and after China joined the World Trade Organization (2001). A close reading of the stamp designs and topics reveals there were changes in the subjects and topics in the "before" and "after" periods. We illustrate examples of the stamp issues. We conclude that stamps can be and are important product of state politics that can be used to reflect internal and external cultural, political and economic changes.

Analysis on China's Energy Geopolitical Environment

ZHANG Hong, LIU Daqing

PLA Information Engineering University, Zhengzhou 450001, China, 627206955@qq.com

Abstract

Today China is the largest importer of petroleum in the world. In 2015 oil and nature gas respectively have the external dependence of 60.6%, 32.7%. Highly external dependency is the weakness of nation's energy security. Especially the Strait of Malacca as the "choke points" threat to the energy-supply security. In the paper, the evaluation system of China's energy geopolitical environment developed by utilizing NET and ArcGIS Engine has effectively managed the spatial geographic data including the import channels of petroleum, "choke points" and "transit countries" of transportation, as well as various kinds of data related to energy. The system is capable of managing, analyzing, and expressing that the spatial distribution of energy-importing regions, varying import channels, and the changes of energy geopolitical environment impacted by geopolitics around "choke points" and "transit countries". Finally put forward to ensure Chinese energy channels security strategies.

Key words:

Study on the Spatial-temporal Evolution and Internal Mechanism of Geo-economics Connection in China

YANG Wenlong, DU Debin, LIU Chengliang, MA Yahua

School of Urban and Regional Science, East China Normal University, Shanghai, 200062, P. R. China,

yangwenlong_pt@163.com

Abstract

The interdependence of economics among countries has been distinctly enhanced due to the end of the Cold War and the intensification of globalization. In terms of its content and form, geo-politics has shifted from a “high politics field”, which focuses on safety, to a “low politics field”, which emphasizes economics; making geo-economics the focus of the researches. This paper revealed China’s evolutionary characteristics of geo-economics connections at the global scale, while exploring its internal mechanism. The results show: (1) China’s geo-economic connections have been through 4 periods of “Inoculating- Sprouting- Raising- Flourishing” respectively, which were significantly correlated to economic development and the adjustment of the industrial structures. (2) Labor-intensive industry is currently dominant in China, but capital-intensive and technology-intensive industry are gradually developing, and the disadvantages of primary goods is prominent. (3) China’s economic power is heterogeneous across space. The geo-economic connections could be identified as global powers’ agglomeration and geographical proximity, but it became homogeneous through time and the diameter of economic power has continuously expanded. China has not only maintained stable geo-economic connections with developed countries like the United States of America, Japan and some European countries, but it has also strengthened connections with developing countries in Africa and South America. (4) Capital endowment, technology endowment and labor endowment are the main internal driving forces behind the spatial-temporal evolution of China’s geo-economic connections, among which capital endowment is the key driving force, technology endowment is the important impetus and labor endowment is the fundamental advantage.

Key words:

geo-economics; spatial-temporal evolution; production endowment; internal mechanism; Exploratory Spatial Data Analysis (ESDA)

The Connotation, Function and Organization of Global S&T Innovation Center

Du Debin, He Shunhui

Institute for Innovation and Strategic Studies, East China Normal University, Shanghai 200062, China,

heshunhui2008@163.com

Abstract

Based on specifying the connotation of global science and technology innovation center, this paper proposed four functions of global science and technology innovation center, including scientific research function, technological innovation function, driving function of industrial and leading function of culture. After that, the paper summarized five salient features, which are functional domination, structural hierarchy, spatial agglomeration, high-end Industries and tolerant culture. Finally, the component elements and structure of global science and technology innovation center were summarized into a multi-factor system with three levels, in which talents are the core elements of formation, university, industry and government are the driving factor during the period of development, innovation culture, innovation capital, innovation infrastructure and professional service are the environmental elements.

Borderland: Ritualized Display of Luxury Hotels in Guangzhou

CAI Xiaomei

School of Tourism Management, South China Normal University, Guangzhou 510631, China, Cultural Industry and Cultural Geography Research Center, South China Normal University, Guangzhou 510631, China; 452761119@qq.com

Abstract

The border was not a line that circumscribed or delineated a territory. Instead, the border was multiple; it was found, practiced and enacted in a multitude of sites beyond and within the territory it was intended to secure. Border as Method, it considers the diverse operations of the border in producing landscapes and subjectivities. Hotel as the border of metaphor, consumers around the world need to provide the effective certificate such as a passport to check in. Besides, consumers that does not locate the ability to act politically in the traditional figure of the citizen, but rather, sees the struggles, contestations and negotiations of non-citizens as intrinsic to the enactment of citizenship and political subjectivity. The study selected 10 luxury hotel in Guangzhou as a case, and used the in-situ observation, depth interview, experience and other research methods. It found that: (1) Consumers through check-in, produce and inspection certificates and other forms of ritualization showed an acute manifestation of the “spectacle of the border”, citizen or non-citizen, resulted in the process of the ritualization of similar border checks are fuzzy. (2) The hotel through language, material products, cultural construction and so on produced blurred border landscape, rendering the multinational national contestations and negotiations. (3) In the process of the interaction of hotel producers and consumers, citizenship is a bordering practice that operates through exclusion and claiming. The study enriched the border related theory, also provides a new perspective for the research of the hotel.

Border; citizenship; landscape; subjectivity; luxury hotel

Cross-border Trade and the Changing Landscape in Border Cities in Yunnan, China

Xiaobo Su

Department of Geography, University of Oregon, Eugene, OR, USA, 97403, Xiaobo@uoregon.edu

Abstract

Situated in the context of China's border opening, this paper focuses on border cities in Yunnan, a southern province sharing a border with mainland Southeast Asia. The primary goal is to examine how the Chinese state rescales to promote cross-border trade in Yunnan's border cities and how cross-border trade shapes land development in these cities. Border cities in Yunnan such as Ruili and Mohan play a key role in promoting cross-border trade. The dynamic interaction between land development and cross-border trade is the key to understanding the spatial development and changing function of border cities. Specifically, my paper addresses three critical questions: 1) Why does the Chinese state reposition border cities as a new frontline of transnational regionalization? 2) How do subnational governments restructure power hierarchy to integrate this repositioning into economic development in border cities? 3) How does land development become a vehicle by which local authorities and trade companies promote cross-border trade? I argue that border cities in Yunnan have already become a key site of capital accumulation via cross-border trade and local governments in these cities harness this opportunity to promote land development and cater to the demand of investors and traders. Cross-border trade dramatically changes border cities and convert them into new hotpots of investment.

cross-border trade; land development; Yunnan; border cities

Economic & Trade Exchanges of Port Cities and the Border Region Cooperation between CHINA and DPRK

Ying Nan, Hua Li, Kun Li

Yanbian University, China, nanying@ybu.edu.cn

Abstract

Along with the rapid development of economy, the Chinese government actively promote aiming at development of northeast three provinces of northeast China. Via the border ports of China and the DPRK, exchange of goods and travelers between two countries are more and more active. On the basis of geographical proximity and complementarity, the network between China-DPRK border cities gradually become closer together. From the view of northeast China, Changjitu(长吉图) diagram development, and even northeast Asia regional cooperation strategy perspective, stability and development of border area is of great significance to the Korea Peninsula and northeast Asia.

On the border area, as the center of cross-border exchange space of the Korean nation, Koreans Chinese, Chinese in North Korea and Koreans is forming a close link in economy and society. Conditions of border cities have played a key role in the regional development. When equipped with the conditions of the resources and economic complementarity on the both sides, border cooperation has far reaching possibilities. Cross-border trade is the main form of communication on the border areas. The border cities maintain a close link to economic trade and human exchanges via road ports and railway ports.

Landscape of Incompatible Desires: Tea Production, Land Use Politics, and Ethnic Minorities in Southwest China

Po-Yi Hung, Ph.D.

Assistant Professor, Taiwan University, Taiwan, China, poyihung@ntu.edu.tw

Abstract

Tea production, especially Pu'er tea, has substantially changed the agricultural landscape in Southwest China, the borderlands of Yunnan in particular. by focusing on the landscape of what is deemed "ancient tea forest" (*guchalin*), this project aims to understand the interactions among tea trees, entrepreneurs, the state, and an ethnic minority population, the Bulang. I analyze the material and ideological components of the tea forest by examining ecological changes, market forces, and state interventions. Data are collected by the intensive ethnographic research to engage in local Bulang villagers' everyday life in a context where the tea landscape in southwest China is symbolically and materially reproduced. In accordance, I find the (re)construction of tea landscape has been a state intervention for the (re)construction of people on China's southwest frontier. In other words, I argue the (re)construction of landscape has been the state project for engineering an ethnic entrepreneurship to re-articulate China's southwest frontier with the market economy. Nevertheless, the (re)construction of both landscape and people, in practice, has been dilemmas between tradition and modernity, territorial margin and connected space, and primitive nature and civilized development.

Tea; Landscape; Ethnic Minority; Dilemma; Yunnan

Narrating Territory and Security in Remote Border Places: The Kokang Dispute and the Evolving Borderlands between China and Myanmar

Hu Z., Konrad V.

Carleton University, Ottawa, Canada, K7H3C5, victor.konrad@carleton.ca

Abstract

In 2015, the remote border region of Kokang in Myanmar experienced armed conflict that was reported around the world. Many of the estimated 100,000 refugees from the conflict crossed the border to China while hostilities continued from February through August with temporary truces punctuating the fighting. Unlike the other ethnic minorities fighting the Myanmar government forces all along the extensive, mountainous border with China, the Kokang are Han Chinese with a well-established and nurtured relationship with China. Based on more than 400 interviews of Chinese and Kokang, media reports, and official government releases, this paper explores the varying imaginaries of territory and security in remote Kokang, by the residents of the cross-border region as well as the analysts viewing the conflict from afar. The study offers a lens through which border studies may view the multi-scalar and extended geopolitics of nation states and their peripheral sub-national components. Specifically, the study addresses the changing role of the border under conditions of conflict and security enhancement, and the malleable definition of borderlands territory. The study reveals how borders are utilized creatively by territorial inhabitants, their neighbors and their governments, how borders work in remote places, and how cross-border culture operates even in conflict situations to mediate borders. The study enlarges our understanding of evolving borders in simultaneous globalization and localization.

Key words:

National and Psychological Boundaries of Dai People in Frontier Xishuangbanna

Chen, Yapin, Zhou, Shangyi

Yunnan Normal University, Kunming, 650500, P. R. China, ypdance@yunu.edu.cn

Beijing Normal University, Beijing, 100101, P. R. China, twizsy@163.com

Abstract

Border between two countries which is both national sovereignty border, namely national border, but also a psychological boundary for local residents on both sides. Besides psychological boundary and national border, there is a cultural boundary which is full of meaning and value of life. Residents on both sides have cultural flowing and imagination of it based on their rich experiences.

Microscopic geography prefers to trace daily life record, using interpretation, and analysis of activity subject, activity space, activity frequency, content of activity, event impacts, it also recognizes changes of these. This case takes Dai people who live on both sides of China and Myanmar as research target. We investigated their psychological icon of boundary from their memories, imaginations, and experiences. Then we give an interpretation of it and find its significance for Dai people.

This case study obtains the following conclusions Cultural spaces play an important role to Dai people's daily life who live on both sides. Even nation border establishes the national identity of local people, but it does not become a cultural boundary of Dai people living in China and Myanmar. It is a window of Dai's culture shown by the cultural activities of both sides. We can tell the psychological boundaries by the imaginations of Dai people, the living experience of Dai residents on each side practice the way of other side by their imagination, thus the understanding of their own life and culture. The flowing range of psychological boundaries take combined effects by local political, economic, cultural, social and other factors.

cross-border; cultural boundary; Psychological Boundaries; National Boundaries; Dai people

The Mule Caravan as Social Agency of Borderland Reconstruction between the Yangtze and the Irrawaddy Rivers: Transportation and Social Integration

Jianxiong Ma

Division of Humanities, the Hong Kong University of Science and Technology, Clear Water Bay, Kowloon, Hong Kong.

hmjxm@ust.hk

Abstract

The mule caravans had been the fundamental means of transportation to link Chinese domestic market along with the Yangtze River with the market circles along with the Irrawaddy River and Indian Ocean together. In order to maintain this transportation system, indigenous communities in Southwest China and highland Southeast Asia developed a regional cooperative network between communities in mountains, basins, and valleys. They were bound into this transportation network for material circulations. The basin communities provided the horsebean harvest to feed animals, while the mountain communities survived under the highland husbandry by providing mule training, and merchants relied on long distant trade to weave them into a network. In addition, the state financial system required for silver and copper supplies as currency, which also enriched the development of mule caravan transportation across different communities and political systems. This research focuses on the development of local social agency based on the mule caravan network, and studying a historical regional cooperative culture on the political borderland between Southwest China and highland Southeast Asia. The borderland communities were continuing reconstructed as a response to the state tax and carve policies in Qing dynasty, as they established pools of common property and managed around communal temples, to provide transportation service for the governments. Thus, transportation network, regional markets and state revenue policy facilitated local interdependency and social integration in different orientations. This is a different perspective to explain the highland-lowland relationship in this region against the Zomia assumption given by James Scott.

Inter-Caste Marriage and Forced Displacement in India

Narzary, Pralip Kumar

International Institute for Population Sciences, Mumbai -400 088, India. Email: pralipkn@gmail.com

Abstract

In India woman leaves her parental home after marriage to live with her husband and his family. Due to caste system embedded in the Hindu religion, marriage is held within the same caste and mate selection is done usually by parents. Couple of inter-caste marriage may be out casted, driven out of parental home, in worse case may be honour-killed. Under such socio-cultural settings, it is pertinent to know which type of people/couple endeavor to take high risk of breaking such stringent social norms and its association with forced migration. Present study used data from the India Human Development Survey 2011-12 (IHDS-II), a nationally representative, multi-topic survey of 42,152 households. Appropriate bi-variate and multi-variate statistics are applied. Result shows that about 5 percent of the sample tied the nuptial knot outside their caste. The trend from 1980s–2012 shows a steady rise in the inter-caste marriage. Four percent of inter-caste married couples were forced to migrate. Parents prefer to bring up their children in the modern way, and that opens the new vistas for inter-mingling and inter-caste marriage. Hence it is most likely that the inter-caste marriage will rise and there will be more forced migration due to it. This type of displacement also causes similar mess as those of displacement due to other issues, however goes unnoticed in the academic arena and not gaining importance. But it has a great policy implication especially in huge country like India. Thus, present paper is a humble attempt in this direction.

Reintegrating Return Migrant Fathers into the Web of Care

Theodora Lam and Brenda S.A. Yeoh

Asia Research Institute, National University of Singapore, Singapore, arilcft@nus.edu.sg

Abstract

In an era of increased feminisation of labour migration, the voices of migrant men-as-fathers have become largely muted. Even as men migrate to fulfil their breadwinning roles, they are expected to continue active fathering from afar and remain an 'absent presence' at home and in the lives of their left-behind children. As they reunite with their family members upon their return, whether permanently or temporarily, they have to adjust to living together with their families again and this may result in tensions and disruptions for the family and the newly spun web of care woven during their absence. Drawing on a larger mixed-method study titled CHAMPSEA (Child Health and Migrant Parents in Southeast Asia) comprising household surveys and in-depth interviews, this paper thus juxtaposes the transnational or long-distance fathering experiences of return migrants vis-à-vis those that (re) develop in the wake of their return. It probes into how migrant fathers' continued (or lack of) involvement in caring for their families while away eases or impedes their ability to reinsert themselves into the web of care upon return. Finally, the paper examines how gendered expectations of fathering remain sticky over time despite the coming and going of migrant and return fathers from the families.

Key words:

Transnational fathering; return fathers; web of care

Reshaping Household Relations through Translocal Connectedness: The Role of Gender in Remittance Practices

Porst, L. & Sakdapolrak, P.

Department of Geography, University of Bonn, 53115 Bonn, Germany, lporst@uni-bonn.de

Abstract

Remittances are powerful resources mediating connections between migrating and non-migrating household members and inducing renegotiation processes of household relations. Meanwhile, remittance transfers are influenced by various factors. Although often neglected in migration research, migrants' embeddedness at multiple places plays an important role in reshaping household relations – given the diverse social settings that hence converge in one household. We therefore aim to disentangle gender effects on remittances and, in turn, implications of remittances for gender relations within multi-sited households. To account for the embeddedness of migrants and households of origin in a network of links between places, we employ a translocal approach, conceptualizing remittance sending as a practice to maintain translocal connections. Based on empirical research in Thailand, we examine how responsibilities among household members are modified or persist as affected by internal migration, mainly between rural communities and peri-urban areas around Bangkok. Applying a multi-sited research strategy, we conducted semi-structured interviews with current and return migrants, and with migrants' household members, in places of destination and origin. Our results corroborate the embeddedness of remitting in family structures. Furthermore, we find that remittance patterns reflect social norms, including gender-specific expectations and behaviour. At the same time, remittance transfers contribute to readjusting gendered roles. We conclude that gender in conjunction with other categories of social differentiation, incl. age and education, affects the intensity of translocal connections mediated through remittance practices, and thus influences the impact of financial and social remittances on the asset endowment of and the activity assignment within multi-sited households.

