

33rd International Geographical Congress

第33届国际地理大会

BOOK OF ABSTRACTS

International Geographical Union

The International Geographical Union (IGU) is an international, non-governmental, professional organization devoted to the development of the discipline of Geography. The IGU was formally established in Brussels in 1922. However, the history of international meetings of geographers is much longer. The first of a series of congresses met in 1871 in Antwerp. Since its early days the Union has consisted of three major components: a General Assembly of the delegates appointed by the member countries which meets at the time of the Congress and is the highest authority of the Union; an Executive Committee which consists of a President, eight Vice-Presidents and a Secretary-General and Treasurer; Commissions and Study Groups which continue their work between General Assembly meetings. The working

languages of the Union are English and French.

The purposes of the IGU are primarily to promote Geography through initiating and coordinating geographical research and teaching in all countries of the world. Its work is conducted through the instruments of its National Committees, Commissions and Task Forces.

The IGU hosts the International Geographical Congress every four years and also promotes regional conferences and other meetings that further the objectives of the Union. The IGU also facilitates the participation of geographers in the global community of scientists through its formal affiliation as a Member Union within the International Council for Science (ICSU), the International Social Science Council (ISSC) and the International Council for Philosophy and Human Sciences (CIPSH).

The forthcoming major events include IGU Thematic Conferences (LA PAZ, Baku, 2017); IGU Regional Conference (Quebec, 2018); 34th International Geographical Congress (Istanbul, 2020); Extraordinary International Geographical Congress (Paris, 2022). More current projects include the International Year of Global Understanding, the Journals Project and Our Sustainable Cities.

Further details can be found on the IGU website at : www.igu-online.org

Geographical Society of China

The Geographical Society of China (GSC) is one of the earliest established academic societies in China. Her predecessor is the Chinese Geographical Society organized by Zhang Xiangwen in Tianjin in 1909. In 1934, Weng Wenhao, Zhu Kezhen, and Zhang Qiyun, some well-known scientists, founded the Geographical Society of China in Nanjing. At the founding of the P.R. China, the two organizations were merged into the current Geographical Society of China in 1950.

At the present, the Society has more than 10,000 individual member, who are geographical workers from research institutes, colleges and universities, middle schools and governmental agencies etc.. There are 31 provincial societies located in the capitals of provinces and autonomous regions, as well as the municipalities of Beijing, Shanghai, Tianjin and Chongqing (not including Taiwan, Hong Kong and Macao). The Society has established 20 academic commissions, 9 branch (academic) societies, 8 working committees, 5 study or working groups and 7 regional offices. There are 16 academic journals and Chinese National Geography (popular science magazine). It is a member of IGU, IAG, IPA and China Association for Science and Technology (CAST). It has established cooperation relation with Japan, France, Korea, United States, and Russia. It has hosted the IGU Regional conference (Beijing, 1990), 6th International Conference on Permafrost (Beijing, 1993), IAG Thematic Conference (Nanjing, 2000) and the First Asian Conference on Geography (Shanghai, 2015).

Main activities: GSC Annual Meeting, Annual Meeting of Human geography of China, China-Japan-Korea Joint Conference on Geography, etc.

Institute of Geographic Sciences and Natural Resources Research, Chinese Academy of Sciences

The Institute of Geographic Sciences and Natural Resources Research (IGSNRR), Chinese Academy of Sciences (CAS) was established in 1999 through the merger of the former Institute of Geography, founded in 1940, and the former Commission for the Integrated Survey of Natural Resources, founded in 1956.

In the past half century, IGSNRR and its predecessors have led the way in geographical research in China, making major research contributions in the rational use of natural resources; ecological and environmental protection; comprehensive land consolidation; sustainable regional development; and resource and environmental information systems.

Much of the work conducted by these institutes has had a very great national impact and has received national awards. Examples include research on the spatial differentiation of China's natural environment; research on the comprehensive management and exploitation of land in medium- and low-yield fields in the Huang-Huai-Hai Plain; study of the uplift of the Qinghai-Tibet Plateau and its effects on the natural environment and human activity; compilation of the National Physical Atlas of China; theoretical and applied research on regional development patterns; and establishment of the Chinese Ecosystem Research Network (CERN), etc.

IGSNRR is a multidisciplinary research institute focusing on, among other things, physical geography and global change, human geography and regional development, natural resources and the environment, geographical information systems and surface simulation, the terrestrial water cycle and water resources, ecosystem network observation and modeling, and Chinese agricultural policy. Through research in these domains, the institute aims to solve major natural resource and environmental problems related to national sustainable development and improve its own innovative capacity at the same time.

The institute is home to the State Key Laboratory of Resources and Environmental Information Systems; the Chinese Academy of Sciences (CAS) Key Laboratory of Water Cycle and Related Land Surface Processes; the CAS Key Laboratory of Ecosystem Network Observation and Modeling; and the CAS Key Laboratory of Sustainable Regional Development and Modeling. It also supports two national field observation stations: the ChinaFLUX observation station at Yucheng, Shandong Province and the Lhasa Plateau Ecological Research Station. In addition, the institute has a Physical and Chemical Analysis Center and five specialized laboratories. These facilities provide excellent conditions for scientific research and observation.

IGSNRR has a staff of 603, of whom 450 are faculty members. Among the institute's faculty are five CAS members, three members of the Chinese Academy of Engineering and three members of the Third World Academy of Sciences—a UNESCO-associated institution devoted to furthering scientific research in the developing world.

The institute offers Ph.D and M.Sc. programs in the fields of physical geography, human geography, cartography and GIS, natural resources, ecology, agro-forestry economic management, and environmental science. In addition, it offers M.Sc. programs in the fields of rural and regional development, meteorology, agricultural informatics, and environmental engineering. It also offers postdoctoral positions in geography and biology.

IGSNRR is very active in international and domestic cooperation and communication. It has established cooperative arrangements with academic institutions in more than 50 countries and regions. Currently, IGSNRR houses 12 branch organizations of international scientific programs and nine joint research laboratories. Every year, around 400 staff members participate in domestic and international scientific events and more than 400 academics and scientists visit the institute. In addition, the institute holds more than 10 international conferences or workshops annually.

Nine academic journals and popular science magazines are affiliated with the institute, including the Journal of Geographical Sciences, the Journal of Natural Resources, and Chinese National Geography.

Chunshan Zhou; Jincan Hu (China, Sun Yet-sen University)

13. [Study on Rural Livable Evaluation and Planning Strategy in Mega-city Suburb: The Case of Weixing Village in Chongming County of Shanghai City](#)

Lu Daodian (China, Tongji University)

14. [The Analysis about Coordinated Development Problems of Land and Sea Economy in China based on the Symbiosis Theory](#)

Shaoyu Dong (China, Liaoning Normal University)

15. [The Geographical Spreading of Critics of Dufu Poetry in Song and Yuan Dynasties](#)

Huiling Zhang (China, Zhejiang Yuexiu University of Foreign Languages)

16. [The Spatial Visualization and Relational Analysis of the Regional Difference of Education and Economy](#)

Zheng Meiling (China, Wuhan University)

17. [The Structure of Folk Belief's Scared Space and Believer's Religious Geographic Identity: Between Family and Community](#)

Hengmi Zheng (China, Collage of Geographical Sciences, Fujian Normal University)

18. [The Theory and Practice exploration of "Remembering Nostalgia" in the Construction of New Urbanization](#)

Peilin Liu (China, Hengyang Normal University)

An Explorative Process of 'Rural Social Construction'

YAO Huasong

Guangzhou university, China, yhsf@163.com

Abstract

China's regional development is witnessing two polarized process: one side is unprecedented and unstoppable urban growth driven by government-led urbanization statics, the other is numerous urban diseases such as traffic jam, air pollution, weak social relations, etc. as a result, lots of theoretical findings on anti-urbanism, ruralism, rural attachment, home, home making occurred. In terms of rural identity, almost all comments and reviews highlighted on rural depression, rural Population hollowing, rural submerge, disappearance of rural identity. This paper put forward, beyond laments and complaints, practice is more powerful than description. We should focus more on how to do and what we can do, compared with what rural is and how about rural. The author took his own hometown as an example, discussed the path and process of rural social construction based on activism. We found that, passion and heart meant more than profession and technology, activate, employ and evoke local social capital and improve rural participatory capacity played a vitally important role in rural social construction.

Key word:

rural social construction; empowerment; rural attachment

Analysis of Spatio-temporal Coupling of Urban Poverty and the Urban Environment in Xi'an City

MA Beibei, XUE Dongqian, ZHAO Huan

Shaanxi Normal University, China, mabb@snnu.edu.cn

Abstract

Based on the residents' income and expenses data and statistical urban environmental data of Xi'an city nearly 20 years, through ARCGIS spatial analysis technology and the multistage fuzzy comprehensive evaluation model, with urban internal microscopic areas (streets) as the carrier, the spatio-temporal coupling and evolution rule of urban poverty and environment are analyzed. The results show the urban poverty structure changed from radial distribution of nested to layers distribution, the degree of urban poverty reduced continuously; the comprehensive environmental quality in suburb was better than that in the centre, but the integrated environmental quality became worse gradually in the whole city, especially in the southern region; the coupling of urban poverty and comprehensive environmental quality changed and did not present some unified rules, but it showed a more refined coupling characteristic in the inner.

Key words:

urban poverty; environmental quality; temporal and spatial evolution; Xi'an city

Assessing Social Values of Ecosystem Services in the Guanzhong-Tianshui Economic Region

Liu J, Li J, Qin K, Yang X, Li T

Tourism and environmental college of Shaanxi Normal University, Shaanxi, 710000, P.R.China, lijing@snnu.edu.cn

Abstract

Ecosystem services are the benefits provided by nature, which contribute to human well-being. As the use of these benefits continues to increase, additional pressures are placed on the natural ecosystems providing them. This makes it all the more important when assessing possible tradeoffs among ecosystem services to consider the human attitudes and preferences that express underlying social values associated with their benefits. Since the politic, economy and culture get rapid development, the ecological environment of the Guanzhong-Tianshui economic region become increasingly fragile. Therefore, it is particularly important to study the social value of ecosystem services in the Guanzhong-Tianshui economic region. There are no efficient methods to quantify social values of ecosystem services in the past. Our study integrated and quantified the ecosystem services with human attitudes and preferences. 12 most representative indicators including aesthetic, biodiversity, cultural, economic, future, historic, intrinsic, learning, life sustaining, recreation, spiritual and therapeutic were chosen in this study. And then combining human attitudes and preferences that were analyzed through our questionnaires with selected environmental background layer, social values were quantified and mapped by using SolVES software. The results show that environmental background layer has a strong influence on social values. High social value appeared in flat area while residents living in gentle slope got a high value of recreation. Owning rich and varied tourism resources, Xi'an has the highest historic and cultural value. Our research provides a reference for the policy makers and researchers of ecosystem services.

Keywords:

Ecosystem services; social value; Guanzhong-Tianshui economic region; SolVES software

Causes of Urban Houselessness: A Geographical Analysis

Dr. Shamshad

Department of Geography, Aligarh Muslim University, Aligarh, shamshad26@gmail.com

Abstract

The genesis of houselessness runs the gamut of the loss of jobs, business closings, broken relationships, low level of education & skills, drug or alcohol addiction, family violence, mental illness, lack of affordable housing, poverty, etc. In fact, the houselessness is not a sudden event in the lives of most of the houseless people. It is more usually the culmination of a long process of economic hardship, isolation, and social dislocation that can be regarded as the cycle of houselessness. Therefore, an attempt has been made to analyse the migration status of houseless households and various socio-economic causes of houselessness in the Kanpur city. The study is based on primary source of data generated through a comprehensive field survey in Kanpur city carried out during 2012. The study reveals that number of houseless migrants was greater than non-migrants in all the zones of Kanpur city, because out of the total houseless households surveyed (1384), 1282 houseless households have been found as migrants which was more than ninety percent of the total houseless households recorded in the Kanpur city. Moreover, the economic reasons, by far, predominated among the causes of houselessness the city in comparison to social, biological and natural causes of houselessness, because nearly three-fourth proportion of the houseless population in the city was the upshot of the economic causes while more than one-fifth people became houseless due to social causes, followed by the biological factors and natural calamities.

Characterizations of Traditional Settlement Landscape Genome Map of China

HU Zui^{1,2}, LIU Peilin^{1,2}

1. Cooperative Innovation Center for Digitalization of Cultural Heritage in Ancient Villages and Towns, Hengyang 421002, China, fuyanghuzui@163.com

2. College of City & Tourism, Hengyang Normal University, Hengyang 421002, China

Abstract

Traditional settlements of China, which have prominent historical and cultural information, are considered as the Chinese treasures. Those play an important role in the new tide of social-economic and urbanization processes of China. Recently, the Landscape Gene Theory (LGT), which aims to understand the cultural features of traditional settlements of China, is a powerful tool for understanding of the landscape patterns of traditional settlements and gaining comprehensive interesting. Plenty of prominent cultural factors which are derived from the traditional settlements are identified by LGT. Those very help to catch the gut features of the traditional settlements. However, LGT does not still cope well with the co-relationships among landscape genes of traditional settlements. Therefore, LGT cannot interpret the mechanisms between the prominent cultural factors and landscape images of traditional settlements. Targeted to partly resolve this issue, at first, this paper employs methods of genome mapping of biology and LGT. Then, this paper tries to integrate these methods into a new research framework that is named as traditional settlement landscapes' genome maps (GSLGM). Firstly, the authors clarify the definition and classification of TSLGM by theoretical features of LGT. Secondly, the authors highlight the functions and significances of TSLGM. Thirdly, the authors present a flowchart for organizing an instance of TSLGM. And here, 30 well-known traditional settlements of Hunan Province of China are taken as cases. The paper portrays the spatial pattern for the cases according to their TSLGM. Lastly, this paper performs an experiment of genome identification. According to this paper, TSLGM can play a paramount role in capturing characteristics of the traditional settlements, which is a potential methodological progress for LGT. It is also suggested that TSLGM has some potential points in traditional settlement digitalization, planning pattern mining and characteristics of regional traditional landscapes identification.

Concepts and Method of Measuring Human Resource Development

Braj Raj Kumar Sinha

Department of Geography, Institute of Science, Banaras Hindu University, Varanasi, India, sinha_brk@yahoo.co.in

Abstract

Human Resource Development (HRD) is one of the most important themes of present day study because the core concept of human welfare lies in the optimum development and efficient utilization of human resources. Human resource development plays a very crucial role in agriculture, industry, mining, trade and commerce, construction, transport and communication, and in other social, cultural, economic and political activities and helps people to lead fuller and richer lives; less bound by tradition and unlocks the door to modernization. In fact, it is an important and more reliable indicator of development than any other single measure and brings the best from the nature and culture for the quality of life of the people. Several geographers and scholars from other disciplines have made their best attempts in analyzing and mapping HRD data but have not paid much attention to devise a reliable method.

This paper aims at demonstrating the underlying facts relating to methodological steps and to develop the way of constructing a logical and reasonable composite index to measure HRD at the individual level in a given area at a given point of time. To accomplish the objectives, several HRD indicators have been suggested and arranged in a logical and practical form for ranking and assigning an acceptable weight as per the nature of variables for devising a reliable and meaningful Index as a result or a guiding tool to apply by the researchers in the field of HRD study.

Key words:

Human Welfare; Human Resource Development; Agriculture; Modernization; Methodological Steps; Composite Index; Indicators; Rank and Assigning Weight; Guiding Tool

Determining Incommensurables in the Spatial Structure of City Regions Using Fractal Scaling

Geyer, H. S.

CRUISE Centre, University of Stellenbosch, South Africa, hsgyerjr@sun.ac.za

Abstract

Complexity theory analyses the development of urban systems as an open system which is taxonomically the sum product of the elementary components from which it is derived, and is described in terms of its perceived spatiotemporal condition. It is a system which is separate from its component elements, independent of the spatiotemporal condition. Related to this is the metaphor of fractals, being the repetition of patterns at different scales, both as the repetition of a form in a subsystem nested within a system or between autonomous subsystems of different scales. However, it is expected that there will be a very real variance between real discrete structure of the city and predicted effects. Fractals serve to illustrate that within the perceived randomness and unpredictability in systems, structure emerges. What we've thus have is equifinality, in which chaos produces a finely tuned and ordered system that is coherent and intelligible. However, as the Mandelbrot set has indicated, there are new details in every successive iteration of the oscillation or fractal, resulting in a level of unpredictability in the system, which is why systems and complex theory is only relatively predictable with a degree of error, not absolutely predictable.

Key words:

Complexity; Fractals; Reflexivity; City Regions

Drought Threats on Ecological Services: The Case of Nomadic Population

Svoray, T

Department of Geography and Environmental Development, Ben-Gurion University of the Negev, Israel,
tsvoray@bgu.ac.il

Abstract

Rangelands provide food to herds of domesticated animals and, therefore, provide the infrastructure for the meat and wool industries. In the semiarid zone, rangelands have a socio-economic role as they support the economy and culture of pastoral societies. However, despite their importance, rangelands are under constant threat due to drought effects. Here, we simulate: (i) the possible effect of global warming on rangelands in the semiarid zone; and (ii) the use of the land by nomadic shepherds in their search for food supply to the animals. These simulations are achieved by linking a model that predicts space-time dynamics in habitat productivity and GPS-based monitoring of the movement of sheep and goats. The results show that the semiarid zone is indeed under clear threat of drought due to expected climate change scenarios. These may cause undesirable phenomena such as tree mortality, decrease in herbaceous vegetation productivity and shortage in water availability. Such a decrease in productivity may indeed affect the local nomadic population, that survived many years in the region, as our GPS results show the dependency of the herds movement on crop biomass in their search for food along the hillslopes. That is, the impact of biomass quality and quantity on the retention time of herds was statistically significant. In addition, the simulations shown here can be used for purposes such as: leading the herds to areas not typically accessed via free will, minimizing grazing in sensitive areas and identifying areas enduring high use, to reduce grazing effects on vegetation.

Key words:

GIS; GPS; space-time modelling; nomadic population; ecological services

Economic Evolution in China Ecologically Fragile Regions

Xiangzheng Deng^{1, 2, *}, Zhan Wang^{3, 2, 1}, Chunhong Zhao⁴

⁴ Department of Geography, Texas State University, San Marcos, 78666, Texas, USA, zhaoch@txstate.edu

Abstract

Economic evolution is considered as being driven by innovation of research and development (R&D) even if regional characteristics usually have critical impacts on various culture-oriented living styles that change in a social transformation dynamically. In documented Chinese history, climate changes and geographic conditions are constraints of the economic evolution in ecologically fragile regions. Lots of unpublished indigenous knowledge of environmental adaptation as a part of culture have been excluded from innovative records. In this research, we review research records of several key factors closely associated with economic evolution in the history of study regions, including climate change, cultural transition, economic base, resource endowment, and transportation accessibility. By surveying previous research records and contents, we examine the paths of economic evolution mixed with adaptive cultures response to climate change in each region, and draw conclusions that (1) the economic evolution with regional climate changes interactively experience three stages of culture-hindered, culture-mixed, and culture-impelled adaptation diversely; (2) regions that have higher economic performance with less innovative records highly likely have a relatively large number of indigenous knowledge unpublished throughout cultural evolution; and (3) English world has research preference to the regions where have lower economic performance with a distinctive culture in China.

Key words:

China; climate changes; culture; economic evolution; ecologically fragile region

Environmental Impacts on Corruption Crime in China: Based on Geography of Crime Theory

Li, Y.

China Executive Leadership Academy Pudong, Shanghai, 201204, P.R. China, liyijing@celap.org.cn

Abstract

The geography of crime theory emphasizes the effects of place, time and environment in shaping crimes, and proposes to take the criminogenic and crime-mediating environmental conditions into consideration when analyzing crime issues. Corruption has been deemed as a high rank problem in almost all the countries, and China has long been trying the best to fight corruptions, especially since the 18th CPC National Congress. However, researches in relevant fields so far mainly focus on the criminals' psychological portfolios, the impetus from deficit institutions and regulations, and the subject driving elements, etc., rarely give enough attention to the objective influences from both natural and social environments.

This study overlaid the corruption numbers in each province of China since 1978, together with local socio-economic and demographic data, as well as the corresponding climate, natural resources and infrastructure layers, in ArcGIS 10. It is designed to build up spatio-temporal models on identifying the criminogenic and crime mediating environmental conditions to corruption crime by stages, from the shaping of potentiality, the original beginning of corruption, its development mechanism, the results and the effects. It aims to provide suggestions to policy makers on making finer institutional construction against corruption, through inhibiting the effects of criminogenic conditions and promoting crime-mediating conditions' influences, and finally helps to reduce the opportunities and atmosphere for committing corruption crimes.

environmental conditions; corruption; geography of crime; criminogenic; crime mediating; GIS; spatio-temporal

Geographic Perspective in Transdisciplinary Research on Social Pathology

WITES Tomasz

University of Warsaw, Faculty of Geography and Regional Studies, Warsaw, 00-927, Poland, t.wites@uw.edu.pl

Abstract

Social geography faces a huge challenge in the form of application-oriented studies, aimed at working out tangible, hands-on measures to include geography in the solution of real-life problems. The research of social pathology, understood as a set of acts that departs from norms established in society, is the object of interest of representatives of various areas. Since it displays the chief problems of civilisation, social pathology is, due to its changeability in time and space, also the object of research of social geography.

The object of this paper is to exhibit a shift in social pathology research from a disciplinary approach, via a multidisciplinary and then interdisciplinary approach, to a transdisciplinary approach. The role of social geography in far-reaching studies on social pathology seems insufficient and often remains imperceptible. The reasons for that are complex and multifaceted. Understood as studies transcending disciplinary divisions and involving stakeholders, transdisciplinary studies represent an opportunity to engage geography in the solving of real-life problems (HADORN et. al 2008). The transdisciplinarity of research is an argument in favour of examining the same issue, in this case – social pathology, on many levels. applying a multitude of methods.

The summary of this paper will indicate a geographical perspective in transdisciplinary research of social pathology. Involving geography in transdisciplinary research on social pathology does not constitute a threat to the cohesion of geography as such, either, but it only reveals the attributes of geography that emphasises the application-centred character of that branch of science.

Key words:

social pathology; transdisciplinarity; social geography; applied geography

Geospatial Analysis of Juvenile Sex Ratios in India

Pathak, Praveen Kumar

Department of Geography, Delhi School of Economics, University of Delhi, Delhi – 110 007, India.,

pkpathak@geography.du.ac.in

Abstract

Despite India's impressive records on economic growth over past two decades, the gender inequalities remain stark across all spheres of modern life (economic, education, health, political, social) over the years. Any further delay in promptly addressing and promoting wider issues of gender equity may deter prospects of India's inclusive and sustainable progress. Using the data from Census of India 2011 and other recent rounds of nationally representative household surveys (District Level Household Survey 2008, sub-national level analysis of juvenile sex ratios (JSR) has been performed. Further, theoretically pertinent demographic, economic, social, and cultural variables were constructed to examine the determinants of juvenile sex ratios in across 76 agro-climatic regions in India. Geospatial techniques (Bi-variate LISA and OLS regression models) were employed to examine the association between juvenile sex ratios and its correlates. ArcGIS 10.1, GeoDA, and STATA 13.0 software were used for performing the analysis. This regional level analysis of juvenile sex ratios offered a fresh relook at the sub-national level about the major hotspots (*low JSR*) *vis-a-vis* cold spots (*high JSR*) of juvenile sex ratios in India. Further, the descriptive and spatial regression analysis helped to test the geographic association between JSR and its selected demographic, economic, social and cultural determinants. This research also highlights outliers of JSR and its determinants. These results will help to inform policy decision regarding ameliorating the status of girl child and women in general, particularly via regional specific and cultural sensitive approach. Findings may help to identify and characterize regions with favourable JSR. Similar approaches may be propagated for regions with deficit of female children.

Informalisation and Informal Employment in Indian Economy: Emerging Debate

Kundan Kumar Das, Research Scholar

Centre for the Study of Regional Development, School of Social Science, Institutional Affiliation - Jawaharlal Nehru University, kundan.das20@gmail.com

Abstract

The “informal sector” in India and in developing country is considered as “dispersed development engine” as everybody wants to get job in “formal sector”, but at the present scenario this sector is unable to absorb the entire workforce. Those who are unable to find job in the formal sector or retrenched by the formal sector generally get absorbed in the informal sector. If formal sector squeezes (i.e., job cut in the formal sector), the retrenched people immediately move to informal sector. On the other hand, if formal sector expands, people move from informal sector to formal sector. That means informal sector serves the role of “reserve army of labour”. According to first school, informal sector is an autonomous segment of the economy producing mainly for consumption within the sector. The second school believes that the informal sector has a dependent relationship with the formal sector and is exploited by the formal sector. According to the third school, the informal sector is integrated with the rest of the economy through complementary linkages. The purpose of the paper is to deal with the debate arousing in case of “informal sector” as in recent years, there has been a deep interest among policy-makers and academics on the one hand and a demand from unorganised sector workers themselves on the other, for economic and social security. An earnest attempt has been made to examine the formal-informal sector linkages and impact of trade liberalisation on informal sector, to estimate the size and growth of employment in this sector and status of employment condition and lastly to find out the rural- urban and male-female work force participation in informal sector. Along with the unorganised sector issues, quality of employment and social protection has also been given importance in this paper.

Key words:

Formal & Informal sector; Informal employment; Informalisation; trade liberalisation.

Roadside Landscape Evaluation and the Most Beautiful Route Planning Based on Big Internet Data

Zhang Xia, Zhao Weidan, Tang Luliang, Jiang Wenping

School of Resource and Environmental Sciences, Wuhan University, Wuhan, 430079, China, 547426563@qq.com

Abstract

Road Beauty Degree (RBD) is a comprehensive evaluation of attractiveness and comfort of roads' cultural history and natural view. On one hand, beautiful routes make public enjoyable and comfortable, and improves the travel's safety and efficiency. On the other hand, it is helpful for urban transportation planning and construction. Firstly, this paper presents a Roadside Landscape Evaluation Model (RLEM) based on big Internet data such as web searching data, web check-in data and web voting data. Secondly, the RBDs are calculated on the road network by the proposed RLEM as well as the landscapes' visual ranges along road. Thirdly, the most beautiful route planning algorithm is designed and realized based on the RBDs. Finally, an experiment is conducted in Wuhan, China, where twenty-eight landscapes are evaluated by RLEM, and the RBDs are calculated, and 230 most beautiful routes are planned. The result shows us that the proposed method is promising to find the most beautiful route than the traditional shortest route planning method.

Key words:

Road Beauty Degree; the most beautiful route; big Internet data

Mapping the Relations between Immigrants and Place under the Perspective of Mobility

Han Zhang, Hong ZHU

South China Normal University, China, zhanghan91@126.com

Abstract

In recent years, with the intensification of urbanization. Mobility become one of the most core characteristics of Chinese society, and the flow of a large number of immigrants have become one of the most important groups for the long-term development of China. The flow is really remarkable in the Spring Festival (one of the most traditional, most solemn Chinese festivals). At the same time, since the 21st century, the rapid development of information technology has brought the advent of the era of "big data", It is great significant to explain People's Daily production and life practice in China. I adopt ArcGIS, and Echart (open-source data visualization software) as the data analysis and processing softwares, analysis Tencent online data during the period of Spring Festival in 2015, the baidu migration data during the Spring Festival of 2015 and 2016, as well as, Chinese National statistics yearbook. Discusses the overall trend of the national population flow during Spring Festival, and the flow mechanism of floating population in Guangzhou. The study found that: 1) The designated population distribution on QQ online 3D figure of Chinese provinces is essentially consistent with "aihui tengchong line". At the same time, as the most populous province, guangdong province, is also the largest number of provinces of tencent online, followed by Yangtze river delta region and the eastern coastal areas; I choose the sixth national census as reference, Beijing is the top one city of whose percentage of tencent online in all over the China; the tencent online number has closely relative with the provincial population and the level of economic development; Eastern coastal areas are significantly higher than the western interior provinces. At the same time in the pearl river delta, Yangtze river delta, bohai rim as the axis, others are around the radiation. 2) As for 21 days during the period of Spring Festival, the distribution of tencent online data of some provinces is high on both sides, and low in middle, generally show "concave" glyph structure, namely the tencent online than during the Spring Festival after the Spring Festival and spring. It also conforms to the general trend of our country's population flow; some populous provinces, whose the distribution of the tencent online data is high on both sides of low, was "convex" glyph structure, the main reason is before Chinese lunar New Year's eve, there are many people return home for the holiday. 3) Before the Spring Festival, baidu migration is the image of the "home hot", the population flow migrate from first-tier cities (such as

Shanghai, Beijing, shenzhen) into populous provinces (such as anhui, henan, shandong, chongqing, etc.), and after the Spring Festival, the hot line of baidu migration is mainly from populous provinces (such as chongqing, shandong, henan, anhui) moved to first-tier cities (e.g., shenzhen, tianjin, Beijing, Shanghai).

Key words:

new urban immigrants; Spring Festival travel; big data, population flow; mobility

Mosque-centered Trade as a Spatial Pattern in China: Mosque Proximity, Market Proximity and Cultural Embeddedness

Shaowei Ai

Center for Yellow River Civilization and Sustainable Development and Collaborative Innovation Center for Yellow River Civilization, Henan University, Kaifeng, Henan Province, China, aishaowei@163.com

Abstract

The "mosque-centered trade is an important and impressive feature of the urban Hui Muslims in China, but it is a big open question and has not been paid enough attention by the academic circle for a long time. Based on the observations on the complication and variability of "mosque-centered trade", the theoretical debates on spatial agglomeration, the focus on cultural construction or cultural embeddedness, and the deep investigation and spatial analysis on the typical case of Eastern Grand Mosque of Shunhe Hui District in Kaifeng, our aim in this paper is, firstly, to highlight the unresolved issues on the spatial pattern of "mosque-centered trade" and, secondly, to made a heuristic theoretical explanation on its spatial characteristics, co-occurring conditions and mechanisms. When doing so, the paper highlights the conditions under which the spatial model of "mosque-centered trade" can be represented geographically and culturally. The findings have been shown as follows: 1) It is argued that the spatial pattern of "mosque-centered trade" can be demonstrated as the variable "mosque-market-proximity" configuration which is contingent on the interactive spatial relationship between the mosque and local markets and its relation to the cultural embeddedness and spatiality of commercial traditions of Hui Muslims in China. According to the case study, a "two-centers and one-belt" "mosque-market-proximity" configuration can be identified spatially surrounding the Eastern Grand Mosque, but, at the same time, due to the obvious differences on the different types and sizes, the "mosque-market-proximity" configuration will be close or loose spatially; 2) The co-occurring conditions can be classified in terms of how the "mosque-market-proximity" configuration occurs. The spatial forms of "mosque-market-proximity" configuration are not only geographically dependent on the market-oriented proximity, but also culturally dependent on the mosque-centered proximity. Additionally, it seems to be controlled by the external conditions which are related to a temporal and spatial context, such as local government and urbanization. In these conditions, none of the three is dispensable and the market-oriented proximity is just as equally important to the formation of the "mosque-market-proximity" configuration as the mosque-centered proximity. On the other hand, the temporal-spatial context is considerable as well; 3) Proximity, location and

space play a geographically decisive role in the formation of "mosque-centered trade" and its "mosque-market-proximity" configuration. At the same time, the multi-markets structure, market differentiation and the irreplaceability of the local "Halal markets" play a basic role in the formation of "mosque-market-proximity" configuration. Additionally, cultural embeddedness, place identity and path dependence to the "mosque-market-proximity" configuration for the Hui Muslims play a culturally decisive role in the spatial pattern of the "mosque-centered trade". We argue that the "mosque-market-proximity" (MMP) model may provide an important theoretical basis for understanding the spatial pattern of the "mosque-centered trades" and, therefore, it will be seen as an exploration or a heuristic breakthrough of doing research on the Hui community in the geography circle.