Key words:

Multi-sited households; gender relations; remittances; domestic migration; translocality; Thailand

Rural-Urban Migration in Gender and Development Perspectives: a case of China

ZHENG Zhenzhen

Institute of Population and Labor Economics, Chinese Academy of Social Sciences, Beijing, 100028, P. R. China,
zhengzz@cass.org.cn

Abstract

The relationship between population mobility and development is a study topic draw attention in China and worldwide. This paper will study the issue in a gender perspective, to exam the impact of migration to rural-urban migrants on men and women. Women migrants made almost half of labor migrants in the last decade in China. Using the Third Wave Survey on the Social Status of Women in China (2010), with a framework of resource/opportunity — agency/competence — decision making/choice — outcome/impact, this paper will analyze the impact of migration experience to rural women, and compare that with other reference groups, such as rural women never migrated or migrant men. Two sets of indicators selected for this study. The first set of indicators measures opportunity and choice, such as self-decision making on going out to study or work, main reasons for migrate out and return home, satisfactory to current job; the second set of indicators measures outcome or impact, such as employment, social welfare, marriage and family issues. The study find that migration provide more opportunities to rural women that never available before regarding economic participation and income earning, the impact could be observed also among returned migrants. However, some institutional constrains especially affected women, put them in a dilemma between work/career development and traditional family responsibility.

Rural migrants; gender differences; employment; gender role in family

Social Network as a Survival Strategy in Cities: A Case Study of Migrant Women Construction Workers in Delhi

DR (Miss) Chandrakanta

SBS College, University of Delhi, New Delhi, 110017, India, verma.chandrakanta@gmail.com

Abstract

It is a well-established fact that the pre-existing social connection makes migration less stressful leading to better migration, but the phenomenon of network is not the same for all; for example, there are gender differences in the type and use of social network. In India, where female migrants are relatively vulnerable mainly if they are migrating alone then these networks play the most important role in the decision-making process. It is well documented that women's network is composed of stronger and more kin-based ties than men's. The use of personal contacts in a job search continues to generate interest as a source of gender disparity in important employment outcomes such as occupational sex segregation, status and earnings. Historically, the building and construction industry has drawn heavily on migrant workers to meet labour needs. It also absorbs those who often migrate seasonally and work at construction sites to augment their farm income. Based on the field survey of construction workers at Delhi, present research paper tries to understand the role of women worker's social network in finding jobs at construction sites and their received pre/post migration assistance.

Key words:

Migration; Construction Workers and Social Network

Household Changes in India with Special Reference to North-Eastern States of India: Evidence from Four Recent Censuses

Donald R. Mawkhlieng¹ & Prof. L. Ladusingh²

¹PhD Scholar, International Institute for Population Studies (IIPS), Mumbai 400088, India, mawdonric@gmail.com

²Head, Department of Mathematical Demography and Statistics, (IIPS), Mumbai 400088, India

Abstract

Among other factors changes in the number of households are actively driven by the changes in fertility level. The household scenario in India is the outcome of decades of population policies adopted by the Government and government of India does not directly involve in birth control. Family planning policy in India is voluntarily not by compulsion and this have major contribution in increasing birth rates and hereafter household rates in the country. The paper specifically focus on household changes in the North-eastern states of India which has a distinction of comprising large tribal population. There is dearth of studies which emphasize on the trend of household changes in the region and also which focus on understanding the household composition and living arrangement of the elderly in India and North-eastern states of India. The data source used in the study is from the four rounds of Indian censuses that is from 1981 to 2011. Descriptive Statistics is used to fulfill the objectives of the study.

Results found that household growth rate in India is much higher than the population growth rate, however, the structure and composition of Indian households have been experienced changes over the four censuses. The household size is dwindling over time revealing that there is a continuous change in the structure and composition of the Indian families. North-East India too has experienced a shift from larger households into smaller ones both in rural and urban centers which reflects the changes in the sociological behavior of the population. The elderly is found to reside mostly in larger households which may be because of familial support from their children and relatives. Household head is found to be concentrated in the age group 30-49 years. Changes in household have serious implication on the demographic and socio-economic characteristics of the country and policy makers should pay attention to address these changes and frame policies adapted to these changes and there is also a need to expand the low cost housing provision to meet the increasing smaller households.

The Characteristics of Residential Patterns and Population Movements Among Urban White-collar Workers: A Study on Workers of Private Enterprises in Hangzhou, China

Yasuhisa ABE¹, Hua XIA²

¹Kyushu University, Japan, snc11960@nifty.com

²Lici International Education, China

Abstract

In this study, we targeted white-collar workers employed in private enterprises in the city of Hangzhou, Zhejiang Province, and examined the characteristics of residential patterns and population movements among urban white-collar workers, with a focus on attributes such as birthplace and gender and whether they lived together with their parents.

For the study methods, we conducted a questionnaire survey and interviews based on it. For the criteria on choosing the target companies and business offices, we first selected five private companies in Hangzhou. We distributed the survey form to the head offices of companies in which the rate of career positions was high. The selection criteria of career workers who were to be survey respondents were as follows: 1) workers who assume management positions, such as middle management, and 2) workers expected to rise to management positions in the future due to their academic background and intra-company evaluation. Human resources personnel in each company were asked to select candidates who satisfied these conditions. The candidates were then asked to respond to the survey. At the point in time of the survey, because we wished to conduct analysis with a focus on women from among the white-collar workers, we requested the names of about 30 women and 20 men from each company. As a result, we obtained responses from 226 workers (137 women, 89 men). In addition, we conducted interviews with five human resources personnel who served as the liaison for this survey in each company.

First, concerning the academic background of the survey respondents, 87.2% graduated from specialized colleges (equivalent to Japan's junior college) or above. This is a high rate considering China's college enrollment rate. The percentage of respondents with membership in the Communist Party was also high at 39.4%. Thus we were able to confirm that many of them were positioned as career-track employees in their companies.

Concerning commuting distance, overall women tended to travel shorter distances compared with men. Especially characteristic of this trend was the high rate of women commuting a distance of 3 km or less compared with men. In terms of commuting time, overall women also tended to have a shorter time compared

with men, with many of them commuting 30 minutes or less. A reason was that for men, a high percentage used their own cars as a method of transportation. This made it possible for many of them to live in areas distant from their workplace.

Also, for women, it was possible for them to choose workplaces near their residential places when finding employment. Moreover, there were those who chose areas close to their workplace when moving. Another survey question asked respondents who had experienced moving their reasons for doing so.

As for the birthplace of the survey respondents, many of both men and women respondents were born in Hangzhou. The results revealed that there were few respondents who had experienced moving outside the city for college or employment. Also notable was the living pattern in which parents lived together with the respondent or close to him or her. Among the results was the finding that compared with women there were relatively few men who were born in regions other than Hangzhou.

In contemporary Chinese cities, men tend to bear a heavy economic burden after marriage, as a result of purchasing a home and automobile, for example. This was also the case in Hangzhou. According to interviews, the reason that compared with women there were few men who were born in other regions was that when single men were employed in Hangzhou, they often returned to their birthplace when they became marriage-minded.

In contrast, because the economic load as described above for women is light when they marry, they remain in the same city. There are many cases of women continuing to live and work in Hangzhou if they marry a Hangzhou man.

Also, while it was assumed that the survey respondents had work positions that allowed them to earn relatively high incomes in their companies, because housing expenses took up a large part of household expenditure, regardless of whether or not the respondent was born in Hangzhou, many of them lived together with their parents (in the case of a respondents born in another region, with his or her parents-in-law) even after marriage. The living pattern that many of them desire was “living close to their parents.” However, in actuality nearly half of the respondents said that they had no choice but to live together with their parents.

In conclusion, we observed that a characteristic of white-collar workers of private enterprises in Hangzhou was the paucity of men who were born outside Hangzhou and the great number of them who lived together with their parents, primarily because of the high cost of housing.

Transnational Marriage Migration from Russia to Turkey

Ayla DENİZ, E. Murat Özgür

Ankara University, Department of Geography, Turkey, adeniz@ankara.edu.tr

Abstract

In the early 1990s, tens of thousands of Russian women have migrated from Russia to Turkey and many Turkish men have left for Russia for various purposes. With the increase of transnational mobilities and the use of internet, the number of Russian-Turkish marriages has become widespread. Russian-Turkish couples have made a bridge between two countries. They have started to effect these countries by economically, politically, socially and culturally. In addition to this, the relations between Russia and Turkey have effected on these couples.

In this paper I analyze some of the issues that enable the understanding of Russian-Turkish mixed marriage and transnational lives of these couples by presenting some preliminary empirical findings resulting from on-going qualitative research being carried out in İstanbul and Antalya.

Detached Housing Development in the Osaka Metropolitan Area since the Late 1990s: Focusing on Its Built-up Areas

Kumano T

Graduate student, Kyoto University, Kyoto, Japan, kumano.takafumi.42s@st.kyoto-u.ac.jp

Abstract

In an earlier phase of economic growth, the development of detached houses greatly contributed to the suburban expansion in Japan's major metropolitan areas. However, since the collapse of the bubble economy in the early 1990s, land use and population in metropolitan areas have been changing in a complicated manner. While the concerns of recent studies are concentrated on the development of condominiums in central areas and the decline of suburban detached housing areas, the detached housing provision from the late 1990s in Japan's major metropolitan areas has been neglected. Accordingly, this paper examines the geographic distribution and land use change of detached housing developments in the Osaka metropolitan area, an advanced example in terms of a shrinking metropolitan area in Japan, starting from the late 1990s. Next, it considers the influence of changes in socioeconomic conditions on housing development.

The results indicate that redevelopment in built-up areas has played an important role in detached housing provision since the collapse of the bubble economy. However, such small-scale and fragmented renewal in areas of dilapidated housing and population decline does not necessarily lead to an increase in the local population. The life cycle of population and housing in old built-up areas, as well as economic factors such as the collapse of the bubble economy, has influenced housing development. These findings suggest that an understanding of contemporary urban housing provision, based on the dichotomy of condominiums in central areas and detached houses in the suburbs, is insufficient.

Detached housing development; Built-up areas; The life cycle of population and housing; The collapse of the bubble economy; Osaka Metropolitan Area

Determinates of Unmet Need for Family Planning and Its Impact on Fertility among Muslims in India

Rahaman Mehebub

Jawaharlal Nehru University, New Delhi, 110067, India, mehebub.rahaman06@gmail.com

Abstract

Unmet need for family planning has a causal relationship with the fertility determination in India. It is evident that due to very high percentage of unmet need for family planning, unwanted fertility is very high among Muslim women. Therefore, present study examines the determinants of unmet need for family planning for Muslim women in India and assesses the demographic impact of unmet need for family planning of Muslims. The multinomial logistic regression results indicate that age, educational level, wealth index, number of living children, media exposure, place of residence and working status were significant predictors of unmet need. Further, potential use of contraception is estimated by Westoff and Bankole's Maximum, Minimum and Realistic need satisfaction models and then with Bongaarts Proximate Determinants Model we have estimated figures of implied fertility rate. Study suggests that TFR of Muslim women can be reduced to replacement level simply by meeting their unmet needs.

Key words:

Unmet need; Muslims; Proximate Determinants; logistic regression; Westoff and Bankole's Model

Growing Gap in Population Dynamics, Closing Gap in Population Size and Structure: The European Union and the United States Compared

Kocourková J, Šídlo L, Novák M, Sýkora L

Charles University in Prague, Faculty of Science, Albertov 6, 128 43 Prague 2, Czech Republic, koc@natur.cuni.cz

Abstract

Differences in population development in the European Union and the United States are investigated. It is a response to the population projections recently published by the United Nations which forecast a growing difference in the population dynamics of the two regions that will lead to convergence between the two populations in the long-term in terms of population size and age structure. The paper aims to ascertain which components of population change are primarily responsible for the different population dynamics, especially the slowdown in growth and expected shrinking of the EU population and the continued growth in the US. We first explore the role of natural change and migration in total population growth. Then, we investigate fertility and mortality patterns focusing on the demographic behavior of ethnic/racial groups in the US and the regional disparities in Europe. With the aid of a detailed analytical comparison of the EU and the US, the paper discusses the determinants and factors that lie behind the disparities that have recently emerged in population dynamics, fostered above all by fertility differences.

Key words:

population dynamics; European Union; United States; fertility; mortality; migration; regional differentiation

Maintaining Food Security in The Midst of Rising Land and Population Pressures in Rural Papua New Guinea

Koczberski, G.¹, Curry, G.N.¹, Bue, V.², Germis, E.³, Nake, S.³

¹Department of Planning and Geography, Curtin University, Western Australia, AUSTRALIA, g.koczberski@curtin.edu.au.

²Unitech, Papua New Guinea

³PNG Oil Palm Research Association, Papua New Guinea

Abstract

This paper deals with rising shortages of land for gardening among oil palm smallholders in Papua New Guinea (PNG) and how they are responding to the pressures to maintain household food security. In the oil palm growing areas of PNG, food production is a key strategy for maintaining household food and income security, and nearly all smallholder families cultivate food crops for home consumption and cash income. For the majority of women, local marketing of garden foods is their most important income source after oil palm, and gardens provide an important buffer against the vagaries of fluctuating oil palm prices. However, rising population and land pressures pose a threat to smallholder household food security. The average population per land holding has more than doubled from the early 1970s and access to garden land has declined significantly over the past 10 to 15 years as families' plant more of their land to oil palm. The presentation will outline the diverse adaptive strategies and farming innovations smallholders have developed to respond to land shortages and the important role of social and kinship networks to facilitate access to additional land and income.

Key words:

Papua New Guinea; food security; agriculture; oil palm; land shortages; household adaptation strategies

Shrinking Suburbs and Revitalization in Japanese Cities

Yoshimichi Yui

Hiroshima University, Japan, yyui@hiroshima-u.ac.jp

Abstract

Suburb is not the dream place for every families and the depopulation has been occurred in several metropolitan regions. As for many traditional urban growth model, suburb is continuous growth and the population inflow occurred as a commuter town of the metropolitan regions. However, this trend has been changing, because population are decreasing in old suburban areas, on the other hand, population in innercity turns to increase. Recently, Japanese old suburban housing estates, which were developed before 1970s, are declining. They are facing several serious problems. Most serious problems are aging of residents and decreasing population, these are caused by long-term dwelling. Because many Japanese think that "Japan dream" is occupancy of detached house in suburb. Japanese suburban resident tends to stay after child rearing. And another severe problem is the increasing vacancy houses. In this study, we try to clarify the conditions of shrinking suburbs in Japanese cities and will introduce some activities for revitalization in suburbs. And we want to contribute the revitalization of suburb from the geographical studies.

As for aging of suburban residents, in old housing estates the first generation of migrants grew older and to continue to live in their own house in suburban areas. Furthermore, their children grew up and moved out. Therefore, aging communities without young generations will be popular in suburbs. These are caused by the failure of town planning, which supplied the same type of houses in short term. Furthermore, increases in vacant houses are seen throughout every old suburban housing estate, it induces new uneasiness and social troubles and drop in housing price. As a countermeasure against the above, some suburban communities try to vitalize and promote community activities.

As a countermeasure for shrinking in suburbs, I will introduce "the housing stock information system of vacancy houses in Hiroshima prefecture".

Key words:

suburb; shrinking; ageing; vacant houses; revitalization

The Demographic Bonus in Romania

Daniel Tudora, Radu Dimitriu

University Al. I. Cuza, Romania, tudoradaniel@yahoo.com

Abstract

The income yielded by the manner in which a particular territory manages to balance its demographic structure may be termed **demographic rent**. From this perspective, the correlations between demographics and economy show that the decrease in the inactive population percentages in junction with the increase in activity rates within the population of working age result in diminished social-economic vulnerability within the respective population. This paper examines the distribution of demographic rent throughout Romania based on a multiple regression model where the dependent variables are the dependency rate of population and the turnover of enterprises, and the independent variable is the income of population. The influence of demographic structure on the distribution of financial welfare in Romania will be established by modeling residues and locking the model on the demographic parameter. Furthermore, by mapping the results, the following questions will likely receive answers: Which are the areas of accumulation of demographic bonuses, and which areas export this advantage? What is the location of discontinuities between repulsive and attractive areas? Which areas require special policies aimed at reducing the gaps generated by the demographic rent?

Key words:

demographic bonus; Romania

Shrinkage as a Challenge for Urban Regeneration

a Look at the East German Experience

adam.c.radzimski@gmail.com

Abstract

Urban shrinkage, which has recently emerged as one of the leading topics in the urban literature, has brought into question the widely used instruments of urban planning and urban regeneration. It has been stressed by several authors that a better understanding of policy approaches to shrinkage is needed. Therefore, the aim of this paper is to look at the relationship between shrinkage and the framework of urban policy, and more specifically the urban regeneration. The Urban Restructuring Programme for the new federal states of Germany is used as a case study to illustrate the evolution from a predominantly housing market oriented policy towards a more comprehensive approach. The transformation processes in Eastern Germany were accompanied by substantial population decline and a rise in housing vacancies, which reached 14% as of the year 2000. One year later a decision was taken by the federal government to launch a new instrument within the already existing framework of urban development support programmes. The Urban Restructuring Programme has become the first federal policy to explicitly address the issue of urban shrinkage. The methodological approach is based on a critical review of several qualitative and quantitative data sources. Sources include existing literature on the subject, policy reports, legal acts and financial data. With regard to housing vacancies, both data of the Federal Statistical Office, which are derived from microcensuses and refer to the overall housing stock, as well as annual data of the German federation of institutional landlords are used.

Key words:

shrinking cities; urban regeneration; Eastern Germany

Abstract

The educational attainment and occupation of the people of an area greatly determine its demographic character and socio-economic well-being. This is also true in the case of Bodoland Territorial Areas District (BTAD) of Assam in India, which is inhabited largely by the scheduled tribes mostly belonging to the Bodo community and many non-tribal population groups belonging to varied ethno-religious identities. The demographic character as reflected in its high birth rate, high infant mortality rate, low life expectancy, high child dependency, early female age at marriage and so on has not been encouraging in BTAD. In the case of educational attainment and economic condition also, the picture is far from satisfactory in most parts of the region characterized by dominant agro-based economy. Moreover, prevalence of marked inter-community variation in educational attainment, occupational structure and demographic character in the region has made the picture quite complex. With this background, an attempt is made in this paper to understand the pattern of educational attainment and occupational structure and its influence on the demographic character in BTAD region in both social and spatial contexts. The necessary secondary data for the study have been primarily obtained from various Census of India publications covering the period 1971-2011. The primary data have been collected at household level from twenty-three villages and two towns through purposive sampling technique. The data so collected have been processed, analyzed and presented with the help of meaningful statistical and cartographic techniques.

Fertility Behaviours Among Tribals: An Insight from Some Tribal Dominated Districts of Rajasthan, India

Dr. Hemant Patidar

Assistant Professor, Department of General and Applied Geography, Dr. Harisingh Gour University, Sagar, M. P. 221005, hpatidargeog@gmail.com

Abstract

This study aims to examine the fertility behaviour among tribals across various socio-economic and demographic backgrounds utilizing the primary data collected from the 800 ever married tribal women of ten districts of South-East Rajasthan. Bivariate as well as multivariate regression analyses have been applied. The analysis reveals that fertility among tribal women varies across the socio-economic and demographic backgrounds. The multiple linear regression results demonstrate that socio-economic and demographic backgrounds such as residence type, education, occupation of husbands, wealth status of the family, tribe or caste, child survival ratio and modern contraception methods (other than sterilization) are the significant predictors of the number of children women have during their reproductive period.

Key words:

socio-economic and demographic correlates; tribals; fertility; children ever born

Spatial Changes in Sex Ratio in India: A Geographical Analysis

Nehete Kishor

ADPM's Womens College of Arts, Commerce, and Home Science, Jalgaon (Affiliated to SNDT Womens University, Mumbai), India, khnehet@gmail.com

Abstract

In the study of population characteristic, age-sex structure is one of the most important characteristics of population composition. Age-sex analysis is based on age and sex structure of population. The data of age sex is more noticeable of rural-urban population, marital status, literacy, occupation structure, fertility and mortality. Apart from purely demographic concerns, age-sex data structure requires for educational, health services, planning, technical, political and commercial purposes. Sex composition directly affects on proportion of marital status, supply of labour, fertility, and migration and indirectly affects the literacy, birth rate and death rate. Imbalance in sex ratio is harmful to social structure. If proportion of males in total population is higher than the females, age of marriage for females decrease and it affects the female's health. In India, numbers of females are less than males because of male dominating culture, status of women in society; social security, educational facilities and less participation in decision making are the barrier. Therefore, study of sex composition becomes very significant for socio-economic planning. For this study data regarding sex have collected at district level for total and tribal population for the year 2001 and 2011. The data for study have been collected from District Census Handbook Jalgaon district for the year 2001 and 2011.

It has been found that the decline in sex ratio started from 1991 and currently it is in the worst situation from 945 girls for every 1000 boys in 1991, it went down to 927 in 2001 and 918 in 2011. The government has also identified 100 gender critical district in the country where the sex ratio is abysmally low.

Key words:

Age-sex; Scheduled Tribe; fertility; migration.

The Motives of Migration to Germany: Cases of Refugees from Post-Soviet Countries

Zelenskaia, A.A.

The European University in St. Petersburg, St. Petersburg, Russia, alenazelenskaya@gmail.com

Abstract

Since the end of the WWII Germany has experienced several so called „waves“ of migration. Different types of refugees were always presented in the „flows“ of resettlers. Part of them originate from the ex-Soviet republics. Although nowadays most of the Post-Soviet countries are peaceful, there are still a lot of people, who seek asylum in Germany alongside with refugees from Syria, Irak or Afghanistan. Why did they flee? Why did they choose Germany as a desired destination? Was Germany their first choice? What life projects in Germany do they have? These and other questions were in focus of the research, conducted from April 2014 till August 2015 in asylums of Berlin and Bavaria. The research was based on the participant observation and biographical interviews with refugees from Latvia, Russia, Turkmenistan and the Ukraine. Comparative and case-study analysis revealed, that refugees' reasons for moving to Germany often involve both push and pull factors. The decision is not obligatory due to hard life circumstances or need to flee wars, unrest, human rights abuse or poverty. The reasons for migration vary by the countries of origin, but also have common features. The main finding of the research is that the narration about the motives of migration has two modes: official and informal. Some stories, told by the same people in a different time, drastically differ from each other. The research contributes to a better understanding of migrants' experience, because it provides insights into their individual stories and examine challenges they undergo in Germany.

Key words:

refugees; forced migration; motives; Post-Soviet countries; Germany

Spatial Distribution of the Elderly Population in Nanjing based on the Street Scale

Xin Xu, Yuan Zhao, Aimei Guo

School of Geography Science, Nanjing Normal University, Nanjing, 210023, P. R. China, xuxin199010@126.com

Abstract

Based on the fifth and sixth census towns, street data of Nanjing city, through the street and circle two scale, analyzing the space distribution pattern of elderly people. Secondly, the temporal and spatial characteristics of the elderly population in the streets were analyzed by the hotspot area evolution. The results show: 1) Nearly 10 years Nanjing street aging coefficient showed a "distribution spanning" circle spread space. The streets in the old population growth phase changes from the distribution in the central city and the main city of the junction zone to the main urban area; The streets of mild aging are distributed in the central city; In the middle of the aging stage, the streets are concentrated in the main urban areas and suburbs; and the streets of the old stage are mainly in the suburbs. 2) The density of the elderly population in the street is dense, and the highest density is located in the central city, the suburbs are second, and the density is the lowest in the main city. 3) Nanjing city street population aging rate is a significant positive correlation, with the passage of time, the difference of the street population aging in the space is increasing, the effect of agglomeration is weakened, the development of space is becoming more and more unbalanced. The hot zone distribution showed "coldest-cold-hot-hottest" circle spatial distribution pattern. 4) The main factors that affect the distribution and evolution of the aged population in Nanjing are analyzed from three aspects: the historical factor, the life cycle and the change of the city.

Key words:

the elderly population; spatial evolution; influence factors; Nanjing City

Analysis of Interprovincial Migration and Its Streams in China from 2000 to 2010 with Multilevel Modelling Focusing on Urban-Rural Divide and Origin-Destination Impacts

Zhang, N

School of Geographical Sciences, University of Bristol, Bristol, BS8 1SS, UK, xz14129@bristol.ac.uk

Abstract

Interprovincial migration in China has taken place with a massive magnitude for decades. This paper investigates how indicators of migration have changed between 2000 and 2010, as well as the differences and similarities among 2010's four different categories of interprovincial migration streams (urban-rural, urban-urban, rural-urban and rural-rural streams), using data from successive censuses and multilevel modelling based on the extended and enhanced gravity model, with particular attention given to the roles of rural/urban segment rather than total population and rural/urban income, as well as origin/destination impacts and the interaction between rural-urban divide and origin/destination impacts. After establishing the cross-classification multilevel model to measure and further explore beyond gravity models upon interprovincial migration and their associations in China from 2000 to 2010, this paper examines the importance of origin/destination impacts and temporal as well as spatial variations in association with interprovincial migration and socio-economic factors in the model. The preliminary results show that multilevel modelling is indeed effective to describe and explain interprovincial migration and its four streams in China, as China's internal migration is so highly directional and social network-induced that rural/urban segment populations are remarkably responsible to China's internal migration in gravity models. These findings are closely related to the unbalanced regional development in China, where the urban/rural divide has remained to be pronounced for the past few decades and rural areas are usually rated as the sending origin while their urban counterparts receiving destinations, with the evidence of China's predominant rural-urban flow.

Bayesian Multiregional Population Forecasting: England

Arkadiusz Wiśniowski¹, James Raymer²

¹Social Statistics Discipline Area, University of Manchester, Oxford Road, M139PL, UK, a.wisniowski@manchester.ac.uk

²School of Demography, Australian National University, Canberra, ACT 0200, Australia

Abstract

In this paper, we extend the well-known multiregional population projection model developed by Andrei Rogers and colleagues to be fully probabilistic. Multiregional models provide a general and flexible platform for modelling and analysing population change over time. They allow the combination of all the main components of population change by age with various transitions that population groups may experience throughout their life course. What distinguishes these models from ordinary projections is that they include transition matrices of interregional migration by age. This information is an important component of subnational population change yet models for forecasting the patterns for use in population projections are largely non-existent. National statistical offices tend to rely on simple deterministic assumptions regarding net migration or gross flows of in-migration and out-migration. These models do not take into account the linkages between origins and destinations and often have to be adjusted to ensure zero net migration and the same totals for in-migration and out-migration. We focus on the full matrix of flows to avoid this problem. To deal with the large number of possible flows and provide measures of uncertainty, we develop a Bayesian hierarchical model to forecast age-specific interregional migration, and then include this information with probabilistic forecasts of regional births, deaths, immigration and emigration. The results demonstrate the differences that arise from different specifications and the promise of the general approach.

Bidirectional Migration Pattern in China- Interaction Value Analysis

Xiao Dou¹, Josep Roca Cladera², Blanca Arellano Ramos²

¹Polytechnic University of Catalonia, China, lynndouxiao456@gmail.com

²Polytechnic University of Catalonia, Spain

Abstract

Interaction value is proved to be one of the most famous methods for determining the spatial extension of employment areas (Travel to Work Areas) and urban systems, which highlights the significance of interaction relationship among the whole system. Introducing this concept, this article tries to explain the population migration pattern and some new characteristics since 1995 based on data of population flows among provinces from Census 2000 and 2010 of China as well as 1% population survey in 2005. Results show that the transition trend from “gradient eastern-ward one-way migration” to “stronger eastern-ward and weaker western-ward bidirectional migration” has been gradually enhanced (even though there is strong concentration of population migration in the eastern area, declining mobility and return migration occurred in some regions); multi-polarization tendency is apparent, Xinjiang and Liaoning add to the line; nearby transfer in the central and western regions accelerated gradually.

Changing Trends of Population in Nashik District, Maharashtra. India

Dr. Pager Mansaram Pandit

Affiliated to Savitribai Phule Pune University -7, Nashik-422001. Maharashtra (India), pagarm@gmail.com,

Abstract

The present paper aims to changing trends of population in Nashik district. The spatial variation of changing trends of population from 1901 to 2011. Nashik, lying between $19^{\circ} 33'$ and $20^{\circ} 53'$ north latitude and $73^{\circ} 16'$ and $75^{\circ} 16'$, with an area of 15530 Sq. K.M. North South lengths is 120 kms. East West length is 200 kms. Nashik has a population of 6,109,052 of which 3,164,261 are males and 2,944,791 and females. Average literacy rate of Nashik district in 2011 was 82.91 compared to 80.96 in 2001. In 1901 the density was 52 and in 2011 the density was 393 per sq. km. The progressive growth rate from 1901 to 2012 was 11.25 to 642.22 per cent, respectively. The population trend is calculated with the help of time series. In 1901 population was 45.44% more and less in 1941 i.e. -13.86. From 1921 to 1981 the population was below the population trend but after 1991 population it gradually increased. The average rainfall it receives is 1034 mm

In the present times, because of advances in good climate, industrialization, development of road, University level educational facilities, religious importance, cargo services, good quality of grapes, pomegranates and onions, more and more people are being attracted towards Nashik districts. Another cause for increase in the population is the main attraction of Ramkund, Muktidham Temple, Kalaram Temple, Coin Museum and Trimbakeshwar.

Chinese Immigrants in Canada: Their Changing Composition and Economic Performance

Wang, S.

Department of Geography and Environmental Studies, Ryerson University, Toronto, ON Canada, M5B 2K3,

swang@ryerson.ca

Abstract

China continues to be a major country of origin for global migration, and Canada is one of the preferred destinations for many Chinese emigrants. In the recent two decades, more than half a million of mainland Chinese immigrated to Canada, where economic returns to their human capitals are expected to be higher than in their home country. Despite their improved human capitals, many Chinese immigrants have experienced different economic outcomes in the Canadian labour market with lower-than-expected earnings. This paper has two purposes. First, it analyzes the changing compositions of the Chinese immigrants who were admitted to Canada in the last two decades, with a focus on their human capitals brought to Canada from China, including levels of education, Canadian official language ability, and immigration class associated with pre-migration work experiences. Second, the paper examines the economic performance of the Chinese immigrants in Canada. Comparisons are made with both the native-born Canadians and the immigrants from India – another major source country of immigrants in Canada, to gauge the levels of integration of the Chinese immigrants in the Canadian economy. This study found that employment income of the Chinese immigrants is indeed lower than both the native-born Canadians and the Indian immigrants. Despite that many Chinese immigrants exhibited high consumption powers, particularly in consumption of real estate in major Canadian cities, their wealth seems to be brought to Canada, not earned here, and their powers of consumption may not be sustainable over the long run.

²University of Lethbridge, Lethbridge, T1K3M4, Canada

³Fudan University, Shanghai, 200433, China

Abstract

The rapid development of urban industries, in combination with gradual relaxation of administrative constraints on rural-urban migration, makes possible numerous rural residents move to and work in cities in post-reform China. Nevertheless, few rural migrants, if not none, prefer to reside overlong in cities, this is especially evident when more and more policy-related benefits are attached to their rural farmland. Existing research on the intention of settlement of rural migrants in urban China explain its determinants and causes mainly based on either urban factors or rural factors. A synthetic analysis regarding this issue in the English-written literature is absent. This paper will provide a comprehensive analysis of factors affecting the intention of rural migrants' settlement in urban China through constructing an all-around urban-rural-migrant analytic framework within which not only objective factors but also subjective ones will be introduced. Our results indicate that whether rural migrants seek for a permanent stay in cities depends on the interaction of their urban performances, rural landholdings and demographic characteristics. The effects of urban performances and rural landholdings on rural migrants' settlement intentions are similar to the push and pull power widely analysed in the migration studies while the effects of migrants' demographic characteristics are non-monotone and conditioned.

Demographic Behavior and Migration Processes in The Republic of Bulgaria in the Past 25 Years

Slaveykov P., Kl. Naydenov,

Sofia University "St. Kliment Ohridski", Sofia 1000, Bulgaria, kl.naydenov@gmail.com

Abstract

Due to the specifics of the historical and socio-economic development of our country, international migration has always been related mainly to emigration of the population. After lasted more than 40 years a ban on the free movement of people across the border in 1989 had caused a huge wave of emigration that in the coming years quickly reduce its scope. This wave in the beginning there were mainly political in nature and was ethnically motivated. Soon after, emigration from the country began to be determined by the conditions and factors that attribute a greater economic nature. Decision migration has become a particular response of the social and economic situation in the country. Bulgaria continues to be a departure of young and educated people, in which the state has invested and which are more easily adaptable to the requirements of the market economy. The emigration of young and highly educated people has serious economic and social consequences for the future development of the country. Emigration has a strong negative impact on the reproduction of the population, as by the export of women in fertile age decreased level of potential future fertility, not only for the next 10-15 years, but for a much longer period of time - 40-50 years. The reasons for emigration in recent years associated with the provision of employment, higher incomes and a higher standard of living for emigrants.

Key words:

Economic situation; emigration; socio-economic development; young and educated people

Determinants of Urban to Rural Return Migration in China: The Roles of Individual, Household and Regional Factors

Jianfa SHEN, Qiang REN, Yu ZHU, Wenfei Winnie WANG, Xiaoman LIU

Department of Geography and Resource Management, The Chinese University of Hong Kong, Hong Kong, China,
jianfa@cuhk.edu.hk

Abstract

There has been large scale rural to urban migration in China since the early 1980s. Most rural migrants become temporary population in destination cities without local hukou (household registration). Such temporary population from rural areas reached over 200 million according to 2010 population census. These rural migrants have stayed in the urban areas for different periods of time. There has also been a count-stream of urban to rural migration which is called urban to rural return migration. Rural migrants return to their home villages or counties for various reasons at various life stages. This paper examines the determinants of return migration from urban to rural areas in China based on the sampling data collected in 2015. The paper will analyze the characteristics of return migrants and the roles of individual, household and regional factors in the decision of return migration. The findings will contribute to the understanding of the migration and return migration process and help the formulation of rural policies, migration policies and urbanization policies.