Key words:

Mosque-market-proximity model; Mosque-centered trade; Mosque-centered proximity; Market-oriented proximity; Cultural embeddedness

Multifaceted Approach to Natural Recourse Management: Ethnology, Geography, Culture

Mikhail Slipenchuk, Elena Vorobyevskaya, Alisa Mazurova

Faculty of Geography, Lomonosov Moscow State University, telelisa@gmail.com

Abstract

Nowadays, the issue of interaction between man and nature is one of the most pressing challenges. One of the aspects of this interaction, as well as one of the prior scientific directions and use of natural resources, is natural recourse management. A limited amount of many resources and the limits of environmental capacity of nature raise questions of equity to the interests of different generations, which implies the need to decide on the optimal use of natural resource potential of territories currently and in the future. The complex nature of the relationships that form the structure of resources management as a complex system, dictates the need for a comprehensive approach to its study. System analysis is this type of approach. It allows holding studies of the functions of resources management and identifying problems to its development.

Key words:

multifaceted approach; natural recourse management; ethnology; geography, culture

Place Alchemy

Srivastava N, Ranjan M

School of Planning and Architecture, Bhopal, India, 462030, s.nayan91@gmail.com

Abstract

Culture defines a community by its social ways and habits and how they go about their daily life. This on occasion, is the result of what profession they engage in guided along with the geography, climate, location, qualities or issues. The cultural aspects are even more involved into the realization of space when communities themselves involve in one profession. The growth of an urban precinct into the city at times loses its sense due to cultural transformation affected by varied changes from the local to the global facing a threat of losing their identity due to various shifts in paradigm at all scales. The silk weavers' community in the city of Varanasi demonstrate the social ways and habits of 16 families residing since the 17th century involved in the handloom silk saree weaving craft. Their occupation had shaped the neighborhood of Reori Talab, one of the many weavers' neighborhoods in the historic city of Varanasi. However, the site is degenerating, losing its identity due to weavers shifting profession as the traditional craft is losing out to cheaper imitation and infrastructural bottlenecks. This has degraded working environment and quality of life and living conditions. The paper discusses the precinct in terms of its culture, profession and its day to day manifestation on spatial configuration which has become the identity of the place and its city. An incremental living-working space strategy would be talked about within the neighborhood in the heart of the city with an aim of preserving the heterogeneous identity.

Quality of Life in Slum: A Case study of Bhopal City

Sen, ARCHANA, Sanyal SRABANI

Department of Regional Planning and Economic Growth, Barkatullah University, Bhopal, India. & Department of geography Banaras Hindu University, Varanasi, archanasen9@gmail.com

Assistant Professor, Department of Geography, Banaras Hindu University, Varanasi, India, Email srabani72@gmail.com

Abstract

Increasing urbanization has resulted in faster growth of slum population. Generally, slums are found in most large cities and vary from one country to another depending upon its socio-economic conditions. Due to migration urban environment depredating in India, about 6.54 crore population lives in slums which are in appalling condition due to dilapidated and infirm housing structures, poor ventilation, over-crowding, lack of safe drinking water, lighting, absence of toilet facilities, and inadequate provision of sewerage, sanitation, non-availability of basic services.

Bhopal being capital of Madhya Pradesh (23°10'–23°20' latitude & 77°20'–77°30' longitude) has a huge influx of population who resides in slums and squatter settlements. According to Census 2011, the total area of Bhopal city is (287.17 sq km) with (17.96 lakh) population. There are 380 slums distributed in Bhopal city with 4.91 lakh (27.38%) living in miserable condition and spread all over the city.

This study is based on primary survey of 350 respondents of 7 selected slums distributed in different wards in the city. Life in slum will examine by composite index. It will calculate through variable related to infrastructure and basic services. This paper attempts relationship between objective and subjective quality of life in slum and find out major issues so there is a need to conduct a deep analysis. It will also help to come out with more practical policy implication at the grass root level.

²Department of Cardiovasology, the Second Affiliated Hospital, Medical School of Xi'an Jiao Tong University, Xi'an 710004, China

³Department of Public Health, Medical School of Yan'an University, Yan'an 716000, China

Abstract

To reveal the relationship between the normal reference value of high sensitivity C-reactive protein (hs-CRP) and geographical factors, taken China as an example, and to formulate a unified standard of establishing reference hs-CRP values. Collected the measured hs-CRP values of 8 350 Chinese healthy adults from 84 cities in China. The spatial autocorrelation analysis is conducted with ArcGIS 10.0 and the correlation analysis method was carried out to investigate the relationship between the reference value and 25 geographical factors with SPSS 21.0. The geographical factors that significantly correlated with the reference value were selected for performing the Ridge Regression (RR) model and the Support Vector Machine Regression (SVR) modeling respectively. Then one of them was selected to estimate reference hs-CRP values of 2 322 cities in China. Finally, kriging interpolation was executed using ArcGIS 10.0, the geographic distribution map of the reference hs-CRP values was produced. The reference hs-CRP value was significantly correlated with the altitude, the average relative humidity, the annual average precipitation, the annual temperature range and the annual average wind speed. The SVR model is better in estimation in this case. Reference hs-CRP values is strongly associated with the geographical factors and regional variations do exist in it. In general, the reference hs-CRP values is higher in northwest and north China than which in the southeast.

Key words:

hs-CRP; geographical factors; Ridge Regression; Support Vector Machine; Regression; geostatistical analysis; kriging

Research on Spatial Logical-Relations of the Historical and Cultural Blocks Place-names in the Landscape and Its Evolution Mechanism in Kaifeng City

Qianlong Bie

Henan University, China, bieqianlong@163.com

Abstract

The Historical and Cultural Block is part of world cultural heritage, and the spatial logic-relation and its evolution mechanism of the street place-names in the landscape is a research category of cultural geography, which has important guiding significance for the overall protection, organic update and sustainable development of the historical and cultural blocks.

The layout changes of Historical street and the evolution of place-names containing a certain spatial order. The order means the charm, the rule and the logical relationship in the space of the historical blocks. Kaifeng is the world-famous ancient capital of history and culture. There are numerous precious cultural relics and historic sites that scattered in the city. However, after several changes and replacement, the street place-names implied complex spatial logic relationships, including the representation of space, and the practice of space. Using text analysis method and GIS method, this program expounds the history and present conditions of historic and cultural blocks place-names, and explains the association between the representation of space and the spatial practice. In the study program, the long-time developing course of perspective will be accepted to analysis the evolution of the cultural landscape of place-names and the driving mechanism. Based on the previous research, the program will abstract the innovated developing spatial strategies for conservation and sustainable development of the place-names in Kaifeng city Historical and Cultural Block. It will provide a scientific decision-making basis to revitalize the place-names and innovate name management in the national historical and cultural blocks. Besides, this program will be very positive important to develop and enrich the exploratory research of social geography on the place in China.

Key words:

the Historical and Cultural Blocks; place-names in the landscape; Spatial Logical-Relations; place; Kaifeng city.

Residential Perception of Floating Population in Urban Villages in Xi'an City Based on the Context and Complex Network Analysis

Yuqian LV

College of Tourism and Environment, Shaanxi Normal University, Xi'an 710062, P. R. China, 2294526619@qq.com

Abstract

The residential perceptions of floating population in urban villages are significant to the urban development and the new pattern urbanization. In addition, internet offer researchers a lot of ways to understand how floating population think about the urban villages they live in. firstly, this thesis explores the important emotional factor perception through online narrative texts. The author collected the data from the Website www.tianya.cn. Context analysis was then used to analyze the filtered data. The factors were evaluated by semantic analysis. Then, the network analysis method is used to analyze the data and determine the important emotional factor. Finally, the result has shown to us: There are 18 attributes which form the residential perception system. Public environment and infrastructure, interpersonal communication and emotional space are defined as system of residential perceptions. It also explores the structure of these attributes and divided them into three layers. They are core perceptions, expected and perceived perceptions and latent perceptions. Based on these results, we discussed relevant policy suggestions to protect the local residents' emotions during the transformation of urban villages.

Key words:

urban villages; residential perception; text analysis; network analysis

Signs taken for wanders¹: Tourist Gaze and the Logic of Re-appropriation of Colonial Monuments in Postcolonial Sri Lanka

Hapugoda, M. and Rathnayake, I.

Department of Languages, Sabaragamuwa University of Sri Lanka, Belihuloya, Sri Lanka, hapugoda@gmail.com

Abstract

Re-appropriating colonial monument for tourism purposes has been a common and lucrative commercial practice in the postcolonial nations. Though they are often redesigned by the government agencies for public display in keeping with their grandeur and archeological significance intact, these monuments also function to regenerate the postcolonial *signifiers* memories of centuries-old Imperial oppression, exploitation and alienation of the indigenous communities in the respective nations. When these monuments are reformed to 'cater to the view' (MacCannel 1985) of the heroic historical nostalgia of the European tourists, they, at the same time, permanently alienate the locals in their own cultural environment who still suffer from their failed project of decolonization. In relation to the history of the postcolonial subjects whose present is retroactively represented by their traumatic and disturbed past, let along the immediate commercial success in tourism, this paper testifies, in line with Homi K. Bhabha who further develops and confirms Frantz Fanon's decolonization paradigm, that these archeological artifacts 'intercut with' the postcolonial identity that further alienate their subjects within their own setting (Bhabha 1994: 40-41). In this light, this paper reviews the ideology behind the rise of restored colonial monuments on the identity formation, depersonalization of once colonized subjects and re-interrogates the role of the present postcolonial rulers with the initial Fanonian question redesigned, 'what do the European tourists and the postcolonial governments want?' It therefore argues that though we do not believe in colonialism, the meaninglessness of these monumental *signs* are presented to give the tourists a '*santa-claus effect*' (emphasis added Zizek 2000) in which *touristic gaze* (MacCannell 1973; Urry 1990) functions devoid of any 'historical meaning' where sight-seeing emptily functions even though nobody truly believes believe in them.

Key words:

colonial monuments; tourist gaze; decolonized identity; sightseeing alienation

¹ This phrase is borrowed, with a slight alteration in the word 'wonders', from a popular postcolonial critic Homi K. Bhabha's *Signs Taken for Wonders: Question of Ambivalence and Authority Under a Tree Outside* (1985) in which he observes the ambivalence in colonial existence. Bhabha claims that the colonial presence is always split between the appearance (civilized people who maintain law and order) or visibility and true authority (racial and cultural discrimination).

Spatial Dependency of Factors Affecting the Evaluation of Subjective Well-being

Wakabayashi Y

Tokyo Metropolitan University, Hachioji, Japan, wakaba@tmu.ac.jp

Abstract

During the last few decades, subjective and objective evaluation of happiness or well-being as a quality of life (QOL) indicator has been attracted attentions of social scientists and policy makers. This trend is exemplified as the development of measures of Gross National Happiness (GNH) in Bhutan and Better Life Index (BLI) by OECD as alternatives to the existing indices of economic affluence, namely, GDP. Compared with the previous indicators of QOL which is usually measured objectively, well-being or happiness tends to be measured subjectively being aggregated into an areal unit. Based on the findings of the previous studies that personal attributes (i.e., age, sex, and income) have considerable influence on the subjective evaluation of well-being, population composition of a region can affect the spatially aggregated evaluation of well-being. In addition, evaluation of well-being represented in areal unit is usually affected by the conditions of neighboring areas according to the Tobler's first law of geography. The aim of this study is to examine these compositional and contextual effects by analyzing empirical data from Japan. Regression analysis of the compositional effect on the subjective well-being at the sub-national level revealed that the population composition have limited effects on the level of subjective well-being. Even after adjusting for the population composition, substantial differences remained in the well-being level across areal units. Spatial autocorrelation analysis detected some spatial clusters with high/low levels of well-being, which indicates spatial dependence of QOL evaluation. At the district level, however, the contextual effect was not obviously observed.

Key words:

Quality of Life; compositional effect; contextual effect; subjective well-being; multilevel model

Spatial Distribution of Agricultural Land Resources and Population in India with Special Reference to Jalgaon District of Maharashtra: A Geographical Analysis

Bharambe Sanjay N

Principal, ADPM's Womens College of Arts, Commerce, and Home Science, Jalgaon (Affiliated to SNDT Womens University, Mumbai), India, snbharambe@gmail.com

Abstract

Agricultural land use and population, its management and relationship is basic problem of modern developing ward. Land may be regarded as a basic resource within and upon which human activities are carried out indisputably leading to all types of productions. In agricultural perspective world's cultivated land are limited while population is growing rapidly and consequently, with passage of time each one of us will get less food, fiber, fuel and fodder. In order to meet this challenge a rational and efficient use of agricultural land need to be given top priority in its developmental strategy and planning. The population continues to grow rapidly in the developing countries and great pressure is being placed on arable land, water, energy and biological resources to provide an adequate supply of food and energy requirements. (Ms. Soumya Mahanty) .

From the global scenario, the agricultural circumstances on the Indian scene are not much different. In contrast to galloping population, its growing greed and need in terms of both quality as well as quantity, the per capita agricultural land is gradually and perceptibly limited and less available. In near future, it is bound to be further reduced. Thus, what is happening at global national and regional levels is very well reflected in the studies carried out at the sub-regional and local level. The present study analyses the spatial characteristics of per capita land available and factors influencing variations in land-man ratio and studies the intensity of population pressure particularly suited to diversified terrain where maximum proportion of daily caloric intake per person is obtained from food grain.

Key words:

Spatial-temporal Analysis of Kongtang tombs Based on LiDAR Data

Yi WU, Lin YANG, Xiaoting ZHU, Ning LI

2. Jiangsu Center for Collaborative Innovation in Geographical Information Resource Development and Application, Nanjing, Jiangsu 210023), yangcius@126.com

Abstract

Archaeological site is the first information source of archaeological research. It's important for archaeological site to record accurately and the site spatial-temporal analysis. In this paper, Kongtang site is taken as instance, which is located in Jurong City, Jiangsu Province, China and has nearly 200 tombs with complex spatial-temporal relationships. In order to record the spatial-temporal relationships of the tombs accurately, the 3D laser scanner was adopted to collect the multi-temporal LiDAR data of tombs. Through a series of data processing of denosing, resampling, registration, segmentation and modeling of the LiDAR data, we rebuilt the 3D scene of the tombs, providing data base for further spatial-temporal analysis. At the beginning of analysis, to express the spatial information of a single tomb object, a new file structure of point cloud was designed based on segmented data. Then, tombs could be divided into several groups by spatial clustering method, and the time division of tombs depends on layer relationships. The spatial overlay of multi-stage tombs could show the tombs developing tendency clearly. Apart from this, by means of spatial-temporal statistical analysis, the attribute data including funerary objects, tomb occupants and animal bones were associated with the spatial data to infer the composition and grade of social units. Based on the precision LiDAR data and spatial-temporal analysis methods, the spatial-temporal relationships of Kongtang multi-temporal tombs were discussed in this paper. The proposed method breaks the limitation of traditional manual methods and the lacking in spatial-temporal analysis, having important significance to related research.

Key words:

spatial-temporal analysis; LiDAR Data; archaeology; tombs

Study on Characteristics and Influence Factors of Middle Class in Guangzhou: The Empirical Analysis of Maslow's Hierarchy of Needs Theory

DAI Dandan

School of Geography and Planning, Sun Yat-sen University, Guangzhou, 510275, P. R. China, daidandan1987@163.com

Abstract

Middle classes in Chinese metropolitan cities have become important social groups, and have increasing influence on urban transformation, economic development and social stability. Therefore, it becomes essential to understand the middle class. Firstly, using the 1130 questionnaire survey data, on the basis of Maslow's hierarchy of needs theory, we analyze the characteristics on the society, substance, values, identity and self-actualization of middle class in Guangzhou. The results show that the physiological needs of middle class is manifested as they have high income and wealth, mainly work in the central district and their jobs-housing relative balance; the safety needs are presented as they feel optimistic about life, have diversified lifestyle, their recreational space of working day is smaller than that of weekend day, and the shopping space for purchasing distinct goods is different; the love or belonging needs and esteem needs are expressed as they have strong subjective identity and higher happiness index, as well as the self-actualization needs is denoted as they basically realize personal ideal, and youngers want to seek greater development, olders want more time to recreation and to accompany their families. Secondly, using multiple linear regression and logistic regression analysis, we analyze the factors influencing characteristics of middle class, finding that age, residential location, income, number of children and education are five main factors. Then, compared with the Maslow's hierarchy of needs of the ordinary class, that of middle class presents the spindle structure, namely "small at both ends but big in the middle".

Key words:

Study on the Evolution of the Spatial Pattern of the Highway Network Density in Hunan Province since the Reform and Opening up

CHEN Z, Yao Z

College of Resources and Environmental Sciences, Hunan Normal University, Changsha, 410081, P. R. China,
254058760@qq.com

Abstract

Select counties in Hunan province as the research unit, and 1:4.4 million GIS vector map data (2012) of Hunan Province for reference base map, using ArcGIS overlay analysis and Spatial auto-correlation function, study of characteristics of density spatial distribution of highway network in Hunan province County. The road network density as the main object of study, study the spatial correlation between the district road network density, analysis of the district road network density and socio-economic, demographic and topographic relationship. Combination five cross section map since the reform and opening, to build database of highway network in Hunan province. Using Nuclear density analysis and hotspot analysis features, study spatial pattern analysis of highway network. Studies have shown that in 2012, uneven distribution of highway network in Hunan province density index for 0.24092, the Highway network distribution has a certain imbalance; The road network density of global Moran's I is 0.826078, road density has a strong positive correlation between districts; spatial distribution characteristics of road network density has a strong convergence and relevance on topography, population density, GDP density. On the evolution of spatial pattern, links between the core road network density levels becomes closely, nuclear renders the all-round and rapid development features. Investment, transportation planning, the development of urban system, administrative changes, and other factors that affect the development of highway network in Hunan province.

The Bottom-up Discourse Construction of Urban Village Based on the Discourse Theory and Body Practice of New Citizen

Tao Wei^{1,2}, Zhao Yongqi^{1,2}

¹ School of Geography, South China Normal University, Guangzhou, 510631, P. R. China, 804565851@qq.com;

² Cultural Industry and Cultural Geography Research Center, South China Normal University, Guangzhou, 510631, P. R. China

Abstract

Urban village is a unique phenomenon in Chinese urban development process. Due to the special system design, urban villages have become one of the most competitive place where most intense discourse collision gathered. This study takes the case of Guangzhou Liede village renovation, and examines the process of rights protection that residents dissatisfied with opaque deal making among village committee, the government and developers in the process of Liede village renovation. Data collection focused on in-depth qualitative interviews with a total of 45 residents and participatory observation. We found that villagers construct a bottom-up Liede village picture which is different from the image pictured by the media and government through group petition, blocking roads, containing shops, appealing against the elections and appealing court. Residents in Liede take their action to defend their Liede village master's status. Finally, we analyse discourse about rights protection under the view of Foucault's discourse theory to explore the essence of rights protection and urban village reconstruction from the perspective of body practice and discourse practice of the villagers. Foucault discourse theory connects space, power and discourse together, realizes the interaction and transformation of integrated, which provides a new theoretical perspective for the microcosmic research of urban village reconstruction. This research will inspire the urban renewal under the situation of China's rapid urbanization, it also will provide a significant guiding for the process of villager to citizen and fulfil the urbanization routine which based on the people-oriented.

Key words:

urban village; discourse construction; power space; body practice; Liede rights protection; citizenization

The Design and Implementation of Beijing Historical and Cultural Geographic Information System

Lei Cai, Zongyong Wen, Hongnian Zhang, Pinxiang Chen

Beijing Institute of Surveying and Mapping, 100038, P. R. China, leicai@126.com

Abstract

Beijing is a world famous historical and cultural city which is rich in historical and cultural resources with extremely important historical, scientific and artistic value. With the increasing urbanization of Beijing in recent years, the economic development and the cultural heritage conservation has become a contradiction. Therefore, it has become an important and urgent task to protect, manage and display the historical and cultural resources. Geographic information system, as the special technology of dealing with spatial data, is suitable for information collection, management, analysis and display of various resources. It is of great significance to establish the Beijing Historical and Cultural Geographic Information System (BHCGIS). It can provide historical and present-day information of the Beijing's historical and cultural resources. And it can also record the evolution of the status of the resources to provide decision support and research basis for the urban planning departments and cultural heritage bureau. In this paper, we set the establishment of BHCGIS as the goal. We analysis and catalogue the various historical and cultural resources including Hutong, former residence, palace, Great Wall, etc in order to establish the spatial database for BHCGIS which is the basis to build other applications. We utilize the service-oriented architecture(SOA) based on secondary development to build the system. Some key technologies in system design and implementation are discussed in detail.

Heritage Conservation; Geographic Information System; Protection of the Famous Historical and Cultural City

The Effect of Traditional Village Landscape Genes in Construction Place Identity:

Taking the Dong Minority Village as an example

Liguo Yang, Peilin Liu

Hengyang Normal University, Hengyang, Hunan, 421001, P. R. China, yangliguo88@126.com

Abstract

The interpretation of inheritance and development of traditional village culture is inseparable from the interpretation of village landscape; it is important to explore the role of the Dong Minority Village Landscape gene in construction of Place identity to the national cultural heritage protection. Based on recognition of Dong Minority traditional village landscape gene as Drum tower, SA altar, surrounded Drum tower layout, China fir paddy, this paper researches the effect of landscape gene in construction Place identity rely on construction structural equation model with 272 questionnaires in Taro Tongdao, Zhaoxing Liping, Gaoding Sanjiang. 1) Village landscape gene have an active effect on construction Place identity, and SA altar > surrounded Drum tower layout = China fir paddy > Drum Tower; 2) Effect of landscape gene in construction Place identity is the intention identity > emotional identity > recognition identity; 3) In the measurement model of Place identity, the following factors have obvious influence to place identity, as residence time, birthplace, occupation, income, level of education, the development of villages, residents type, Drum Tower, SA altar, surrounded Drum tower layout, China fir paddy, ect; 4) In the three measurement models, as the personal characteristics, social economy, landscape gene individual living time has the most influence of obvious characteristics, village development has the strongest influence of social and economic, SA altar has the greatest contribution to landscape gene perception; 5) Personal characteristics, social and economic factors have indirect effects on the Place identity through the landscape gene sense.

Key words:

Traditional village; Landscape genes; Place identity; Effects of action.

The Implications of Population Ageing on the Geography of Health and Residential Care for the Elderly: A Case Study of Cornwall, UK

Acraman C., Clarke G.P., Petters H.

School of Geography, University of Leeds, Leeds, UK, LS2 9JT, g.p.clarke@leeds.ac.uk

Abstract

One of the greatest challenges to providers and planners of health, residential and nursing care over the next 10-20 years will come from population aging. According to the UK Office of National Statistics, the percentage of the population in the UK over the age of 65 is set to increase from 23% today to 30% by 2030. Population aging is already putting great stress on care provision. The lack of care beds for the elderly is said to have increased 'bed blocking' in hospitals and is putting great strain on NHS budgets. An additional core issue for future planning is whether the population will age in good or bad health. Although people are living longer, they are more likely to be living with disabilities and increasingly prone to aging diseases – dementia, rheumatoid arthritis for example.

The aim of this paper is to first map the socio-economic variations in the elderly population in one UK region, Cornwall, using geodemographic data. This region has been selected as it already has the lowest rate of council-supported permanent admissions of people aged 65 years and over to nursing and residential care home settings in the UK (the NHS Atlas of Variation in Healthcare 2015). Then, the paper will present a set of most likely future scenarios for 2030, modelling population aging under various what-if scenarios relating to aging with good and poor health. The implications of these scenarios for the geography of future health, residential and nursing care provision will be discussed and analysed.

Keywords:

Population ageing; health care; residential care; accessibility

The Potentiality in the Contribution of Geographers to the Planning and Management of Historical Environment

Ryu, Je-Hun

Korea National University of Education, Cheongju City, South Korea, jhryu@knue.ac.kr

Abstract

Since the concept of place was introduced through the *Burra Charter* (1979), the concept of heritage has become broader and deeper to embrace various spatial implications. The *Burra Charter*, by itself, was the most notable evidence for the recent trend of integrating the pervasive dichotomous thinking between cultural and natural heritages into a spatial and humanistic interpretation. From these changing perspectives, the category of cultural landscape has provided a new angle for the heritage field, while challenging the old concept of heritage in the 1960s and 1970s. Cultural landscape has emerged as a new paradigm in the field of heritage since the 1990s, and a number of countries have set up the heritage policies to follow the UNESCO guidelines and conserve their outstanding cultural landscapes. Along with the notion of cultural landscape, sustainability of historic environment in the field of heritage management has emerged as a key topic to be pursued to be integrated into the planning issues. As cultural landscape is one of the major topics for cultural geography, geographers will be potentially able to make a substantial contribution to the planning and management of historic environment. The aim of this paper is to discuss the geographer's potential engagement with the problems in association with the multiple and complicated aspects of historic environment in South Korea.

Key words:

Burra Charter; cultural landscape; historic environment; heritage management; cultural geography

The Relationship Between Reference Value of Fibrinogen and Geographical Factors based on Neural Network

LI Meng-jiao¹, GE Miao¹, WANG Cong-xia², CEN Min-yi¹, JIANG Ji-lin¹, HE Jin-wei³, LIN Qian-yi¹, LIU Xin¹

¹Institute of Health and Geography, College of Tourism and Environment, Shaanxi Normal University, Xi'an 710062, China, 317865094@qq.com;

³College of Medicine, Yan'an University, Guanghua Road, Yan'an, 716000 Shaanxi, China.

Abstract

To analyze the relationship between the reference value of fibrinogen(FIB) of Chinese healthy adults and geographical factors and to provide scientific evidences for establishing the uniform standard. Reference values of Fib of 10701 Chinese healthy adults from 103 cities were collected. The correlation analysis method was adopted to investigate the relationship between the reference value and 18 geographical factors, including spatial index, terrain index, climate index, and soil index. Geographical factors that significantly correlated with the reference value were selected for conducting BP neural network model, the spatial distribution map of the reference value of Fib of Chinese healthy adults was fitted by the disjunctive kriging interpolation. The reference value of Fib of Chinese healthy adults was significant correlated with the latitude, sunshine duration, annual average temperature, annual average relative humidity, annual precipitation, annual range of air temperature, average annual soil gravel content, soil cation exchange capacity (silt). The artificial neural networks were created to analyze the simulation of the selected indicators of geographical factors. This research chooses 5 layer neural networks 11 hidden layers and 2000 times of training to build a simulation rule, and this rule thereafter was used to simulate the relationship between FIB of Chinese healthy adults and geographical environment use the MATLAB software. The spatial distribution map of the reference value of Fib of Chinese healthy adults showed a distribution feature of higher in the south and lower in the north, the higher in the east and the lower in the west. If the geographical factors of a certain area are known, the reference value of Fib of Chinese healthy adults can be obtained by establishing the neural network mode or plotting the spatial distribution map.

The Spatiotemporal Trends of Religious Institutions in Zhejiang Province, China

Lee, Jay

Department of Geography, Kent State University, Kent, Ohio 44242-0001. USA, jlee@kent.edu

Abstract

Religion institutions live on supports by their followers in most cases. They have been, however, heavily influenced by social, economic, cultural, and even political factors in their development. Using a dataset that has the locations, years, and other associated information of religious institutions in Zhejiang Province, China, we show that the spatio-temporal trends of how religions diffused and evolved can be quantitatively measured and qualitatively discussed with social and cultural factors.

We applied a spatial statistic, nearest neighbor index, to calculate the spatial patterns of established religious institutions in different years. The patterns in different years were then regressed to formulate their temporal evolution pattern. Curve estimation method was used to classify the spatio-temporal patterns according to the classic spatial diffusion patterns: contagious, expansion, hierarchical and relocation diffusion patterns.

Our analytic results showed that the methodology applied in this study was indeed feasible and effective. With these results, we will review the spatiotemporal trends we found with respect to social, economic, and cultural trends in the studied area.

Key words:

spatiotemporal analysis and mapping; spatial diffusion patterns

Theoretical Construction on Spatial-Temporal Integration of Cultural Information Flow Between Urban and Rural Areas

Zhu Yuanyuan^{1,2}

¹ Key Laboratory for Geographical Process Analysis & Simulation Hubei province, Central China Normal University, Wuhan 430079, Hubei, China, zhuyy990@126.com;

² Academy of Wuhan Metropolitan Area, Hubei Development and Reform Commission & Central China Normal University, Wuhan 430079, Hubei, China

Abstract

Problems reflected from the communication of cultural information between rural and urban areas have already impeded the process in which our country devotes its effort to promote the development of rural and urban cultures' integration. Little contents on the researches of "information flow", however, have involved in cultural information flow, and there were weak in academic fundamentals on cultural integration. In order to explore the basic rules of cultural information flowing between rural and urban areas, the scientific questions which are how to simulate quantitatively the flowing state and how to construct the spatial-temporal integration model are to be answered based on the big-data thinking, Petri network theory, RS-GIS-GPS integration technology and the analysis tool of State flow. From the perspective of dynamic "field" of rural and urban cultures, the spatial-temporal integration of cultural information flow between urban and rural areas is our research object. While, the research is to explore the influences of culture information flow on the forming of rural-urban cultures in space, uncover its mechanism, construct spatial-temporal integration model, initially establish spatial-temporal integration theory of rural-urban cultural information flow, and strive to promote the integrative development of multidiscipline such as culture geography and information sociology and create new theory list, which is to establish the theoretical foundation for accelerating the development of urban-rural cultural integration, and to provide the scientific and theoretical basis for sustainable construction of Cultural Information Resources Sharing Project between rural and urban areas in china.

Traditional Cultural Taboos and its Impact on Socio-economic Conditions of Gadia Lohar Tribal Community of Rajasthan

SINGH Rani¹, JANGWAN Ashutosh², UPRETI Pallavi³

¹Post-Doctoral Fellow, University of Rajasthan, Jaipur, India, raniprasdsingh@gmail.com;

^{2,3}Research scholar, H.N.B. Garhwal University, Srinagar, Uttarakhand

Abstract

Cities –culture, technology, wealth and power presents a complex structure. Jaipur city in Rajasthan is facing a dilemma, which we call microcosm. Urban environment and the location of different activities have adversely influenced the community. The present paper is an attempt to find out how the process of urbanization and development has affected a community which was primarily living in the heart of city are now living in peripheral region. Gadia Lohar is a social group that shares a common and distinctive culture, religion and language. They claim themselves that the Chittorgarh was their home and in the 1568 A.D., they moved from the fort when the Mughals took over Delhi and surrounding areas (singh 1998). But now, they are socially neglected group and led a life of isolation which made them so vulnerable and they are unable to with stand with the society. The methodology applied is personal interviews and search along with secondary sources with statistical techniques. The objectives of the study are, to know the reasons for their migration, to know the socio-economic status, to find out the present distribution of the community and to study the government assistance being sanctioned for the community. As, most of these people are illiterate, they remain unaware of their rights and have never approach any authorities regarding the lack of basic facilities in the area. The living condition of these people tells all about their problems and need. The government and NGOs need to take urgent initiatives to help these deprived Indians.

Socio-economic; gadia; urbanization; community

Traditional technology and Development of Village Industries: Case Study in North Bengal, India

Sao, S.

The Geographical Society of China, Beijing, 100101, P. R. China, igc2016@IGSNRR.ac.cn;

University of North Bengal, Raja Rammohunpur, India

Abstract

Village industries which constitute an important segment of rural India exhibit the great tradition and cultural heritage of our country. Technological innovations were made prior to the advent of modern means of industrial development in India. Traditional technologies followed in village industries have stood the test of time and remain popular even today. Modern industrial development in some of the rural areas has led to a gradual decay of the symbiotic functional system of rural society. This has ruined the economy of village industry, shattered the economic integration of the communities, and brought a complete holocaust to the cultural distinctness. Subsistence agriculture economy of the rural areas continues to dispel part of its working force which leads to out migration of work force to urban areas. The situation necessitates creation of job opportunities in areas where people are living now; development of work places which are cheap; adoption of production technology which are relatively simple; promotion of less sophisticated organizational forms related to supply, finance and marketing and production for the conservation of local resources. Thus development of village industries which follow traditional technology, are economically viable as well as appropriate to rural environment seems a rational solution. Objective of the present study which is based on case study of different village industries of North Bengal which constitutes six districts of the state of West Bengal is to identify the role of traditional skill in the production process and to formulate strategies for the development of selected village industry.

Traditional technology; Traditional skill; Village Industry; India

Using Enhanced Two-step Floating Catchment Analysis Techniques to Examine the Spatial Variations in Accessibility to Fire Services: A Case Study of Brisbane Statistical Division, Australia.

KC K, Corcoran J

School of Geography, Planning and Environmental Management, University of Queensland, Brisbane, Australia,
k.kc@uq.edu.au

Abstract

Fire services are essential public agencies which ensure the safety of people and properties. A relatively large literature base exists on the use of traditional access based methods such as location-allocation model to examine the spatial variations in access to emergency response to fire services. Although such methods identify locales that are either covered or not by a fire station based on its service delivery standard, it does not reveal how accessible such locales are to fire services in relation to their coverage. Drawing on unit record data from Brisbane Statistical Division in Australia, this paper critically assesses the use of enhanced two step floating catchment analysis techniques to examine the spatial variation in accessibility to fire services according to service delivery standards so as to determine strategic location of fire station in relation to inaccessibility. Results reveal that locales with most vulnerable population have less access to fire services compared to those living in least vulnerable locales in the case study area. The findings offer a new evidence base to inform policy decisions from a resource allocation perspective through the spatial allocation of finite fire resources.

Visual Discrimination of Urban Historic landscapes

Eliahu Stern, Orly Rechtman

Department of Geography and Environmental Development, Ben Gurion University of the Negev, P.O.B, 653, Beer-Sheva 84105, Israel, elistern@bgu.ac.ill

Abstract

Subjective discrimination of historic landscapes is rarely studied by geographers. The need to deepen into the perceptual and visual aspects of the urban historic landscape has recently increased due to the growing interest of preserving historical structures and elements within the current, dynamic, urban areas. For example, the 2009 conference of UNESCO Forum – University and Heritage, dealt solely with the conservation and function of urban historic landscapes in both western and non-western countries. Assuming that the individuals' ability to identify urban historic landscapes within the modern urban structure is the first step in defining a preservation policy and means, the present study examines the subjective visual discrimination of such urban fabrics. More specifically, what are the visual attributes that determine the perceived level of historicity, and what are the effects of familiarity and ratio of contemporary development on the individuals' perception.

Subjective evaluations of historicity were solicited from 90 geography students in a laboratory - type experiment. Each participant evaluated the level of historicity of nine historic urban landscapes based on photographs from Israel and Europe. Their task also involved discrimination of visual attributes and subjective landscape preferences. The main contributing attributes to the level of historicity were architectural style, visual landmarks, buildings density, and the perceived contrast between old and modern buildings. Familiarity and preliminary knowledge were found irrelevant to the perception of historicity. The subjective preferences to urban historic landscapes were found to be affected mainly by salient historic elements (e.g. city walls, towers, domes), and the visual absence of modern structures. Finally, the paper contributes to the integration of visual perceptions in shaping conservation policies of urban historic landscapes.

Key words:

Urban historic landscapes; historicity; subjective discrimination; perception; conservation policy

A Geo-ethical Issue of Caste Base Human Discrimination-A Fault Line For Harmonious World

Chanyal, P.C.

Department of Geography, Kumaun University, Nainital, India, Nainital 263001, Uttarakhand,

prakash_chanyal78@yahoo.com

Abstract

Caste has been one of the oldest and most distinctive feature of human society of the world, which are discriminate in layers basis on various parameters such as, color, occupation, heredity, rituals and religious as well as by birth. Caste Discrimination Effects (CDE) an estimated 360 million peoples on worldwide, the huge population living in South Asia. These are facing massive violation of civil, untouchability, sexual assault, murdered, economic, social, festivals, and political, however their have suffering from fundamental rights and needs. Caste systems is spreading other country such are Jati in Nepal, Pakistan, Sri Lanka, Burkumin in japan, Baekjeon in Korea, Al-Akhdam in Yeman and as well as in African countries similar to India. Caste system divided peoples into unequal and hierarchical social groups. Those at the bottom are considered lesser human being and polluting to other caste group.

It is a geo-ethical issue for as geographers. In this paper, I will compiled and correlated that we cannot reduce and make harmonious world without mitigation of Caste base discrimination of the human societies in the world. We have try to analyze, how can mitigate the impact of man-made & natural disaster, Climate changes, Inequality, Poverty, Chronic Diseases and Terrorism also. We want introduce also, a new discipline in geography education as a "Caste & Casteism Geography–A Geoethics", because we believe the sustainable social Development is must be our first priority and we cannot go as untoward, than will be influenced on another issues.

Caste Geography; Mitigation of Disasters; Caste Discrimination Effects (CDE); Sustainable Society

Analysis and Prediction of Land Use Change in Beijing: A Cellular Automata-markov Model

Huang Yingchun

Beijing Institute of Surveying and Mapping, Beijing, 100038, P. R. China, 176483135@qq.com

Abstract

The rapid urbanization that has dramatically changed land use in Beijing over the past 20 years is clear from an analysis of the evolution of land use change during the period 1992-2012. This paper combines remote sensing, geographic information systems and integrated cellular automata, or Markov models, to predict changes in land use for 2020 and 2030. The key findings: 1) in the period 1992-2012, land-use structure has changed significantly, and the rate of change for every type, including farmland, ecological land, construction land and other uses, is greater than 6%; 2) the transition areas from farmland to construction land are 778km², the largest among land use patterns, and they are mainly concentrated to the north, east and south of the city center; 3) according to the 2030 projection, land use change will result in a reduction in farmland, from 22.14% to 19.05%, and an increase in construction land, from 18.14% to 19.74%, relative to the total area in 2012. The evolution of land use change and the process of urbanization are predicted to result in structural changes that will stabilize after an initially dramatic period, but achieving stability will require an accelerated level of comprehensive planning. Urban sprawl and diminishing farmland are found to be current problems in Beijing that will continue in the future, suggesting the need for planners and government officials to improve land use management strategies to better balance urban expansion and ecological conservation and thereby reach a stable state.

land use; land-use structure; CA-Markov, prediction; Beijing

Diffusion and Displacement of Residential Burglary Based on Environmental Characteristics in a Small-area

Tang Yicheng, Zhu XinYan, Guo Wei, Hu Tao

State Key Laboratory of Information Engineering in Surveying, Mapping and Engineering & Collaborative Innovation

Center of Geospatial Technology Wuhan University, Wuhan 430079, China

Abstract

Like diseases which can transmit and diffuse, residential burglary may also spread in a certain period of time and to a certain area. This spread is known as near-repeat effect. Traditional near-repeat analysis focuses on spatial spread of crimes to adjacent areas, with little regard to the displacement effect. Crime displacement refers to the changes offenders make, primarily in the target area, when they are deterred from committing crime or find crime not worthwhile. If this phenomenon is neglected, the near-repeat analysis will tend not to obtain the overall spatial distribution pattern of residential burglary, leading to limited effectiveness of crime control. For this reason, we present a non-homogeneous diffusion model where crime spreads not only to spatially and temporally adjacent areas, but also to areas with similar environmental characteristics. The characteristics can be incorporated into residential burglary risk value; the diffusion equation is applied to stimulate the crime spread in order to identify the risky places not recognized by the historical crime data and find the distribution pattern of the crime. The algorithm we described is an expandable model, which allows easy inclusion of more environmental characteristics for further study and for provision of more valuable information for the crime control. By virtue of spatial constraints and environmental characteristics, the most crucial areas to residential burglary are identified, and this will be helpful for developing policing strategy.

near repeat; burglary; hotspot analysis; PDE; Non-homogenous; data fusion

Discussion of Excavation and Inheritance of Traditional Rice Culture in Hollow Villages

Shunqing Zhong^{1,2}, Peilin Liu, Yunyuan Deng

¹ Hunan Provincial Engineering Laboratory for Technology of Traditional Settlements Digitalization, zhongzs@hynu.edu.cn;

² City and Tourism College, Hengyang Normal University Hengyang Hunan, 421002, P. R. China

Abstract

Traditional rice culture is disappearing gradually in rural villages. In order to carry forward the traditional rice culture and play the role and function of rice culture in the construction and development in new rural areas, it is urgent to excavate and inherit the rice culture. By the means of visiting and questionnaire survey system of rice cultural diversities in hollow village, its root of the loss was revealed currently that it was a large number of rural labour force emigrating, land use changing in rural, and cropping pattern has undergone a fundamental change, which make traditional rice culture lost its basic soil. In this context, such measures should be taken: (1) to fully seek for and classify the rice culture in the hollow village. (2) to display and save the traditional rice culture in the modern media with the help of modern information technology. (3) to establish exhibition hall and interactive museum to learn from traditional rice culture, it becomes the regional traditional culture education base, only by these, traditional rice culture in the hollow village never be vanished and the future generations will carry forward the rice culture, then, the hollow village culture will be forever.

Key words:

Rice culture; hollow village; labour force emigration; interactive museum hall

Endogenous & Exogenous Patterns: Two Ways of Regional Developments of Chinese history

Youjiang Wu

Institute of Historical Geography, Wuhan University, Wuhan, China, wuyoujiang@whu.edu.cn

Abstract

The survival and development of a human social group depend on material resources, and the meaning of life and social norms are derived from social culture. Resource endowment and culture system are the basic variables of regional developments of Chinese history. It can be concluded that the regional development of China's historical period can be classified as two models, endogenous and exogenous ones. This kind of thought has the important significance to the construction of development process of Chinese human geography. During Unification period China generally had the trend of endogenous development, and the development of various political entities in the period of separation was mainly the exogenous pattern. This situation has gradually been changed after the Opium War, even if it is a unified period, the development of Chinese society is also the exogenous pattern, and this trend in twenty-first Century seems to have been no change.

Key words:

Endogenous Model; Exogenous Model

Measurement and Identification and Classification of Multi-Dimensional Poverty in Rural China

Wang BX, Wang YH

Beijing Key Laboratory of Resource Environment and Geographic Information System, Capital Normal University, Beijing 100048, Wang BX. China, 1173886959@qq.com

Abstract

Since the 13th Five-Year Plan started, the precise poverty has become the new stage of Chinese poverty alleviation strategy. The effective targeting of rural poverty population and effective identification of its spatial distribution are urgent problems to rural poverty alleviation of the contiguous poor areas. Taking emphases depressed region--Hechi City as the object of study, this paper is based on the perspective of capability poverty, selected four dimensions--housing, health, education and living standers, systematically designed the Multidimensional Poverty Index, calculation method and used "dimension aggregated" and "dimension decomposition" of "A-F dual cutoff" to calculate and analyze the Multidimensional Poverty at a village level. This paper used Kriging method to deal with the measurement results with spatial interpolation, thus, it could systematically analysis the spatial distribution pattern of multidimensional poverty.

The results showed: (1) 830 villages were identified as multidimensional poverty village which involved in the population of 623846 people. (2) The spatial distribution showed from northeast to southwest as the boundary, and the multidimensional poverty village gathered in the southeastern region of relatively flat terrain; most of the Multidimensional Poverty distribution was at the junction of two counties. (3) 66.3% of designated poor counties overlap with identified poor counties' villages, and identification of the non-national key support multidimensional poverty village areas are in a more serious disadvantage at infrastructure level. (4) According to the disadvantage/deprivation situation of different dimensions, multidimensional poor villages are classified into eleven types, i.e., lack of financial capital, lack of medical facilities et al.

Key words:

Multidimensional poverty measurement; Multidimensional Poverty recognition; Multidimensional Poverty index; type of poverty; rural Hechi City

Migrants' Inhabitation of Religiosity: Christianity, Social Transformation and Negotiated Empowerment of Peasant-workers in Shenzhen

Quan Gao, Junxi Qian

Centre for Cultural Industry and Cultural Geography & School of Geography, South China Normal University, Guangzhou, P. R. China, gaoquan@m.scnu.edu.cn

Abstract

This paper presents a case study of migrant workers' religious practices in Shenzhen. In particular, it examines how communal life organised around shared faith in Christianity enables communal participation and the building of belonging and "home". Due to the marginalized status in the cities, increasing migrant workers start to convert to Christianity, which has been refigured Shenzhen's religious landscape. In Shenzhen, the peasant-workers has constituted the majority of churchgoers of many churches around or in the areas where the migrant workers concentrate. Interestingly, Christianity has become an anchor of identity and community, providing emotional shelter for migrant labourers working in manufacturing factories to negotiate with labour regime and sense of alienation. This paper attempts situate the case study within China's dramatic social transformation and the context of emerging modernity, seeking to link individuals' religious experience with the wider social and political process. We are particularly interested in the ways in which religious practices enable migrants to manoeuvre local cultural resources and negotiate the existential conditions of being migrants. Three aspects of this negotiated process of empowerment will be discussed, namely the building of communal belonging and home, the mobilisation of communal participation, and the use of religious values to re-interpret actually existing social inequalities and labour alienation.

Key words:

Migrant workers; religiosity; Christianity; empowerment; social transformation

Relationship between Reference Value of Hematocrit of Newborn Girls and Altitude

Miao Ge, Xue Ni

Shaanxi Normal University, Xi'an, China, 1553770566@qq.com

Abstract

To study the relationship between the reference value of hematocrit of newborn girls and altitude, this paper aims at supplying a scientific basis for unifying the reference value standard of hematocrit of newborn girls. A research is made about the relationship between the reference value of 2443 examples of hematocrit of newborn girls and altitude in 42 areas in China. It is found that the correlation of altitude and the reference value of hematocrit of newborn girls are quite significant ($r=0.473$, $F=11.542$, $P=0.002$). One regression model is given out: $\hat{Y}=48.64+0.004371X\pm 3.09$. If altitude is obtained in some areas, the reference value of hematocrit of newborn girls of this area can be reckoned by using the regression equations. Furthermore, according to the similarity of the reference value of hematocrit of newborn girls, China can be divided into three regions: Qinghai-Tibet plateau region, central region, eastern region.

Key words:

Hematocrit; Reference value; Altitude; Regression analysis

Research of Urban Culture Construction Mode in the Undeveloped Area under the Background of New-Type Urbanization: A Case Study for Country Area of Chengkou

CHEN Yi-Duo, YANG Qing-Yuan, Zhang Yin, LIU Su
Southwest University, Chongqing, 400700, P.R.China, 513dyc@163.com

Abstract

Chengkou county is located in the northeast of Chongqing, it's transportation is inconvenient and with undeveloped economy, but the development of cultural industry is perfect. The paper makes the new-type urbanization as research direction and the culture construction of Chengkou as research object, we use the space production theory, the cultural function theory, the case literature research, the case analysis method and the comparative method, research on how cultural construction promote social and economic development of undeveloped areas. The purpose of this paper is to explore by analyzing inner and outer environment of the Chengkou culture construction, we can get the deep reason of Society economic development lagging, summary the unique urban culture construction mode of Chengkou, and we put forward the concrete measure in the undeveloped areas. It has been discovered: (1) The meaning of urban culture construction is discussing urbanization by culture construction, this paper creates a mode called "Culture+", it includes construct cultural system and carrier, develop culture industry and build a urban cultural space system, by building a Chengkou characteristic culture blend of folk culture, red culture and ecological culture, economic and social development in Chengkou has been promoted. (2) There are some reference significance for those undeveloped areas, and for those counties have characteristic culture that are developing specialty industry, we could provide some worthy advices.

Key words:

urban culture ; undeveloped areas; new-type urbanization; Chengkou county

Research Summarization Dynamic Characteristics of Ecological Footprint and Ecological Carrying Capacity of Water Resources in Jiujiang City During 2010—2104

Che Yinping

Gannan normal university, China, 1204492631@qq.com

Abstract

Water is a unique natural resources on earth, with its unique physical and chemical properties, its role and status of human production and living, is any other resources cannot be replaced. In response to development of urban agglomeration in the middle reach of Yangtze river, Jiujiang stepped up, is in a period of rapid development. The sustainable development of the rational use of water resources in Jiujiang region plays an important role. Therefore, the Jiujiang reasonable evaluation on the sustainable utilization of water resources has important significance. The ecological footprint theory provides quantitative evaluation scale for the sustainable utilization of water resources. In Jiujiang city water resources construction of the ecological footprint and ecological carrying capacity model, calculation and analysis for 2010-2014 Jiujiang ecological footprint and ecological carrying capacity of water resources, at the same time, choose the water ecological deficit (surplus), ten thousand yuan GDP ecological footprint of water resources, water resources load index, water resources per capital ecological deficit (surplus), ten thousand yuan GDP ecological footprint of water resources, water resources load index and index to evaluate the situation of sustainable utilization of water resources.

Key words:

Jiujiang; Water resource; Ecological Footprint; Ecological Capacity; Load Index of water resource

Social Life and Social Implications of Tribals in Telangana State, India

Lonavath Ashok Kumar, Jhansi.K, Karunakar.Virugu, Sathish Kumar.V

Department of Geography, Osmania University, Hyderabad, India 500007, ashokouprof@gmail.com

Abstract

Social life is the essence of human life. It grows out of constant patterning of social interactions and relationships among human beings as such. Social implication is often correlated word to social life. In broader terms the social implications can be defined as the impacts of social life of individual or communities. The factors which form the matrix of social life are five. Natural environments, Population, Human being, Material technology and Social environment constitute the parameter for organized social life and implication is inherent. The natural environment is often conceived as the basic. The human being is another factor in this regard and the action of an individual in a group or society is responsible for the patterns and ways of the social life of the tribal groups. Material technology always is inseparably linked with social life. This technique helps in obtaining natural resources, erecting a shelter making tools, preparing food, etc. In Telangana state the tribal social life is specific in nature and has their own ways of life. There are different factors of primitive structure and organization in tribal people viz., sex discrimination, age differences, local feelings, social position, political participation, occupational characteristics, religion, totemism and civil societal organization etc., of these religion and totemism are special features of the tribal life of state. Particularly, tribal people of Telangana have all intermingled organizations- socio-economic, socio-political, religio-economic and so on. The social life is a composite whole of the web of different social organizations and phenomena.

Key words:

Social life; Social Implications; Social structure; Totemism; Socio-cultural

Socio-spatial Differentiation Based on the 2010 Community Level Census Data: A Case Study of Guangzhou

Chunshan Zhou, Jincan Hu

School of Geography and Planning, Sun Yat-sen University, Guangzhou, P.R.China

Abstract

Socio-spatial differentiation study has been one of the hot topics and has contributed significantly to the understanding of urban spatial and social structures. However, few Chinese case studies published in recent decades were based on the community level. This paper aims to research the socio-spatial differentiation of Guangzhou based on the 2010 community level census data. Our findings reveal that the socio-spatial differentiation base on the community is much more complex than that base on the sub-district level, and affected by the total influence of the market, administrative, and the family life cycle, and have shaped a complex pattern of socio-spatial differentiation.

Key words:

Socio-spatial differentiation; community level; Guangzhou

Study on Rural Livable Evaluation and Planning Strategy in Mega-City Suburb: the Case of Weixing Village in Chongming County of Shanghai City

Lu DD

College of Architecture and Urban planning of Tongji University, Shanghai, 200092, P. R. China, 17720436@qq.com

Abstract

Shanghai is a typical mega-city in China, which population more than twenty million. There are more than 1000 villages in the suburbs of Shanghai. Weixing village is one of them in Chongming County. It has some prominent features in livability of community, including the basic safety requirements for people, a strong sense of belonging and identity, convenient traffic conditions, reasonable spatial layout, better green environment and so on. Meanwhile, it exists some shortcoming too, such as the micro level security risks, no-specification for Parking, rural aging, and the low quality of ecological environment. This article propose some suggestions, for example, develop a rural community planning, transformation of public service facilities and public space for elderly people, introduction of new building materials and technology to reform residence, and guide residents to participate in community governance. All of these suggestions is to improve the livability of rural community.

Key words:

rural; livability; evaluation; planning strategy; Shanghai city

The Analysis about Coordinated Development Problems of Land and Sea Economy in China based on the Symbiosis Theory

Dong Shaoyu

Liaoning Normal University, Dalian, China, 734997003@qq.com

Abstract

The development of both sea and land economy is the necessary choice to break through the bottleneck of land economic development and achieve overall construction on sea power by both sea and land. Based on Symbiosis theory, the paper discusses sea and land economic symbiosis mechanism and mode, and takes Logistic symbiotic function to construct symbiosis evolution model of sea and land economy. What's more, after making determination, division and feature analysis of the interactive mode between sea and land economy of 11 provinces or cities along the coast of China during 1996 to 2013, the paper discusses issues about the mode of sea and land economic development of these provinces or cities. The results show that during the study time, the coordinated development mode of national sea and land economy is belong to symbiotic mode; Fujian province shows mutualism model; Jiangsu, Hebei, Shandong and Guangdong show dominance symbiosis mode; Tianjin, Zhejiang and Shanghai show parasitic mode; Guangxi and Hainan show competition mode; Liaoning shows symbiotic mode. Except that the land economic development mode of Jiangsu and Fujian and the sea economic development mode of Guangdong are improving the quality and efficiency of Factors of production, other provinces' development mode are all improving productivity of factors of production, which achieves economic development by improving productivity of factors of production to expand the scale of production.

Key words:

symbiosis theory; Logistic model; sea and land economic system; the coordinated development

The geographical spreading of critics of Dufu poetry in Song and Yuan dynasties

huiling zhang

Zhejiang Yuexiu University of Foreign Languages, China, 237055269@qq.com

Abstract

The study of Dufu poetry reached its first high point in Song and Yuan dynasties. By the statistics on whole collection of Song dynasty's poetry notes and whole collection of poetry notes in Liao Jin Yuan dynasties, there were 307 critics at this period all over the 16 provinces, especially in Zhejiang, Jiangsu, Jiangxi, Sichuan and Fujian. Jin is a northern dynasty, most of the 26 critics were from Shanxi, Hebei, Shandong. Yuan dynasty has 96 critics and almost half of them came from Zhejiang and Jiangxi province. These statistics show the center of literature went from North to South. Song Dynasty's center located in Zhejiang and Jiangsu, there are much more information like economy, policy and culture to learn from the situation at this time, which we can also analyze in aspect of Jiangxi poetry party.

Key words:

critics of Dufu poetry in Song Dynasty; Geographical distribution pattern; Reason of spreading situations.

The Spatial Visualization and Relational Analysis of the Regional Difference of Education and Economy

Zheng Meling

Wuhan University, Wuhan, 430079, China, 1312452164@qq.com

Abstract

This thesis mainly discussed the space difference and relational analysis of the regional education and economic development. From the perspective of spatial econometrics, introducing Geographical Information Systems (GIS) to regional education study, and using GIS, Exploratory spatial data analysis (ESDA) and traditional statistical methods, this thesis designed the research frame to analysis the regional education development, made qualitative analysis of spatial difference and dynamic imbalance of regional education geographical distribution, mapping the spatial evolution.

The main research questions include: (1) The spatial difference of regional education in China and its evolution. Then from the provincial levels, the results of variation coefficient and Theil coefficient show that the spatial difference of many education indicators are increasing. The result of Moran's I and LISA clustering analysis indicates that there exists obvious spatial autocorrelation of regional education development. (2) The spatial analysis of regional education and regional economy. The matching situation and discrete degree of the two improved a lot along with the time. Further more, it sets up a model of relations of the development of the two and produces related thematic maps and knowledge maps based on cartographic visualization. (3) And make the regression analysis for the link between education and economic development for the urban historical data, to conclude the cities' transition by the established model.

Eventually, this paper presents some policy suggestions for the mutual coordination problems of the China's education and social economic development.

Key words:

Region education development; Spatial Statistics Analysis; Regional Difference; Relational Analysis; Education and Economy; Cartographic Visualization

The Structure of Folk Belief's Sacred Space and Believer's Religious Geographic Identity: Between Family and Community

Zheng Hengmi, Hu Xiaorong, Jiang Chi

Collage of Geographical Sciences, Fujian Normal University, Fuzhou, P. R. China, jqsha@163.com

Abstract

In China, folk belief is a significant signs of place's religion tradition, it is obviously included both religion tradition and region of place, so it is an appropriate case to reveal place scared space's structure and it's building. In this paper, we make an investigation of folk belief's scared space in Fujian Fuzhou with an aim to understand the structure of place scared space and believers' religious geographic identity. We found: 1, On Fuzhou, scared space has the characteristic of multiple spatial scale. Multiple spatial scales include scared space in family, community corresponds to public temple, and community alliance corresponds to public temple. 2, scared space in family and public temple may both be the base of place religion tradition. The two can contact with each other. In this process, the religion tradition is rooted in daily life and be inherited. 3, with some scared activity, such as the deity parade, the boundary of scared space of community or community alliance is determined regularly. At the same time, through these scared activities, believers recognize their religious geographic identity.

Key words:

place scared space structure; Multiple spatial scale; religious geographic identity

The Theory and Practice exploration of “Remembering Nostalgia” in the Construction of New Urbanization

Liu Peilin^{1,2,3}

¹ Department of Geography & Tourism Management, Hengyang Normal University, Hengyang, Hunan 421002, liu_peilin@126.com;

² Cooperative Innovation Center for Digitalization of Cultural Heritage in Ancient Villages and Towns, Hengyang, Hunan 421002, China;

³ Hunan Provincial Research Center for Human Settlements, Hengyang, Hunan 421002

Abstract

The national working conference of new urbanization proposed that to improve the level of urban construction, we should let the residents see mountain, see water, and remember the nostalgia. Nostalgia is a kind of memory、missing or longing for hometown or the places you have once lived in your deep heart; Nostalgia is the softest inner emotion and a kind of spiritual demands. On the one hand, the nostalgia which the new urbanization should remember is to protect its historical culture, historical memory and humanistic spirit of the hometown; On the other hand, the nostalgia should preserve the historical gene of these places and inherit rural civilization. The foundation of remembering the nostalgia is to intensify culture protection. And by means of protecting cultural heritage and style of the traditional settlement practically, preserving cultural gene, inheriting cultural memory, creating cultural brand and characteristic landscape etc., the nostalgia can meet the spiritual demand of the residents’ homesickness, life emotion, historical emotion and cultural emotion in the process of new urbanization construction. The key of remembering the nostalgia is to promote the construction of small characteristic towns vigorously. Relying on site urbanization, the significant ways of achieving new urbanization are star-studded layout of small towns and the construction of characteristic tourism small town. The construction of Hunan characteristic tourism small town is the helpful attempt and positive exploration of remembering the nostalgia, and it could help to create a beautiful homeland filled with poetics for new urbanization construction which is full of humanistic care.

Key Words:

New urbanization; Remembering Nostalgia; cultural gene; characteristic tourism small town

Abstract

The Tibetan Plateau (TP) is the third pole of the world. Because of its high altitude and harsh climate conditions, the natural environment of TP is fragile and vulnerable to human activities. And the objective of this research is to assess the human influence intensity (HII) in TP. On the basis of in-depth analysis of local physiographic characteristics and previous studies, four factors, including population density, land use, grazing intensity and road density/distribution, were selected. Then, grading and quantization were carried out at county level and 1 km level respectively to assess HII of TP for 2000 and 2010. The results show that the mean HII of the whole TP is low for both time points. At county scale, the counties with a high HII value, including Xining city, Ping'an County, Chengguan District and Dazi County, distribute at east and southeast of the TP. And the HII value of counties in the mid-west of TP close to zero. At 1 km scale, the Yellow River-Huangshui River Valley region and the middle reaches of Brahmaputra River and its two tributaries (including Lhasa River and Nyang Qu River) Valley region have highest HII value. The HII value of 2010 is higher than that of 2000, which means the HII increased over the past decade. Comparison with previous studies indicated that the results of this study are rational.

Assessment of Risk of Endangering Environmental Sustainability in a Fragile Ecosystem: A Case Study of Indian Arid lands

Azizur Rahman Siddiqui

Professor in Department of Geography, University of Allahabad PIN-211002(Uttar Pradesh), India,

arsiddiqui1970@yahoo.com

Abstract

Endangering environmental Sustainability and declining production potential of land is a universal phenomenon but the problem is more alarming and sensitive p [particularly in an arid environment due to weak and inherent morphological and environmental vulnerability. Man has been one of the most important and active agent of biotic interference in an arid ecosystem. It has been observed that there are some serious observation and consequences of adverse Climatic characteristics and adverse human practices and mismanagement of resources in desert ecosystem which endangers the sustainability of the region. It has been observed in recent time that there are risk of endangering ecological and environmental sustainability due to stress of human and animal population in the form of reducing the availability of arable land, problem of overcultivation, shrinking vegetation fraction cover, eroded agricultural field, lowering of water table etc. The study carried out on the basis of Satellite derived data mainly used for monitoring vegetation health Index(VHI), Temperature Condition Index(TCI) and Normalised Difference Vegetation Index(NDVI). An attempt have also been made to examine the status of grazing system in Indian desert ecosystem.

Endangering; sustainability; vulnerability; potential; morphological; arable

Causes and Countermeasures of Rural Households Livelihood Poverty and Environmental Degradation in Agro-Pastoral Zone--The Case of Shuangyushu Gaqa; Horqin Right Middle Banner, Inner Mongolia, China

Chaoketu S, Yangang F, Yongfang W

School of Geographical Sciences, Northeast Normal University, Changchun 130024, P. R. China, sqckt@126.com

Abstract

Poverty life and environmental degradation are threatening the rural households in global arid areas, which have seriously restricted the sustainable development in these areas. Combined the questionnaire and structured interview method, this study investigated the typical village of Shuangyushu Gaqa (Gaqa is the smallest administrative unit in Inner Mongolia) in Agro-pastoral zone, Inner Mongolia. Land degradation in pasture and farmland has led to changes in households' livelihood, reduction of household's income even the impoverishment. According to the income, production method, land use patterns and activities of livelihood, living type of rural households can be divided into three aspects of pastoral, farming and off-farm. Then, the study divided the different types of households into three levels of rich, medium and poor based on capital (natural, physical, human, financial, social) at their disposal. In addition, the study also expounded the resource of households, labor, type of operation, production pattern, analyzed the relationship between rural households and land degradation and the causes of reduction in household incomes. What's more, the study proposed the counter measures which coordinated the national, local and households that help farmers and pastoralists out of trouble, improve the environmental degradation and alleviate the poverty of rural households.