Key Words:

return migration; individual factors; household factors; regional factors; China

Disparities of Sex Ratio in Maharashtra State of India

Mr. Pramod B. Waghmare¹, Dr. Parag A. Khadke²

¹Research Scholar, School of Earth Sciences, Swami Ramanand Teerth Marathwada University, Nanded, Maharashtra, 431606. Email- waghmarepramod2@gmail.com

²Assistant Professor and Research Guide, School of Earth Sciences, Swami Ramanand Teerth Marathwada University, Nanded, Maharashtra, 431606

Abstract

Sex ratio plays the pivotal role in assessing the reproductive performances, mortality, occupational structure and the migratory character of the population. There are many ups and downs in sex ratio over a period of time in 1901 to 2011. Some of the reasons commonly put forward to explain the consistently low levels of sex ratio are neglect of the girl child resulting in higher mortality at younger age, high maternal mortality, sex selective abortions, female infanticide. There were 984 females for every thousand males in the World in 2011. Europe had the highest sex ratio followed by North America and Africa. Asia, on the other hand, had the largest deficiency of females. India, there were 933 females for every thousand males in India, which increased to 940 in 2011. The country's sex ratio has declined from 934 in 1981 to 927 in 1991. In west Maharashtra has high sex ratio in comparison to other part of Maharashtra. The tribal belt of Maharashtra is characterized by high sex ratio. Highly urbanized districts of Maharashtra is Mumbai, Mumbai suburban and Thane (832, 860 and 886 females per thousand male) distributed sporadically also had a low sex ratio. In India urban sex ratio of 1901 census was 910 and 2011 are 926 females, whereas urban Maharashtra sex ratio was 862 in 1901 and which was increase slightly up to 899 females per 1000 males in 2011. We found lot of variation in rural and urban sex ratio in Maharashtra state.

Error Analysis of Modelling Regional Migration in China

Jianfa SHEN, Yefang HUANG

Department of Geography and Resource Management, The Chinese University of Hong Kong, Hong Kong, China, lucy-huang@cuhk.edu.hk

Abstract

There has been much methodological advancement in the regional migration modelling. Previous studies have focused on the modeling of the whole migration process and are not able to identify the bottleneck of achieving good model performance. Traditional migration modelling reports the overall performance of the migration model. The method developed in this paper can be used to determine whether modelling errors are due to poor performance of origin, destination variables or due to the poor modelling of spatial interaction. There are three steps for error analysis. The first step is the estimation of a migration model for a specific regional migration system. The second step decomposes each set of migration flows into the relative emissiveness, attractiveness and the level of interaction between pairs of regions. In the third step, the relative emissiveness, attractiveness and the level of interaction based on real and estimated migration flows can be compared to calculate the modelling error. This paper uses interregional migration of China in the period 2005-2010 as a case study. Error analysis shows that the modelling errors of the constant K, the relative emissiveness and attractiveness caused mean relative errors of -1.20%, 3.12% and 2.21% in migration flows. The spatial interaction caused the greatest mean relative error of 12.11% in migration flows. Thus the spatial interaction effect remains the most difficult to be modelled in migration modelling. The findings of this research contributes to a better understanding of migration process and points to directions to improve migration modeling.

migration modelling; error analysis; regional attribute; spatial interaction; China

Finding Regions Where Non-Japanese Live Dispersed in Japan

OKAMOTO K, MORITA M, SHIMIZU, S

Nagoya University, Nagoya, 464-8601, Japan, h44540a@cc.nagoya-u.ac.jp

Abstract

The Great East Japan Earthquake made a realization of non-Japanese living dispersed in various areas across Japan. The non-Japanese trainees working in the small-size factories in the underpopulated areas and the immigrant wives married to Japanese men in the farming areas were there to compensate for the decreasing Japanese working-age population and the decreasing number of Japanese women who will marry farmers. These women, mostly Chinese and Filipino, live in local communities, isolated from the other non-Japanese residents. Their distribution pattern is very different from that in foreigner-concentrated areas in metropolises like Tokyo and Osaka. This study analyses the pattern by using the Grid Square Statistics of 2010 Population Census and GIS. The Grid Square Statistics is one of the small area statistics which divides the whole area of Japan into small mesh. This study uses statistics of 1km x 1km grids. So far, we have seen that the degree of the isolation of the non-Japanese woman is remarkable in northeastern Japan. For example, among the 6,729 inhabited grids of Iwate Prefecture, one of disaster-affected Prefectures, 1,357 of which had non-Japanese residents, 704 had only one non-Japanese, and 617 of those 704 non-Japanese were women. In other words, of the one-square-kilometre grids with any non-Japanese, roughly half of them had only one non-Japanese resident and that person was female. On the other hand, this ratio was relatively low in the Prefectures of southwestern Japan. This regional difference would be based on how many foreign brides the rural areas adopt

General Aspects of Immigration in Brazil in the 21st Century

Georg Uebel, R.R.

Federal University of Rio Grande do Sul, Porto Alegre, Brazil, robertouebel@hotmail.com

Abstract

This paper analyzes through the thematic cartography, spatial data analysis and confrontation with the recent and classic literature, the immigration flows in Brazil and their dynamics and networks in the first two decades of the twenty-first century. According to the findings and reports obtained in the field researches in four regions of the country, we can infer that Brazil is definitely inserted on the routes and on the global agenda of international migrations. Therefore, with this research we also intend to identify and discuss the main migratory flows (of economic immigrants and refugees) from each continent towards Brazil nowadays.

international migrations; brazil; migratory dynamics; demographic profile; thematic cartography; 21st century

Geographical Analysis of Population Settlement in the Southwest of the Caspian Sea

Nasrollah Molaei Hashjin

Full Professor at Geography Department, Rasht Branch, Islamic Azad University, Rasht, Iran, nmolaeih@iaurasht.ac.ir

Abstract

With regard to the situation and geographical variations in the Southwest of the Caspian Sea, the formation and spread of urban, rural, and nomadic settlements is divergent in such a way that this area has been classified into two main parts of plain and mountainous and four parts of littoral, plain, piedmont, and mountainous. Guilan Province is located in the Southwest of the Caspian Sea. This province covers 14044 square kilometers and comprises three regions, two thousands and ninety-two villages. Findings of the research reveals that while 35.8 % of the Guilan area, 5027 square kilometers, 64.2 %, 9017 square kilometers, are located in the littoral-plain and piedmont- mountainous areas, respectively, the distribution of population indicates around 56 percent of rural settlements and 80 percent of rural population, around 83 percent of cities with 93 percent of urban population and the winter dwellers in littoral-plain, 44 percent of rural settlements with 20 percent of population, 17 percent of towns , with 7 percent of urban population and the areas of Spring and Fall dwelling and county side migrants in piedmont–mountainous regions.

Geographical Factors Affecting Small Population Settlement (Case from Mongolia)

Batbuyan B, Khishigdorj D

Institute of Geography and Geocology, Mongolian Academy of Science, Ulaanbaatar, Mongolia, info@geo-eco.mn

Abstract

This paper examines the potentials for creating a multi-center system of population settlement in Mongolia considering the present mixture of the traditional pastoralism and the sedentarized lifestyle such as a village type (soum center). In line with the three magnets law, the pull-and-push process of urbanization is rapidly increasing in Mongolia. As a result, the role and functions of some settlement have changed. A population growth in the larger cities has an effect of a territorial expansion of the settlements. One of the reasons for the migration of pastoral herders towards the urban centers is their interest in intensive farming business. Therefore, there is an urgent need to identify an appropriate planning of population settlement surrounding larger towns. We conducted this study in an area where rapid infrastructure development has been observed attracting intense migration to the cities. The study found that there are distinguishable agricultural zones created surrounding the big settlements such as provincial capitals in the form of the settlement network. The population of small settlements has decreased due to the influence of bigger settlements with the developed market and infrastructure. The roles of these little settlements become to host agricultural production as well as to provide new opportunities to migrant herders. Nevertheless, many of them still lack access to the social services and infrastructure. To address these issues, for many people centrality purpose deliver to social services, its preserve the central location in out-settled areas, value chain to create areas of the cities (soum centers) the particular role of the conditions of two bordering provinces first must to logically develop those areas (soum centers).

Have Many Children Have Been Lost? A Simulation of Post-Communist Social and Demographic Transformation on Population Ageing in Slovakia and the Czech Republic.

Branislav Bleha

Comenius University, Faculty of Natural Sciences, Ilkovicova 6, Bratislava, Slovakia, bleha@fns.uniba.sk

Abstract

The political changes in Europe around 1990 started a transformation, social changes and also rapid and fast demographic changes. These are known facts, analysed by hundreds of studies. However, so far, these changes in the dynamics and ageing have not been precisely quantified. Thus the main objective of this “what-if” study is to quantify the impact of changes in reproductive behaviour associated with social changes to the age structure in the example of the Czech Republic and Slovakia and their mutual comparison. How would the populations of the transition countries look like if socialism had not ended, and if the pronatalist socialist regimes had continued? How many children were “lost”, or unborn, and how many more seniors will be there as a consequence of the fall of the communist regimes? A theoretical simulation, retrodiction using the cohort-component method, was carried out. Parameters of reproduction actual at the end of the socialist period (1989) were extrapolated until 2040. Differences in the medium scenario of official forecasts and in the theoretical simulation are more or less surprisingly significant and, in the more distant future, they increase rapidly. The more communism “preserved” higher levels of fertility and mortality, the more their rapid and fast decline has been manifested after 1990.

Czech Republic; Slovakia; transformation; ageing; simulation

Household Population Dynamics and Livelihood Changes in a Rice Farming Village in Central Laos

Nishimoto F¹, PRELIC Team (Population dynamics, reproduction and livelihood changes in small-scale communities of Laos)

¹Nagasaki University, Nagasaki, Japan, nishi-f@nagasaki-u.ac.jp

Abstract

Household undergoes the change of size and composition over time as its members come and go through birth, death and migration. Such household population dynamics is one of the important variables to see the process of population and migration change in small areas. This is true for rural society in Laos, where single households have great power to make livelihood decisions. Based on the retrospective survey of changes during the last fifty years in a rice farming village in central Laos, this study aims to identify the development process of household with the key demographic and livelihood factors affecting that process. The study village had 110 households with a population of 765 at the end of Y2014 while almost 300 people were temporarily away for work and study. There were 159 families of husband and wife both alive with children. Among them, 60 husbands and wives (37%) left their children at grandparents' care to go to work. Back in Y1970 when there were few opportunities for migrant labour, the village had 50 households with a population of 335. The average number of persons per household was almost the same between the two periods. But its composition and the form of cooperation between households was changed in response to the demographic and livelihood changes over the time. How had Population Changes Affected Paddy Holdings? A Result of Dynamics for Three Generations in a Rice Farming Village of Central Laos

Yokoyama S¹, PRELIC Team (Population dynamics, reproduction and livelihood changes in small-scale communities of Laos)

¹Nagoya University, Nagoya, Japan, s-yokoyama@nagoya-u.jp

Abstract

It is hardly clarified detailed population dynamics in the small-scale community in developing countries which does not exist complete data of residents. However, an accumulation of the case studies in those communities from comprehensive perspective must be needed to estimate future population trends of the world, because most of world population are occupied in developing countries. Therefore, we are trying to clarify the interrelationship between population dynamics and livelihood changes at the household level for three generations in a rice farming village of central Laos. In the study village, paddy reclaiming began from the lowlands along the stream from the 1930s, but the rate of paddy reclaiming has sharply decreased since 1960s because the lack of lands within the village. Then villagers have begun to purchase the paddy since 1970s. The source of purchase funds was due to migrant to Thailand that has been made since the 1970s. The first migrant worker in the study village was seen in the early 1960s, and villagers have constantly been going to work to Thailand since the 1970s. With an increase in the migrant workers, purchase of paddy from the neighbouring villages and from ex-villagers who went to out of the village made vigorous. As a result, the study village has achieved rice self-sufficiency. Regarding the relationship between population increase and paddy holdings, it is greatly affected by temporary transnational migration under the movement toward regional integration of mainland Southeast Asia. Acknowledgement: This work was supported by JSPS KAKENHI Grant Number 25257004.

Identities of Refugees from Post-Soviet Countries in Germany

Zelenskaia, A.A.

The European University in St. Petersburg, St. Petersburg, Russia, alenazelenskaya@gmail.com

Abstract

Europe and Germany in particular are facing an ever increasing influx of refugees since the 1990s. Today most refugees come from the Middle East, Africa and the Western Balkans. By the end of 2013, however, the major donor country was Russia. Since the refugees from Russia and other Post-Soviet countries do not originate from war ridden countries, they wait for the official refugee status for months or even years. During the whole period of the asylum procedure they remain between two worlds. The aim of this research project was to shed light on how these migrants adapt to new life circumstances, whether they conserve their various identities (ethnic, religious, professional, linguistic, etc.) and which strategies they employ to do so. The field research was conducted from 2014 to 2015 and was based on participant observation in German asylums in Berlin and Bavaria as well as biographical interviews. Among the interlocutors were not only refugees from Latvia, Russia, the Ukraine and Turkmenistan, but also German asylum wardens, social workers and decision makers. The interviewing of both sides allows a more balanced perspective. The results reveal that the ways these refugees keep and form their identities highly depend on the legal framework they are confronted with and how they are perceived by the host society and by other refugees. My research can contribute to a better understanding between migrants from Post-Soviet countries and the host society. It may also assist decision makers in the area of integration.

Impacts of Rural-Urban Migration on Alleviating Rural Poverty in Different Landforms in Inland China

Pan ZH, Xu W, Huang ZY, Wang GX

University of Lethbridge, Lethbridge, T1K3Y4, Canada, zehan.pan@uleth.ca

Abstract

Large scale of rural to urban labour transfer is widely acclaimed as major factors for reducing rural poverty as a whole in China. However, most of the poor are living in the remote, mountainous rural areas in inland China, where are the main migrants sending areas, with a concentrated tendency. Why does the poverty still concentrate to the mountainous rural areas in inland China as the huge amount of rural labour transfer? Whether labour transfer alleviates the poverty in mountainous rural area compared to the plain rural area in inland China? If it is same in the effects of labour transfer on rural productivity under different landforms in inland China? Few scholars have realized that the effects of labour transfer on rural productivity may depend on the topographic conditions and try to compare the effects under different landforms. This paper will provide some insights into these questions based on the data collected from a recent survey of intentions of rural labour transfer in several inland provinces of China. The results show that labour migration exercises much less negative influences on the income of rural households who reside in the plain area than that of those in the mountainous area. Therefore, the local wage in plain rural areas can be improved more easily by labour migration. The deep reason lies in the greater difficulties in applying modern agricultural technologies and consequently slower agricultural productivity growth in rural areas characterised by rough terrains.

Rural-Urban Labour Transfer; Topographic Conditions; Alleviating Poverty; Inland China

Impact of Urban-Rural Return Migration on Rural Development in China

Wang W, Du H

School of Geographical Sciences, University of Bristol, Bristol, BS8 1SS, United Kingdom, w.wang@bristol.ac.uk

Abstract

Population mobility is an essential element in the livelihoods of many households in developing countries as a diversification strategy. However, migration remains a selective process as the poorest of the poor do not have the connections and resources that are needed to engage in migration. While alleviating rural poverty and reducing rural-urban disparity have been imperative issues in developing nations, urban-rural return migrants who are equipped with accumulated human, financial, and social capital through their migration experiences are capable of acting as agents of change to bridge the gaps between the origins and destinations and facilitate rural industrialization and urbanization. China has experienced massive rural-urban migration over the past 30 years. Recent research has shown that the majority of the rural migrant workers do not have the intention to settle permanently in cities due to structural and institutional constraints and many have returned. This study aims to analyse both economic and social impacts from return migrants on rural development in China using a multilevel approach. The empirical study will be based on a primary data set collected from seven provinces in China in 2015. The study examines the impacts of returnees' economic engagement on job creation, investment and economic diversification as well as how the livelihoods of non-migrants are affected by return migration over time. The results provides valuable implications for policy makers in China on how to effectively incorporate return migration to stimulate rural development and help the rural poor to exit poverty.

Internal Displacement in Ukraine: Social Consequences, Territorial Disparities and Policy Implications

Gerasymenko G.

Institute for Demography and Social Studies, NASU, Kyiv, Ukraine, geranna@ukr.net

Abstract

Political destabilization and armed conflict in Eastern Ukraine (2014) has led to development of a new social phenomenon – the large-scale internal displacement of people. Such process posed a new development challenge for the whole country, as thousands of people have to leave their households; they still are particularly vulnerable in many aspects, facing unemployment and lack of income; they also could experience the increased risks of social exclusion, discrimination and stigmatizing in hosting communities. In practice, internal displacement is associated with losses of dwellings, land plots, usual environment, as well as disintegration of family ties. Moreover, the consequences of internal displacement could be seen in the long-term run, affecting economic stability, facilitating humanitarian and environmental problems, posing new treats in terms of population health and epidemiological safety, etc. Internal displacement affected the regional development as well, leading to the increase in territorial disproportions and inequality.

The proposed paper deals with analysis of the current and potential challenges caused by development of the internal displacement flows in Ukraine. Official data on the registered IDPs are used, as well as data of a special population-based survey in the conflict-affected regions. The paper provides assessment of the major social consequences of displacement, including demographic processes, trends at the labour market, increased pressure on the social safety nets and environmental risks of displacement.