Desert National Park- A Unique Ecosystem Center in the Rajasthan (India)

Meena, Ved Prakash

Lecture in geography, M.S.J. Govt P.G College Bhartpur (Rajasthan) India, ecopss@yahoo.in

Abstract

The mystique of desert national park is its bio-diversity within a big area, exhibited in a myriad form of animals, birds, insects, aquatic plants and tree vegetation which has developed by relentless efforts, of man over the year. In their continued efforts the people living within the ecosystem should be educated and made aware of the great advantages of maintaining the quality of the desert ecosystems by dedication to the national park. They should be made to understand that the conservation of the natural system would also improve the quality of their life within the desert. They may be provided gas for their kitchens from the oil fields which have been explored in the vicinity in recent years. This would save the trees from cutting for fuel wood. Efforts may be made in scientific harvesting of the sewan grass for the upkeep and earning revenue to the park. The indigenous system of water harvesting and utilization of the water of the intending I.G. Canal is a prime requisite as the biotic life may vanish with water famine.

The Glory of this natural desert ecosystem can be enhanced if the aforesaid points are taken into consideration.

Abstract

The twentieth century has witnessed the population growth, increase in agricultural output, and the reduction of natural lands. The climate change, increase in temperature, and global warming, the result of the carbon dioxide (CO₂) increase, are some of the environmental issues which have attracted many scientists as well as ordinary people in last years. A great part of CO₂ emission is due to the change in land use. The objective of this study is to investigate the effect of conversion of land use types on carbon storage. Two adjacent land use types are including the corn fields, and rangelands dominated by *Artemisia sieberi*. This was achieved by collecting soil and plant samples from three sites of the Semnan province. Soil samples were collected randomly at 0-50 cm deep with 3 and 5 profiles respectively on *Artemisia sieberi* rangelands and cultivated lands. Vegetation data was collected systematic-random in 20 to 30 plots 1*1 along two to three 200 meters transects in *Artemisia sieberi* rangeland. The amount of carbon storages in corn fields with 57.98 ton/ha was more than rangelands with 40.15 ton/ha. As a whole, the statistical analyses indicate that the effects of conversion of rangelands to corn fields in Semnan province on carbon storage were not significant; however, considering per site, it was significant at the level of 1% that shows changes of land use rely on some environmental factors of rangelands including geography, density, aerial cover, rainfall amount, etc. In conclusion, it is advisable to promote sustainable agriculture approach in the areas with the same condition due to the up scaling of this land use change.

land use change; carbon storage; rangelands; *Artemisia sieberi*; Corn field; Semnan province; Iran

Migration and De-agrarianisation as Climate Change Adaptation Strategies in West African Drylands

Maryam Liman

Department of Environmental Management, Bayero University, PMB 3011, Kano, Nigeria, maryamaliman@gmail.com

Abstract

The concerns over climate change in recent times are of greater relevance in dryland Africa. The drylands of West Africa are particularly prone to devastating impacts of climate change due to its geo-physical position and socioeconomic context. This is a vast land but constrained by desiccation and aridity that forces some form of migration. This paper has the objectives of investigating the type, nature and pattern of climate induced adaptation strategies in the nature, forms, patterns and length of migration in some parts of northern Nigeria and southern Niger Republic. It further seeks to identify the communities that engage in the migration, their destinations and movement timeframe; as well as the implications of the migration types/patterns as they may reflect in the possible de-agrarianisation. Data on the migrants' demographics, migratory histories and general assessment of climatic conditions was collected through interviews as captured on the Open Data Kit (ODK), focus group discussions and field observation. Findings indicate southward movement of the people (which is wetter) especially during dry seasons. Patterns have been ascertained to take the form of short-term movements at first which later lengthens to permanence. There are also change of livelihood options and eventual de-agrarianisation. The end result may show that the de-agrarianisation might be explained by the Climate Change phenomenon through seasonal migration. When this is confirmed the study will propose appropriate policy direction towards a credible adaptation programme especially at the source regions [of migrants].

Key words:

Climate Change; seasonal migration; livelihood options; de-agrarianisation; adaptation

Precipitation Gradient Determines the Tradeoff Between Soil Moisture and Three Plant-soil System Variables in the Loess Plateau, China

Cong Wang, Shuai Wang, Zongshan Li, Bojie Fu*

State Key Laboratory of Urban and Regional Ecology, Research Center for Eco-Environmental Sciences, Chinese Academy of Sciences, P.O. Box 2871, Beijing 100085, China, wang7088sdu@126.com

Abstract

A tight coupling exists between ecosystem productivity, surface energy balance, biogeochemical cycles, and water resource availability in drylands, in which soil moisture (SM) is fundamental to the biophysical processes (Wang et al., 2012). However, few studies focused on the close coupling among soil moisture, soil carbon/nitrogen, and vegetation structure, and the challenge of clarifying these relationships changing with climate gradient in the arid environments is daunting. Thus, soil organic carbon (SOC), total nitrogen (TN), and species richness (SR) were selected as plant-soil system variables, and the tradeoff relationships between soil moisture and these variables and their variations with the precipitation gradient were quantified in the Loess Plateau, China. Results showed that the SM, SOC, TN, and SR increased linearly with the precipitation gradient in the woodland, shrubland, and grassland, respectively ($p < 0.05$). Covariance analysis revealed that SM-SOC tradeoff was affected by the mean annual precipitation (MAP), vegetation type, and their interaction ($p < 0.01$, $p < 0.05$); SM-TN tradeoff was affected by the MAP ($p < 0.01$); and SM-SR tradeoff was affected by vegetation type, and vegetation-MAP interactions ($p < 0.01$). The linear piece-wise quantile regression was applied to determine the inflection points of these tradeoffs response to the precipitation gradient. SM-SOC tradeoff was increased with the precipitation gradient till MAP=570mm, and then decreased slightly; SM-TN tradeoff was increased with the precipitation gradient, and no inflection point was detected; SM-SR tradeoff variation trend with the precipitation gradient were different in the woodland and grassland, and the inflection points were detected at MAP=370mm and MAP=570mm, respectively. The results demonstrate the tradeoff relationship exists in the plant-soil system, and it's affected by vegetation type and precipitation gradient. Consequently, tradeoffs could be an ecological indicator and tool for restoration management and decision-making in the Loess Plateau. In further study, the mechanism of how the tradeoff is affected by the precipitation gradient should be clarified.

tradeoff analysis; plant-soil system; precipitation gradient; Loess Plateau

Spatial Prediction of Soil Inorganic Carbon Using Spatially Correlated Auxiliary Information in the Loess Plateau

Ye LP

Institute of Soil and Water Conservation, Chinese Academy of Sciences and Ministry of Water Resources, Yangling
712100, P. R. China, 1509638913@qq.com

Abstract

Loess plateau is located at arid and semi-arid area. There is much calcium carbonate which has important contribution to carbon cycle in China. Zhifanggou watershed is a typical watershed in hilly region of loess Plateau. It is used as a case study to predict the spatial variation of soil inorganic carbon (SIC) by integrating spatial information technology and remote sensing. In pedometrics, it has been widely recognized that using spatially correlated auxiliary information can improve the prediction accuracy of soil properties. However, the prediction of SIC based on the analysis of categorical variables (e.g., land use types and topographies) has not been taken account of. In this study, a grid method (200m×200m) was used to collect 142 soil profiles and 1750 samples. We aimed to examine whether quantification of categorical variables can improve the accuracy of SIC prediction. Then a geospatial prediction model has been established for predicting the spatial distribution of SIC by considering factors including terrain features, climate factors, vegetation index and land use. Spatial distribution of SIC was predicted by multiple linear stepwise regressions, ordinary Kriging, regression Kriging, geographical weighted regression and geographically weighted regression Kriging, respectively. Results indicated that spatial variation of SIC was mainly affected by terrain indices, vegetation and soil genetic types. And quantification of categorical variables, such as land use types, improved the prediction accuracy for a given prediction method.

² Institute of Soil and Water Conservation, Chinese Academy of Sciences and Ministry of Water Resources, Yangling, China

³ College of Natural Resources and Environment, Northwest A&F University, Yangling, China

Abstract

The water, as the most important limiting factor in the Chinese Loess Plateau, challenges and tests the large-scale re-vegetation, especially the Grain for Green Project (GGP) since 1999. It is important to know how, exactly, re-vegetation influences soil moisture conditions, which not only crucially constrain growth and distribution of vegetation, and hence, further re-vegetation, but also determine the degree of soil desiccation and, thus, erosion risk in the region. Three eco-environmental factors, which are Soil Water Index (SWI), the Normalized Difference Vegetation Index (NDVI), and precipitation, were used to investigate the response of soil moisture of top layer of above one-meter to the re-vegetation during the GGP. Two separate periods, which are 1998–2000 and 2008–2010, are selected to examine the spatiotemporal pattern of the chosen eco-environmental factors. It shows that the amount of precipitation in 1998–2000 was close to that of 2008–2010 (a difference of 13.10 mm). From 1998–2000 to 2008–2010, the average annual NDVI increased for 80.99%, while the SWI decreased for 72.64%. The average NDVI increased rapidly by 17.76% after the 10-year GGP project. However, the average SWI decreased by 4.37% for two-thirds of the area. More specifically, 57.65% of the area had an increasing NDVI and decreasing SWI. These results indicate the re-vegetation has consumed a large quantity of soil water and the GGP should be pay more attention on its sustainability on the Loess Plateau.

Urban Energy Pressures in the West African Drylands

Adamu Idris Tanko, Maryam Liman

Bayero University, Nigeria aitanko, geog@buk.edu.ng;

Abstract

Drylands have been the focus of academic and policy enquiry into the links between vegetation modification and woodfuel production, consumption and exchange. Researchers have warned that the dynamic impacts of rapidly changing world economy – including the limited physical availability of, and economic accessibility to, non-wood energy substitutes – is challenging traditional resource management systems, and is threatening the long-term diversification and sustainability of local and regional systems in urban centres. Attempts to deal with the problems through scientific/technical sector-based interventions designed and implemented through science-based action plans have been disappointing. It is clear that sustainable solutions require social transformation over a platform of consensus through which societies can be mobilized, community trust and flexibility built, and empowerment through dialogue promoted. In the drylands of sub-Saharan Africa (SSA), where there are presently several cities with huge population that continue to expand through high growth rates and rural-urban migration, different expert groups and other stakeholders on urban management from different parts of the SSA are mobilized and are working as a team to: build trust for community empowerment and consensus; and focus critical areas of enquiry with a view to addressing the urban energy challenges through socio-cultural interventions. The paper is an attempt to widen consultation and mobilise wider inputs towards finding acceptable learning situation through dialogue and negotiations that will lead to self-critique and involvement of scientific humility.

Woody Vegetation Structure in Protected Versus Farmed Parkland in Parts of Nigeria's Drylands

Adamu Idris TANKO; Badamasi, M. M. and Momale, S. B.

Department of Geography, Bayero University, PMB 3011, Kano, Nigeria, aitanko.geog@buk.edu.ng

Abstract

Long term changes in natural vegetation in “farm parkland” have demonstrated the need to explore the ecology of vegetation at different landscapes and its connection to human use. This is the focus of this paper that determines the woody vegetation structure of plant communities at two different sites – farmed parkland and forest reserve – within a similar environment, and relating the differences to the impacts of disturbance. This was carried out through the quantification of the differences in the vegetation structure measured and classified in nine plots. Results indicate diversity of species was higher in the farmed parkland than in the conserved area basically due to the management practices of agroforestry. In terms of the structure, similarities were found in almost all classes except two. The distribution of all species height and stem diameter shows that the values were also similar with the exception of one species which have an inverse relationship between height and the stem diameter. Statistical analyses confirmed the observation. Attempts were made to understand the impact of the main drivers of vegetation dynamic, i.e. climate, fire, animal and human activities. It is finally concluded that farmed parkland shows more prospect of sustainable vegetation resource management in drylands than the conserved areas. Hence, farmers should be encouraged to practice agroforestry using fast growing species.

Key words:

Farm parkland; forest reserve; agro-forestry; ecology; vegetation dynamics; disturbance

Ecological Footprint of Rural Households and Its Determinants in Agro-Pastoral Interlaced Region

H.G. Hao¹, J.P. Zhang², H.Y. Zhang¹

¹ Chinese Research Academy of Environmental Sciences, P. R. China;

² Beijing Municipal Research Institute of Environmental Protection, P. R. China, haohg@craes.org.cn

Abstract

The impact of human production and consumption on ecosystem is always at the center of academic attention, and an understanding of their linkages is important for effective environmental policy and decision-making. Based on rural household survey data in three counties in the Inner Mongolia Autonomous Region, China, we calculated ecological footprint of rural households and investigated its determinants. We defined and calculated six kinds of ecological footprint (EF): total production footprint (PEF), arable land production footprint (APEF), grassland production footprint (GPEF), total consumption footprint (CEF), arable land consumption footprint (ACEF), and grassland consumption footprint (GCEF). The results showed that the PEF was three times more than the CEF. The ecological footprint, especially the GCEF and GPEF had a significant positive correlation with income, which indicated that increasing of income more depend on livestock production and the household with more income consume more livestock products. Part-time farming or non-farming employment reduces the occupancy of local natural resources to some extent. The ethnic minority households, the households with higher proportion of income obtained from livestock rearing, and the households with more grassland per capita had bigger ecological footprint and bigger GCEF and GPEF, while their ACEF and APEF were smaller. Ecosystem conservation policy makers should take measures to reduce the ecological footprint and improve the welfare of farm households such as establishing and improving the ecological compensation mechanism, transforming livestock- rearing patterns from an extensive style to an effective style, and improving the diversification of livelihoods of farm households.

Key words:

rural households; production and consumption; ecological footprint; non-farming employment; agro-pastoral interlaced region

Evaluation of Farmers' Perception on Comprehensive Management of Small Watershed Based on IPA Method: A Case Study of Qinzhuanggou Watershed in the Dry Upland to North of the Weihe River

CHEN Jian-ying¹, SUN Hu¹, CHANG Zhan-huai²

¹ College of Tourism and Environment Science, Shaanxi Normal University, Xi'an, Shaanxi 710062, China, bscjy113@126.com;

² Shaanxi Provincial Institute of Soil and Water Conservation Surveying and Planning, Xi'an, Shaanxi 710000, China

Abstract

Based on on-the-spot investigation and questionnaire, IPA analysis is used to study local farmers' perception on the comprehensive management of Qinzhuanggou watershed. Results showed that farmers' perception on comprehensive control of soil and water loss can be embodied in associated factors. Combined with the comprehensive soil and water conservation planning of the small watershed, 28 factors for farmers' perception are divided into 4 quadrants of the IPA. Advantage and disadvantage factors are in quadrants I and II, respectively. Based on the analysis of the advantage and disadvantage factors, the corresponding countermeasures are presented for the comprehensive management of the small watershed, such as sustaining superiority development of soil and water conservation, promoting economy so as to increase local farmer's income, improving residential environment and extending ecological agriculture. To deal with the problems concerning local farmers, a model of comprehensive management for a small watershed should be established in order to improve the level of comprehensive management of the small watershed and meet the needs of local farmers for production and life.

Key words:

IPA; Qinzhuanggou watershed; farmers' perception; comprehensive management of small watershed

IHPACT: Analysis Framework of Sustainable Consumption: Take the Low Water Consumption Patterns of Zhangye city in the perspective of Water Footprint as Case

DING YANG, SHANG Hai-yang

Lanzhou University of Finance and Economics, Lanzhou, 730000, P.R.China, 771325505@qq.com

Abstract

“Low-carbon” has been the topical focus of global attention and becomes a common view in society at large, while the water crisis that is one of the most severe questions of reality human facing in 21st century, compels us to pay close attention to the low water problems as soon as possible. Population growth, technological change and increased consumption are considered to be the three most important reasons generating environmental crisis. The environmental problems caused by consumption do not get enough attention and in-depth study at present. Classical IPAT built the identical equation of accounts which are about the influencing relationship between humanity factor and environmental implication. According to extending IPAT equation, this paper gets influence factors which analyze influencing sustainable consumption, and directed the IHPACT frame which is set by sustainable consumption policy. Meanwhile, this paper discussed feasibility and necessity of the analysis framework from the perspective of water footprint based on the study and accounting data of Heihe River Basin Zhangye city. The research results indicated that decreasing meat consumption known as water footprint luxury in food consuming –eat more vegetables and eat less meat-can effectively adjust residential consumption water footprint; the more enhance of power of consumption will increase residential consumption water footprint, but Kuznets curve hypotheses establish between environmental influence represented by water footprint and power of consumption, that is to say, the enhance of power of consumption will finally decrease the environmental influence of consumption.

Key words:

water footprint; IPAT; IHPACT; sustainable consumption

Influencing Mechanism of Energy-related Carbon Emissions in Xinjiang Based on IO-SDA Model

WANG Changjian¹, ZHANG Xiaolei², ZHANG Hongou¹, WANG Fei³

¹Guangzhou Institute of Geography Guangdong Open Laboratory of Geospatial Information Technology and Application, Guangzhou 510070, China, www.wangcj@126.com;

² Xinjiang Institute of Ecology and Geography, Chinese Academy of Sciences, Urumqi 830011, China;

³ College of Geography Science and Tourism, Xinjiang Normal University, Urumqi 830054, China

Abstract

Global warming and climate change are issues that have garnered widespread attention, and the need for a low carbon economic transition has become the consensus of the international community. China has become one of the world's largest energy consuming countries, as well as one of the biggest emitters of greenhouse gases. Questions like whether China can fulfill the most restrictive carbon emission reduction commitments while maintaining rapid and stable socioeconomic development further highlight the importance and urgency of research on carbon emissions from energy consumption. Based on regional perspectives of its impacts on energy consumption, the analysis of carbon emission mechanism is an important research method capable of achieving energy savings and emission reductions. Xinjiang, an important Chinese energy production base, is currently going through a period of strategic opportunities for rapid development. Ensuring stable socioeconomic development while achieving energy savings and meeting emission reductions targets, thus preserving the harmonious development of "society - economy - energy - environment", is the key issue currently facing the region. This paper is based on the input - output theory, and conducts a structural decomposition analysis on the factors affecting energy-related carbon emissions in Xinjiang from 1997 to 2007; this analysis employs a hybrid input-output analysis framework of "energy - economy - carbon emissions", and uses an extended IO-SDA model. The data for this study comes from the Xinjiang input - output tables (1997, 2002, and 2007). Population, economic and energy source data are derived from the statistical yearbook of the Xinjiang Uygur Autonomous Region. ① Xinjiang's carbon emissions from energy consumption increased from 20.70 million tons in 1997 to 40.34 million tons in 2007; carbon emissions growth was mainly concentrated in the production and processing of energy resources, the mining of mineral resources, and the processing industry. ② The analysis of the direct effects of the influencing factors on carbon emissions showed that the change in per capita GDP, the final demand structure, the population scale, and the production structure were the important factors causing an increase in carbon emissions, while the decrease

in carbon emission intensity during this period was the important influencing factor in stopping the growth of carbon emissions. This showed that while the sizes of Xinjiang's economy and population were growing, the economic structure had not been effectively optimized and the production technology had not been efficiently improved, resulting in a rapid growth of carbon emissions from energy consumption. ③ The analysis of the indirect effects of the influencing factors of carbon emission showed that the inter-provincial export, fixed capital formation, and the consumption by urban residents had significant influence on the changes in carbon emissions from energy consumption in Xinjiang. ④ The growth of investments in fixed assets of carbon intensive industry sectors, in addition to the growth of inter-provincial exports of energy resource products, makes the transfer effect of inter- provincial "embodied carbon" very significant.

Key words:

carbon emissions; Input output-structural decomposition analysis; Influencing factors; Xinjiang

Optimal Spatial Land-use Allocation for Limited Development Ecological Zones Based on the Geographic Information System and A Genetic Ant Colony Algorithm

Nan Mi¹, Jingwei Hou^{2,3}, Wenbao Mi², Naiping Song⁴

⁴ Key Laboratory Ministry of Education of Restoration and Rehabilitation for the Degraded Ecosystem in Northwestern China, Ningxia University, Yinchuan, China

Abstract

Limited development ecological zones (LDEZs) are often located in poverty-stricken, ecologically vulnerable areas where ethnic minorities reside. Studies on optimal spatial land-use allocation in LDEZs can promote economic and intensive land use, improve soil quality, facilitate local socioeconomic development, and maintain environmental stability. In this study, we optimized spatial land-use allocations in an LDEZ using the geographic information system (GIS) and a genetic ant colony algorithm (GACA). The multi-objective function considers economic benefits and ecological green equivalents, and improves soil erosion. We developed the GACA by integrating a genetic algorithm (GA) with an ant colony algorithm (ACA). This avoids a large number of redundant iterations and the low efficiency of the GA, and the slow convergence speed of the ACA. The study area is located in Pengyang County, Ningxia, China, which is a typical LDEZ. The land-use data were interpreted from remote sensing (RS) images and GIS. We determined the optimal spatial land-use allocations in the LDEZ using the GACA in the GIS environment. We compared the original and optimal spatial schemes in terms of economic benefits, ecological green equivalents, and soil erosion. The results of the GACA were superior to the original allocation, the ACA, and the multiobjective genetic algorithm, in terms of the optimum, time, and robust performance indexes. We also present some suggestions for the reasonable development and protection of LDEZs.

Study of Interspecific Hybridization Between *Populus Laurifolia* L with *Populus Suaveolens* Fisch

Batdorj E., Bilguun Kh.

Institute of Geography and Geoecology, Mongolian Academy of Sciences, Ulaanbaatar 15170, e_hoomboo@yahoo.com

Abstract

The objective of this study was to investigate and evaluate possible breeding, propagating values of the isolated population of laurel leaf poplars in Zuunsaikhan mountain of Gobi-Altai. As being southernmost and only natural stand of *P.laurifolia* in Gobi region of Mongolia, this small population amidst of dry Gobi region presented the value of use in tree improvement programs for drought resistant poplar varieties.

During our work it was observed that in Ulaanbaatar city, flowering began since 1 of May and seed dispersal on 14 of June, which equals 40 days after flowering.

Also in one seedpod of *P.suaveolens* counted 28-32 seeds, while in branch culture it was 8-12 seeds per seedpod. Seeds germinated within 36 hours after it put on wet tissue paper. We used 2 different approaches to grow poplar seedlings first half were grown in ordinary seedbed ground of greenhouse, the other half were grown in containers.

In greenhouse condition, containerized seedlings had slightly more growth than seedlings grown in open ground.

Poplar growth was most intensive in July and August. Highest containerized seedling was 41 cm and highest bareroot seedling was 33.5 cm. Apical growth stops by 15 August, foliage begins on 15 September and by 4 December seedlings completed winter bud dormancy.

Pollen collection: Collected pollens were stored in glass tube until the artificial pollination whit-25°C. Pollen grain of Laurel leaf poplar is of orange color, 24-32 mkm, round shaped. Pollen grains that not round shaped are dead pollen unable to fertilize the egg cell.

Key words:

Study On Ecological Effect Factors on Native Grassland in Ningxia Based on Fitting-analysis

Qi, T.Y.¹, Wittig, R.², Qiu, K.Y.³

¹Application Research and Development Center of New Technology, Ningxia University, Yinchuan, 750021, P. R. China, qty1983@yahoo.com;

² Institute of Ecology, Evolution and Diversity, Goethe University Frankfurt am Main, Frankfurt am Main, 60438, Germany;

³ Institute of Geobotany, Leibniz University Hannover, Hannover, 30167, Germany

Abstract

Ascertaining the ecological effect factors on grassland is a conundrum which has been troubling scientists for many years. According to research findings in this field, we found that most papers focus on a single factor or several factors, but research on multiple factors is rare. Facing this conundrum, we introduced the fitting-analysis method. By analyzing the ecological effect factors on native grassland in Ningxia from 2001 to 2011 we obtained the following results: i) regarding the whole period, except for precipitation, not natural but anthropogenic factors had the main effect on native grassland in Ningxia. ii) during the 11 years considered, grazing had the greatest influence on native grassland ecosystem in Ningxia. iii) considering each year separately, from 2001 to 2008 human activities and grazing were the main ecological effect factors, while from 2008 to 2011 natural factors were dominant. From these results we conclude that, during the period 2001 – 2008, grassland was not well protected in Ningxia, in particular grazing prohibition did not work or showed no effect. In the more recent years, however, grazing was obviously reduced. For the future, we suggest that measures should be taken in order to improve the native grassland ecosystem of Ningxia.

Study on the Effect of Water Resources on Grain Yield in Western Songnen Plain: Take Tao'er River Basin for Example

Liu Yumei¹, Li Jiuyi²

¹ Suzhou university of science and technology, Jiangsu Suzhou, 215009, P. R. China, plumyliu@163.com;

² Institute of Geographic sciences and natural resources research, CAS, Beijing, 100101, P. R. China

Abstract

Western Songnen Plain is an important commodity grain production base. Meanwhile, it is a typical water shortage area. In order to achieve efficient use of water resources and food security, the relationship between water resources and food production must be clarified. Taking the Tao'er River Basin (TRB) as a typical area, gray correlation method (GSM) was used to evaluate the relationship between grain yield and its relative factors on the basis of the grain yield data, agricultural data and meteorological data from 1990 to 2013. Then, water shortage was calculated by Penman-Monteith equation and crop coefficient approach. Finally, the relationship between grain yields and water shortage rate of different growth stages was analyzed. The results indicated that: (1) Grain planting area, fertilizer input and rural labor force are important to the grain yield. And the effective irrigation area and supporting the number of production wells associated with the continuous improvement of crop yield. (2) Different crops at different stages have different water requirement, corn: early > mid > development > mature, rice: early > mid > Mature > development, soybean: mid > initial > mature > development. (3) The influence of water shortage rate in different stages to different crops is different, for rice, the influence of water shortage rate to yields showed early > mature > development > mid; for corn, the early > development > mature > mid; for soybean, early > mature > mid > development. Conclusively, the work will provide a reference for agriculture ministry as increasing the crop yields and developing water saving agriculture.

³ Guangzhou Institute of Geography, Guangzhou 510070, China

Abstract

The security and quality of livelihoods for peasant households is the core issue for rural areas in China. A stable livelihood contributes to the harmonious development of related policies, poverty eradication and sustainable use of resources. In Qinghe County, located in the extremely arid zone of Northwest China, 238 validated surveys were conducted. The analysis focuses on the importance of livelihood capitals for the selection of on- or off-farm livelihood strategies among beneficiaries of different kinds of ecological compensation packages. The goal is to see if different groups of beneficiaries are better able to pursue off-farm livelihoods activity, which reduces pressure on the resource base, and whether specific capitals are especially effective in helping households pursue off-farm livelihoods, which benefits their well-being. The findings show that proportionally more herdsmen (who participated in a pastureland rehabilitation program) were able to pursue off-farm livelihoods than farmers (who participated in the cultivated land reforestation program), and especially agro-pastoralists (who participated in both programs). Further, models of livelihood strategy show that human and financial capitals facilitate off-farm livelihoods, while productive capital tends to lead to on-farm livelihoods. These findings indicate that there is no single determinant of livelihood strategy, and future policies must consciously differentiate among beneficiaries to reach the desired result.

Key words:

ecological compensation; livelihood capital; livelihood strategy; rural mountain community

The Health Evaluation of *Stellera Chamaejasme* Community in Qilian Mountains of QINGHAI Province

Zhimei Z, Junbin D, Yongmei L

Department of Urban and Resources of Northwest University, Xi'an, Shanxi, 710127, P. R. China, zhzhmx@126.com

Abstract

Using principal component analysis (PCA), the health status of grassland degradation in Qilian County of *Stellera chamaejasme* community in Qinghai province was evaluated for. The results showed that grassland health index (HI) could be obtained by the extraction and combination of the least indicators of community characteristic factors, geographical factors and soil factors. By HI's quantitative classification, status of degradation in survey sample in Mole town Duolong pasture moderately degraded for geographical boundaries ($0.3 < HI < 0.6$), respectively, the Amidongsuo scenic was in potential degradation ($HI > 0.9$) and the Huangcaogou village and Mangzha pasture in Epu town were in slight degradation ($0.6 < HI < 0.9$); part of the pasture of Arou town were in strong, even severe degradation ($HI < 0.3$), accounted for 50% of the sample under investigation. A quantitative determination and evaluation of the study area of grassland degradation succession status, and the analysis shows that the degradation of different stages is due to the different grassland use and intensity of use there is a big difference, namely, grassland degradation and grazing, management conditions and geographical environment to adapt. This paper provides a theoretical basis for the establishment and classification management of the grassland degradation research and evaluation system, and provides some reference value for the vegetation restoration and ecosystem health assessment.

Abstract

Salt in arid area oasis irrigated soil is soil characteristics of the most active and most complex part, analysis of the spatial variation of soil salinity in the region and influence factors is to understand the process of soil salinization, the premise and foundation of the saline soil improvement. In Keriya Oasis as a study target, the use of 24 sampling points of the surface soil salinity data and selected nine and soil salinity is closely related to the impact factor, combined with spatial auto correlation, the traditional regression analysis and geographically weighted regression model, analysis the salinity of surface space distribution characteristic and influence factor of spatial differentiation, results show that: 1. Keriya Oasis Soil Salinity in space are not randomly distributed, but there is strong spatial dependence, spatial autocorrelation indices 0.479 was positive spatial autocorrelation. 2. the mineralization degree of groundwater and groundwater buried depth, elevation and temperature is the main factor of the influence of arid plain oasis soil salt accumulation, these factors with spatial heterogeneity, selected nine environmental variables in addition to the pH value of the soil, strength of other variables impact on soil salinity there are significant spatial differentiation. 3. The ability to explain and the estimation accuracy of GWR model for spatial non-stationary data is superior to the OLS model, and has obvious advantages in the visualization model to estimate the parameters of the regression.

Factor Analysis of Daihai Wetland Dynamic Change in Recent 40 Years

Wenjun Liang, Jiyao Liu, Xi Chun, Bilige Siqin, Zhiwen Wu, Shixin Huang

Inner Mongolia Normal University, China, 745911726@qq.com

Abstract

The paper takes Daihai wetland as the researching object to discuss the changing process and reasons by visual interpretation method to extract the area of Daihai wetland from topographic map and MSS/TM/OLI etc remote sensing images in recent 40 years. The results showed that, the wetland area gradually shrank from 149.55km² in 1976 to 60.54 km² in 2015. It is mainly affected by Precipitation, Temperature, Evaporation and Human activities. Precipitation showed a reducing trend in fluctuations and the temperature had an increasing trend annually, which results in the shrinkage of wetland area with a negative correlation with precipitation. On the other hand, the pressure from rapid expansion of cultivated land with population growth has a great effect on the wetland area, becoming one of the most important factors.

Key words:

Inner Mongolia; Daihai wetland; Remote sensing analysis; Influential factors

Geographical Analysis of Water Resources of Rajasthan State, India

Mohammed Muslim Sheikh

Associate Professor, Dept. of Geography, Govt. Lohia College, Churu (Rajasthan) India, mmskh@rediffmail.com

Abstract

Rajasthan is the largest state in India covering an area of 342,226 sq.km. The state is predominantly agrarian as the livelihood of 70 percent of its population depends on agriculture based activities. Though it covers 10.5 percent of the country's geographical area, it shares only 1.15 percent of its water resources. Planning, development, operation and maintenance of all water resources to support the growth of the state economy and the well-being of the population, in response to the growing need for drinking water, agricultural products, industrial production. The ground water also plays an important role especially in agriculture and drinking water supply. The situation of ground water exploitation is also not satisfactory as in areas where surface irrigation is provided there is a tendency of not using ground water for agriculture which creates problem of water table rise and even water logging. On the contrary, in large areas of the State, ground water is being over exploited and the water table in some areas is going down even at the rate of 3 meter per year. Our ancestors were very careful about the harvesting of rain-water and conservative use of ground water. But with the expansion of population volume and consequently enhanced use of ground water for drinking, industrial and irrigation purposes, the balance of ground water recharge and exploitation has lost its existence. This paper describes the present water situation and future demand of water with the increasing of population.

Key words:

Water resources; rain water harvesting; demand and population

Implications of the Looming Drought and Surging Food Price Hikes on Food Security in Low-Income Households in South Africa

Mutyenyoka, E.M.

University of Limpopo, South Africa, Edwin.mutyenyoka@ul.ac.za

Abstract

The purview of this contribution predicts significant threats posed by a consortium of a looming drought, a grappling economic downturn, an acute economic austerity and surging inflation-driven food price hikes to already-stringent food security of, especially, low-income households in a South Africa where a third of the population is unemployed. With the National Weather Service reporting 32 temperature records being broken already in the first two weeks of 2016, South Africa is ostensibly on the verge of its worst drought since 1904. The National Agricultural Marketing Council, on the other hand, recorded a maize production plunge of up to 30% over the years and forecast an even more drastic plummet in the current agricultural season. These plights are further compounded by the fact that the contingency of importing food is, not only, coincidental but as prejudicing as the value loss plaguing the local currency against international trading currencies. Such trends have the aptitude to inflate and hike local food prices whilst simultaneously turning up the heat on hand-to-mouth aliment conditions already endured by most low-income households in post-apartheid South Africa. This paper tentatively projects prospective implications of a combination of an imminent drought and the ensuing food price hikes on the propensity of low income households to sustain their float just above the lower bound poverty line.

Drought; Food Prices; Food Security; Wellbeing; South Africa

Lake Baikal Basin Rivers Runoff Under Climate Change Conditions

Garmaev E. Zh, Ayurzhanaev A.A.

The Baikal Institute of Nature Management SB RAS, Ulan-Ude, 670047, Russia, garend1@yandex.ru

Abstract

Lake Baikal is a unique water body included in the UNESCO World Heritage List. In recent years, environmental problems of Lake Baikal and its catchment area manifested in the reduction of water availability, increasing the number and area of the fires, the spread of *Spirogyra*, etc. are concerned.

In the report the issues of formation of Lake Baikal basin rivers runoff and its spatial distribution patterns are examined. We analyze the water regime of rivers, depending on the dynamics of total precipitation amount. From 1980 to the present time on the territory of Lake Baikal basin two wetness periods were marked - wet and dry. The dynamics of the flow rate annual values of major rivers forming the filling of Lake Baikal is consistent with trends in precipitation. It is shown that the dry period is currently ongoing, which is reflected in a decreasing in total precipitation amount throughout the territory of the Lake Baikal basin with a minimum value down to -30 mm per year.

In the given report the spatial correlation between total precipitation amount and various indices oscillations is analyzed. It was found that the greatest impact on the amount of precipitation in the Baikal Lake basin have Arctic Oscillation Index and the El Niño – Southern Oscillation Index.

Key words:

Lake Baikal; river runoff; climate change; total precipitation amount; oscillation indices

Minimum Instream Flow requirement for the Water-reduction Section of Diversion-type Hydropower Station: A Case Study of the Zagunao River, China

PENG Li ^{1,2}, SU Chunjiang ², CHEN Tiantian ^{2,3}

¹ State Key Laboratory of Simulation and Regulation of Water Cycle in River Basin, China Institute of Water Resources and Hydropower Research, Beijing 100038, China, pengli@imde.ac.cn.

² Institute of Mountain Hazards and Environment, Chinese Academy of Sciences, Chengdu 610041, China.

³ University of Chinese Academy of Sciences, Beijing 100049, China

Abstract

Diversion-type hydropower development can reduce instream flow and destroy river ecosystem continuity. Therefore, the minimum instream flow must be assessed for proper ecosystem recovery. The Physical Habitat Simulation System (PHABSIM) still probably remains as the most widespread habitat method used to establish instream flow standards or to link habitat variations with fish population dynamics. This study applies the PHABSIM models, which create a habitat-flow relationship, describing the physical habitat suitability of alternative instream flow releases. Selecting the water-reduction section of the Sangping Power Station on the Zagunao River as the research object, the hydraulic pressure at a cross section was obtained through habitat simulation. The cyprinidae family of fish, dominant in this region, was targeted using velocity and depth suitability curves. The quantitative relationship between flow and suitable habitat area was established, with the minimum instream flow of the study area calculated as 30.0m³/s, according to the weighted usable area-flow curve. The minimum instream flow of the study area was also estimated through common hydrologic and hydraulic methods. The resulting comparison indicated that the habitat simulation model achieved very similar results to those of the wetted perimeter method and achieved between “good” and “very good” levels using the Tennant method.

Key words:

Habitat simulation; minimum instream flow; hydropower development; Zagunao River

Problems of Productive Using and Protection of Water Resources in Dry Regions of Ararat Hollow of the Republic of Armenia

Margaryan V.G.

Yerevan State University, Faculty of Geography and Geology

Department of Physical Geography and Hydrometeorology, Yerevan, Armenia, vmargaryan@ysu.am

Abstract

In last ten years considerably increased the interest to productive using and protection of water resources, which conditioned mainly by development of world economy, growth of requirements to drinking water, as well as by global change of climate. It is especially mentioned in dry low-lying regions of Ararat hollow of our republic because of shortage of surface water resources and irregular distribution. In future the water resources can be more vulnerable because of global climate change.

The study territory is an agricultural region of intensive irrigation. On the other side, the region occupies less than 1/10 part of republic's territory here are more than half of industrial enterprises and population of the republic. Therefore, productive using and protection of water resources of dry regions of Ararat hollow has an important significance.

Taking account this, the purpose of this work was to study the dynamics change of water resources of region, estimate the vulnerability of water resources discover the problems of using and protection of surface water resources.

For solving these problems in the work as a theoretical base were appropriate studies, and as material base – actual data of long-term observations of air temperature and atmospheric precipitation, river runoff of study territory, which are kept in the fond of Armstatehydromrt of the Ministry of emergency situation of the Republic of Armenia. As a methodological base in the work are used general scientific, characteristics, analyses, statistical analyses, mathematic, extrapolation and correlation methods.

Analysis of observations of historical data shows, that during all period of observations are mentioned considerable changes of climate and river runoff characteristics. Mainly is observed the tendency of increasing of values of average annual means of air temperature and atmospheric precipitation and deceasing of average annual values of river runoff. So, in the case of possible change of climate the estimation of vulnerability of water resources and realization of adaptation arrangements have important significance for future development of economy of the republic and for improve of social conditions of population. Productive using

and protection of water resources is necessary to realize by systematized and ecosystem approach. At the same time have to be account, that some catchment basins are various ecosystems. Ecosystem studies require concrete approaches and actions, which more correspond to conditions of ecosystems.

Thus, based on the provisions of the aquatic environment of the study territory and the existing problems, to improve the productivity of activities, rational use and protection of water resources, regulation and management, to address the primary tasks necessary:

- ✓ quantitative and qualitative comprehensive systematic and continuous monitoring of water resources;
- ✓ ecosystem studies of water resources;
- ✓ reduce and prevent water loss in the water consumption, water saving and reuse, operation of collecting rainwater and sewerage system;
- ✓ repair and maintenance of irrigation networks and other hydraulic structures, construction of new, progressive introduction of modern technologies;
- ✓ improvement of water supply and sewerage services;
- ✓ prevent water pollution, improve the quality and control the observance of sanitary norms of water resources, the expansion of the network of sanitary zones;
- ✓ strengthening of the legislative (legal) and the institutional framework and implementation of reforms;
- ✓ the development of strategic programs for further development of water resources management, the scope of water management;
- ✓ participation of the general public and communities in the use and nature conservation.

Key words:

Water resources; productive using and protection; air temperature; atmospheric precipitation; river runoff; the Republic of Armenia; dry Regions of Ararat Hollow

Remote Quantification of Surface Area Dynamics for Large Endoheic Lake Using Landsat Imagery: A Global Perspective

Song K.S, Li Y.Q, Zang J.J, Wang M, Du J, Wen, Z.D

Northeast Institute of Geography and Agroecology, CAS, Changchun, 130102, P.R. China, songks@iga.ac.cn.

Abstract

Saline lakes, mostly situated in endoheic basins, are sensitive to both climatic and anthropogenic changes. The endoheic basins ($2.05 \times 10^7 \text{ km}^2$) were retrieved for all continents except Antarctica and Greenland Island using SRTM data. Images acquired by Landsat series sensor during 2009-2011 were used to delineate water bodies in endoheic basins across the world, while images acquired by Landsat during 1972-2014 were applied to examine typical saline water bodies across the world. Endorsed with extensive endoheic area, Asia possesses the vast area and numbers of saline waters (N: 173896; A: $1.85 \times 10^7 \text{ km}^2$), followed by Oceania (N: 9716; A: $1.85 \times 10^4 \text{ km}^2$), South America (N: 2109; A: $1.15 \times 10^4 \text{ km}^2$), North America (N: 10741; $0.99 \times 10^4 \text{ km}^2$), and Africa (N: 9651; A: $0.97 \times 10^4 \text{ km}^2$) with respect to water surface area. The results indicated that most of the saline lakes are showing a decreasing trend during 1972-2014, i.e., the Aral Sea, the Great Salt Lake, the Chiquita Lake, and the Lake Chad. In the contrast, some of the closed saline lakes locating in the alpine regions (Nam Co and Shiling Co) fed with glacier or snow melting waters showed an inverse trend, particularly these situated in the Tibetan Plateau or the Pamir. Our investigations also demonstrated that saline lakes of Tectonic origins tend to be more stable than these shallow lakes sitting in flat plains. The investigation revealed that anthropogenic activities are the major driving forces for saline lake areal variations, particularly these feeding rivers diverted for irrigation, while the alpine saline lakes are more sensitive to climatic change. It also should be highlighted that shallow saline lakes in Oceania and Africa is more sensitive to climatic variation caused fluctuations, rather anthropogenic driving forces.

Key words:

saline lakes; water surface area; endoheic region; satellite imagery

Soils and Water Interplay in Sokoto-Rima Flood Plain

Murtala Gada Abubakar, Sheikh D. Abubakar, Gaddafi Bala, Abdulkadir A. Usman

Usmanu Danfodiyo University, Sokoto, Nigeria, mahagada@gmail.com

Abstract

Groundwater hydrochemistry can be affected by multiple natural factors, such as chemical reactions between water and soil or sediments, biochemical reactions, and surface water–groundwater interactions, as well as human activities. The aim of this research is to assess the soils and water interaction as it affects groundwater quality along Sokoto-Rima flood plain; the correlation analysis was used to find the degree of relationship between pollutants in soils and water. Seven sample points were selected systematically from the map at 6.13km interval, and in each sample point, three samples were taken for soils and water from the river at hundred meters' interval giving a total of 21 samples each of soils and water. After the laboratory analysis of the samples, the results revealed positive correlations between soils and river in P and PO_4 , Mg, Ca, and Fe. R^2 (co-efficient of determination) values are .124, .013, .053, and .445 respectively. While, negative correlations exist between soils and river in pH, N and NO_3 , K, and OC and CO_3 . R^2 values are .015, .224, .075, and .027 respectively. It was confirmed that the correlation is statistically significant between N and NO_3 at 0.05 and also, it is significant in Fe at 0.01 levels.

Spatial-Temporal Change of Surface Water in The Middle Mu Us Desert Areas from 1999 To 2013

Peiyun Zhang, Gefei Wang, Liwen Liang, Shiqiang Zhang*

Northwest University, Xian, 710127, P. R. China, zhangsq@lzb.ac.cn

Abstract

The information of surface water plays an important role in economic development and ecological protection in Mu Us Desert. This study uses 1999-2013 Landsat TM/ETM+ image, with the research object of representative Mu Us Desert in arid area of Northwest China. To acquire the surface water area of the middle area of Mu Us Desert and its temporal and spatial variation in 14 years. The results demonstrate a phenomenon that the surface water in the study area has shrunk first and then picked up, but the overall area is severely reduced. Total area of the surface water reduced from 368.51km² in 1999 to 299.04km² in 2013, the overall area of the area reduced by 69.47km² (18.8%).

Abstract

Several factors have decimated what was once the sixth-largest lake in the world, the Lake Chad. Over the past four decades, the lake's surface has shrunk significantly in size. These problems are expected to worsen in the coming years as population and water demands increase. If this trend in the shrinking of the Lake Chad continues unabated, economic activities such as fishing, livestock rearing and farming will be adversely affected. This paper examines the origin of the Lake Chad, major causes of the shrinkage of its water, current situation, threats to its sustainability, and, opportunities offered by the Lake Chad Basin.

An Evaluation of 5 Kinds Water Indexes for Land Surface Water Extraction with Landsat-8 OLI Imagery

Wang Xuhong, Yan daijiang

Northwest University, China, 1441989629@qq.com

Abstract

The automatic water extraction index (AWEI) and the normalized difference water indices (NDWI_s) were successfully used in map land surface water extraction (LSWE) from Landsat 8 multispectral images in the Yellow River Basin River Basin. This paper evaluates the potential of Landsat-8 Operational Land Imager (OLI) multispectral images for LSWE using two AWEI modes and three NDWI water indexes models. We tested the accuracy and robustness of the five OLI AWEI models in the Yellow River Basin River Basin in China. The results demonstrate that the five water indexes models achieve an overall accuracy of more than 95%, a kappa coefficient of 0.89 and a producer's accuracy of 95% for LSWM. The results also demonstrate that the AWEI model using the green band (Band 3) and the SWIR1 band (Band 6) (referred to as NDWIO6,3) of the OLI sensor has a higher LSWM accuracy than the other two NDWI models.

water index; Water extraction; AWEI

Application of DPSIR-PLS to Assess Water Poverty in China

SUN Cai-zhi, WU Yong-jie

Liaoning Normal University, China, 745193264@qq.com

Abstract

Aiming at shortcomings of existing methods of water poverty problem, this paper combines DPSIR model and PLS structure equation model, from the "driving force -pressure- state -impact -response" five dimensions to build the evaluation index system of water scarcity poverty, builds water poverty evaluation framework, with testing index system and structure model from structural equation model software verification index system and structure model, finally estimates water scarcity score and cluster of 31 provinces in our country . The results reveal some conclusions : (1) DPSIR-PLS model can make up for lack of existing water poverty research methods and suitable for evaluation of water poverty in China; (2) the path relationship the poor situation of water in China shows relatively stable situation of China's water poverty, but greater pressure; (3) overall, eastern water poverty status is better than that of the central region, western water poverty most serious;(4) in the eastern region, water poverty problem is often five subsystems, "short board" system,while the western region water poverty is a serious problem, which is generally five subsystems development levels low. This paper measures the water poverty in China from a new angle, which aims at improving the theoretical reference for the development of water resources management policies in the provinces of China.

water scarcity; DPSIR-PLS model; Water resources management

Comparison of Six Normalized Difference Water Indexes Focus On Turbid River

Mapping in Yellow River Basin

Dajiang Yan, Xuhong Wang, Chang Huang

Department of urban and environment, Northwest University, China, 1441989629@qq.com

Abstract

Land water mapping is of great significant for remote sensing. Scholars have proposed several water indexes using Landsat imagery. Two-band indexes is one of optimum method to distinguish water from the earth's surface. It is difficult to extract turbid water for its high turbidity especially in yellow river basin. The maximum of reflectance removed to red band in turbid water body in yellow river basin. Building on this variation, this paper used three normalized difference water indexes (NDWI₅₄, NDWI₆₄, NDWI₇₄) focus on turbid water mapping using Landsat-8 OLI that acquired higher accuracy. Furthermore, we evaluated the result of NDWI₅₃, NDWI₅₄, NDWI₆₃, NDWI₆₄, NDWI₇₃ and NDWI₇₄ in yellow river basin in China. We defined NDWI₅₃, NDWI₆₃ and NDWI₇₃ as NDWI_{green}, meanwhile, we defined NDWI₅₄, NDWI₆₄ and NDWI₇₄ as NDWI_{red}. This paper used zero as threshold to segment water from surface feature. The test demonstrated that NDWI₆₄((red-SWIR1)/(red+SWIR1)) based on red, SWIR1 were more suitable for turbid water mapping in three study sites, except the area where the main background is urban. NDWI₆₃(MNDWI) also was the optimum index for turbid water mapping where the dominant background is urban which accord with xu' result. On the contrary, NDWI_{green} could obtain higher accuracy compared with NDWI_{red} in clear water mapping. The overall accuracy performed by NDWI_{red} exceeded 86.4350%, while NDWI_{green} just reach 81.9507% in turbid water mapping. On the contrary, the overall accuracy performed by NDWI_{green} exceeded 95.5644%, while NDWI_{red} reach 93.4315% in clear water mapping. Therefore, NDWI_{red} can be used for turbid water mapping successfully.

Contribution of the 3D Geological Model to the Study of the Sahel-Abda Aquifers Structure (Coastal Meseta, Morocco)

ELBCHARI F., SOUHEL A.

University of Cadi Ayyad, Polydisciplinary Faculty, Safi, 4162, Route de Sidi Bouzid, 46000 Safi, Morocco, elbchari@yahoo.fr;

University of Cadi Ayyad, ENS, N8, 40000 Marrakech, Morocco

Abstract

The Sahel-Abda, which is part of the Coastal Meseta, contains Mesozoic aquifers. The information sheets are still fragmentary and insufficient. In order to improve the knowledge of these aquifers and the determination of the structure of aquifers, a 3D geological model was developed in this study.

It was constructed from information provided by 265 mechanical soundings and geological maps, which were analyzed, coded and integrated in the specific software. For doing this, three lithostratigraphic units were considered: The Plioquaternary, the Lower Cretaceous and the Upper Jurassic. The operation of the 3D stratigraphic model allowed making it closer to the geometry of Lower Cretaceous aquifers.

The modeling process includes the following steps: inventory of available boreholes; analysis of boreholes data; realization of a database containing the details on the information (x, y, z) of drilling, geological units and Z coordinate encoding horizons and lithological structure.

The elaborated three-dimensional model, based on the available geological data permitted us to visualize the architecture of the Sahel-Abda area, to realize out geological sections in all directions and at any location of the model and to monitor changes in depth of Lower Cretaceous aquifers. This 3D geological model has the advantage of being based on a number of exploratory boreholes. It allows to specify the geometry and structure of the area.

Distribution of Vegetation Types and Their Influences on the Hydrological Processes in Dongling Mountain in Beijing

Xu Fei, Jia Yangwen, Niu Cunwen, Liu Jiajia, Han Chunmiao

China Institute of Water Resources & Hydropower Research (IWHR), Beijing 100038, China, jiaYW@iwhr.com

Abstract

To clarify the vertical zonality on mountain vegetation types and the influence on the hydrological processes, Qingshui river watershed in the Dongling Mountain which is the highest peak in Beijing was selected as the research area, on the basis of using the land use data and combined with field survey, analysis the distribution of vegetation types, the WEPL hydrological model was used to simulate hydrological effect of different vegetation types, and analyze the different contour with different vegetation types impact to the hydrological processes of the region in the Qingshui river upstream. Results showed that the distribution of vegetation in Dongling Mountain was obvious, subalpine meadow at an altitude of 1700~2300m, at an altitude of 1200~1700m was deciduous conifers birches, and deciduous broad-leaved forest Liaodong oak forest at an altitude of 800~1200m. Vegetation types at different altitudes which influence on the hydrological processes, the difference is more apparent, runoff in unit area from the high order of subalpine meadow, birches and Liaodong oak forest. At the same time, the processes of energy of different vegetation types are also quite different. The research is of a significant value for us to understand the hydrological processes of different vegetation types in mountain regions and effective utilization of water resources.

Long Time Series Remote Sensing Monitoring of Evapotranspiration in Xilin River

Basin and related factors

Yu Hongbo, Zhang Qiaofeng

College of Geography Science, Inner Mongolia Normal University, Huhhot 010022, China, y_b_fan6@aliyun.com

Abstract

Our study area is the Xilin River basin. Remote sensing approach was used to retrieve instantaneous evapotranspiration based on the estimation of land surface fluxes by using MODIS images from July 2000 to July 2014 and from Apr. to Sept. of 2000、2007、2010 to 2014, and using auxiliary environmental data from the same time periods. Daily evapotranspiration was estimated by scaling. Monthly evapotranspiration were weighted by the number of days. Results were verified by the product of reference crop evapotranspiration and crop coefficients provided by FAO. This level of uncertainty was acceptable; therefore, the method that we concluded was applicable.

In the time distribution, the evapotranspiration of fifteen years from 2000 to 2014 was no fixed trend. The trend of evapotranspiration was consistent with precipitation. There is enough water for evaporation and transpiration in the abundant water year (2012-2014). June and July are the peak season for plant growth and leaf area index is the largest. So the largest area is available for transpiration. The maximum evapotranspiration of a year appeared in June to July. There is less precipitation in the dry year. Water is the main limiting factor of evapotranspiration. Therefore, the time of the maximum evapotranspiration is consistent with the time of maximum precipitation. The single factor correlation analysis of the monthly evapotranspiration and monthly average temperature, wind speed, relative air humidity, vapor pressure, and monthly precipitation showed that the most relevant meteorological factor with evapotranspiration is precipitation. So precipitation is the main limiting factor of evapotranspiration. Air temperature is also an important factor because of its obvious seasonal changes. But air temperature is not the main factor when it does not change obviously such as in July from 2000 to 2014.

Abstract

Spatiotemporal dynamic of evapotranspiration (ET) plays an important role in understanding the impact on vegetation of water and heat. In the present study, MODIS MOD16A2 and MOD13A3 monthly data and meteorological data were employed to analyze the spatiotemporal dynamics of monthly and seasonal ET in different types of grassland in recent 15 years (from 2000 to 2014) in Xilingol steppe and the correlation between ET and related factors by means of regression analysis and correlation analysis. From March to October and in spring, summer and autumn, ET decreased from east to west in Xilingol steppe and meadow steppe > typical steppe and sandy vegetation > desert steppe. In contrast, ET increased from east to west in Xilingol steppe and meadow steppe < typical steppe and sandy vegetation < desert steppe during January, February, November, December and in winter. The max ET appeared in November and winter in desert steppe, but it reached the maximum value in July and summer in other types of grassland. The min ET all appeared in May in different types of grassland. In all types of grassland, ET had a trend of decrease from March to May, and October and in spring and autumn, but in January, June, July and December and in summer and winter, it had a trend of increase, but all the changes were not significant. Pearson correlation analysis indicated that there was significant positive correlation ($P < 0.05$) between ET and NDVI, precipitation, vapor pressure and relative humidity from March to October and in spring, summer and autumn. On the contrary, during January, February, November, December and in winter, there were no significant negative correlation between ET and precipitation and relative humidity, but appeared significant positive correlation ($P < 0.05$) between ET and mean temperature.

Xilingol grassland; ET; NDVI; Meteorological factors; Correlation analysis.

Temporal-spatial Characteristics of Drought Based on the Vegetation Health Index in Longdong, Gansu Province, China

Yang J H, WU J J, Zhou H K

Academy of Disaster Reduction and Emergency Management, Beijing Normal University, Beijing 100875, China,
yangjh15@mail.bnu.edu.cn

Abstract

Longdong belongs to the important rain fed agricultural region of Gansu province, which is often influenced by drought disasters. In this paper, the Vegetation Health Index was calculated using Land Surface Temperature and NDVI data at Vegetation growing seasons from 2002 to 2013. Meantime, we calculated the Palmer Drought Severity Index in Huanxian, Kongtong, and Xifeng sites, and the PDSI was used to inspect the applicability of the VHI for drought monitoring. Lastly, the drought temporal-spatial characteristics were analyzed using the VHI in Longdong from 2002 to 2013. The results show that the VHI has quite similar fluctuation trends with the PDSI, especially when water deficit is severe. There are many severe drought events in the vegetation growing seasons in Longdong from 2004 to 2009, especially the continuous and severe drought event occurred at vegetation growing seasons in 2007 and 2008. After 2009, there was an alleviation for the drought condition. The vegetation growing season in 2012 was wetter than other years'. When it comes to the spatial characteristics, the northwest of Longdong region was affected more seriously by drought compared with other regions. The drought usually evolved from southeast to northwest at vegetation growing season.

The Moderate Intensive Utilization of Cultivated Land under the Restriction of Water Resources on Agro-pasture Zigzag Zone

Yingcheng LIU

China Agricultural University, Beijing, 100193, P.R. China, ycliu@cau.edu.cn

Abstract

Based on the 2014-2015 194 ordinary farmers and 45 scale famers survey data and statistics, analyzed land intensive utilization under the restriction of the cultivated land water resources. Through the analysis of ordinary farmers non-irrigated land, ordinary farmers irrigated land, scale farmers irrigated cultivated land, this article get the following conclusion: the scale of the stage of cultivated land extensive use is not restricted by water resources; The scale of intensive stage is in $37.79 \times 10^4 \text{hm}^2$ -- $41.99 \times 10^4 \text{hm}^2$ under strong water resources constraints, is in $41.9 \times 10^4 \text{hm}^2$ - $46.60 \times 10^4 \text{hm}^2$ under weak water resources constraints, is in $35.65 \times 10^4 \text{hm}^2$ - $32.09 \times 10^4 \text{hm}^2$ under medium water resources constraints; The scale of scale stage is in $8.91 \times 10^4 \text{hm}^2$ - $9.90 \times 10^4 \text{hm}^2$ under strong water resources constraints, is in $13.62 \times 10^4 \text{hm}^2$ - $15.13 \times 10^4 \text{hm}^2$ under weak water resources constraints, is in $10.42 \times 10^4 \text{hm}^2$ - $11.57 \times 10^4 \text{hm}^2$ under medium water resources constraints. The excessive utilization of resources on the regional ecological environment and farmers' life has had a notable effect. Because planting large circle of sprinkler irrigation makes the local underground water level continues to decline, the average annual decline in more than 2 m. In Inner Mongolia patterns in the ecological fragile district, its far-reaching impact of land use, therefore, how to develop a more reasonable more deliberate policy to guide the intensive utilization of cultivated land moderate, promote regional sustainable development is facing an important task of local policy.

Characteristics of Quaternary Red and Brown Earth deposits in North Western province of Sri Lanka

Wickramasooriya, A. K.

Department of Geography, University of Peradeniya, Peradeniya, 21000, Sri Lanka, awickramasooriya@gmail.com

Abstract

Red and Brown Earth deposits exist in North Western coastal regions in Sri Lanka were formed during Quaternary period. Ten representative samples were collected from Aruakkaru region in the Puttalam coastal region to identify the physical and chemical characteristics of the Red to Reddish Brown Earth deposits of the North Western province of Sri Lanka. After analyzing these samples, it was found that the average thickness of the Red and Reddish Brown Earth deposit in the region varies from 0.5 m upto about 10.5 m. General stratigraphic sequence of the samples include Reddish Brown clay, dark Brown clay, light Brown clay with rounded Quartz pebbles, clean Quartz sand followed by an unconformity surface. The top stratigraphic layer composed of well sorted Reddish Brown clay which is developed upto about 0.5 m upto about 7.50 m followed by moderately sorted dark Brown sandy clay with the thickness of about 0.35 m to 1.5 m. Poorly sorted light Brown clay with rounded Quartz pebbles appears below the Brown sandy clay with the thickness ranging from 0.25 m upto about 1.0 m. According to the texture of these stratified layers and the particle size distribution curves of them implies that these are fluvial deposits. There is no significant mineralogical variation in both Reddish clay layer and the dark Brown sandy clay layer. These two layers mainly composed of Hematite and Magnetite with Monazite, Garnet, Zircon and Rutile as accessories. In Red Earth Hematite is dominant while Brown Earth clayey fraction is dominant.

Sand Mining and Its Impact to River Water Environment in Benthara River in Southern Sri Lanka

Ranjana. U.K. Piyadasa

Department of Geography, University of Colombo, Colombo 03, Sri Lanka, ranjana@geo.cmb.ac.lk

Abstract

Sand mining and its impact on livelihood is one of the main problems in the most river basins in Sri Lanka. Due to salinity intrusion most of the coastal paddy lands along the river basins has been abounded our land degradation. The research objective was to assess saline water intrusion considering the surface runoff and tidal wave. Saline water intrusion impacted to the many paddy lands located in the left bank of the Benthara river in Southern Sri Lanka. Continuous monitoring was conducted over year period from January 2014. Twelve (12) sampling points along the river from sea to twenty-five kilometers (25 km) upstream were identified, based on two kilometers' interval in-between two sampling points. Further three water depth samples collected from three levels that is surface, mid-stream and deeper level were taken from each collecting point. Laboratory techniques were established to analyses the chemical water quality parameters on Na, Fe and presented in maps depicting salinity levels in the river using GIS software. Sea water intrusion is progressing in Benthara river basin in Kaluthara district due to anthropogenic impact such as river sand mining activities as well as natural reasons. Mainly this depends on the fluctuation of tides in the ocean. So two times per day, river will intake much salt water and saline water intrusion it in lands along with the river. The study revealed that the Saline water intrusion has been affected along with the river bed due to high density of the sea water.

Abstract

In this study, based on the scientific calculation system of carbon emissions in agriculture, we calculated the carbon emissions of agriculture in the Hotan prefecture between 1999 and 2013 and analyzed their spatial-temporal characteristics; next, we used the LMDI model to study the driving factors of agricultural carbon emissions. The results demonstrated the following: (1) in time series, the agricultural carbon emissions showed three stages of change, i.e., “decline, continued to rise and decline”, during the period of 1999 to 2013 in the Hotan prefecture. (2) In space, the carbon emissions from agricultural land use, paddy fields, enteric fermentation and manure management were different due to different sizes of cities and counties. The intensity of agricultural carbon emissions was varied and high, but the agricultural production structure, agricultural carbon emissions structure and other aspects had a high degree of consistency and homogeneity in cities and counties of the Hotan prefecture. (3) Regarding the driving mechanism, the labor factor, agricultural labor productivity and planting-animal husbandry carbon intensity are the main factors that increase agricultural carbon emissions in the Hotan prefecture. Compared with 1999, three major factors cumulatively achieved a 199.68% carbon emission increment from 2000 to 2013, of which the labor factor cumulatively increased by 120.04%, the agricultural labor productivity factor cumulatively increased by 54.94% and the planting-animal husbandry carbon intensity factor cumulatively increased by 24.70%. The agricultural production structure factor largely inhibited agricultural carbon emissions of the Hotan prefecture, which cut 99.74% of the carbon emissions from 2000 to 2013.