International Migration in Poland. A Migration Policy Perspective

Potrykowska Alina

The Government Population Council of Poland, Warsaw, Poland, a.potrykowska@stat.gov.pl

Abstract

The phenomenon of migration, which is associated with the globalisation process of the world's economy, is also reflected in Poland. The emigration of Poles indicates a tendency of temporary or seasonal departures, which is in accordance with the migration trends observed in Europe or throughout the world. The current migration processes and the consequences of implementing the Union's principle of the free flow of workers, are not reflected in the state strategies. Their presence is required in light of the data concerning emigration potential and emigration resources, as well as the newest CSO demographic projections up to the year 2050. The treatment of the migration policy as a permanent element of the state's development and modernisation strategy requires it to be based on solid knowledge regarding the nature and results of migration.

From the perspective of the ensuing migration processes in the world, Poland plays a dual part. On the one hand, we are observing the phenomenon of migration for work and permanent residence by Poles, mainly to other highly developed countries. From this perspective, Poland can be described as a source country. On the other hand, to a considerably lesser extent, we are dealing with an inflow of young persons to Poland seeking employment and/or wishing to settle here, or to continue their education. Above that, even refugees are looking for shelter in our country, so immigrants escaping armed conflict and other disasters which confronted them in their own countries. We are also noting returns of country mates on the basis of the Repatriation Act. Finally completing the picture of immigrant inflow to Poland are persons who attempt to cross the border illegally. Poland therefore also plays the role of a destination country. The migration process from and to Poland is therefore very complicated and, due to this, difficult to capture, and additionally its nature is very dynamic, as can be observed with the changes related to the worsening of the economic situation in the world.

International migration; Poland; migration policy

Investigation of Demographic Trends in Rural Areas Gilan Province

Vahid Riahi, Frahad Javan

Associate of Geography and Rural Planning, Kharazmi University, Tehran. Iran, vrli2004@yahoo.com

Abstract

In today's world the importance of awareness of statistics and information has been increasing. Valuable information has increased, such a way that having detailed information and statistics on every section of society directly associated with the correct planning and decision-making. Of the most important required statistics and information in the different sectors of society is having awareness of population statistics. That not only have been considered in the past but also has been facing a hundredfold importance in recent decades. An accurate understanding of Iran's rural community's related issue is very important. Because root cause of all problems and issues of retardation such as widespread poverty, growing inequality, rapid population growth and rising unemployment located in rural areas. In this research has been paid to demographic trends in Gilan rural settlement in three censuses, to be determined the process of transformation in the past and new strategies for rural situation of province in the future. In this framework the required information were taken from Central Organization for Statistics and Population and housing censuses. After extraction of required data transformations were shown in map form in Arc GIS software. The results showed that the rural population in Gilan province during the years 1355 to 1390 has changed so that the population of rural areas in 1355 was totaled 1,120,517 persons. With a growth rate of 5.1 percent in 1365 increased to 1,296,859 persons. This increase was stopped the next few decades so that during the 1365-75 the rural population at an annual rate of 84 / -0% to 1,191,916 persons. During the decade 1375-85 annual growth rate 72 / -0% to 1,109,110 persons. And in the years 1385-90 with an annual growth rate of 37/2% to 983,704 persons have fallen. This indicates the urban unbalanced growth in the province. That continued of this trend leading to the elimination of rural settlements and a sharp decline in agricultural production in the province will follow, therefore seems to be one of the government policy during the future program should prove to be the rural population.

Level and Trend of Internal Migration and Demographic Change in India

Lokhande Sachin, Chavan Sayali

International Institute for Population Sciences, Mumbai 400088, Maharashtra India, sachinlokhande33@gmail.com

Abstract

The study of internal migration or the movement of population within the boundaries of the country is important for the valuable insights it may provide regarding the social and economic forces responsible population redistribution. It has a strong linkage with the social, political and economic constraints of the place of origin or destination. According to census of India 2011 data there are 7935 towns, more than 6 lakhs of villages and pattern of internal migration is from rural to urban areas. This has caused many implications like population imbalance, health issues and other. This paper ascertains the level and trend of internal migration and demographic change in country using the data from Census of India (1991, 2001, and 2011). Level and trend analysis were used to understand the internal migration scenario with time. Descriptive Statistics were used to understand the social and economic forces responsible for migration. The study shows that internal migration has resulted in the population redistribution and is associated with political, economic and social factors. Population redistribution can also occur due to differential rates of natural increase. There are striking differences in the characteristics of out-migrants from villages by sex, associated with the basic differences in the motives for out-migration. Since marriage is main reason for female out-migration. This signifies the difference in the factors affecting migration by sex. There is a need to scrutinize the causes, pattern and consequence of migration at lower levels which may throw interesting light in the dynamics of migration in India

Migration and Market Potential in China

Hua Zhang¹, Huimin Luo¹, Hongsheng Li²

¹School of Geography, Beijing Normal University, Beijing, 100875, China, zhanghua@bnu.edu.cn

²State Key Laboratory of Resources and Environmental Information System, Institute of Geographic Sciences and Natural Resources Research, Chinese Academy of Sciences, Beijing 100101, China

Abstract

The core-periphery model, as a basic model of New Economic Geography, describes a cumulative causation process resulting from interaction of two centripetal forces: First, considering low transport costs and scale economies, firms seek to concentrate in the location with good market access, which is called backward linkage; second, the labors would like to migrate to the industrial agglomeration in order to save the living costs and purchase all kinds of commodities, which is called forward linkage. More attention has been paid to test the backward linkage, while the empirical research on forward linkage is limited. China, as a developing country, has a large number of migrants and a special migration mode considering migration period, the stability of migration and migrants' returning flow. Based on the NEG theoretical model, the paper estimated the market potential index in 283 cities of China, using the data from China Population Census, China City Statistical Yearbook and China Statistical Yearbook for Regional Economy. Then the relationship between market potential and migrants is proved by using the method of regression aiming at testing forward linkage. The results show market potential decreases from the eastern coastal regions to the western inland in Chinese cities, which is consistent with the spatial distribution of economy development. The market potential index of Yangtze River Delta, Pearl River Delta and Jingjinji region is the highest and the market potential degrades from the centers (Shanghai, Guangzhou and Beijing) of three city clusters to periphery. The spatial distribution of migrants is similar with that of market potential in China. The cities with the largest amount of migrants are located in Yangtze River Delta, Pearl River Delta and Jingjinji region. The market potential makes contributions to labor migration. The regression results show that the market potential, staff annual wage and per capita GDP make significantly positive effects on migration in all the cities.

Key words:

Labor migration; Market potential; New Economic Geography; Forward linkage

Modeling Skilled and Less-Skilled Interregional Migration in China, 2000-2005

Ye LIU¹, Jianfa SHEN²

Department of Geography & Sustainable Development, University of St Andrews, St Andrews, KY16 9AL, UK, ye.liu@st-andrews.ac.uk

Department of Geography & Resource Management, The Chinese University of Hong Kong, Hong Kong, jianfa@cuhk.edu.hk

Abstract

Previous studies on interregional migration modeling in China have tended to treat migrants as a homogenous group. The rise of skilled migrants became a hot topic in recent years, while far less attention has been devoted to the comparison between skilled and less-skilled migration. This paper aims to advance our knowledge of internal migration in China by analyzing the difference between skilled and less-skilled migration in terms of migration patterns and determinants. It also contributes to the study on Chinese migration by using eigenvector spatially filtered method to capture network autocorrelation among migration flows. Results from descriptive analysis show that both skilled and less-skilled migrants tend to move away from the interior to the coastal region. Results from eigenvector spatially filtered negative binomial regression model shows that, compared to the migration of less-skilled people, the migration of skilled people is less influenced by the friction of distance, regional unemployment rate, and the concentration of foreign investment but is more affected by regional wage disparity. With respect to the effect of amenities, climatic amenities exert a strong influence on skilled migration but have positive effect on less-skilled migration at origin and no effect at destination. Quality medical services are influential for the migration of less-skilled people to destinations but no effect on skilled people. Our findings suggest that the decisions of migrants in China increasingly resemble those in Western developed countries, but the migration of skilled people in China is unique as a result of Chinese social and cultural particularity.

Occupational Changes of Migrants in China: Analyses of Three Censuses from 1990 to 2010

Fan, Cindy; Ma, Zhongdong

Department of Geography, University of California-Los Angeles (UCLA), Los Angeles, CA 90095, USA, fan@geog.ucla.edu

Abstract

Informed by dual labor market theory and reinforced by hukou barriers, it is generally understood and expected that Chinese migrant workers are segregated into the lowest urban occupational rungs, sometimes referred to as 3D (dirty, dangerous, and difficult) jobs such as construction, recycling, and factory work. This paper is concerned with if and how migrants' employment and occupations have changed over a 25-year period, from the mid-1980s - when rural migrants began to enter the urban labor market in large number - to 2010. We argue that the dual labor market framework as well as the hukou lens privilege a top-down and static perspective. Meanwhile, increased market forces, the labor market's changing skills demand, as well as new migrant demographics have all tended to foster occupational mobility of migrants. Hukou is not as important as before. Rapid economic changes have generated new jobs that require higher skills. Compared to older and earlier migrants, younger and new-generations migrants have stronger human capital and are more selective and less tolerant. Through analysis of micro-data from the 1990, 2000 and 2010 censuses, with over ten million records for each census, this paper documents the occupational changes of labor migrants at the one and two-digit levels. Our findings highlight changes "up the skill ladder" within the same occupational category as well as occupational diversification into other categories especially services.

Population Geography in China Since The 1980s: Forging The Links Between Population Studies and Human Geography

Zhu Y, Ding J H, Wang G X, Shen J F, Lin L Y, Ke W Q

School of Geography, Fujian Normal University / Asian Demographic Research Institute, Shanghai University, Fuzhou, 350007, P. R. China, zhu300@fjnu.edu.cn

Abstract

This paper reviews the progress of population geography in China since the 1980s. The review results suggest that contrary to the common perception of its invisibility and marginalized status in the field, tremendous progress has been made in population geography in China since the 1980s. Population geographers have made significant contribution to the understanding of a wide range of population issues from geographical perspectives, including migration, urbanization, population distribution, the relationships between population, environment and resources, aging, marriage patterns, and migrants' crimes, although such contribution often did not appear in the geographical circle. Furthermore, population geographers have played an indispensable role in revitalizing population studies in China and forging its links to human geography, occupying an important position in this multi-disciplinary field. Population geographers' contribution to the areas of migration and urbanization research has been particularly significant, playing a leading role in these multidisciplinary research areas. The paper demonstrates that population geographers in China have gone through a process of catching up and increasing engagement with developments in social sciences since the 1980s, and have benefitted greatly from it; however, there is a tendency for population geography to be increasingly alienated from the main stream human geography. The paper argues that population geography is only half way in the course to forge the links between population studies and human geography, and it needs to strike a healthy balance between the field of population studies and that of human geography so as to promote its further development in a multi-disciplinary field.

Key words:

population geography; the 1980s; population studies; human geography; links; China

Population Growth in the Adjacent Area of Bucharest (Romania) - Positive Effects?

Stoica Ilinca-Valentina, Zamfir Daniela, Tălângă Cristian

University of Bucharest, Faculty of Geography, Interdisciplinary centre for advanced researches on territorial dynamics (CICADIT), Bucharest, Romania, stoicailincavalentina@gmail.com

Abstract

After 1990, within the socio-economic transformations that have taken place on the background of the political regime change, there has gradually begun to emerge a process of emigration of the population from Bucharest to the adjacent area (predominantly rural). As a result, there has been a population growth and the emergence of new residential areas. The process of urban sprawl was not radial around the capital, noting the existence of certain attractive areas, which registered an increase in the number of inhabitants by 50%, simultaneously with an increase in the number of new housing units (in certain situations by more than 70%). The work can be divided into two parts, the first focusing on identifying settlements that have registered a significant increase in population, as well as the causes that led to the manifestation of these migratory flows. The second part focuses on analyzing the changes manifested locally, from several points of view: demographic (changes in structure by major groups of age), services (in terms of education and health), local infrastructure, pressure over the environment and land use changes. Simultaneously, there is also analyzed the way the process of territorial development is managed, being under constant pressure due to the proximity to Bucharest. In this sense, to investigate the perception of the local authorities' representatives, there was applied a questionnaire in several representative settlements. To overview all the registered changes, there will be calculated more demographic and socio-economic indicators.

Bucharest; adjacent area; urban sprawl; population growth; local authorities

Recent Immigration to Czechia: A Case of Chinese

Tadeusz Siwek

University of Ostrava, Czechia, tadeusz.siwek@osu.cz

Abstract

Czechia as a small country (10.5 million inhabitants) in Central Europe is not too attractive place for immigrants. Only 0.5 million foreigners live in this country today (4.3 % of total population), and their number has not been growing in the last 5-7 years. But among former European communist countries number of foreigners in Czechia is quite high. Foreigners in Poland, Slovakia, Hungary, Romania and Bulgaria share on the total population less than 1.5%. First part of the paper presents the immigration to Czechia.

Second part of the paper deals with Chinese immigrants to Czechia. Chinese are small part of foreigners living in today Czechia: their number is only about 5,500 (1.2% of all foreigners and 0.05 % of total population of the country). Chinese are relatively new immigrants in Czechia, but their number is quickly increasing especially during the last decades. They come to Czechia predominantly due to business, most often to small family enterprises like restaurants and shops. Big Chinese investments in Czechia started last year (2015). Economic success of Chinese strengthens their position despite of their small number and a big cultural distance from majority of Czech population. Last part of this paper presents the formation of their community predominantly in Prague, a capital of Czechia, during last two decades.

Czechia; immigration; Chinese immigrants

Region, Income and Urbanization of 200 Million People

Wang GX, Pan ZH

Fudan University, Shanghai, 200433, China, wanggx@fudan.edu.cn

Abstract

China's population urbanization process specially develops a "two-stage" pattern, from "formal centralization" to "essential citizenization", under the dualistic society based on the "Hukou" system since the Reform and Openness, and is moving forward with the Reform and Openness going on. The government raised 3 questions about how to promote the urbanization of "300 Million People" before 2020 in the "National Plan of New-Type Urbanization (2014-2020)". Among the 3 questions, one is how to help 100 million people who have migrated from rural areas to urban areas but can't enjoy the rights of citizens get "Hukou", the process of which means the "essential citizenization". Another question is how to conduct 100 million rural people to become urban citizens in nearby cities and towns directly, the process of which means the accomplishment of "formal centralization" and "essential citizenization" simultaneously. The population distribution and migration choices vary inside the vast country where the natural environment and the development level of social and economic also differ in different regions. Generally speaking, both of the abovementioned questions are related to the regional location and the income level in there. This paper is to analyse where are the reasonable regions to solve the above 2 questions of 200 million people respectively. This will afford scientific references for achieving the 200 million people's urbanization.

Regional Distribution of High Skilled Foreigners in Japan: Recent Trends and Underlying Factors

Dai Erbiao

Asian Growth Research Institute (AGI), Kitakyushu, 803-0814, Japan, dai@agi.or.jp

Abstract

After 2005, Japan's total population turned to decrease. Its negative impacts of population decline on labor supply, domestic consumption demand and the national pension system are deeply worried by the government and the economic society. Besides the decrease in labor quantity, the shortage of skilled workers in some fields also attracted high concerns. In order to improve Japan's economic competition power and maintain its leading role as one of the major countries in the world, it has been recognized that it is necessary for Japan to receive more young foreign-born labor, particularly those with high skill and challenge spirit. Under such a background, many cities in Japan have implemented related policies for attracting highly skilled foreigners. However, the regional distributions of skilled foreigners are quite uneven. Based on official statistical data, this paper analyses the characteristics of regional distribution of various categories of skilled foreigners in Japan and examines the underlying factors of these distributions.