Key words:

Hotan prefecture; agricultural carbon emissions; spatial-temporal characteristics; driving mechanism; LMDI model

The Influence of Exponential Parameters Selection on the Exponent and Profiles Precision in Neutral Wind Tunnel Test

QI Honggang

South China Normal University, China, 1154245553@qq.com

Abstract

Based on the 3D model of Guangzhou main built-up area at 1:7000 horizontal scale, 1:500,1:1000,1:2000 vertical scale respectively,a wind tunnel simulation was carried out on the neutral flow of B atmospheric boundary layer.With wind velocities in more than 20 test points,15 heights of each prevailed wind of the northwest and southeast,the uncertainties generated by reference height z_{ref} , zero-plane displacement height d and sample thickness t to exponent α and fitting precision were all discussed,which provide some guidance to raise fitting precision on power law applications later.It is founded that a reference height equal to maximum height of test points has a relatively smaller mean value and dispersion of α ,and a better fitting precision than other z_{ref} ; d can improve fitting precision and is correlated with α negatively,not to consider d is more practical especially for the researches of inhomogeneous terrain and numerous test points;In differently rough terrain, α converges at 0.25-1H of the thickness of wind profiles,0.25-1H is the ideal sampling thickness.

Key words:

power law; exponent α ; zero-plane displacement height d ; sampling thickness t ; fitting precision

The Research on Spatial Difference of Urban Human Settlements Environment in Inner Mongolia

Ning Xiaoli¹, Yin Dongxu²

¹College of Source & Environment, Baotou Teachers college, Baotou 01403

²College of Geography Science, Inner Mongolia Normal University, Hohhot 01002

Abstract

This research is from the regional level to study urban human settlements environment in Inner Mongolia which is according to the connotation of Urban Human Settlements and the considering of the original foundation of Inner Mongolia. The evaluation index system of urban human settlements environment was established from the urban ecological environment, urban infrastructure and urban social and economic environment three aspects. The quality of urban human settlements environment of 12 cities in Inner Mongolia was evaluated using the principal component analysis(pca). The Results showed that the urban human settlements environment level of Inner Mongolia is divided into three categories. The quality of urban human settlements environment of Ordos city, Hohhot is good. The quality of urban human settlements environment of Xilinhote City, Baotou City, Hulunbeier City and Ulanqab is better. The quality of urban human settlements environment of Wuhai city, Chifeng City, Ulanhot City, Bayanhot, Tongliao City and Bayan Nur City is poor.

Abstract

Biological soil crusts (BSCs) endure the most extreme habitats in the world. They grow on the soil surface in desert regions and withstand extreme temperature, drought and intense radiation. BSCs comprise many kinds of micro-organisms, such as bacteria, algae, lichen and moss. Winter snowfall is an important factor in the growth and development of BSCs in temperate desert regions of China. In this study, lichen was sampled from an artificial vegetation area of Gurbantunggut Desert. Five snowfall treatments were applied: snow removal (0S), snow decrease to half that of ambient conditions (1/2S), ambient snow (S), snow increase to 1.5 times that of ambient conditions (3/2S), and snow increase to twice that of ambient conditions (2S). A series of important physiological indexes were measured, including photosynthetic pigment content, proline content, water-soluble sugar content, water-soluble protein content and malondialdehyde (MDA) content, to evaluate the effects of snowfall on physiological and biochemical characteristics of lichen during the melt and at the end of the growing period. The results clearly showed differences in physiological indexes between snowfall manipulation treatments in March, and further found that the values of most of the physiological indexes were influenced by snow removal/reduction treatments in October, such as with an increase in snowfall, the content of photosynthetic pigment and water-soluble protein increased, while the content of MDA decreased. This study elucidates the physiological and biochemical activities of lichen under snowfall, and has academic and practical significance in maintaining the stability of desert ecosystem.

Key words:

winter snowfall; lichen; physiological and biochemical characteristics

Plant-Soil-Water Dynamics of Canagana Ecosystems in Ecological Restoration Areas in Alpine Sandy Land, Qinghai-Tibet Plateau

Abstract

Vegetation restoration as an effective measure that can take advantage of the function of soil-plant system to improve the local environmental quality. We choose Shazhuyu as a study site to study plant-soil-water dynamics of ecological restoration in alpine sandy land, which is the most serious wind erosion area of Gonghe basin in Qinghai-Tibet Plateau. The results show: Total vegetation coverage and shrub coverage are first increased and then decreased within fixed years' growth and the peak point was growing thirty years, while herb cover always showed an increasing trend as time flying. The more years old of artificial ecosystems, the higher community diversity was existed. The coarse particle size, the lower organic matter content was on dunes. NT 80 had the maximum organic matter mainly caused by the highest vegetation coverage. Soil moisture came into peak in July on the dunes planted Caranaga. More herbs, more water could be stored. In different month of plant growth, the vertical dynamics of soil moisture was different on dunes because of rainfall and evaporation.

Scientific Investigations and Research Progress of the Badain Jaran Desert

Nai'ang Wang, Zhuolun Li

College of Earth and Environmental Sciences, Center for Desert and Arid Region, Lanzhou University

Abstract

Systematic scientific investigations of the Badain Jaran Desert were carried out by our research group that from Lanzhou University. The main achievements are as following: (1) Trans-Badain Jaran Desert expedition (from the north to the south). It was the first time all over the world for humankind to traverse the desert which has the highest sand dune (450 m) in the world by walking. (2) We measured the area of the Badain Jaran Desert by field investigation and remote sensing, and the result showed that it has an area of 52,100 km², which could be the second largest desert in China. (3) There are 110 perennial lakes in the Badain Jaran Desert, and the evaporation from fresh water is about 1500 mm/yr, which is higher than saline water with different total dissolved solids (TDS), indicating the effect of salinity. (4) Lakes and shallow groundwater in the Badain Jaran Desert are recharged by exogenic deep groundwater, and they have a Lisse effect. (5) Remote sensing data and field observation shows, temperature of lake and its surrounding areas in the desert hinterland are higher than that of other regions in the desert and desert surrounding areas, suggesting the existence of “warm island effect” in the Badain Jaran Desert. (6) During the last glacial period, the landscape of Badain Jaran Desert is actually discontinuous permafrost. The mean annual temperature in the Badain Jaran Desert dropped by 12°C during the Younger Dryas event, which was recorded by the sand wedges and mirabilite deposition. (7) The paleo-lakes had high lake levels in MIS 3 on the Alxa Plateau. Moreover, Holocene High lake-levels and Pan-lake period were existed in the Badain Jaran Desert. (8) At the beginning of the Holocene, peat was widely developed in the Badain Jaran Desert. Furthermore, Holocene environmental evolution were reconstructed by the terminal lake records. (9) Total of more than 110 archaeological sites (from the mid-late Neolithic Age to Bronze Age) were distributed in the Badain Jaran Desert and Yabulai Mountains, suggesting that one of the origin centers for nomadic herding were located in the Badain Jaran Desert. (10) One of the two biodiversity centers in north China was located in Badain Jaran Desert.

Abstract

Blowouts environment as the research object in the wangong town of chenbaerhu county in the hulun buir sandy grassland northern sand strip, selecting different forms of typical blowouts, through the wild vegetation observation and blowouts shape measurement, and grain size characteristics on the blowouts surface analysis, studies soil grain size characteristics in the sandy grassland and its influencing factors. Results show that the blowouts sand material structure is given priority to with fine sand, the second is the medium sand, very fine sand and silt content rarely, and apart from wind erosion grassland topsoil contain extremely coarse sand, and does not contain all other sample. Because of the sand sediment grain size composition is uniform, different forms of blowouts soil grain-size frequency curve were unimodal symmetric or nearly symmetric; Response to wind erosion and accumulation, in all parameters of particle size, coarse sand and fine sand content, frequency curve modal particle size, and obvious changes have taken place in the average particle size, etc.

Wave-like Motion of Tranverse Dunefields in the Korqin Sandy Land, Northeast China

HAN G

College of Resources and Environmental Sciences, Hunan Normal University, Changsha, 410081, P. R. China,
hanguang@hunnu.edu.cn

Abstract

There are noticeably transverse dunefields of variant spatial scales, composed of barchanoid chains, along major rivers on the extensive Xiliaohe Plain, Northeast China. With respect to their plan-forms, these dune chains are regularly spaced with nearly equal distance, whereas local longitudinal profiles show irregular curves, not standard trigonometric curves owing to the occurrence of slip-faces. Provided that the discontinued streamlines in windflow separation zone are not taken into account, and the streamlines between the brink on a dune and the reattachment point in interdunes are linked together, a quasi-regular trigonometric curve can be then acquired. By means of field observation and wind measurements, results show that a river valley is necessary and it acts as a disturbance for free windflow to produce wave-like motion in near-surface boundary layers, and barchanoid dune trains can, in turn, propagate downwind like real wave in water. Sufficient sand supply and the erodibility of the underlying loose late Quaternary sediments allow the wave-like motion under the circumstances of regular occurrence of high winds following the cold air outbreaks.

Key words:

wave-like motion; barchanoid chain; disturbance from river valley; erodibility of surface; high wind

Indication of Millennial-Scale Moisture Changes by The Temporal Distribution of Holocene Calcareous Root Tubes in The Deserts of the Alashan Plateau, Northwest China

Zhuolun Li, Nai'ang Wang, Ruolan Li, Kai Ning, Hongyi Cheng, Liqiang Zhao

College of Earth and Environmental Sciences, Center for Desert and Arid Region, Lanzhou University, Lanzhou 730000, China, lizhuolunlzl@163.com

Abstract

Calcareous root tubes or rhizoliths have strong potential for paleoenvironmental studies, especially in reconstructing paleoenvironmental conditions and paleovegetation. Previous studies suggested that the effectivity of the moisture level affects the formation of calcareous root tubes in the deserts of the Alashan Plateau, Northwest China. However, it remains unclear whether the temporal distribution of calcareous root tubes can be used to reconstruct paleo-effective moisture in this area. In this study, based on conventional ^{14}C dating results of 34 Holocene calcareous root tube samples collected from the Badain Jaran Desert, the Tengger Desert and the Ulan Buh Desert in the Alashan Plateau of northwestern China, millennial-scale changes in paleo-effective moisture during the Holocene in this area were reconstructed. The frequency of the ^{14}C dating results demonstrate that ~62% of the Holocene samples were dated to 7–5 cal kyr BP, and ~38% of the Holocene samples were dated to 4–2 cal kyr BP, indicating an arid period during the early Holocene (before 8.0 cal kyr BP), a humid period during the mid-Holocene (8.0–5.0 cal kyr BP) and a humid to arid period during the late Holocene (after 5.0 cal kyr BP). The reconstruction results were consistent with other previous reconstruction results from lake sediments and aeolian sand-lacustrine sequences, which indicated that temporal distribution of calcareous root tubes can reflect millennial-scale changes in paleo-effective moisture in this area. However, a single sample could indicate local environmental changes that may differ from the overall desert environmental changes. Hence, the relatively humid environmental record obtained from the presence of calcareous root tubes is a local signal or a regional signal that should be noted.

Influence of Topography On Soil Formation and Its Implications for Holocene Paleoenvironmental Reconstruction in The Wulanmulun River Basin, Ordos, China

Qiu W.-L., Yao W.-W., Zhang J.-F., Zeng Q., Rui X.

School of Geography, Beijing Normal University, Beijing, 100875, P. R. China, qiuweili@bnu.edu.cn

Abstract

Paleosols in desert areas are generally regarded as evidences of sand dune stabilization and indicators of rainfall increase or climatic change in the past. However, the influence of topography on soil formation in desert is often not considered. Since that water tends to concentrate in depressions, affording local conditions for soil formation, the climatic interpretation of paleosols in deserts may be complicated by topography. In the Wulanmulun River basin, located on the northern margin of the Mu Us desert, the formation ages and physical features of the buried Holocene soils have been found to vary with landscape positions. This provides a good case for studying the influence of topography on soil formation. Based on the investigation of eight outcrop sections in the basin and the results of ^{14}C and OSL dating on twenty-three samples, we found that during dry and cold stages soil also formed with the occurrence of limnetic deposits in low areas, although its development was limited. In the wetter periods, well-developed soil formed widely on divide highlands and sand-dune-covered hill slopes. These results indicate that soil formation in desert areas can proceed in different climate conditions. Paleosols in depressions formed in dry climate mainly reflect the influence of topography and its change on soil formation. This kind of paleosols cannot provide valuable information about paleoclimatic conditions. Relatively, paleosols formed on highlands and sand dunes are more suitable for paleoclimate proxy. Thus, geomorphic analysis is very important when reconstructing paleoenvironments in the arid areas using paleosols.

Abstract

Progress in geochronology and fast growing chronological records have opened the possibility of exploring and synthesizing the Quaternary environmental changes in the Asian mid-latitudes dune fields directly from the on-site aeolian sand archives. This study synthesized the sand dune chronologies from northern China and their value in paleoenvironmental reconstruction had been assessed. The available ages are concentrated mainly in the last 20 ka and many are from the fields of stabilized dunes in the eastern portion of the desert belt in northern China. The number of records and the ratio between the records of stable state and the total records could act as a proxy for the palaeoenvironmental interpretation. The aeolian sand activities deciphered from the chronological data in the eastern portion of the desert belt in northern China show a reasonable correlation with the general global climatic curves at the glacial–interglacial timescales. On the other hand, discrepancies exist between dune activities and records from other archives. The limited aeolian sand records from the glacial period, however, hamper the understanding of the detailed features of the dune fields during glacial times. In the last two millennia, however, there has not been any meaningful correlation between aeolian dune activity and climatic variation at the centennial time scales, probably due to the complexity of the aeolian sand systems and human interventions.

Sedimentological Studies of Holocene Palaeoflood Slackwater Deposits Along the Middle Yiluohe River Valley, Middle Yellow River Basin, China

Xueru Zhao

Shaanxi Normal University, China, zhaoxr1990@163.com

Abstract

Palaeohydrological investigations were carried out in the middle reaches of the Yiluohe River, a major tributary in the lower-middle Yellow River basin. Typical palaeoflood slackwater deposits (SWDs) were identified in the Holocene pedostratigraphy on the cliffy river banks. Analytical results, including magnetic susceptibility and grain-size distribution data, indicated that these SWDs were deposited from the suspended sediment load in flood water. A comparison study shows that these SWDs are different from the eolian loess, soils and aeolian sand in the valley. These SWDs recorded several episodes of extraordinary palaeoflood events. In the Longmenxia reaches of the Yihe River valley, these flood events were dated at 3100–3000 a, 1800–1700 a, 770–610 a, and 420–340 a using the optically stimulated luminescence method in combination with the pedostratigraphic correlations. In the Longhutan reaches of the Luohe River valley, the palaeoflood events were dated at 1975–1466 a, i.e., from the Han to Wei dynasty (AD 25–534), during which the capital city on the river banks was flooded many times, as recorded in the literature. These extraordinary flood events are well correlated chronologically with the known Holocene climatic events that occurred in the Northern Hemisphere. This suggests that the monsoonal climate was highly variable with both floods and droughts occurring frequently during these episodes. These results are important for understanding the response of river systems in eastern Asia to global changes.

Climate change; Palaeoflood event; Slackwater deposit; Holocene

The Loess Provenance of the Chinese Loess Plateau Inferred from The U/Th Ratios and Rare Earth Elements of Detrital Zircon

Zhixiang Wang, Chunju Huang

State Key Laboratory of Biogeology and Environmental Geology, China University of Geosciences, Wuhan 430074, China, huangcj@cug.edu.cn

Abstract

The loess deposits on the Chinese Loess Plateau (CLP) provide an excellent continental archive for reconstructing the history of Neogene climate changes. Deciphering the source areas of the CLP is very important for understanding the past East Asian atmosphere circulation patterns and transport mechanisms.

Nevertheless, there are still disagreements on whether the loess provenance contains spatial and temporal variations. Here, the U/Th ratios and rare earth elements of detrital zircons from the CLP and potential provenance have been firstly used to reveal the spatial characteristics of loess provenance. The discrepancies of the zircon REE patterns as well as the zircon U/Th ratios among different sites on the CLP indicate that the loess provenance is spatially variable, at least during the last glacial periods. Further statistical analyses of the zircon U/Th ratios and comparison with results from potential provenance demonstrates that the loess provenance has obviously proximal-deposited characteristics, from western CLP to eastern CLP with significant decrease of detrital materials from the western arid regions but remarkable increase from the northern deserts in China. In addition, the differences of the zircon U/Th ratios between the Northern Tibetan Plateau and the Western Mu Us deserts that are located in the downwind of the Yellow River alluviums and upwind of the CLP might be suggested that the Yellow River systems unlikely play a great role during the CLP forming.

Abstract

As an important strategic material related to the livelihood of the people, food security was an important component of national security. Grain production potential could reveal whether arable land pattern was reasonable. Therefore, the grain production potentials under different conditions in different years in Western Jilin were calculated by Global Agro Ecological Zone (GAEZ) model. Since 1976, the total grain production potential of western Jilin continues to increase; it increased about 4,516,700 tons between 1976 and 2013; the total grain production potential of western Jilin Province were 11,002,900 tons and 14,056,200 tons in 1976 and 2000; by 2013, the total grain production potential of western Jilin was 15,519,600 tons; the average grain production potential of western Jilin in 1976 were 2346.76 kg/hm², it increased to 2997.99 kg/hm² in 2000; the total grain production potential of western Jilin increased by 1,463,400 tons and the average grain production potential of western Jilin increased 312.12 kg/hm² in 2000-2013; changes in grain production potential was mainly affected by climate, land use and irrigation rates.

Key words:

Abstract

In this paper we study the impact of climatic factors on area planted and yield for the two main crops in South Africa, i.e. maize and wheat, in the period 1980-2007 using agricultural census data. In particular, we account for political and economic structural breaks occurred in South Africa after the end of apartheid, including the strong reduction of agricultural subsidies. We do so by running a set of panel data models at the level of magisterial districts, where in addition to climatic variables we feature a number of alternative specifications as to common vs. specific time trends and dummies. We find a consistent non-linear concave relationship between climatic variables (annual precipitation and annual average temperature) and maize/wheat area planted and yield. This relationship is more significant for maize than wheat. Our results also show that the political and economic reforms put in place in post-apartheid South Africa have contributed to reduce the crop area planted, but to increase crop yield. We suggest that this may be due to market forces selecting the most efficient farms, located in the most productive areas. Our results also hint at a reallocation of crop planting in marginal areas in favour of grazing.

Dryness Temporal-Spatial Distribution Based on Precipitation in Mongolia Plateau

Jiyao Liu, Wenjun Liang, Xi Chun, bilige siqin, Zhiwen Wu, Shixin Huang

Inner Mongolia Normal University, China, ajiyao@126.com

Abstract

In order to monitor the drought disaster variation in Mongolia plateau, based on climate data of Inner Mongolia and Mongolia, we analyzed the temporal-spatial distribution of the drought disaster using methods of linear regression and Standard Precipitation Index (SPI) in recent 40 years. In time series, the climate changed to dryness after 2000, while changed to wetness in Mongolia in the total period. In spatial pattern, the most significant dryness trend occurred in the southeast of Inner Mongolia and west of Mongolia, but weak wetness trend in west of Inner Mongolia and middle of Mongolia. SPI shows that, drought volatility and intensity enhance, the influencing sphere enlarges and move to east, which coincided with actual conditions of local area in Inner Mongolia, while move to east in Mongolia. So it is pretty important to predict the changes over Mongolia plateau in the future.

climate change; Precipitation; Mongolia plateau

Interception and Rain Shadow Effects of Two Individual Shrubs at the Southeast Edge of the Tengger Desert, Northern China

Yang Zhao, Zhi-shan Zhang*

Shapotou Desert Research and Experimental Station, Cold and Arid Regions Environmental and Engineering Research Institute, Chinese Academy of Sciences, 320 Donggang West Road, Lanzhou, 730000, China, zszhang@lzb.ac.cn

Abstract

Rainfall interception and rain shadow effects of individual shrub during wind-driven rain event influences redistribution of rainfall, which is especially important in water-limited ecosystems. Two individual shrubs, *Caragana korshinskii* with inverted cone shape and big crown size and *Artemisia ordosica* with hemispheroidal shape and small crown size at the southeast edge of the Tengger Desert of northern China were selected. Throughfall at four positions with different distances from trunk and at three directions were measured during 210 rain events from 2004 to 2014 (except for 2007). The results showed that all of rain events are wind-driven and most of them are classified as light breeze. The relative interceptions of *C. korshinskii* and *A. ordosica* were 29.1% and 17.1%, respectively. Thoughfall of *C. korshinskii* at near trunk and under crown, and those of *A. ordosica* at edge of crown and space between plants had higher variations than those in other positions. Rainfall properties have more contributions than crown characteristics to throughfall and interception of shrubs, and can be explained by gross rainfall amount and duration (GR and RD), RI_{60} (maximum rainfall intensities during 60 min) and rainless gap (RG) in decreasing importance. However, relative throughfall and interception of two shrubs have different responses to rainfall properties and crown characteristics, those of *C. korshinskii* merely tightly related to rainfall properties, while those of *A. ordosica* were more dependent on crown characteristics. The coefficient of variation of throughfall in distances from trunk ($CV_{Distance}$) for *C. korshinskii* showed significant relationships with height and branch and leaf area index (BLAI), while $CV_{Distance}$ for *A. ordosica* showed significant or marginally significant relationships with height, branch leaf area index, crown area and volume. We highlight that long-term monitor is very necessary to find the relationships between throughfall and interception with crown characteristics. Also, rain shadow effect of individual shrub were structured by interspecific crown shape rather than crown size and density of single plant, and embodied in throughfall variations in distances from trunk instead of those in directions.

Abstract

Based on the methods of dendrohydrology, this paper analyzes the temporal and spatial changes characteristics of radial growth of *Populus euphratica* in the upper and middle reaches of the Tarim River. The delayed variable model is applied to simulate the delayed effect of river runoff on radial growth of *Populus euphratica*. The results show that: (1) there are significant differences in radial growth of *Populus euphratica* in four transects in the upper and middle reaches of the Tarim River. The average annual ring width is respectively 3.7 mm (1970a-2010a) in Transect Xiaojiake, 1.75 mm (1947a-2010a) in Transect Xinquman, 3.44 mm (1986 a -2010a) in Transect Shazihekou and 2.38mm (1969a-2010a) in Transect Aqike. (2) From the change trends of ring width and ring index of *Populus euphratica*, the ring width changes have declining trends in Transects Xiaojiake and Shazihekou, while the changing trends of ring width are not significant in Transects Xinqiman and Aqike. The ring index of *Populus euphratica* has a significant declining trend in Transects Xinqiman and Aqike. However, the changing trends of ring index are not significant in Transects Xiaojiake and Shazihekou. (3) The delayed effect of river runoff change on the radial growth of *Populus euphratica* is obvious. The simulated result from delayed variable model shows that the delayed duration is different in four transects. The lagged duration is respectively seven years in Transect Xiaojiake, five years in Transect Xinquman, three years in the Transects Shazihekou and Aqike. The year of the greatest impact of river runoff on radial growth is also different in the four transects. The year of the greatest impact is the fourth year in Transects Xiaojiake and Xinqiman, the first year in Transect Shazihekou, and the third year in Transect Aqike respectively.

Key words:

The radial growth of *Populus euphratica*; Ring index; River runoff; Delayed variable model; The upper and middle reaches of Tarim River

Summer and Winter Dust Blows Toward Eastern Mediterranean: Are They Normal or New Phenomena?

H, Al-Rimmawi

Geography Department, Birzeit University, Palestine, hrimmawi@birzeit.edu

Abstract

Throughout the last few years, the region of Eastern Mediterranean has witnessed severe winter and summer dust blows. Such a phenomenon raised many questions regarding its causes and effects. This paper tries to answer such questions. In fact, dust blows toward Eastern Mediterranean have been occurring during winter and summer seasons for a long time and people who resided in this region have been familiar too with this phenomenon. They gave loaded winds with dust several names such as “poisoning winds” in which they believed that such winds poison plants. People residing in Eastern Mediterranean used to think that winds with dust usually poison flowers of olive trees if it blows in Early May of each year. However, they were aware to these blows every year either during summer or winter. It has been observed that blowing winds toward Eastern Mediterranean region are loaded with great amounts of dust and satellites has taken images which shows that these winds were loaded with great amounts of dust. Researcher will tackle physical causes of winter and summer dust blows and their impacts on human health, fauna and flora. Finally, author is certain that these blows will remain blowing. However, author will present solutions to minimize physical and human consequences of such phenomena.

Key words:

Dust blows; Mediterranean; Phenomenon; Physical Causes and Effects

Evaluation of Risk of Access to Water Resources Regarding the Process of Late half Century in Arid and Semi- Arid area

Abstract

One of the main apprehensions of the arid and semi- arid areas is the accessibility of water resources out of droughts. Iran is known as a country that its main section is located in dry areas and the experience of drought is known as one of the obvious characteristics of these areas. So this study decides, by monitoring and pursuing of late half century droughts (1965 to 2014), to present the first step in controlling the accessibility to water resources in sixteen arid and semi- arid stations of Iran. One of the new factors of estimating drought is the reconnaissance drought index (RDI) which estimates drought on the basis of two variables, say, rainfall, evaporation and potential perspiration and its estimating process including calculating primary amount, normalized RDI that its high ability of this index in monitoring droughts caused them to be used in this study. In the present research, in order to investigate the process of changing rainfalls and droughts, the nonmetric Mann Kendall has been applied. The result of this research shows that the maximum excess level of RDI index belong to normal territory that this situation is more obvious especially for winter, autumn and spring seasons. On the other hand, the least amount of RDI index was about hot summer season. The research finding show that the maximum vulnerability of droughts with respect to the procedure changes relates to Zahedan, Yazd and Bam in the hot summer season respectively; and in a sense the most vulnerable stations is in terms of getting access to water resources of the above mentioned stations, panorama of global warming effect upon getting drier in arid and semi- arid regions of the middle east, water crisis for all future decades, these regions lead to a major environmental challenge. Thus, as a solution, the use of virtual water for disparate financial and agricultural sections is suggested; thereby the pressure of exploitation from restricted water resources is diminished.

Abstract

On the basis of remote sensing and GIS technologies studied saline soils of arid ecosystems of the Baikal region. Saline soils are formed on the lower parts of the relief around the salt lakes. Lakes are located in the north-east direction, the length above 7 km, at an altitude of 185 m above the Lake Baikal level. In the configuration of the lakes is marked cyclic: increase-decrease. The dynamics of the flooding – drying associated with climatic and hydrogeological conditions. The processes of drying lakes with close saline groundwater lead to the formation of saline soils – solonchak. Salts from groundwater accumulated on the soil surface and formed a salt crust. Satellite were analyzed by MapInfoProfessional of interpretations and combinations of data channels Landsat TM/ETM+. The contours of lakes shore lines, shallow water, saline soils. Integrated analysis of remote sensing data and soil research materials to help solve complex scientific monitoring task. The shoreline of lakes and configuration of saline soils around them are in direct dependence. After drying of the lake increases the area of saline soils, so easy soluble salts transported by the wind. It is the reason the salinity of soils are not saline. We offer three main groups of salinity: alkaline carbonate, alkaline and neutral. The main part of the soil - 52% have neutral chemistry salinity; with alkaline carbonate - 25%; alkaline - 23%. GIS mapping provides long-term use of the information on basic physical and chemical properties of soil and other properties of soils.

Abstract

Exploring the interactions between vegetation and soil erosion in semi-arid environment is critical for understanding feedback mechanism between ecological function of plants and corresponding hydrological processes. Based on five years' runoff-plot monitoring, we employed binomial and Poisson distribution functions to describe the randomness property of runoff and sediment generation in three typical restoration vegetation types (*Armeniaca sibirica* (AS), *Spiraea pubescens* (SP) and *Artemisia copria* (AC)) of Loess Plateau. The results indicated that, triggered by 134 precipitation random events, the obvious canopy structure with largest crown could cause AS have strongest precipitation interception capacity, with lowest average probability of runoff (18.3%) and sediment (5.6%) generation; Meanwhile, the thicker litter layer and denser root system lead SP to have relative stronger throughfall interception and overland flow reinfiltration, with low mean risk of runoff (approximately 20%) and soil loess (about 8.7%) occurrence; However, due to the morphological structure in AS with lower capacity for water interception and infiltration, the average probability of runoff (24.0%) and sediment generation (15.8%) was highest in all vegetation types. With the increasing of rainfall duration, the effect of morphological properties of plant on stochasticity of soil erosion was weakened. Moreover, the parameter analysis implied that Poisson probability distribution is more suitable for describing the sensitivity of erosion occurrence than binomial distribution over long-term monitoring. This study confirmed the effect of restoration vegetation on stochasticity of runoff and sediment, which could be meaningful to apply more effectively restoration on protecting the soil and water resources in water-limited environment.

Key words:

stochasticity; restoration vegetation; probability distribution; the Loess Plateau

Rainfall Anomalies and Their Impacts on Crop Production in Thar Desert (Western Rajasthan, India)

Jaglan, Mahabir Singh

Professor, Department of Geography, Kurukshetra University, Kurukshetra, India

msjaglan@kuk.ac.in

Abstract

The western most part of Rajasthan state in India is covered by Thar Desert and its expanses spread eastward in the province up to its boundary with Haryana. The land of Western Rajasthan has often suffered from vagaries of weather and in particular frequent dry spells and droughts. Having arid and semi-arid climatic conditions this region is often frequented by droughts resulting in crop failures, un-replenished ground and surface water resources and scarcity of food and fodder. Consequently, the region experiences perpetual soil moisture deficiency and fluctuations in rainfall affect agricultural production systems and area and yield of crops and animal husbandry. The study aims to assess the magnitude and frequency of drought occurrence in Western Rajasthan over the period 1960 to 2010. It also analyses districtwise distribution pattern of rainfall during last 50 years. Temporal variations in annual rainfall and rainy days have been depicted with the help of trend graphs. Correlation and regression analysis has been done to assess the degree of association and impact of annual rainfall and rainy days on area and yield of main rainfed crops cultivated in the region. The study reveals that on an average western Rajasthan experienced drought every third year. The frequency of droughts occurrence is found to be higher in western districts of the region. There is not a significant change in the amount of annual rainfall received over the period of study. It is also evident from the study that annual rainfall and number of rainy days have positive influence on area, production and yield of most rainfed crops. It shows that weather anomalies in terms of rainfall fluctuations continue affecting the people's livelihood and agricultural economy in the region.

Drought; annual rainfall; rainy days; agriculture; crop area and yield

Remote Sensing and GIS Contribution to the Detection of Areas Susceptible to Natural Hazards in W- Morocco (Sahel of Abda-Doukkala)

Elbchari F., Theilen-Willige B., Lowner R.

University of Cadi Ayyad, Polydisciplinary Faculty, Safi, 4162, Route de Sidi Bouzid, 46000 Safi, Morocco, elbchari@yahoo.fr

Abstract

When catastrophic hazards happen and affect cities, settlements and infrastructure, immediate and efficient actions are required which ensure the minimization of the damage and loss of human life. Proper mitigation of damages following disastrous events highly depends on the available information and the quick and proper assessment of the situation.