Return Migration and *in Situ* Urbanization of Migrant Sending Areas: Insights from a Survey of Seven Provinces in China

Zhu Y, Wang WW, Lin LY, Shen J F, Ren Q

School of Geography, Fujian Normal University / Asian Demographic Research Institute, Shanghai University, Fuzhou, 350007, P. R. China, zhu300@fjnu.edu.cn

Abstract

Based on a survey in migrant sending counties of seven provinces, and drawing on the experiences of *in situ* urbanization in the coastal areas, this paper attempts to examine whether the emerging trend of return migration of migrants from the inland areas could play a similar role to that of overseas Chinese, who served as catalysts in *in situ* rural-urban transformation of their hometowns, and contribute to closing the gap between the inland and coastal areas in urbanization and regional development. The paper first looks at the characteristics of return migrants in comparison to non-migrants, and demonstrates that return migrants are more advantaged in educational attainment and income level, and their migration experience has been conducive to their increase in capital accumulation, innovative spirits and entrepreneurship, creating an important condition for rural-urban transformation of their hometowns. The paper then shows further that there has been some noticeable increase in the share of non-agricultural activities in return migrants' employment structure and income sources, and in the share of town centers in their employment and residential location, suggesting that return migrants have contributed to the accumulation of urban elements in their hometowns. The paper also identifies some major drawbacks in *in situ* rural-urban transformation of migrants' hometowns, suggesting that measures should be taken to tackle the problems of weak manufacturing industries and small and over-dispersed patterns of non-agricultural activities to promote further development of *in situ* urbanization in migrant sending areas.

return migration; *in situ* urbanization; migrants; sending areas

Return Migration and Rural Urbanization in Western China

Yong CHEN

Institute of Population Research, Faculty of Social Development and Western Development Studies, Sichuan University, Chengdu, Sichuan, China, 610064

Abstract

Hundreds of thousands of migrant workers return to their homeland when they retreat from labor market or grow aged. Instead of going back to their villages doing farm work, the bulk of them opt to settle down in towns or small cities near their villages. Different from distance migration-driven urbanization in big cities, local or rural urbanization are pushed by demand by returned migrants and local farmers. While local towns and small cities play a major role in absorbing retired farmers and promoting rural urbanization in agricultural areas in western China, there emerge some challenges and problems facing their sustainable future: lack of sustained industrial activities, outflow of active labors, high vacancy rate of houses, inadequate provision of social services. It is desired that preferential policies be put in place for development of rural nonagricultural industries and more public investment be streamlined in urban infrastructure and social services for rural towns and small cities in western China.

return migration; rural urbanization; western China

Rural-Urban Commuting in Romania after the Fall of Communism (1990-2015)

Sabin-Alexandru NICULA, Ioan ABRUDAN, Vasile SURD, Bogdan-Nicolae PĂCURAR

Center for Settlements and Urbanism Research, Faculty of Geography, Babeş-Bolyai University, Cluj-Napoca, Romania,
vsurd@geografie.ubbcluj.ro

Abstract

The paper at hand aims to present a general view of the rural-urban commuting in Romania, after the fall of the socialist regime. The employed methodology involved the processing of statistical data provided by the Romanian National Institute of Statistics (for the year 2015), followed by their cartographic representation in ArcGIS 10.2.2. The results emphasize a massive decrease of the commuting phenomenon in the last 20 years, caused by the general break down of the national industry. Furthermore, the structure of the current rural-urban commuting presents a strong tertiarization, commuters being employed mostly in the low-skill service sector. The strongest commuting flows were found in tier-one urban centers (provincial metropolises): Cluj-Napoca, Constanța, Timișoara, Brașov, Craiova, Galați, and Iași. The intensity of the current rural-urban commuting has a strong correlation with the number of inhabitants of those urban centers with a strong services tradition, even in the interwar period.

Scenarios for the Near Future: The Demography of Africa at the Horizon 2025

Bouhdiba S

University of Tunis, Tunisia, 2092, sobouhdiba@gmail.com

Abstract

The XXIst century poses many challenges to the African populations, and an intensive debate is addressing the global prospects it offers. This study examines the possible scenarios concerning the populations living in Africa in the XXIst century. I propose to examine more specifically fertility and mortality.

Will fertility stay high in Africa? What can we expect mortality levels to be in the region in the coming years? What about the African epidemiological transition in the XXIst century? What are the causes and consequences of the main demographic changes we expect in Africa? Can we expect a change in the current “demographic images” of Africa (high mortality, high fertility, overcrowding)? These are some the questions to which I will try to find an answer in my research.

The study is organised into three sections. The first one exposes the possible scenarios of fertility (fertility rates, fecundity,) and mortality (mortality rates, life expectancy, main causes of death,) in Africa at the horizon 2025, basing on the prospects issued by the United Nations (United Nations, *World population prospects, the 2013 revision*, New York, 2014). The second part of the research discusses the major determinants that will lead to such demographic changes. The last part of the paper deals with the demographic, economic and social consequences of these demographic scenarios on the African society.

In each part of the study I will try to show to what extent there will be a drastic change in the current images of the African population.

Demography; population; future; Africa

Settlers, Floaters and Returnees: Settlement Intention and Topology of China's Rural Migrants

Shuangshuang TANG, Pu HAO

School of Geographic and Oceanographic Sciences, Nanjing University, Nanjing, 210046, P.R. China, sstang@nju.edu.cn;

David C. Lam Institute for East-West Studies, Hong Kong Baptist University, Hong Kong, P.R. China, ppuhao@hkbu.edu.hk

Abstract

In the rapid urbanization process, settlement intention of rural migrants has been paid increasing attention by scholars and policy-makers. In the Chinese context, settlement is closely related to both settlement places and *hukou* conversion. According to the definition, rural migrants in China could be classified into four sub-groups: settlers (rural migrants aiming to settle down in cities through *hukou* conversion), floaters (rural migrants floating between rural and urban areas and postpone their settlement decision), rural returnees (rural migrants who have no intention of converting *hukou* and will return to their home villages) and urban returnees (migrants who intend to convert *hukou* but settle in rural areas). Although previous studies have compared the migration or settlement decisions of several groups amongst rural migrants, the settlement intentions of the four sub-groups, especially under the changing context, have been rarely concerned. Therefore, based on a recent survey, the paper tries to examine the disparities between the four sub-groups of rural migrants and to explore the causes of their varied settlement intentions under the changing circumstances. Both statistical analysis (multinomial regression models and ANOVA testing) and in-depth interview are adopted in the paper. The results indicate that the settlement intentions of the four sub-groups are based on two separate decision-making schemes, which are to maximize individual and family utilities. And with the changing context, such as the increase of rural migrants' human capital and the development of countryside, rural migrants have had some new considerations of the settlement places and identities.

Key words:

settlement intention; rural migrants; regression model; ANOVA testing; China

Spatial Difference and Its Determinants of Migrants' Hukou Transfer Intention in China's Cities

Liyue LIN, Yu ZHU

Fujian Normal University, Fuzhou, 350007, P. R. China, lly30@163.com

Abstract

Based on data from the 2012 national migrant population dynamic monitoring survey and related statistics, this article examines the spatial pattern and its determinants of migrants' intention of *hukou* transfer in China's 276 prefecture- and provincial-level cities, using GIS spatial analysis and statistical modelling. The results show that the overall level of migrants' *hukou* transfer intention in the cities is not high, and has significant spatial differences. Migrants' *hukou* transfer intention is generally higher in coastal mega-city regions than in other cities, but it is also relatively high in some provincial capital cities and small and medium-sized cities in inland regions with good transport location and resource endowment. Meanwhile, the intention of migrants' *hukou* transfer increases as the administrative level and/or the size of their destination cities increase. The spatial pattern of migrants' intention of *hukou* transfer is shaped jointly by the characteristics of the destination cities and migrants' individual factors, with the former exerting more influence than latter. High level of socioeconomic development and good location of the destination cities can effectively promote their migrants' intention of *hukou* transfer; however, their level of basic public services does not have the same effect. The degree of migrants' social integration in the destination cities can also exert positive effects on their *hukou* transfer intention. However, having medical insurance, the concentration in the secondary labor market and higher household income are negatively related to such intention; furthermore, the individual and family characteristics of migrants do not have a significant impact on it.

Abstract

Regional population distribution has been increasingly concerned in the field of population geography, but still lack of research in a long time series analysis and fine scale estimation in China. This paper focuses on the spatial-temporal characteristic and dynamics of the population distribution in a long time series, taking Guangdong province in the past 50 years as an example. Previous population census data of all the 92 counties in 1964, 1982, 1990, 2000, and 2010 are collected. By using the Lorenz Curve and some quantitative models in Arc GIS and surfer software, to analysis the variation of population distribution, spatial agglomeration, population gravity centre and the population potential over the past 50 years. This study also uses the grey correlation analysis and stepwise regression to discuss the influencing factors in the population change. The result shows that: (1) the population distribution tends to be concentrated in some high population density areas. The population density gap between different counties is widening, and the gravity centre is moving to the southeast. (2) The spatial distribution of potential population could be described as "point - zone" shape characteristic, forming the "Pearl River Delta – East Guangdong high concentrated region" and the "West - North Guangdong low concentrated region". The population density contour of the three high density areas are moving to southeast; (3) The economic and social factors are the main driving forces, and at the same time, the improving transportation condition and the regional policy also directly influence the characteristic of the changing distribution.

This case study could provide valuable experience for cognizing the mechanism of population evolution, also are of great essential to optimizing the spatial distribution, setting up a scientific and sustainable population development policy in other similar regions.

Spatial-temporal Network of Child Trafficking Crime in China

Gang Li, Huijuan Wang, Ran Tan, Xiang Yan, Ying Fu

Northwest University, Xi'an 710127, P. R. China, lig@nwu.edu.cn

Abstract

Child trafficking crime caused huge losses and damage on society and families and in recent years it become the focus of attention. Current related studies made few progress due to the lack of relevant empirical research and overall knowledge, especially the lack of basic knowledge of the macroscopic features of child trafficking crime in China. Consequently, based on 647 pieces of successful relative-seeking data from the online public platform "Baobeihuijia" and the socio-demographic characteristics and spatial-temporal network features of child trafficking crime in China were examined through using SPSS and ArcGIS analysis methods from the perspective of crime geography. This study found that the crime presented "centralized trafficking-out while decentralized trafficking-in" and "trafficking-out from the west while trafficking-in to the east" features: the core area of trafficking-out concentrated in Southwest China while the core area of trafficking-in concentrated in South China and North China. The crime also presented the main "field-flow" features of the spatial pattern as "three-area and two-route" and the two crime flows were formed between the three crime areas: the south route was from Southwest China to South China and the north route was from Southwest China to North China. South route was much severer than north route. Both trafficking-out and trafficking-in crimes occurred in the southeast half of Huhuan Line. Child trafficking crime presented a geographical proximity effect and reflux phenomenon occurred in several provinces and cities. Gradually in future, the crime was sure to be developed from regional to national, which would be a big challenge for future prevention and control.

child trafficking crime; spatial-temporal distribution; crime network; crime geography; China

Spatiotemporal Analysis of the Population Drain in the Northeast China on Regional Economic Development

Wang Linfeng^{1,2}, Zhang Pingyu², Huang Jie³

¹University of Chinese Academy of Sciences, Beijing, China, 100101, wanglinfeng@iga.ac.cn

²Northeast Institute of Geography and Agroecology, Chinese Academy of Sciences, Changchun, China, 130102

³Institute of Geographic Sciences and Natural Resources Research, Chinese Academy of Sciences, Beijing, China, 100101

Abstract

Since 2000, the population drain issues and the economic recession problems have become the bottleneck to the sustainable development of *Heilongjiang, Jilin, Liaoning Province* in China. Based on the Fourth, Fifth, sixth national population census data in China and economic statistical data of the three provinces, this study firstly analyzed the population flow and general economic conditions since 2000, by taking city scale as the research unit and using GIS Spatial Analysis method. Then, convergence theory and multiple regression analysis methods were used to quantitatively analyze the impacts of the population flow of the three provinces in Northeast China on the regional economy. The results show that: (1) The extent and intensity of the outflow of the population are increasing, while the net outflow is about 2.191 million in 2010 and about the five times compared with 2000, which indicates the population loss crisis. The spatial distribution of population mobility on city scale tends to be intensified in core-edge, which agglomerates along the Harbin Dalian railway line direction. (2) The economic situation of the three provinces in Northeast China is grim, while the average GDP growth rate is only 5.97% in 2014, far below the national average of 7.4%. (3) The population flow on city scale reduces the rate of convergence of economic growth to a certain extent, but the different types of population mobility areas are significantly different. Population mobility has a negative effect on regional economic growth, which is about -3%. This study is helpful for the government to make differentiated population policies and promote regional economic development.

Study on the Population Distribution Prediction of Xi'an City Based on the Census

MI Rui-hua, SHI Ying

Yanan University, Yanan, 716000, P. R. China, rice221@163.com

Abstract

The prediction of urban population distribution is significant to protect the correctness of the urban population policy and the planning of the supporting facilities. The research visual displays the population distribution trend in the central area of Xi'an city in 2020, by using the methods of the grey prediction in population and the 36-dimensional space expansion, which is based on the District census data from the second to the Sixth (1953~2010). Projections indicate that the core area of Xi'an will remain high population density in 2020, urban areas continued to spread to the surrounding suburbs, around the circle type and enclave expansion function zones, the industrial parks will gather population and service industry and commerce, forming a construction which was super positioned by the sheet, shaft, and ring to formed a series of large and mixed function areas. This study can help to understand the spatial distribution and evolution of the urban population, and the conclusion can be used as the reference of city planning, public service, business location, et al.

The Boom: Population and Urban Growth of Dubai City.

Elessawy, F. M.

United Arab Emirates University, AL Ain City, P.O Box 17771, UAE, f.elessawy@uaeu.ac.ae

Abstract

The total population of Dubai has grown by 1000% over the last 40 years alone. In 1975 the total population was 183,000 inhabitants which increased in 2015 to about 2 millions. This increase makes Dubai population one of the fastest growing in the world. In a related context, the guest workers (immigrants) have profoundly contributed to this population growth since they constituted 91% of the total population.

Dubai is a good example of a rapidly developing city. Until 1955 Dubai was characterized by its slow growing economy. Its population lived in traditional houses made of palm fronds with poor infrastructure. In 1957 Dubai municipality was established and the first master plan was formed which resulted into the appearance of a road system and a new town center in addition to the construction of new modern buildings made of concrete blocks. These buildings started to emerge at that time. Nevertheless, the urban growth continued on a slow pace. From 1975 to present the urban area expanded enormously, the rapid development of the city transforms Dubai from a small regional business, financial and leisure hub into a global center. During the last two decades Dubai built up area expanded like never before, the economic growth accelerated and so did the investment level, more development projects were planned to support the urban growth. The total built up area increased from only 54 square Kms in 1975 to 977 square Kms in 2015, as Dubai (1700 %) that high percentage make Dubai one of the fastest growing cities in the world.

Key words:

Economic boom; Guest workers; Asians; Infrastructure; Built up area; global business hub

The Changing Population Distribution of Shanghai Metropolis: A Recent Study Based on Fine Spatial Units

Chunlan WANG, Shangguang YANG, Jun HE

Population Research Institute, East China Normal University, Shanghai, 200241, P. R. China, clwang@soci.ecnu.edu.cn

Abstract

Population distribution of Metropolises has been a focus issue for more than one hundreds. And as early as in the middle of the 20th century, researchers, including Steward and Clark, have found a close relationship between distance away from city center and population density. Since the reform and opening up, Chinese large cities quickly expand. A huge number of descriptive studies and simulation models have been done, and demonstrated that multi-centered pattern has emerged in Chinese metropolises, which would has significant influence on public policies and urban governance in the next decades. However, there exists research limitation in the previous studies, including the availability of census data and official statistical consistency. With the recent census data in fine statistical units of so called residents' committee which is much smaller than town or neighborhood and just a little bigger than census unit, we describe and simulate the population distribution change of Shanghai metropolis in the first decade of the 21th century, and compare the results with that of the previous studies which were mainly based on statistical units of neighborhoods, explore the differences and deviations caused by data spatial fineness. We also analysis the deviations that are caused by area of non-residential land which is usually accounted in gross population density. In the conclusion, we mainly discuss the problems of official statistics such as consistency of statistical codes and optional adjustments of administrative division, and the influence of metropolitan population distribution change to public policies.

Key words:

Population Distribution; Data Fineness; Public Policy; Shanghai Metropolis

The Impact of Local Factors on the Urban Integration for the Migrant Population

Ming Tian

School of Social Development and Public Policy at Beijing Normal University

Abstract

From geographic perspective, based on a survey of 2496 migrant workers in nine cities in eastern and central China, this research investigated the impact of local factors on social integration of migrant workers. A multiple-level regression model was applied to analyze and reveal the differential impact of local factors, including level of economic development, intelligibility of local dialect, population share of migrants, and cost of rent. The cities with the characters that the more difficult to join the local endowment insurance, the higher level of the economic development, the greater gap between the earnings of the migrant workers and urban capita income, the higher rent, the urban dialect that is more difficult to master and the higher proportion of urban immigrant population, have a lower integration. Those cities which attract a smaller scale, whose migrant population are mainly from the province inside, have a higher inclusion degree of the migrant population. The results of the analysis affirmed the importance of local factors and their differential impact on social integration. Given the large variety of cities, it was suggested that localized social policies are promoted to ease the integration of migrant workers in urban communities.

migrant workers; social integration; urban; local factors

The Relationship between International Migration to Thailand and Fertility Decline in Rural Laos

TAKAHASHI, S¹, PRELIC (Population dynamics, reproduction and livelihood changes in small-scale communities of Laos)

¹Niigata Sangyo University, Japan, takahasi@zau.att.ne.jp

Abstract

In last year's IGC, I presented how population growth gave impact to various aspects of the villager's livelihood changes, particularly to temporary international migration to Thailand, using results of a village survey in central Laos by PRELIC project funded by JSPS (Japan society for the promotion of science). High fertility rate which was one of the major causes of the population growth in the village had continued for long time, but since the 1990s it gradually declined. In this presentation I would like to examine how and why fertility rate declined that related to international migration.

Population growth in the village brought about reclamation of forests for paddy land. The paddy increase finished almost in the 1970s, although fertility rate has still remained in high level. In the 1990s, the villagers began to temporarily migrate to Thailand, and young families experiencing the migration could build new houses and buy paddy lands of mainly other villages, that enabled increased population to absorb in the village. At the same time international migration to Thailand forced to practice birth control to young people because it is difficult to have babies during their staying in Thailand. Was this migration the first cause of fertility declines in the village? The answer is no. It will be considered that first cause of fertility decline is development of market economy, and international migration to Thailand is a factor to accelerate the fertility decline.

Key words:

rural Laos; international migration; fertility decline; market economy; Thailand

Transit Migrants in Northern Africa: Translocality as Social Practice

Wehrhahn, Rainer and Zine-Eddine Hathat

University of Kiel, Department of Geography, Kiel, Germany, wehrhahn@geographie.uni-kiel.de

Abstract

For several decades the mobility of African migrants between Africa and Europe has attracted attention from numerous politicians and scholars across different disciplines. While this mobility has been analyzed for the most part in the context of irregular migration and/or European security policies, this paper conceptualizes the movements of African migrants as part of a “migration space” that has always been characterized by mobility, fluidity and transition. Based on qualitative empirical studies that were conducted during several stays in Algeria between 2014 and 2015 we will focus on transit migrants, their different translocal social practices and connections to other migrants in other places in the Maghreb. The aim is to identify processes of incorporation, belonging and local place attachments. The results show that, depending on the translocal connections and relations between the migrants, different information about changing policy decisions, migration routes and successful or unsuccessful border crossings are exchanged among the migrants. This plays an important role for the strategies of the migrants and is essential for their decision to continue migration or to settle down in the region for some time.

Key words:

transit migration; translocality; social practices; North Africa and Europe

Transnational Behaviour of Ukrainian Remitting Migrants

Eva Janska

Faculty of Science, Charles University in Prague, Czech Republic, ejanska@natur.cuni.cz

Abstract

In connection with the growing trend of so-called transnationalism in international migration flows, increases in recent years in the world and in the Czech Republic the number of transnational communities circulating migrants' specific way, the target country's migration to their mother country of origin. The aim of this paper is to describe the transnational processes using the example of Ukrainians and Ukrainian workers in the Czech Republic. The research was conducted with immigrants in the Czech Republic and their families in Ukraine. There were conducted more than 50 interviews, which were analysed using qualitative content analysis. Based on the remittances sent, marital status and gender was created typology of remitting, in which then was assessed specifics of transnational processes. Different behaviour of transnational migrants because, inter alia, a reflection of their socio-demographic characteristics, e.g., family status, education or number of children, and as they may change over time.

Transnationalism; Ukrainians; gender; typology; remittances; labour migration

Transnational Labor Migration from Lao PDR to Bangkok, Thailand: Perspectives from Sending and Receiving Areas

Niwa T, Nakagawa S, PRELIC Team (Population dynamics, reproduction and livelihood changes in small-scale communities of Laos)

Teikyo University, Utsunomiya, 320-8531, Japan, geo1geo2@gmail.com

Saitama University, Saitama, 338-8570, Japan

Abstract

Many studies conducted about transnational labor migration to Thailand focused on the illegal situation of foreign workers in Thailand. However, most of them have not been interested in the sending areas of the migrant workers. Therefore, we conducted field surveys in Bangkok and in a sending village in central Laos, as well. The village (Pop: 765) is sending their ca.273 young villagers to Bangkok and we made interviews to 83 villagers among them in Bangkok. The main results of the survey are as follows: First, most of the interviewees got job information in Bangkok in advance from their relatives and friends, which suggests the villagers' transnational network is important for their decision-making. Second, the average monthly income (8,400 Baht =240 USD) of them is upon the official minimum wage in Bangkok. All of the villagers work in small firms in manufacturing and service sectors as unskilled workers and some of them don't have any official documents. There seems thereby to be a win-win relationship between the Lao villagers and the Bangkok labor market suffering from labor shortage. Third, the average remittance reaches 4,000 Baht (=115 USD) per month, which is a quite large amount for the village. The remittance has been used mainly for building houses and expanding paddy fields. The transnational labor migration has been changing Lao villages' main source of income from agriculture to remittance. Acknowledgement: This work was supported by JSPS KAKENHI Grant Number 25257004.

Transnational labor migration; chain-migration; remittance; Bangkok; Laos

A Study on Migrant Workers' Willingness to Cities of People Living in Minority Gathering Area

Tao WANG¹, Qiqi LIU²

¹Peking University, Beijing, 100871, P. R. China, wangtao9346@pku.edu.cn

²East China Normal University, Shanghai, 200241, P.R. China

Abstract

Since the 1980s, with the rapid development of China's market economy and urbanization, research on urbanization response become the hotspot. Based on field research and mathematical analysis, this study uses Cross Analysis, Fuzzy Comprehensive Evaluation and builds a Logistic Regression model to investigate the minority groups' response to urbanization issues in Guanghe County, Gansu Province, focusing on migrant workers' willingness to cities and the factors in individual characteristics, economic, cultural and environmental aspects. Although of the research has placed the emphasis on minority populations who live in urban area, this study considers the opposite point of view, selecting minority gathering area to investigate. It can be the effective supplement of current study of minority.

The results show that (1) the top three factors in individual characteristics, economic and cultural level are gender, education level and family income. (2) In the environmental aspects, migrant willingness is less affected by environmental factors, because more people will choose the profits and try to adapt to the environment. But for Muslims, environment and activities of religious sites is particularly important, which of course affects a certain number of people's migrant decisions.

Key words:

migrant worker; minority group; willingness; work in city

An Analysis on the Change of Employed Labor Force Spatial Structure in Guangzhou City

Zhong Lichun

South China Normal University, Guangzhou, 510006, P.R. china, 1175096458@qq.com

Abstract

The employed labor force is one of the most active factor of urban spatial structure evolution. Setting the township streets as the basic geographical unit, this thesis using the data of Fifth (in 2000) and Sixth (in 2010) Establishment Census of Guangzhou to research the labor force's spatial and time distribution, evolution features and its employed centre's spatial structure base on GIS spatial statistical analysis and mathematical statistics. Studies show that: (1) The employed labor force has the trend that the density of old town area drop while the centre area and the suburb area increase obviously. (2) On the scale of space, the general characteristics of Guangzhou employed labor force is that the density is thereby diminishing lower and lower from old town area to peripheral area. The gravity of employed labor force moved to the north and the distribution of employed labor force tend to be regularization and equilibrium. (3) Through curves fitting, the employed labor force fit the discipline of density diminished with the distance increased and Exponential can match the distribution of employed labor force density properly. (4) The features of Guangzhou employed labor force distribution show that the points of peak number of employed labor force are more than before and the employed centre turn from single-core to polycentric by using spatial interpolation methods.

Key words:

Employed labor force; Spatial and time distribution; Guangzhou; Urban spatial structure

Migration Pattern of Floating Population in New Urbanization: A Case Study of Zhongda Cloth Market, Guangzhou

Haitao Liu, Miaoxi ZHAO, Xinjian Li, Mengdi Wu, Fan Zhang

South China University of technology, Guangzhou, 510641, P. R. China, l.ht@mail.scut.edu.cn

Abstract

Migration is the major way and the kernel body of the China 's urbanization. However, there are few studies about the migration pattern of the floating population from the perspective of microcosmic angle. This paper is based on the investigations of questionnaire surveys and in-depth interviews about 619 subjects of floating population working in typical floating population gathering area in Guangzhou. With an aim to understand their migration pattern and its influence mechanism, we systematically introduce the demographic and social characteristics of the subjects, analyses their migration process, the degree of social integration and the scale of the city they will migrate to. By the statistical methods such as factor analysis and cluster analysis, the results illustrate that in the study area: 1) 34.5% of floating population keeps to migrate to the larger cities, while the economic factor is the key factor. 2) nearly 86% of floating population tends to settle in the super city with a population of 10 million or the small town with a population of 0.5-1 million in the future. 3) the degree of social integration has a great impact on migration model. Floating population with the higher social integration usually holds the less frequency of migration, while inclined to live in the larger city in the future. On the basis of the above, we propose the refinement suggestions according to the different scales of the cities. We believe the proposed approach will have significant implications for population management and urban planning research during the new urbanization.

Key words:

Floating population; migration pattern; social integration; new urbanization; Zhongda Cloth Market; Guangzhou

Overview on Domestic and Foreign Research of Low-Fertility Trap

HUANG Caihong, ZHANG Xiaoqing, CHEN Shuangshuang

College of Geography and Environment, Shandong Normal University, Jinan 250014, P.R. China, sdnuhch89@163.com

Abstract

We have been facing a worldwide low fertility since the 1990s. Related research puts forward the “low-fertility trap” hypothesis, besides discusses the causes of the phenomenon, mechanism and its social and economic influence. Based on a theoretical model of low fertility and continuous development of calculation method of the total fertility rate, scholars estimate the fertility changing trends by using multiple sources of data has become a research hotspot. There are two kinds of judgment according to whether China has falling into the “low-fertility trap”, while estimation of Chinese fertility under the universal two-child policy are also different. Tracking survey should be taken in order to explore the new trend of China's fertility.

Key words:

Low-Fertility Trap; Total Fertility Rate; A Universal Two-Child Policy

Seasonal Population in the Rural Areas of Central Russia: Opportunities for Research

Fomkina A.

Faculty of Geography, Lomonosov Moscow State University, Moscow, 119991, Russia, alpresents@mail.ru

Abstract

The continuing depopulation in the rural areas of Central Russia is well-known process. According to the recent studies there are some other trends also. The population is pulsating more and more depending on the day, week or season. As a result, many rural settlements are becoming seasonally inhabited; especially in summer when the townspeople come to countryside for recreation. However, the issue how and why the permanent settlement turns into temporary is not well-understood yet. Our field work, which was conducted in rural areas in Tver region has shown that one of the main factors influencing the placement of seasonal households is the size of the settlement. If it is smaller, the proportion of seasonality is higher. But what is more important, the basic cause why people choose the particular place for second summer living is their "roots" and relations with local community. In fact, there are a lot of other reasons in this process. Advice of friends, attractiveness of landscapes, and the cost of the land could influence people's choice. The case studies in different villages of Tver region demonstrated the important role of the people who live there only during the specific period of time (week, month, etc.). As they live in cities most part of a year; they are often more creative and initiative. In our point of view, this role of the "temporary", seasonal, population will become more significant in future. The study was funded by Russian Foundation for Humanities (project № 15-03-00743).

Seasonal population; rural area; Central Russia; Tver region

Space Pattern Evolution of Population Distribution and The Driving Factors in Northeast China

YU Tingting, SONG Yuxiang

Northeast Normal University, Changchun, 130024, P.R. China, yutt931@nenu.edu.cn

Abstract

Northeast China is considered as the important old industrial base. However, the change of population distribution and its driving factors were not clear yet under the circumstance of a new round of revitalization. Therefore, based on the population census data in 1900, 2000 and 2010, this paper employs Lorenz curve, relative change rate of population density, and Moran's I to analysis spatial pattern evolution of population distribution in Northeast China from 1990 to 2010, which consists of 176 counties. Subsequently, based on the partial least squares (PLS) regression method, 10 natural and socioeconomic factors are recognized to conduct quantitative analysis on spatial pattern evolution of population distribution in Northeast China. Major conclusions can be drawn as follows: (1) Population density changed from comparative dispersion to comparative concentration. And the areas which had higher population density occupied smaller land, while those with lower population density hold larger land; (2) From the perspective of the change of overall distribution pattern in nearly 20 years, average population density shows: HeiLongjiang < Jilin < Liaoning province. There was growing tendency of the multicenter "T" type population distribution pattern with the provincial capital as the core; (3) Population distribution presented remarkable and positive spatial auto-correlation. From the perspective of the changing type of population density, 80 counties' population were increased and 96 are decreased over 20 years; (4) Natural and socioeconomic factors were acting together on the change of population density, but the level of socioeconomic development was the major factor that influenced the change of population density.

Key words:

population distribution; spatial-temporal evolution; driving factors; old industrial base

Spatial Distribution of Migration and Economic Development: A Case Study of Sichuan Province, China

C.F. Yang¹, H.R. Han², J.P. Song¹

¹School of Geography, Beijing Normal University, Beijing, 100875, P. R. China, phoenixycf@mail.bnu.edu.cn

²College of Territorial Resources and Tourism, Anhui Normal University, Wuhu, 241002, P. R. China

Abstract

The spatial distribution of China's rapid growth in population and economic development is uneven, and this imbalance leads to migration. However, the literature concerning migration in China has been primarily focused at the provincial scale and on eastern parts of the country. Relatively few studies have examined migration between counties and these rarely involve poor areas, and even more rarely involving out-migration areas. Using statistical data, this study analyzes the spatial correspondence between population distribution and economic development in Sichuan with an index, the Correspondence of Population and Economy (CPE). We also build a regression model of net-migration to analyze the driving forces of migration. The results include the following: (1) The distribution of population, population density, GDP, and GDP growth are all similar, and the high value areas are mainly concentrated in eastern Sichuan; (2) The number of counties that are balanced in CPE dropped from 30 to 12 from 2005 to 2012, but the counties did not overlap; (3) Most in-migrants come from Sichuan itself, and in-migration areas are primarily concentrated in cities; (4) In the regression model, the four economic factors have a positive influence on net-migration, but rural employment has a negative influence; (5) CPE has a weak negative correlation with net-migration.

Key words:

correspondence of population and economy index; migration; linear regression

Spatial Pattern of Population Variations and Its Influencing Factors in Northeast China from 1990 to 2010

Liu Zhimin, Xiu Chunliang, Wei Ye, Feng Zhangxian

College of Geographical Science, Northeast Normal University, Changchun, 130024, P. R. China, liuzm291@nenu.edu.cn

Abstract

Regional spatial pattern of population variations depicts the evolved path of human-land relationship. Though analyzing population variations during a period, the integrated development of socioeconomic laws can be extracted which hidden behind. As China's old industrial base, Northeast China, which has made great contributions to our country's economic prosperity after the foundation of the PR China, was honoured as "the eldest son of the Republic". However, since the end of 20th century, it suffered from "Northeast Phenomenon" and "New Northeast Phenomenon", also the nationwide economic "New-Normal". As a result, Northeast China is facing with the unprecedented low economic growth and a huge loss of population at present. Based on some kinds of statistic methods, the article researches spatial pattern of population variations and its influencing factors in Northeast China from 1990 to 2010, with a view to achieving its economy and society coordinated development. The results reveal that: 1) The number of population is growing, but the growth rate has slowed down, and the continuously decline in natural population growth rate and expanding size of net emigration have led to the trend. 2) Despite the "core-periphery" gradient pattern has not changed, population variations manifests clearly "polarization" pattern. 3) Significant population variations units demonstrate "little centralized and big decentralized" distribution and central city proves might be "near domain deprivation". 4) Densely populated units have reduced, meanwhile, the density pattern shows more differences between the north and south. 5) Economic development, industrial structure, employment levels and medical services have a significant impact on population variations, and economic factors perform more important functions.

Key words:

population variation; spatial pattern; influencing factor; Northeast China

Spatial Patterns of Population Migration in Thailand: Analyzing Population Census 2010

NIWA T

Teikyo University, Utsunomiya, 320-8531, Japan, geo1geo2@gmail.com

Abstract

This research investigates on features of population migration in whole of Thailand. Although many research studies on migration in Thailand have been conducted, most of them have focused on before 2000. Thailand experienced economic growth after the Asian currency crisis, and its economic event might cause Thai people to change their mind of migration. In addition, they have been little interested in foreign migrants in Thailand. This presentation tries to clear the spatial patterns of population migration in Thailand. Furthermore, I try to clear detail relationship between population structures and socioeconomic structures overly spatial patterns and socioeconomic structures by GIS analysis. This viewpoint will be important for the future of Southeast Asian economy since AEC started.

From this research, most of migrants still tend to move to the Bangkok Metropolitan Region. In addition, the number of immigrants to the East region considerably increased. This result illustrates that metropolitan areas of Bangkok have been expanding to the Extended Bangkok Metropolitan Region. This phenomenon was occurred by that job opportunities, especially engineering jobs pull migrants relating with industrial aggregation.

On the other hand, some provinces in rural region have a feature as center of their region, but pull factors of them are very weak.

Key words:

spatial pattern; population migration; socioeconomic structure; GIS

The Population Spatial Evolution in Hangzhou Main City under the Influence of Land Development

Xin Chen, Wangming Li

College of Civil Engineering and Architecture, Zhejiang University, Hangzhou, 310058, P. R. China, 529967860@qq.com

Abstract

Based the statistics of land development projects in Hangzhou main city from 2001-2010 and combined with Hangzhou's fifth and sixth census data, this paper analyzes the characteristics of population spatial evolution under the influence of land development from two aspects, the population and population density by using surfer8.0 and arcgis10.0. The study found that the suburbanization was co-existed with the population reflux to central area in the main city of Hangzhou; urban population concentration and diffusion of the internal space has become more complicated, and the expansion of the regional population diffusion has increased; suburban high intensity of land development kept the developments in suburban areas and the outer suburb areas in a high-rate growth; the demographic structure of the city was transferred from the "one main two" into "a main three times."

Key words:

population spatial evolution; land development projects; influence mechanism; Hangzhou main city

Aging in Place in Shanghai? A Demographic Equation Approach

Banggu Liao, David W. S. Wong

Shanghai Normal University, Shanghai 200234, P. R. China, liaomap@163.com

Abstract

The English literature on the geography of ageing argues that migration shapes the spatial patterns of ageing population at the intra-country level, and housing choice is the primary determinant at the intra-city level. But this framework based upon developed countries may be not applicable to developing countries and cities. As many large Chinese cities experienced the influx of floating population, ageing in Chinese cities may have a more complicated picture. This paper hypothesizes that migration, both the floating population migrating into cities and intra-urban migration of local residents are the main determinants shaping the spatial patterns of ageing in Chinese large cities. Using Shanghai as a case study, and based on the 5th and 6th Chinese population censuses at the committee level, this paper describes the changing geographical distribution of ageing population in Shanghai from 2000 to 2010. We then analyzed the extent that the distribution of ageing was contributed by the floating population in the Chinese context and intra-urban migration. This analysis was based upon the projection of ageing in place, which was compared with the actual 2010 population. We conclude that the spatial patterns of ageing in Shanghai can be described as a rippling pattern with polarized age distribution, which was accentuated by the arrival of floating population.