Morocco is facing miscellaneous natural hazards presenting all serious risk. The demographic growth, the economic development, urban expansion and the vulnerable infrastructure increase more this risk and make difficult any classical disaster mitigation.

Responding local and national authorities should be provided in advance with information and maps where the highest damages due to unfavourable, local site conditions in case of extreme natural events such as stronger earthquakes and earthquake-related secondary effects (landslides, liquefaction, soil amplifications or compaction) can be assumed.

The aim of this contribution is to develop adaptation strategies by presenting an approach in which Geographic Information Systems (GIS), used together with remote sensing data, contribute to the analysis and presentation of information, especially required for the increasing geo-hazards in Morocco. The ability to undertake the assessment, monitoring and modelling can be improved to a considerable extent through the current advances in remote sensing and GIS technology. Causal or critical environmental factors influencing the disposition of settlements, industrial and infrastructural facilities to be affected by natural hazards and the potential damage intensity can be analysed interactively in a GIS database. The interactions and dependencies between different causal and preparatory factors can be visualized and weighted step by step in this GIS environment.

GIS; Remote Sensing; Natural Hazard; Morocco; Sahel of Abda-Doukkala

Research on the Effects of Snow Disaster on Herdsmen'S Livelihood Capital

Zhao Shuang^{1,2}, Fang Yiping¹

¹Institute of Mountain Hazards and Environment, Chengdu, 610041, P. R. China, shuang-999888@163.com

²University of Chinese Academy of Science, Beijing, 10049, P. R. China

Abstract

Grass animal husbandry is an essential part of Guoluo State's economy system and the proportion of the local herdsmen reached 90%. In recent years, the increasing number of snow disasters has brought great loss to the herdsmen's livelihood. Therefore, this paper takes advantage of the natural and social data in 2010 and 2012 in Guoluo State to analyze the effects of snow disaster on the herdsmen's livelihood capital including natural capital, material capital, financial capital, social capital and human capital. The indicators to describe snow disaster include the largest snow depth, snow-cover area, snow last days and the frequency of disaster. According to correlation analysis of snow disaster and herdsmen's livelihood capital, it is concluded that (1) in 2010, the snow disaster has weak relationship with pastoral livelihood capital; (2) In 2012, the pastoral livelihood capital is mainly affected by the frequency and the negatively correlation between financial capital with the frequency of snow disaster is significant.

Key words:

snow disaster; herdsmen; livelihood capital; effects

Road Erosion and Its Environmental Influence Caused by Mining in Trans-Boundary Area of China and Mongolia

Davaadorj.D¹, Juanle Wang², Lu Xin², Uyangaa.U¹, Baasansuren.G¹, Khongor.G¹

¹ School of Arts & Science, National University of Mongolia, Ulaanbaatar, Mongolia

Abstract

The off-road from vehicle is one of the dominant impacts of environmental degradation in Mongolia. Off-road vehicles also main resources of the gully erosion, dust emission and land degradation. Nowadays 50000 km roads have been used for transportation of Mongolia. Most of road has been used for coal transporting in southern boundary of Mongolia. Therefore, strongly degradation occurred in trans-boundary area.

This study has been focused by to estimate soil losses from vehicle effects in soils and to develop methodology to calculate the erosion from off-road vehicle. The result has indicated an average soil losses are 1.40 kg/m² in study area. Soil loss was 29 tn/ha from studied 24.0 ha areas on central Mongolia. Also road erosion has been affected the soil properties and bulk density has increased 12.1gr/cm³ and organic content has decreased 0.1% in off-road vehicle.

Steppe area soil in established on arid condition by influence from vehicle truck which has been change the physic characteristic and soil particles flapping to air from impacts of car wheels thus get down to near the road through the area. Which is create the accuracy parts covering impact to land surface other else, arise swelling along the road depend on hydrous, density, particle composition as well as cause of technical destruction.

Key words:

Off-Road Vehicle; vehicle track; soil erosion

The Nile Delta Is Going Underwater, It Is A Disaster.

Ashour, Mahmoud Mohamed.

Geomorphology, Ain-Shams University, Cairo, Egypt. ashour43@hotmail.com

Abstract

The Nile Delta which supported one of the most ancient and fascinating civilizations and the most heavily populated areas in Egypt and the world, is facing in the last few centuries the piece-meal encroachment of the sea water. The process is now accelerated for reasons we all know. It is estimated that by the end of the 21st century, a rise of the sea by one to three meters: one third of the Delta will be lost to the sea, approximately one million acres of arable land would be submerged, about 15 millions of inhabitants will be homeless, major port cities like Alexandria, Damietta, and Port Said would be reduced to small protected islets, many factories and other hundreds of other settlements will be washed out along with many archeological sites.

This flooding is mainly attributed to: 1- Natural agents and 2- Anthropogenic Agents.

We believe that works confronting such disaster should be planned among concerned agencies and academics without delay. Any work plan should contain the following subjects:

1-Establishment of new integrated centers with new policies upholding the major theme of understanding the compound relations among the physical setting, cultural heritage and land use plans.

2- Plans should be drawn to compensate lost lands by reclaiming suitable desert lands and/or helping people to create other activities, e.g., industry and services.

3-Constructing efficient barriers at the coastal tips of the Delta.

Key words:

Nile Delta; Sea-Water encroachment; confronting the disaster

Characteristics and Analysis of Soil Salt in Xarxili of China

WANG Yonghui, WANG Ruixia, JIAO Li

College of Geography and Tourism, Xinjiang Normal University, Urumqi 830054, P. R. China, wyhsd_3011@163.com

Abstract

Xarxili Nature Reserve is located in the southern piedmont of the Alataw Mountain in Xinjiang, its western part borders on the Republic of Kazakhstan, and its area is 314 km², the Xarxili Nature Reserve returned to China in 1999. Due to its nature of less artificial interference, Xarxili Nature Reserve is seen as an ideal place to study environmental background. In this study, the soil in Xarxili was chosen as the object of interest, of which the contents of eight ions (Cl⁻、K⁺+Na⁺、CO₃²⁻、HCO₃⁻、SO₄²⁻、Ca²⁺、Mg²⁺) and total salt were determined. The results show that the contents of total salt content is 2.29 g/kg - 9.45 g/kg in the desert, 6.11 g/kg - 8.41 g/kg in the mountain, 2.32 g/kg - 7.83 g/kg in the oasis region. According to the classification standard of soil salinization in Xinjiang, the three regions belong to moderate soil salinization. The variation coefficient of soil total salt and eight ions in three regions of Xarxili show moderate variability. The spatial distribution shows that the contents of eight ions and total salt were in the following order: total salt in the desert > mountain > oasis; Cl⁻、HCO₃⁻、K⁺+Na⁺ in the mountain > oasis > desert; CO₃²⁻、Mg²⁺ in the desert > mountain > oasis; SO₄²⁻ in the oasis > mountain > desert; Ca²⁺ in the desert > oasis > mountain. By correlation analysis, a significant positive correlation was found between such pairs as total salt and Cl⁻、HCO₃⁻、SO₄²⁻、Ca²⁺、K⁺+Na⁺; In addition, Xarxili is maintained a good ecological environment in the absence of disturbance conditions, the salt characteristics has a good reference value for the related study to the arid area.

Key words:

soil; salt; Xarxili; arid area

Characteristics of Agricultural Drought Disaster in Northern China

AN Xueli· WU Jianjun

Academy of Disaster Reduction and Emergency Management, Beijing Normal University, Beijing, 100875, P. R. China,
xlan1992@163.com

Abstract

This paper analyzed the variation characteristics of drought disaster in Northern China from 1949 to 2000 based on two indicators extracted from the disaster statistical data, one is the agricultural drought rate, and the other is drought frequency using county as spatial study unit. Results showed that there was an increasing trend of the agricultural drought rate in the latter half of 20th century. After the year 1980, the frequency of moderate drought and above increased significantly. The North-East of Henan Province, the North and the South-West of Shanxi Province, and Jinzhong Area showed the highest drought frequency. The drought frequency increased in most area of Henan Province and Qingdao City in Shandong Province. This study recognized the areas where drought disaster occurred frequently and the years when the agricultural drought was severe. We believe that the results above can provide theoretical support for risk prevention of drought and national disaster prevention and mitigation.

Key words:

agricultural drought disaster; agricultural drought rate; drought frequency

Greater Impacts of Collembola On Mineralization of Soil Organic Matter Compared with Leave Litter

Xu Guoliang

xugl@gzhu.edu.cn

Abstract

Soil Collembola played an important role on soil carbon (C) cycling, but their contributions to the mineralization of C with different bioavailability such as soil organic matter (SOM) and leave litter are not clear. Here, ^{13}C -labeled litter was used to investigate the effect of the Collembola (*Folsomia Candida*) on the transformations of both SOM and litter C in laboratory microcosms. Three treatments were set up: control soil (S); soil and labeled litter (SL); soil, labeled litter and Collembola (SLC). The CO_2 evolved from each microcosm was measured every two weeks during the experiment. In addition, microcosms were destructively sampled on days 7, 21, 63 after the experiment initiation. The litter mass, Collembola number, microbial biomass (indicated by PLFAs), and the $\delta^{13}\text{C}$ values of CO_2 were determined. We found that the presence of either Collembola or litter did not significantly affect soil microbial biomass PLFAs and the loss of litter mass. Furthermore, collembola showed limited contribution to the total C mineralization within the first weeks during which litter-derived CO_2 dominated. However, collembola increased the emission of SOM-derived CO_2 considerably at later stage of the incubation when litter-derived labile C being depleted. These results suggested that collembola impacts on C mineralization was regulated by C availability.

Space Diffusion Effect of NIMBY Facilities: A Case Study of Funeral Home in Nanjing, China

Yunqing WU¹, Liangliang ZHAN¹, Guofang ZHAI²

¹College of Geomatics Engineering, Nanjing Tech University, Nanjing, China, njwuyunqing@163.com;

²College of Architecture and City Planning, Nanjing University, Nanjing, China

Abstract

With the acceleration of urban development in China, public facilities have been improved, but meanwhile, it is inevitable to encounter the problem of NIMBY facility layout. Because of the negative externality of NIMBY facilities, they may form some spatial effect around them. As a special Chinese Traditional Geomantic Omen culture, people pay more attention to death, and then form a kind of cemetery culture. In order to measure the space diffusion effect of the funeral home, a massive official data survey was conducted around the funeral home in Nanjing. Hedonic price model was used to measure the correlation between the variable- “the distance to NIMBY facilities” and house prices. On this basis, Kriging interpolation method was used to display the spatial effect intuitively. The conclusion is that the spatial effect of funeral NIMBY facilities changes with the distance to NIMBY facilities as “concentric circles – irregular areas” variation. Hopefully the study will provide some technical support and scientific basis for the siting and planning of funeral NIMBY facilities and compensation for surrounding residents in China.

Spatiotemporal Variability of Two Precipitation-Based Drought Indices in Xinjiang, China

Yi Li^{1, 2}, Ning Yao¹

1.College of Water Resources and Architecture Engineering, Northwest Agriculture and Forestry University, Yangling, Shaanxi, 712100, China;

2.Global Institute for Water Security, University of Saskatchewan, Saskatoon, S7N 3H5, Canada

Abstract

Global increases in duration and prevalence of droughts require detailed drought characterization at various spatial and temporal scales. In this study, we investigated drought intensity in Xinjiang, China, from 1961 to 2012. Using meteorological data from 57 weather stations, we calculated Erinc's Aridity Index (I_m) and Sahin's Aridity Index (I_{sh}) at the monthly and annual scale and looked at their spatiotemporal variability for north, south, and entire Xinjiang. At the monthly time scale, I_m for entire Xinjiang had moderate variability (as determined by the coefficient of variation C_v) from April to September, while I_{sh} had moderate to strong variability from January to December. I_m could not be calculated at 53 stations in winter as T_{max} was below zero. Annual I_m , MYM and I_{sh} , MYM showed strong spatial variability. I_m and I_{sh} dynamics correlated with the drought dynamics calculated in earlier work from the more complex dryness index (DI). Trends in precipitation, maximal temperature, relative humidity and specific humidity were all increasing, only that in air pressure decreasing, which resulted in increases of the three drought indices. This indicated a decrease in drought severity of Xinjiang with the local climate becoming warmer, but also wetter. Both indices I_m and I_{sh} were easier to calculate than ET_o based indices. However, due to its successful applicability at both the monthly and the annual timescales, we recommend I_{sh} as the better drought index for Xinjiang.

Abbreviations: CMA-China Meteorological Administration; DI-dryness index; e_a -vapor pressure of air; I_m -Erinc's Aridity Index; I_{sh} -Sahin's Aridity Index; MYM -multi-year mean; P -Precipitation; PR -Air pressure; RE -Relative error; RH -Relative humidity; S_h -Specific humidity; SPI-Standardized Precipitation Index; SPEI-Standardized Precipitation Evapotranspiration Index; T_{max} -maximum air temperature; T_o -mean air temperature; C_v -Variability coefficient; $C_{v,t}$ -Temporal C_v ; $C_{v,s}$ -Spatial C_v .

The Partition of Fragile Eco-Environment Based on the Landscape Pattern

Mei-mei Wang

School of Resource and Environmental Science, Lanzhou University, Lanzhou730000, Gansu, China, wmm035@163.com

Abstract

YanChi county, TongXin county and HongSibu region of the middle arid belt of Ningxia are located in the transition zone of the loess plateau and drought, the ecological environment in this area obviously fragile. The villages and towns are choose as the study units in this paper, based on the principle of availability and practicability, scientific research methods such as combining theory with practice, integrating qualitative analysis with quantitative analysis are used in research, based on natural factors, via GIS platform, the ecological fragile degree classification of Space in study area is gotten: YanChi county, TongXin county and HongSibu region of the middle arid belt of Ningxia is divided into 4 parts: highly fragile area, moderate fragile area, mild fragile area and not fragile area. After that, ecological characteristics and corresponding countermeasures of each partition are put forward.

Key words:

The Remote Sensing of Vegetation Coverage Change in Mu Us Sandland: A Case Study in Inner Wushen

Qian Xue

Chongqing Jiaotong University, China, 610032582@qq.com

Abstract

With the development of social economy and the speeding up of urbanization in arid areas, makes the land degradation problems such as desertification increasingly serious. Taking hinterland of Mu, us desert Wushenqi for the study, research and analysis of remote sensing data of 2000, 2007 and 2014, secondly, based on Vegetation Index and pixel dichotomy model of vegetation coverage study in Wushenqi, and finally, analyze the driving factors vegetation coverage change in Wushenqi. The results show that: the vegetation coverage of Wushenqi area is very low in 2000, 86.54% of regional vegetation coverage is only 20% or less; Since 2007 the whole vegetation coverage in the region increased, 18.82 percent area vegetation coverage reaches 20% - 40%; In 2014, the vegetation coverage has significantly increased, 72.37% area vegetation coverage has reached 20 to 40%; the main factors according to the study is policies

Governments' interference and farmers' adaptive responses against drought: a case study in the North China Plain

Xiaoyun Li

Institute of geographic sciences and natural resources research, China, lixy.15b@igsnr.ac.cn

Abstract

Agricultural production will be confronted with more serious challenges under climate change. Understanding households' adaptive behaviors and the influence of government policies on it is the fundamental step to improve further relevant policies for enhancing farmers' ability of adaptation against drought. The overall goals of this study are to evaluate the farmers' adaptive behaviors and its influencing factors, especially the interfering of government policy, like early-warning and policy supports. The analyses are based on a household and village survey in three provinces of Northern China Plain (NCP), and the econometrics method will be used. The results show that: (1) Most of households are apt to take adaption measures when facing drought, and more serious droughts, more adaption measures will be taken. (2) The adaptation behaviors of farmers affected by interfering of government policy. The enthusiasm to take adaptations of households can be promoted obviously by the governments' early- warning information and relevant policy supports, especially when the warning information released by multiple channels and the subsidies or multiple supports provided by the township government and the village. However, most of the households haven't got any support by any government. Besides, TV as the present main channel has very little effect. (3) Adaptive behaviors vary along with different households' characteristics. Farmers those who possess larger cultivated land block acreage and live in irrigated areas as well as lower levels of social capital are more inclined to take adaptive measures. The finding can provide policy reference for government to make household adaptation measures under drought.

Key words:

drought; interfering of government policy; household; adaptation

Temporal and Spatial Distribution Pattern Evolution of British Colony based on

Temporal Model

Liu HongJian

Information Engineering University, China, chxy_lhj@126.com

Abstract

Colony is one of the main factors that influence the development of British sea power, which has a great influence on the rise and fall of the British sea power. This paper to GIS spatial analysis technology as the support around Britain in different historical periods of colonial distribution, spatial pattern, development strategy, guiding ideology is studied, in order to reveal the geographical environment of the deep influence of the British colonial expansion.

Vulnerability of Smallholder Farmers to Drought in the Drylands Zone of North-**Western Nigeria**

Umar, A., Mohammed, S., and Adamu, I. A.

Department of Geography, Federal University, Birnin-Kebbi, Nigeria, adanmalam@yahoo.com

Abstract

Significant studies on drought have been conducted in the study area. However, holistic vulnerability assessment of drought remains an emerging issue as it has been relegated by previous works. In this paper, we aimed to assess smallholder farmers' vulnerability to drought in Bungudu, Dange, Dawakin-Tofa and Rimi, Northwestern Nigeria. A sixty one year (1952-2013) rainfall data of four stations was subjected to analyses to obtain rainfall trends and Standardized Precipitation Index was generated to compute intensities and duration. Also eighty (80) smallholder farmers were interviewed to determine their sensitivity and adaptive capacity to drought. Vulnerability Model was employed to assess communities' vulnerability to drought. The result reveals that in the study area, vulnerability ranges from 0.0 to 0.2 an indication that the communities are moderately vulnerable to drought. It is concluded that adaptive strategies of the communities such as adjusting feeding habit may probably be their sources of resilience. It is recommended that those strategies should be enhanced and be blended with other strategies not common in the communities such as getting weather information and community based storage facility of farm produce.

Key words:

Drought; smallholder farmers; drylands; vulnerability assessment; sensitivity; adaptive capacity; ecological degradation

A Study on the Spatial and Temporal Variations of Land Surface Phenology in Northeast China and Its Responses to Climate Change over the Past Three Decades

Zhao Jianjun, Zhang hongyan, Zhang Zhengxiang, Guo xiaoyi

School of Geographical Sciences, Northeast Normal University, Changchun, Jilin, 130024, P. R. China,

zhaojj662@nenu.edu.cn

Abstract

Northeast China is located at high latitudes in the Northern Hemisphere, and it is a typical region with relatively high sensitivity to global climate change. The present study inverted land surface phenological parameters from the Global Inventory Modeling and Mapping Studies (GIMMS) normalized difference vegetation index (NDVI) 3g dataset collected from 1982 to 2013, analyzed the variation pattern of the land surface phenology in Northeast China on multiple scales, and discussed the internal relationship between phenology and climate change from multiple angles. The results show that the start of season (SOS) did not exhibit an obvious variation trend, whereas the end of season (EOS) exhibited a significant delaying trend over the entire study area for the past 32 years (0.128 day/year, $P < 0.05$). The SOS in the forest areas exhibited a significant advancing trend, whereas the SOS in the grassland areas exhibited an insignificant variation trend. The EOS in the study area exhibited a predominantly delaying trend, and the pixels showing this trend accounted for 39.11% of the total pixels. Spring temperature had the largest impact on the SOS, and spring temperature increases resulted in an advancing of the SOS. Precipitation had an insignificant impact on the SOS in the forest areas but a relatively large impact on the SOS in the grassland areas. The EOS were jointly affected by temperature and precipitation. Fall temperature and precipitation increases both promoted the delaying of EOS. The lag effect of temperature on the SOS produced an insignificant delay.

Abstract

Understanding of vegetation growth in response to environmental change is helpful to manage forest resources and promote sustainable development especially sensitive ecosystems such as mountainous ecosystems. In this paper, we use long-term NDVI data to analyze the relationship between vegetation growth and different climate factors in the Taihang Mountain during the period of 2000-2014, with the consideration of topographic condition. The results showed that: 1) NDVI has a significant increasing trend in this area over the last few years(Fig. 1); 2) the highest NDVI values mainly occurred from 1800 to 2500m in elevation(Fig. 2); 3) the area of increasing NDVI generally reached maximum from 5 to 10° on slope(Fig. 3); 4) the response of NDVI change to aspect was not notable expect for deciduous broad-leaf forests and mixed broadleaf-conifer forests(Fig. 4); 5) contribution analysis indicated that vegetation growth was mainly influenced by atmospheric CO₂ concentration rather than other environmental factors in lower elevations and on lower slopes, while by hydrothermal conditions in higher elevations and on higher slope. Spatiotemporal variation of different vegetation types displayed different characteristics along the vertical direction, which suggested that vegetation growth is generally controlled by climate change, while in mountainous areas, the moisture and thermal conditions could change rapidly with elevation, consequently leads to variance of vegetation gradient.

Key words:

Altitudinal zonation; vegetation; topography; Taihang Mountain

Climate Change and the Vegetation Response in Qinling Mountains

BAI Hongying, WANG Jun, ZHANG Shanhong, LUO Xinping, HOU Qinlei, ZHANG Jie, QIN Jin

School of urban and environment, northwest university, xi'an, 710127, P.R.China, hongyingbai@163.com

Abstract

Qinling Mountains is located in warm temperate and subtropical ecological transition zone, which is an important natural ecological barrier suitable for the regional climate change research. Based on field investigation, this study integrated RS and GIS technology as well as the methods of dendrochronology, using GIMMS NDVI data and the SPOT/NDVI data, collecting the natural and social background to explore the distribution features of the ecological factors and the changing trend of air temperature, precipitation, and runoff and vegetation response to climate change. Results showed that, the average temperatures began to rise in recent 25 years, especially for the annual average temperature in north aspect was rising at the speed of 1.79 °C per year. In recent 15 years, the climate change in Qinling has the trend of warmer humidification, which is more obvious than that of the southern aspect. In recent 50 years, Qinling mountains 0°C isotherm in January vertical averagely ascended 143.7m obviously; On the other hand, NDVI are falling at both aspects of Qinling Mountains and the falling speed is higher in the north than the south in the past 30 years. The sensitivity of the vegetation response to temperature of northern slope in Taibai Mountain is more sensitive than the southern slope, temperature variation are more likely to cause the change of the vegetation at North Slope. In recent 46 years, the beginning period of phenology showed an early trend while the end of phenology lates back on the whole and the change of beginning period of phenological phase is more evident than the ending period. Global warming caused the invasion of Taibai sequoia bush meadow to the top of the mountain, but based on different habitats, different location of niche and rising extension degree all makes the line shape complicated. With comprehensive method of multivariate data, which verified that Qinling has become a climate change sensitive district and existed obvious vegetation response to climate change.

Deteriorating Physical Environment and Transformation of Socio-economic Status: A critical analysis of Western Indian Himalayan Communities, India

Negi, Virendra Singh

Associate Professor, Department of Geography, Shaheed Bhagat Singh (Eve) College, University of Delhi, New Delhi, 110017, India, negivirens@gmail.com

Abstract

The changing global climate and increasing warming affects the fragility of high mountain systems, their sensitivity to even small disturbances and tendency of such disturbances to irreversible have attracted social, scientific and developmental attention onto the deteriorating physical environment in the mountain areas. With the induction of various developmental efforts now these populations inhabiting the high mountain areas of Himalaya present days have either undergone or undergoing a major transformation of socio-economic status. A survey conducted by an NGO, GERES-India indicates that between 1973 and 2013, there was a rising trend in mean temperatures by 1° C in winter and 0.5° C during summer. These trends raise several concerns for the region, particularly for the livelihood and environmental front. The words development and progress were unknown to the people of Ladakh, the northern most part of India which lies in the heart of Himalayas until the influx of tourism increased in the area from 1974. Despite rapid development and socio-economic change occurring throughout Ladakh in the past four decades, the people or communities from backward regions still remain in a state of relative disadvantage. Present paper attempts to highlight the various issues related to the phenomenon of climate change and its impact on the livelihood and other socio-economic aspects of the people in the remotely located societies in this part of Himalaya. The study has focused on improving, expanding or rethinking existing and future academic and policy approaches to shared sacred landscapes of religion and ecology among Himalayan communities.

Extreme Events Assessment for Disaster Risk Reduction in High Altitude Region of Mountain Ecosystem: Alaknanda River Basin, Uttarakhand, India

Pandey, Bindhy Wasini, Prasad, Abhay Shankar

Department of Geography, Delhi School of Economics, University of Delhi, Delhi, India, bwpdsegeo@gmail.com,
abhaydse@hotmail.com

Abstract

Anthropogenic activities are continuously disturbing the natural system of the Garhwal Himalaya and its impact on hydrological behaviour of river. Factors causing these changes have been attempted to be understood through the use of GIS and LANDSAT TM. Geospatial technique is used to find out the land use/cover change detection for three time periods. Human interference, unscientific developmental activities, agriculture extension, tourism activity and road construction are anthropogenic factors creating the hydrological imbalances in the Alaknanda River Basin. Soil erosion and landslide have been recognised as major hazards in the high altitude. This Paper has analyses the Climate and Livelihood Vulnerability and its adaptation for the near district headquarter (NDH) & away district headquarter (ADH) determined mainly by a weighted matrix index value in the Alaknanda river basin, Uttarakhand. Qualitative research methods included participatory methods (PRA) involving focus group discussions and key informants at village level through workshops and direct observations among others. Analysis of the survey findings shows further scope for generation of livelihood options, in agricultural inputs and practices, phasing out of high risk land use practices, dissemination of knowledge on climate impacts and adaptation, etc. This paper also discusses identifies Landslide Hazard Zonation and other vulnerable issues and suggests the adaptation method for disaster risk reduction. The present study attempts to formulate sustainable development strategy and disaster risk reduction techniques/method in Alaknanda river basin. Efforts has been done to overcome the impacts of these natural calamities, traditionally of the local people adopted various techniques and approaches.

Extreme Events, Vulnerability and Himalayan Geosystem: A Case Study of Alaknanda River Basin, Uttarakhand, India

Prasad , Abhay Shankar and Pandey, B. W.

Department of Geography, Delhi School of Economics, University of Delhi, New Delhi-110007, (INDIA),
abhaydse@hotmail.com

Abstract

Extreme events are sudden calamities, which involve loss of life, property and livelihood. Anthropogenic activities are continuously disturbing the natural system and its impact on hydrological behavior of river. Alaknanda river basin is located in the eastern part of the Garhwal Himalaya and represents one of the most acutely hazard-prone regions in India. The important factor causing the flood and also accelerate several hydrological hazards during monsoon periods are heavy rainfall, cloud burst, GLOF, landslides, Slope failure, earthquakes, deforestation, poor drainage. These hydrological hazards are mainly responsible for several socio-economic consequences (cultivated land degradation, infrastructure loss, human casualties, loss of transmission lines, and so on) in the Alaknanda river basin, Uttarakhand. Factors causing these changes have been attempted to be understood through the use of GIS and LANDSAT TM. The Geospatial technique is use to find out the land use/cover change detection and secondary data is taken for to carry the analysis work. Primary data from each hotspot has been collected through a questionnaire survey and a Participatory Research Approach (PRA) procedure that is based on the LIFE approach. The LIFE Approach is based on Livelihood options, Institutional participation in adaptation policy design and implementation, Food security and Empowerment parameters like health and education. This parameter are important in building resilience capacity and ensuring sustainable development pathways and provides the various mitigation processes. This paper focuses on the techniques to characterize and monitor hazards in high mountain areas and sustainable development in the Alaknanda river basin Uttarakhand, India.

Geospatial Strategy for Environment Impact Assessment of Urban Heat Island in Mountain Areas Using Landsat ETM+ Sensors

Kumar Amit, Tomar Vandana,

National Institute of Technology, Kurukshetra, India, 136119, amitkumar8530@gmail.com

Haryana Institute of Public Administration, Gurgaon, India, 122015

Abstract

We are living in the age of rapidly growing population and changing environmental conditions with advance technical capacity. This has been resulting in wide spread land cover change. Urban Heat Islands exist in many large cities especially metropolitan cities and can significantly affect the quality of life in affected areas. The Urban Heat Island (UHI) for the temporal period is estimated using geospatial techniques which are then utilized for the impact assessment on climate of the surrounding regions. Rapid growth of industries in peri-urban areas results in excessive warming and variations in weather conditions. Remotely sensed data of thermal infrared band in the region of 10.4-12.5 μm of EMR spectrum, available from LANDSAT-7 Thematic Mapper and Enhanced Thematic Mapper (TM and ETM+) with 60 m resolution is proved to be very helpful to identify urban heat islands using surface topography. The present paper describes the methodology and resolution dynamic urban heat island change on climate using geospatial approach for Haridwar district of Uttrakhand. NDVI were generated using day time LANDSAT ETM+ image of 1990, 2000 and 2005. Temperature of various land use and land cover categories was estimated. In Haridwar district the temperature is inversely related and negatively correlated with NDVI value. The present study has showed that heat island effect need not be limited to a particular temperature epoch which signals towards the increasing dominance of anthropogenic heat emissions in rapidly developing cities such as Haridwar District in Uttrakhand, India.

Heterogeneity in the Spatio-Temporal Patterns of Phytoplankton Distribution and Biodiversity in a Large Subtropical Lake of SW China

Li Chen, Yineng Jiang, Tao Zhang, Rui Li, Guangjie Chen

Provincial Key Laboratory of Plateau Geographical Processes and Environmental Change, School of Tourism and Geography, Yunnan Normal University, Kunming, 650500, P. R. China, chenli5311@163.com

Abstract

Fuxian Lake, an oligotrophic and subtropical lake from southwest China, is a biodiversity hotspot due to its high diversity of endemic species. As the second deepest lake in China with long geological history, it is home to ~9% of the strategic freshwater resources of the country. However, the lake-water nutrient level is increasing in recent years and has led to the deterioration of water quality in Fuxian Lake. It is urgently needed to evaluate the spatio-temporal pattern in the changes of lake water quality and ecosystem health. As the key primary producer in lake food webs, Phytoplankton can be used reliably to monitor ecosystem health through assessing species distribution and biodiversity. We aim to uncover the spatio-temporal pattern of phytoplankton distribution and biodiversity through monthly surveys of 16 sampling sites in 2015. Our result showed Chlorophyta was generally predominant, followed by Bacillariophyta, Cyanophyta, Cryptophyta, Pyrrophyta and Chrysophyta. The phytoplankton community showed strong temporal and spatial heterogeneity in this large lake, and the degree of temporal turnover was generally greater than the difference between the south and north parts of the lake basin. Redundancy and variation partitioning analyses further indicated that water temperature and nutrient status were among the main environmental factors in driving phytoplankton community structure and biodiversity. Therefore, in the context of continued regional warming, large and oligotrophic lakes such as Fuxian Lake are vulnerable to anthropogenic disturbances through community reorganization and biodiversity changes over space and time, leading to the strong heterogeneity of ecosystem structure and functioning that needs to be considered in lake management and climate mitigation.