Anglophone Concepts in China: Cul-De-Sacs or Avenues of Opportunity?

Darren Smith

Loughborough University, UK, d.p.smith@lboro.ac.uk

Abstract

This paper will draw upon the work of Warde (1991), Lees and Davidson (2008) and Clark (2002) to reflect on the salience of mainstream anglophone definitions of gentrification, and their transposition to the context of China. Developing a diagrammatic representation of gentrification, the paper will focus on the social, economic, cultural and physical manifestations of mainstream gentrification, and consider their pertinence alongside scholarship of broader urban changes to Chinese cities and rural places. This will then be considered in relation to the transformations associated with studentification in the Chinese context (He, 2015; Gu, 2015), to address the main question: is studentification an expression of gentrification in the Chinese context.

Key words:

Gentrification; studentification

Coupling Coordination between Population Change and Land Change in the Urbanization of Pearl River Delta, China

Shijie Li, Chunshan Zhou

Sun Yat-sen University, Guangzhou, 510275, P.R. China, lishijie0309@163.com

Abstract

Land and population are two key and interactive factors in urbanization, and it's extremely important to coordinate them for healthy urbanization. This paper aims to examine the coordinate development between population change and land change in the urbanization of the Pearl River Delta, China and provide some scientific basis and references for its future urbanization development. A comprehensive evaluation index system on population change and land change, including population structure, population quality, life quality, land structure, input and output is respectively established. On the basis of calculating the level of population change and the level of land change by using the variance of the weight method, the coupling coordination model is used to calculate the coupling degree, coordination index, coupling coordination degree between them in 9 cities of this region from 2004 to 2013. Based on the results obtained from the calculation, the coupling coordination between population change and land change is empirically analyzed. The results are as follows. (1) Both of the level of population change and the level of land change rose continuously with fluctuations between 2004-2013, and the advances of the two levels were extending from center to periphery. (2) The population change lagged behind the land change, but the gap between them was narrowing. (3) The coupling coordination relationship between the population change and the land change was unbalanced spatially, and it presented a spatial difference in different cities.

Key words:

urbanization; population change; land change; coupling coordination; Pearl River Delta

Culture-Led Urban Regeneration in China: A Case Study of Dayuan Road Culture Square District in Xiamen

Li X, Huang Y, Mai X, Chan E.H.W, Lang W

Urbanization Institute, Sun Yat-sen University, Guangzhou, 510275, P. R. China, maixiay@163.com

Abstract

In China, after the rapid urbanization in the last 30 years, urban renewal has become a critical approach to enhance urban competitiveness and facilitate the transformation of extensive development paradigm. Since space is the container and carrier of culture, society and industry, urban renewal as a process of spatial reconstruction brings the threat of losing local culture and breaking traditional community with the challenge of reconstructing urban industry. Besides, various interest groups are co-related, which make it difficult to tackle interest redistribution. It is important to find out effective approaches to lead urban renewal and to create a more socially sustainable urban area. The Dayuan Road Cultural Square renewal project in Xiamen has provided a valuable practice of culture-led, organic and gradual renewal approach. By studying this case, the paper tries to examine the ‘catalyst effect’ of the approach. Through analysis, three strategies have played a key role, including (1) place making of the public space which triggered a self-sustaining “virtuous circle” of renewal of the nearby buildings, (2) organizing cultural activities to rediscover cultural resources and flourish local cultural industries, (3) encouraging local particularities (both social organizations and NGOs) to help the elderly and children so as to “de-code” the use values of people’s live spaces and give them a sense of belonging. The paper points out that the “catalysted” model of culture-led regeneration is an alternative approach to sustainable urban revitalization in China in future from social, cultural and economic perspectives.

Demographic Trends and Spatial Distribution of Taiwan Ethnic Minorities: Some Implications for Ethnic Policy in Taiwan

Andrew Dikarev

Leading researcher, Center for East Asia Research, Institute of International Studies, Moscow State University of Foreign Relations (MGIMO) andreydikarev@yahoo.com

Abstract

In the official publications of mainland China all ethnic minorities of Taiwan have usually been nominated as “gaoshan” (literally: “living in the hills”) though most of them live in coastal areas. In Taiwan modern approach to serious studies of these people and their culture actually was applied at the end of 20-th century only. As a result, several ethnic communities were nominated as separate national minorities.

Beginning from 2008 when Guomindang came back to power the main task was to define further strategy of the policy towards aborigines. The modernization process and economic development resulted in massive outflow of aborigines to the industrial regions of Taiwan where they can get jobs much easier. Now more than 40% of aborigines live out of the 55 townships historically (from the times of Japanese occupation) designated as territories with predominance of aboriginal population.

Strategic approach to ethnic policy can be formulated as one of the choices: Separation and conservation (case of Indians in the USA) or participation and progress. It is clear that for Taiwan with its extremely limited natural resources it will be absolutely necessary to develop and use rich resources of central and eastern parts of Taiwan. The question is: will it be possible for aborigines to keep their habitat, culture and traditional activities intact or they will merge somehow with Han majority.

Key words:

Taiwan China; aborigines; ethnic policy; population

Environmental Cleanup and a Reconfigured, Rescaled “Right to the City” In Jing-Jin-Ji

Kay, S.

The Ohio State University, Columbus, Ohio, USA. Kay.87@osu.edu

Abstract

Environmental cleanup, increasingly high on the agenda of both municipal and national authorities, is reshaping where different types of people and industries fit into China’s urban network. Insofar as the right to occupy particular places has become linked to freedom from exposure to toxins, emerging environmental policies and discourses may be reconfiguring the “right to the city.” We are thankfully past the time when it might be acceptable for Western scholars to write about X “with Chinese characteristics,” a time when transformations taking place in Chinese society were written about as variations on a theme already composed in Europe and North America. Urban scholarship, as Robinson and Roy (2015) have argued, is now in “a phase of rich experimentation” which stems from taking seriously places beyond Europe and North America as theory-producing sites. Many China scholars have already begun the challenging work of rethinking urban theory for a Chinese context. This paper adds to that work by examining in particular the usefulness and limitations of “the right to the city” and other critical urban theory concepts derived from the likes of Marx, Harvey, Lefebvre, Soja, Smith, and others for work in Chinese contexts. Ran Liu has more than ably taken up this specific question in her recent book, and I seek to build on her analysis to look more closely at environmental issues, and also consider the role of foundational concepts such as space, nature, and scale.

Explore the Relation Between the Growth of Population and the Expansion of Land in Different Scales with the Newest Standard of Urban Division

CHAN Jian, ZHOU Xiaofang, WANG Xiaoguang

School of Geographical Sciences, South China Normal University, Guangzhou, 510631,

Guangdong, China, 710125385@qq.com

Abstract

In this paper, we research the relation between the population and land in urbanization according to the latest State Department criteria for the classification of the city from 2003 to 2012, and calculate the rate of urban population growth and land expansion of 277 cities to analyze the coordination. It shows ① type I small and medium-sized cities changed most severely in recent decades, there are many type I small-sized cities changed to medium-sized cities, and medium-sized cities changed to type II big-sized cities. ② type II big-sized cities and medium-sized cities show to population urbanization. ③ all of these seven standards cities appear to a trend that land expansion faster than population growth in the macro scale, and show that the model of urban development is extensive.

Key words:

population growth; land expansion; urbanization; urban development.

How Should We Understand / Frame 'Alternative Food Networks' in China's 'Ecological Civilization'?

Martindale, L

Lancaster University, Lancaster, UK, l.martindale1@lancaster.ac.uk

Abstract

China's project of 'Ecological Civilization' can be seen as an explicit recognition on behalf of the Chinese Communist Party (CCP) that a version of 'green development' is becoming necessary due to the rising tension between essential economic growth and the increasing levels of environmental degradation. This paper probes this need for a green transition via the issue of food. Food is a pertinent framing to analyse this transition as agriculture accounts for nearly 50% of China's pollution and issues concerning food safety have been brought to the fore in China due to a succession of recent food scares and poisoning incidents (Yan, 2012). This paper critically interrogates the emergence of so called alternative food networks (AFNs) that have arisen to counter China's chemical intensive industrialised food system. Instead, AFNs are often organic community farms, in peri-urban areas, which are run by white collar professionals who emphasise face to face contact, not distribution by supermarkets. In a Western discourse the study of AFNs has often been impeded by dichotomized ways of thinking, i.e. by binaries of scale (local/global), ethics (neoliberal/participatory) or difference (mainstream/alternative) (Holloway et al, 2007; Levkoe, 2011; McClintock, 2014; Turner & Hope, 2015). That Chinese AFNs have generally emerged out of practicality – in response to issues of food safety – and are not driven by ethical, environmental or anti-capitalist motives, this paper argues that Chinese AFNs can perhaps offer novel ways of understanding AFNs that somewhat challenges, and somewhat breaks with, established Western theories.

Alternative Food Networks (AFN); Ecological Civilisation

Induced by International Students but Displaced by Local Gentrifiers: The Evolution of a Studentified Area in Nanjing, China

SUN J, ZHU X G, LIU F B, CHEN J

School of Architecture and Urban Planning, Nanjing University, Nanjing, 210009, P. R. China,
sunjie20063953@hotmail.com

Abstract

The last decade has witnessed evolutionary diversification in the form of studentification in western countries. However, little attention has been casted on its evolution trajectory which helps to trace the internal relation between studentification and gentrification. This study aims to illustrate a unique transformation process of studentification taken place in China. A line of empirical evidence is presented based on fieldwork in Jinyin Street, Nanxiu Street, Hankou Road and Shanghai Road, four neighborhoods close to Nanjing University campus that exemplifying how a studentified area foremost composed of international university students gradually displaced by increasing local mature gentrifiers that developed into a gentrified area. Notably, the renewal of Jinyin Street was leaded by city government and university administration in early to cater to international university students' tastes aimed at creating an international cultural atmosphere contributes to learning. And it stimulated private business owners along nearby streets& roads to repair their shops by changing style and scale, as well as updating the item of business spontaneously, which attracted more and more local gentrifiers for consuming diverse education services or experiencing multinational lifestyles. Subsequently, international university students were marginalized for their smaller population and lower economic ability. In the Chinese context, studentification formed by international students acted as the accelerant of gentrification promoted by marketing. This research reveals profoundly the nature of capital accumulation in the process of uneven development and provides a prism to understand the complex dynamics of urban transformation in Chinese cities with the commercialization of education and culture consumption.

studentification; international university students; local gentrifiers; gentrification; Nanjing University

Polarization or Professionalization? Social Structure Changes in Chinese Global

Cities: The Case of Beijing

Shi, Q., Liu, T., Cao, G.

Peking University, Beijing, 100871, P.R. China, shiedelweiss@gmail.com

Abstract

Social structure changes in global city have been debated over the past decades with multiple factors being taken into account recently. It is admitted that economic globalization, large-scale migration and institutional factors, especially welfare states and the developmental state, are three main forces shaping the social outcomes in global city, which remains unstudied under Chinese context where all these factors are endowed. This paper, constructing on theoretical explanations for social structure changes in global city, takes Beijing – the capital city and a ‘global city’ of China – to discern its social structure changes over the past decade by large-scale quantitative economic censuses data. The results show that although economic globalization and large influx of migration occurred in Beijing, which may indicate a trend of social polarization, it was an accelerating professionalization with an increasingly relative growth in the upper class at the expense of all other groups that prevailed in Beijing during 2004-2013. These results implicate that institutional factors – the localized and biased welfare system and government-centred developments – are still important in shaping the social structure in Chinese global cities, where the influential forces should be re-considered in a broader way in future theoretical and empirical works.

global city; social structure; institutional factors; Beijing

Population Distribution and Polycentric Spatial Structure of Chinese Megacities: Taking Hangzhou, Wuhan, Xi'an and Shenyang as Examples

LI Mengxue, ZHAO Xinzhen, LI Tongsheng

Northwest University, Xi'an, 710127, P. R. China, lmxlucky1030@163.com

Abstract

Based on census data of 2000, 2010 and Exploratory Spatial Data Analysis, this paper examines the spatial distribution and evolution characters as well as the spatial structure of four Chinese megacities including Hangzhou, Wuhan, Xi'an and Shenyang, which represent the megacities in Eastern, Central, Western and Northeastern regions respectively. We found: 1) there are significant regional difference between four megacities and circle difference in each megacity. Suburbanization exists in each city. The population density difference is increasing between different towns in suburb region. Two spatial expansion models are summarized for the megacities. In the first model, megacities are mainly expanded in inner suburbs as well as very few broken in outer suburbs. In the second model, megacities are sprawling very far along with river, mountain or transport lines. 2) The population spatial agglomeration very high and increasing. Both spatial agglomeration and spatial diffusion are existed in the megacities. 3) Polycentric population spatial structure of megacities has been formed and is constantly enhanced.

Key words:

Spatial structure; Suburbanization; Polycentric; Megacities

Research on Spatial Distribution Characteristics of the Elderly Population Based on Multi Scale Analysis

Yishan XU, Dian ZHOU, Zhe LI, Zhiwei QIU

Xi'an Jiaotong University, Xi'an, 710054, P. R. China, yishan1010@163.com

Abstract

Research on the spatial distribution characteristics of the elderly population is of great scientific and practical significance for the rapid aging of the population and the construction of a livable environment for the elderly. In this paper, the data from PUWU and PUTIU in XI'AN city is used to explore how to provide a scientific basis for building urban facilities for the elderly and pension policy-making. To achieve this, method of ring structure and statistical correlation analysis is applied such that GIS spatial processing works on the elderly population density and aging rate, from two dimension (city and street) to expose spatial distribution of the elderly population.

Key words:

elderly population; spatial distribution; multi-scale analysis; spatial processing works

Semi-Urbanization and Evolving Patterns of Urbanization in China: Insights from the 2000 to 2010 National Censuses

Guangzhong CAO, Xiang LIU

Peking University, China, caogzh@pku.edu.cn

Abstract

Based on the prefecture-level data of the 2000 and 2010 national censuses, the spatial evolution of China's semi-urbanization is analyzed in this study. The stages of urbanization are re-examined by considering semi-urbanization. Nine models of urban development are presented according to the relations between semi-urbanization and urbanization, and China's urbanization is divided into five stages, namely, high incoordination, incoordination, low coordination, coordination, and high coordination. Results show that China's semi-urbanization rate varies significantly from one area to another; its order in 2010 from the highest to the lowest value was as follows: east, middle, west, and northeast. Urbanization and semi-urbanization rates in inland cities increase more than those in coastal cities. In addition, semi-urbanization displays a spatial pattern similar to that of urbanization across China, with the sole exception of the northeastern region. Through a spatial autocorrelation analysis, the spatial concentration of semi-urbanization is determined to be increasing. High-value concentration areas are expanding in the coastal east, whereas low-value concentration areas are growing in the northeast. Lastly, the evolution of China's urbanization model suggests a weakening trend of coordination between urbanization and semi-urbanization over the studied decade. Semi-urbanization can be viewed as a special production of China's *hukou* system, which restricts the permanent settlement of migrants in cities. As such, China's semi-urbanization trend is expected to exhibit a reverse U-shaped pattern as urbanization and citizenization develop.

Key words:

semi-urbanization; urbanization; spatial evolution; hukou; census; China

Studentification in China: Changing Geographies of Haidian District, Beijing

Hao Gu

School of Public Policy and Management, Tsinghua University, Beijing, 100084, P.R. China, haogu@Tsinghua.edu.cn

Abstract

Processes of studentification encompass socio-economic, cultural and physical changes which are tied to seasonal population movements of university students. To date, most empirical investigations of studentification have tended to take place in Anglophone contexts. This thesis extends the lens of study to China, and shows the salience of the concept for understanding urban transformations which have unfolded since the introduction of a new state policy in 1999 for the expansion of higher education. Using the case study of Haidian District (Beijing), and focussing on Peking University students, the thesis makes original contributions to academic knowledge. First, it argued that the concept of studentification can be transposed to the Chinese context, and that social, cultural, economic and physical signifiers of studentification are evident in Beijing. Second, four main geographies of studentification are revealed, which concur with Smith and Hubbard's (2014) discussion of the co-existence of diverse geographies of studentification in the UK. By contrast to the UK, it is shown that all geographies of studentification are 'gated'. Yet, differential residential and socio-cultural experiences are highlighted, in part, influenced by state regulations for Chinese students to reside within university-managed dormitories, or acquire permission to live off-campus; contrary to less-regulated accommodation patterns of International students. This division marks a conceptual difference between studentification in China and UK, with international students more aligned to stereotypical cultural/lifestyle traits of UK students (e.g. noise, partying), as opposed to Chinese counterparts residing in regulated (study-oriented) spaces on-campus.

Key words:

studentification; students; student housing; community; urban change; Beijing

Study of Spatial-Temporal Change of Population Distribution of China in Recent 60 Years