Linking Microbial Community Structure to Phosphorus Fractions along the Altitudinal Gradient at Gongga Mountain, SW China

Hongyang SUN, Yanhong WU, Dong YU, Na LI, Jun ZHOU, Haijiang BING

Key Laboratory of Mountain Surface Processes and Ecological Regulation, Institute of Mountain Hazards and Environment, Chinese Academy of Sciences and Ministry of Water Resources, Chengdu, 610041, P. R. China, yhwu@imde.ac.cn

Abstract

Many environmental factors vary significantly with elevation on a relatively small scale in subalpine and alpine environments. It has been proved that carbon and nitrogen markedly affect microbial community composition and function, but the relationship between microbes and phosphorus is poorly understood in alpine environments. In this study, we analysed phospholipid fatty acid (PLFA) profiles and phosphorus fractions in soils from 9 sites along an elevation gradient (2000 m – 4300 m) at Gongga Mountain in southwest China. Although the total PLFA concentration displayed no regular trend with elevation, many biomarker PLFAs indicated that there were the microbial distribution patterns for some soil microorganisms, which were most often parabolic distribution along the elevation gradient. HCl-P and residua-P were the main phosphorus fractions and were likely derived from primary soil minerals, while the proportion of NaOH-P indicating high weathering soil was small. A redundancy analysis (RDA) and correlations revealed that $\text{NaHCO}_3\text{-Po}$ and HCl-Pi are as important as soil moisture, pH and total nitrogen for influencing the distribution of microbial PLFAs across the elevation gradient. Also, our results suggested that the effect of pH on the microbial community can be partially explained by soil nutrient status (e.g., phosphorus fractions). In addition, our results showed that phosphorus is released from primary soil minerals by microorganism, which plays an important role in maintaining the phosphorus supply in the mountain ecosystem.

Predicting the Responses of Forest Distribution and Aboveground Biomass to Climate Change under Rcps Scenarios in Southern China

WU Zhuo, DAI Erfu, GE Quansheng, XI Weimin, WANG Xiaofan

Key Laboratory of Land Surface Pattern and Simulation, Institute of Geographic Sciences and Natural Resources

Research, Chinese Academy of Sciences, Beijing 100101, P. R. China, wuz.14b@igsnrr.ac.cn

Abstract

In the past three decades, our global climate has been experiencing unprecedented warming. This warming has and will continue to significantly influence the structure and function of forest ecosystems. While studies have been conducted to explore the possible responses of forest landscapes to future climate change, the Representative Concentration Pathways (RCPs) scenarios under the framework of the Coupled Model Intercomparison Project Phase 5 (CMIP5) have not been widely used in quantitative modeling research of forest landscapes. We used LANDIS-II, a forest dynamic landscape model, coupled with a forest ecosystem progress model (PnET-II), to simulate spatial interactions and ecological succession processes under RCPs scenarios, RCP2.6, RCP4.5 and RCP8.5 respectively. We also modelled a control scenario of extrapolating current climate conditions to examine changes in distribution and aboveground biomass (AGB) among five different forest types for the period of 2010-2100 in Taihe County in southern China, where subtropical coniferous plantations dominate. Our results show that climate change will significantly influence forest distribution and AGB. Evergreen broad-leaved forests will expand into Chinese fir and Chinese weeping cypress forests. The results also demonstrate that forest total AGB increases rapidly first and then decrease slowly on the temporal dimension. The results suggest that, even though the fluctuation patterns of total AGB will remain consistent under various future climatic scenarios, there will be certain responsive differences among various forest types. By the year 2100, the total AGB in Taihe County under RCP4.5 will reach its highest level.

Abstract

Glaciers respond to climate by shrinking or growing, therefore they are best sources of climate studies in remote Himalayan regions. The Himalayan glaciers serve as an important source of water supply downstream e.g. to hydropower projects (HPP) and irrigated agriculture. Their shrinkage poses a significant threat to HPP in future and further to irrigation and regional economy. In the Uttarakhand Himalaya, about 450 HPP are under construction or planned for construction and a large number have already been completed. Therefore, it is imperative to assess glacier change of recent decades so that its future impacts on regional water supply to HPP can be adequately understood and estimated. The study therefore analysed Corona images (1968), Landsat 5 TM (1992), Landsat 7 ETM+ (2000) and Landsat 8 OLI (2013) to estimate glacier shrinkage, fragmentation, and recession over the 1968-2013 period. The results reveal that Khatling and Phating glaciers retreated by about 45.9 m yr⁻¹ and 37 m yr⁻¹ respectively during 1968-2013. In 1968, both the glaciers were joined in a single glacier ice body, which was found to be fragmented in 1992. During 1968-1992, 1992-2000 and 2000-2013, the Khatling glacier retreated by about 23, 20.8 and 66.6 m yr⁻¹ and Phating by 15.7, 80.9 and 33.9 m yr⁻¹, respectively. Many of the tributary glaciers have fragmented from the main glacier by a few hundred meters. The glacier de-buttressing at higher elevation has also led to the formation of many glacial lakes, which are another potential threat to HPP due to the risk of outburst floods.

Temporal and Spatial Variations of Temperature Rate Lapse in Mt.Taibai in central Qinling Mountains, China

ZHAI D P, BAI H Y, Qin J

College of Urban and Environmental Science, Northwest University, Xi'an 710127, Shaanxi, P. R. China, zhaidp@163.com

Abstract

In this paper, based on 25m resolution DEM and the records of daily average temperature in the period of 2012-2014 from 11 standard meteorological stations which are located at different altitude areas and on the northern and southern slopes of Mt.Taibai, we analyzed the variation of temperature lapse rate on different time scales and spatial distribution characteristics. Results showed that annual temperature lapse rate on the northern slope is greater than that of southern slope in 2013a, 2014a and 2015a. The average of temperature lapse rates in 2013-2015a are $0.513^{\circ}\text{C}/100\text{m}$ on the northern slope and $0.499^{\circ}\text{C}/100\text{m}$ on the southern slope, and it exists some differences in different altitude regions along the northern aspect. In the seasonal scale, the maximum of temperature lapse rate on the northern slope was summer, while it appeared in spring on the southern slope. In contrary to winter, the temperature lapse rate on the northern slope is greater than that on the southern slopes in spring and summer. The temperature lapse rate in the monthly scale also showed significantly temporal difference, even double among monthly values. The trends of temperature lapse rates are inconsistent on the northern slope and northern slope, especially in July which has obvious difference. The temperature lapse rate obtained in this paper can reflect the generalizations of temperature change with elevation about 57 years at Mt.Taibai and its average state of under climate warming.

The Ecosystem Classification of the Peruvian North Andes and the Influence of the Climate Change in Plant Distribution and Ecosystem Classification

Sabogal, A

Pontificia Universidad Católica del Perú, Lima, Peru, asabogal@pucp.pe

Abstract

The Andes are characterized by a huge ecological diversity. There is no uniformity between the worldwide ecosystem classification and the local mountain ecosystem classification. In addition to this, the local classification changed with the climate change. The eco-diversity has been transformed through the climate change, now it is necessary to work in a new ecological classification, which includes the worldwide ecosystem classification, and the modifications due to the climate change. A biogeographical revision will be made for the nor-Peruvian ecosystem, were the Andean Huncabamba depression has an influence and has divided the ecosystems. The selected evaluation zone is influenced by the Amazonas and the Pacific basin, and is characterized by a huge biodiversity and endemism.

The research revises the biogeographical characteristics from the studied ecosystems and proposes a new ecological classification. For the new proposed classification the geographical theories and hypotheses in each ecosystem, and then the present plant distribution will be revised. The changes of plant distribution will be discussed, in the light of the consequences of climate changes and a new classification will be proposed.

Treeline Responsiveness to Climate Warming: Insights from a Central Himalayan Treeline Ecotone

Schwab N, Schickhoff U, Bürzle B, Gerlitz L, Müller M, Böhner J, Chaudhary RP, Scholten T
Physical Geography, Center for Earth System Research and Sustainability (CEN), University of Hamburg, Hamburg, Germany; niels.schwab@uni-hamburg.de

Abstract

Climate warming is expected to induce treelines to advance to higher elevations. Empirical studies in diverse mountain ranges, however, give evidence of both advancing alpine treelines as well as rather insignificant responses, pointing to an evident research deficit. We aim at investigating the sensitivity and response of the near-natural treeline ecotone in Rolwaling Himal, Nepal, to climate warming. Treeline response is analyzed focusing on the modulation of climate change effects by spatially differentiated patterns and processes. We implement an integrated landscape approach focusing on topography, climate, soils and vegetation on randomly selected forest stands along elevational transects (3700–4200 m) across the ecotone. Objectives of this paper are to identify environmental variables which influence the complex species specific tree density of the treeline ecotone and assess the parameter's relevance in particular with regard to climate change effects on stand structures. Our methods comprise extensive field sampling, modelling of vegetation, soil and climate data and a dendroecological approach. Results indicate that treeline trees in the ecotone show species-specific responses to the influence of environmental parameters, and that juvenile and adult tree responses are modulated by different variables.

Estimates of Surface Energy in Qinling Mountains Area by Remote Sensing Methods

Xiaolin Cui

Xi'an University of Science and Technology, China, xiaolin_cui@xust.edu.cn

Abstract

The variation characteristics of surface energy in the region reflects the energy and the evolution trend of the land air process, and affect the regional climate change further. With the developing and maturity of remote sensing technology, it is more convenient to study the surface energy of large scale range. The study of surface energy budget in Qinling Mountains area is an important guarantee for the study of the change of the surface cover in Qinling Mountains area. Therefore, it is of great significance and value of research to monitor the surface energy of Qinling Mountains area by remote sensing methods. In this paper, MODIS, DEM and meteorological data were used to estimate the surface energy budget. Firstly, it estimates of surface energy budget in Qinling area, and carries on the analysis to the surface characteristic parameters affecting the degree of surface energy size,: In terms of the influence of net radiation flux albedo rate greater than surface temperature greater than surface emissivity; In terms of the influence of soil heat flux, surface temperature greater than surface albedo rate greater than surface emissivity; In terms of the influence of soil heat flux, surface albedo rate greater than surface temperature greater than surface emissivity.

Modeling the Effects of Climate Change and CO₂ Elevation on Productivity of Temperate Forest in North China

Peng Junjie

The Henan Academy of Social Sciences, Zhengzhou, 450002, P. R. China, pengjunjie00@163.com

Abstract

A warmer climate induced by greenhouse gas emissions could significantly alter the rate of forest productivity. Responses of forest ecosystems in China to climate change and CO₂ elevation are still unclear. Based on BIOME-BGC model and tree-ring data, a modeling study was conducted to estimate the inter-annual variations of temperate forest ecosystem net primary productivity (NPP) in North China in 1952-2008, and explore the responses of radial growth and NPP to regional climate warming. The simulation results indicated that the annual NPP of the *Larix principis-rupprechtii* ecosystem in 1952-2008 varied between 268.18 g C m⁻² year⁻¹ and 667.01 g C m⁻² year⁻¹ with a mean value of 428.09 g C m⁻² year⁻¹. The annual NPP of the *Pinus tabulaeformis* ecosystem varied between 244.12 g C m⁻² year⁻¹ and 645.31 g C m⁻² year⁻¹ with a mean value of 418.60 g C m⁻² year⁻¹. The mean temperature in May-June and precipitation from prior August to current July are the main factors limiting the radial growth and ecosystem NPP in North China. In recent decades, both the radial growth and NPP presented a decreasing trend due to regional warming and drying climate condition. In the future climate scenarios, NPP had positive responses to precipitation increase, temperature increase and combination of precipitation and temperature increases. The accumulation of NPP was enhanced by elevated CO₂ and the *Larix principis-rupprechtii* and *Pinus tabulaeformis* ecosystem NPP were increased by 9.1% and 16.1% due to CO₂ fertilization effect. In addition, the tree-ring data is an ideal proxy predicting the ecosystem dynamics at both ecosystem and regional scale, and can be used to calibrate process-based ecosystem models such as BIOME-BGC.

Key words:

Temperate forest ecosystem; net primary productivity; climate change; elevated CO₂; tree-ring; BIOME-BGC

Permafrost Carbon Loss and Chemical Changes Associated with Thaw Slumps in Northern Tibetan Plateau

Cuicui Mu

Key Laboratory of Western China's Environmental Systems (Ministry of Education), College of Earth and Environmental Sciences, Lanzhou University, Lanzhou, 730000, China, mucc@lzu.edu.cn

Abstract

Permafrost thaw causes ground subsidence or thermokarst. Thermokarst terrain on hilly slopes can lead to the formation of thaw slumps, which dramatically alter soil properties and carbon emissions, but little is known regarding the effects of thaw slumps on the biogeochemical processes of soil carbon. In the present study, we measured soil carbon contents and physiochemical properties in different thaw slump stages (no slump, slumping and slumped) in the upper reach of Heihe River Basin in northeastern Tibetan Plateau. With these samples, the carbon mineralization rates were measured using laboratory incubations. Meanwhile, the chemistry changes of organic matter were examined using Fourier transform infrared (FTIR) spectroscopy analyzer before and after the incubation. The results showed that there was a significant decrease in soil carbon and nitrogen stocks in the slumping and slumped stages. The loss of organic carbon and total nitrogen was $29.6 \pm 5.9\%$ and $31.1 \pm 8.8\%$ in the upper 0-10 cm layer of the slumping soil compared to the no slump soil. The slumped soil had a significantly lower loss of carbon and nitrogen content than the slumping soil (*t*-test, $p < 0.05$). The incubation results implied that slumped soil has significantly higher cumulative CO_2 production than that of slumping soil (*t*-test, $p < 0.05$). In addition, the slumped soils had a higher intensity of hydrocarbons and lignin/phenol backbone composition than that of no slump and slumping soil for the 0-10 cm layer. This study demonstrates that abundant carbon and nitrogen loss occurs during the process of thaw slumps. Slumped soils can accumulate some organic matter, accompanied by substantial changes in its carbon chemical structure and characteristics. These results demonstrate that thaw slump plays an important role in the impact of permafrost thaw on chemical characteristics of organic matter and merits greater attention.

Permafrost, thaw slump, thermokarst, carbon chemistry, incubation

Response of Runoff to Climate Change and Human Activities in the Southern Humid Area River Basin: A Case Study of Ning Jiang

Yang Chuanxun, Zhang Chengdong, Wan Luwen

School of Geography Science, South China Normal University, Guangzhou, 510631, China, 747009083@qq.com

Abstract

Based on six meteorological stations of Ning Jiang river and hydrological data gathered from Hekou station from 1953—2013, landscape pattern metrics with land use and land cover data derived from the Landsat TM imagery acquired in 1986, 1995, 2005 and 2013. We apply the methods of Mann-Kendall trend analysis, Wavelet analysis and SCRAQ method aiming to analyze the contribution ratio of precipitation and human activities on the runoff in the Ning Jiang river. Results show that: (1) the temperature and runoff had significantly increasing and decreasing trend, the precipitation appeared weakly increasing trend. (2) The temperature and precipitation have 27a multiple time-scale, the runoff has significantly regular 27a multiple time scale from 1953—1990, while was destroyed since 1990s. The significant correlation coefficients between precipitation and runoff at the scale of 11a. (3) With the development of economy and soil and water conservation from 1980s, woodland area increased 26.2%, grassland area land reduced 41.6% and cultivated area reduced 61.2%. The large area of land use change occurred in the northern Xing Ning. (4) No considering the effect of temperature, taken 1953—1963 as the base period, the contribution rate of the precipitation and human activities to the decreased runoff was 79.3% and 21.7% in 1964-1983; 36.5% and 63.5% in 1984-2013.

Spatiotemporal Variation of Vegetation Coverage and Attribution Analysis in Qinling Mountains

Deng C H, Bai H Y, Zhai D P, Liu R J, Q J

College of Urban and Environmental Science, Northwest University, Xi'an 710127, Shaanxi, P. R. China,

chenhuisnow@126.com

Abstract

Vegetation change is generally caused by the combined effects of various climate variables, which is further complicated by the impacts of human activities. Based on MODIS-NDVI products, DEM and meteorological observation data, the current study investigated the patterns of spatiotemporal variation of vegetation coverage in the Qinling Mountains during 2000-2015a. The method of Sen+Mann-Kendall model, partial correlation analysis, Hurst index, partial least squares, residual analysis were used to analyze the data and the reasons. The results of the study showed that (1) the vegetation coverage of the study area revealed a significant increase nearly 16 years. (2) The structure characteristics of the Vegetation coverage have significant difference, the area covered with $FC < 10\%$ in the slowly rising, $10\% < FC < 70\%$ in decreased significantly, $FC > 70\%$ in increased significantly. (3) In terms of spatiotemporal variation, vegetation cover showed a "high in the middle and low in surroundings, high in South slope and low in North Slope" pattern, North Slope does not change significantly year by year, and the southern slope increased significantly. Significant difference was found in different altitude about vegetation coverage change, showed increase significantly under 1500m, fluctuational falling in 1500-2600m, and slow decline more than 2600m. (4) The reverse characteristics of vegetation coverage change were stronger than the same characteristic. (5) The climate change is the important factors that affects vegetation coverage. (6) In addition, human activities were also important causes resulting in vegetation cover change, that are dominant on vegetation degradation area and vegetation improvement area.

Vegetation coverage; spatiotemporal variation; Climate stress; man-made interference; attribution analysis; Qinling Mountains

The Distribution Response of 8 Representative Endemic Species in Jiangxi Province to Different Climate Scenarios of the Future

Zhongjun Hu, Shulan Jin, Huahua Pan

College of History, Geography and Tourism, Shangrao Normal University, Shangrao, Jiangxi, 334001, P. R. China,

hzj98027@sohu.com

Abstract

Jiangxi province is rich in biological resource in China, a large number of endemic plants are distributed in this province because of its good hydrothermal condition, the methods of MaxEnt and the least cost path law (LCP) are used in this research to model the niche drift and area changes of 8 endemic species of Jiangxi province in current and 6 future hypothetical climate change scenarios, the result shows that when the temperature and rainfall increases, distribution range and niche core of most endemic species drift toward regions of high height and high latitude, and the effect of rainfall changes is more apparent than temperature on the niche drift of most endemic species, As for the endemic species with large ecological amplitude, such as *Rhododendron kiangsiense* Fang, *Acer kiangsiense* Fang et Fang f, *Acer leptophyllum* Fang and *Berberis jiangxiensis*, their migratory extent of niche core is less than endemic species with smaller ecological amplitude, such as *Pteris obtusiloba*, *Lysimachia jiangxiensis*, *Gyrtomium confertifolium* and *Pseudotaxus chienii*; and changes in core area of the endemic species also shows the same tendency. The response of endemic species with narrow habitat range to the climate change is more significant than endemic species with wide range of habitat, because species with wide range of habitat has certain regulating function and less sensitive to the climate change. The research on the distribution changes and ecological drift of endemic species of Jiangxi province in different climate change scenarios of the future can help us adopt correct countermeasures to protect and manage the resource of endemic species in Jiangxi province better in condition of climate deterioration.

Endemic species; distribution pattern; potential distribution; niche drift; climatic changes.

The Responses of NDVI-based Vegetation during the Green-up Period to Temperature in the Headwater Region of the Yellow River

Dandan SHI, Jinming HU

YunNan University, Kunming, 650091, China, 1038437732@qq.com

Abstract

In this study, by using two definition methods of phonological-growing season and climatic-growing season, we analyzed the correlation between the NDVI during the green-up period and mean temperature the same time as well as that of about 3 months before the growing season at the temporal span of 16 days. NDVI was averaged over multiple-spatial-scale (1km×1km, 5km×5km, 10km×10km) areas centered on each meteorological station. The results were shown as follows: (1) the best correlated spatial scale of each meteorological station is various (36% is 5km×5km, 64% is 10km×10km) and discrepancy exists in most cases (55%) even in the same meteorological station between the two kind of growing seasons. (2) The responses of NDVI to temperature during the green-up period of phonological-growing season presented good consistence, the 82% correlation coefficients are significant or highly significant. That of climate-growing season is rather complex, and 9% correlation coefficients are actually significant, but it remained identical for the areas with similar warmth and coldness. (3) In the phonological-growing season, and 82% of stations presented significant correlation at green-up period and about 3 months before the growing season, whereas it demonstrated consistency with that of climate-growing season in the same temperature areas. This study highlighted the impacts of temperature on vegetation in the green-up period, but further research is needed to understand the vegetation-temperature interaction profoundly because of the different results of phonological-growing season and climate-growing season.

Abstract

Understanding of the variability in soil hydraulic conductivity in the mountain headwaters of river basin is critical to the hydrological modelling of mountainous runoff and the water resources management in the middle and lower reaches of the river basin, especially in the arid and semiarid areas. In this study, a total of 32 soil profiles with 5 layers within 0-70 cm (0-10, 10-20, 20-30, 30-50, 50-70 cm) were sampled under different land cover types: forest, meadow, high coverage grassland (HCG), medium coverage grassland (MCG) and barren land in the upper stream of the Heihe river watershed, Northwest China, saturated hydraulic conductivity (K_s) was measured for each sample. The vertical variation of K_s and soil hydrological response under different land covers were analyzed. Results showed that K_s value in layer 5 (50-70 cm) was significant lower than the values of above 4 layers (0-50 cm); K_s decreased in the order of forest, meadow, MCG, HCG, and barren land, corresponding to the degree of vegetation degradation; The K_s decreased with depth under forest, HCG and barren land, but increased first and then decreased under meadow and MCG; The dominant stormflow paths (DSP) for different land covers were different: forest was dominated by deep percolation (DP), HCG was dominated by subsurface flow (SSF), meadow was prevailed by Hortonian overland flow (HOF) and had no SSF, while MCG and barren land were also dominated by HOF, but still formed SSF. The large-scale field sampling of the hydraulic conductivity under different land covers in the Qilian Mountain can improve the accuracy of hydrologic simulation and provide decision support information for the water resources management and ecological environment in the Hexi Corridor and Alashan Plateau.

Abstract

Accelerating anthropogenic disturbances have altered species distribution over local to global scales, posing severe challenges for the maintenance of biodiversity and ecosystem functioning. Biogeographical studies in China have long focused on terrestrial ecosystems, with freshwater data predominantly derived from short-term surveys. Here, we combined lake sediment records with modern surveys from SW China to examine the productivity-diversity relationship (PDR) over multiple temporal (i.e. from seasonal to centennial ones) and spatial scales. Firstly, we conducted monthly limnological surveys of a large lake in providing a short-term and local perspective on the PDR. For a long-term perspective (i.e. > 100 yrs), we reconstructed the changes of lake productivity and community structure based on sedimentary pigment concentrations (i.e. Chl-a) and diatom assemblages for lakes with contrasting trophic status, as well as through a top-bottom comparison of diatom communities for > 20 lakes. Principal Component Analysis (PCA) of diatom community data showed that lake productivity was among the most significant environmental gradients in driving diatom community reorganization over both time and space. Diatom diversity indices generally showed unimodal changes in response to lake productivity over space, while over time they showed a positive relationship in oligotrophic systems but an opposite trend in nutrient-enriched lakes. Our results collectively suggested that disturbance-associated changes (i.e. lake productivity) could lead to the long-term homogenization of regional species pools, despite that local biodiversity could change towards either of the two opposite directions over time.

Abstract

Analysis of biodiversity is the actively developing method of the Earth biota state control. The input of biodiversity in the Northern Eurasia and on Russian territory into the whole planetary biodiversity is exclusively big. Biogeographical approaches contribute a lot into the study and conservation of biodiversity. Practical ecological monitoring, its mapping and visualization could be made through biodiversity analysis in different ways. One of the ways in the strategy of biodiversity conservation is based on its quantitative and comparative estimates in the natural ecosystems on different levels (monitoring of various territorial groups within the areal). On the next stage – cartographic – the series of biogeographical maps are produced. They are made on various levels of spatial-temporal integration of different types of information. The aim of this work is to generalize the many years' authors experience of working out and applying the biogeographical approaches in monitoring and mapping of biodiversity on various spatial scales and levels. As the elementary units of biodiversity the protected plant and animal species in various parts of Palearctic are considered. Those parts chosen basing on the biogeographical division into regions are: The Russian Subarctic, the Central Kazakhstan and the Baltic region of Russia. Biogeography analyses of biodiversity distribution and monitoring of endangered species are discussed and effective strategies of wildlife conservation in different regions are proposed.

Abstract

The community structure of zooplankton and characteristics of environment were investigated in 13 sampling sites in the North Luo River system, as the second largest tributary of the Weihe River basin, Northwest China, in autumn of 2012, and analyzed by canonical correspondence analysis using Canoco 4.5 software. It was found that there were 49 zooplankton species belonging to 26 genera, with dominant rotifers accounting for 83.67% in the species composition, followed by protozoa (8.16%). The zooplankton had a density with an average value of 57.7 ind. L⁻¹, and biomass with an average value of 0.070 mg L⁻¹. There were six dominant species of zooplankton in the North Luo River system, including *Brachionus angularis*, *Accomorpha saltans*, *Proales sordida*, *Brachionus calyciflorus*, *Asplanchna priodonta*, *Polyarthra dolichopteria*, with average Shannon-Weiner species diversity index (H') of 2.67, Evenness index (J) of 0.89 and Richness index (M) of 1.68. Clustering analysis based on zooplankton density revealed that the zooplankton in every section of the North Luo River system was divided into four groups. The canonical correspondence analysis indicated that the community structure of zooplankton in the North Luo River system was primarily affected by the water environment including phytoplankton and nitrite. Water quality evaluation based on the community structure of zooplankton indicated that the water in the North Luo River system belonged to β -middle pollution and a simple zooplankton community structure according to the species diversity index. Thus, it is necessary to strengthen the ecological management and to reduce the nonpoint source pollution in the North Luo River system.

imrandse12@gmail.com

Abstract

The Sundarbans covering some 10,000 km² of land and water are part of the world's greatest deltas formed by sediments deposited by the three rivers namely the Ganga, Brahmaputra and Meghna. Indian Sundarbans which is around 38% of the whole are located between 21° 32'-22° 40' north and between 88° 85'- 89° east, and the rest lies in Bangladesh. This reserve forest is bounded by the 'Dampier-Hodges Line on the North, Bay of Bengal on the South, Ichhamati-Kalindi-Raimongal on the East and the river Hooghly on the West including 4264 km² of mangrove forests, accounting for more than 60% of India's total mangrove forests. Few areas exist in the world with such diversities in animal species that live in a complex physical, chemical, mechanical and animate environment. Sundarbans play an important role in the lives of the people in the neighbouring communities who depend on the forest for subsistence and protection from natural calamities. But for the past few decades its biodiversity is continuously threatened by rising pollution, increasing human population which puts a lot of pressure on its biological resources, as well as impacts the freshwater inflows from upstream areas. New emerging threats are from oil exploration in coastal areas and global climate change leading to for e.g. sea level rise. Urgent steps are needed to stop and reverse the present trend of deforestation and loss of biodiversity in the Sundarbans, which is under immense pressure from a growing number of issues.

Faculty of Earth and Life Sciences, Vrije Universiteit Amsterdam, 1081 HV Amsterdam, The Netherlands, h.yu@vu.nl;

yhrhl@163.com

Abstract

The establishment of habitat corridors has been recognized as a key strategy to conserve landscape connectivity and protect biodiversity in front of the pressing environmental challenges caused by unprecedented widespread land transformation in China. The objectives of this paper are to meet this challenge by delineating corridors that are essential for functional connectivity at national level and assess their risks under rapid land use changes. Main corridors and habitat concentration areas (HCAs) across China were delineated based on a landscape 'naturalness' approach, which mainly consisted of 5 small models (land cover modification, land use intensity, roads influence, resource extraction affects and slope). We compared the spatial differences between HCAs corridors and corridors of current protected sites to facilitate further reserve networks development. Risks to land use changes were assessed based on observed recent land use change and land use simulations by CLUE-S model for 3 scenarios (business as usual scenario, planned scenario, and optimum scenario) up to 2030. The risk assessment reveals that threatened hotspots are mainly located along the 'Hu' Line and East China, areas where rapid land use changes are highly expected. This delineation of habitat corridors provides directions for the recent ecological 'redline' policy on the construction of ecological corridors and the assessment has significant implications for national conservation planning.

Decades of Changes in Biodiversity Under the Pressure of Environmental Degradation in Plateau Lakes in Yunnan, China

WANG Sihai^{1,2,3}, WANG Juan^{1,2}, YANG Yuming^{1,2}

¹ Key Laboratory of the State Forestry Administration on Conservation of Rare, Endangered and Endemic Forest Plants, Yunnan Academy of Forestry (YAF), Kunming 650201, Yunnan, China;

² Yunnan Provincial Key Laboratory of Cultivation and Exploitation of Forest Plants, YAF, Kunming 650201, Yunnan, China;

³ National Plateau Wetlands Research Center, Southwest Forestry University (SWFU), Kunming 650224, Yunnan, China.

Abstract

Yunnan Province, China has more than 37 plateau lakes over 1 km² in size, with a total area of 1,164 km², which are associated with six major rivers, four being international rivers. These lakes are rich in biodiversity. These lakes have experienced different magnitudes of biodiversity deterioration over recent decades.

We reviewed primary literature reporting the occurrence of such hydrophyte and fish species between the 1950s and 2000s. During this period, 46.3% of native hydrophytes and 84.0% of native fish species in Dianchi Lake had gone locally extinct, compared to 21.4% and 58.8% in Erhai, and 11.8% and 41.7% in Fuxian, respectively. In Dianchi alien species comprised 15.4% of total hydrophytes and 87.5% of total fish species, compared to 5.7% and 70.8% in Erhai, and 11.8% and 65.0% in Fuxian, respectively. The extinction of endemic fish species was particularly serious. The proportion of endemic fish species extinct was 90.0% in Dianchi, 75.0% in Erhai and 63.6% in Fuxian. Homogenization of fish assemblages (calculated Jaccard indices) across the lakes increased during the study period in parallel with the extinction of endemics and introduction of alien species. Results showed that lacustrine conditions determined the observed changes of hydrophytes and fish species. It is likely that pollution and introduction of alien species largely attributable to human activities were the primary factors causing the degradation of species diversity. In developing regions like Yunnan, it is crucial to better balance economic development with the protection of its important lacustrine habitats.

Geo-Spatial Techniques for Identification of Sustainable Tiger-Corridor and Biodiversity Revjumention in Rajasthan, India

Singh, BVR; Sen, A

Department of Geography, Delhi School of Economics, University of Delhi, New Delhi, India -110007

Bhanwarsa28@gmail.com

Abstract

Our future depends on carrying capacity of ecosystem services although now-days biodiversity resource depletion is very rapidly to increasing all over the globe. In the biodiversity Tiger is icon of wildlife which is considered as vital factor for maintaining Universal Food Chain System, in the present on research “geo-spatial techniques for identification of sustainable tiger-corridor and biodiversity rejuvenation for Rajasthan, it’s a micro level Study based on Primary and secondary data through GIS mapping of Socio-Economic & Physical factors to inter-connect all Tiger habitats. The slope and relief has been derived from Cartosat-image and obtained from BHUVAN portal. NDVI, type of forest and LULC have been obtained from the Multispectral images from ETM and ETM+ sensors of Landsat and LISS-III and AWiFS sensors of Resourcesat-satellites. The data for month-wise surface water resources has been collected form BHUVAN portal. The socio-economic data has been collected from Village directory of Census of India, 2011. The data analysis process involves digitization and village directory data was attached with the digitized map and raster maps have been created using those demographic attributes. The physical indicators are obtained in raster formats. Using all the raster maps the final delineation of corridor has been done through spatial analysis using the raster calculator tool in ArcGIS and Erdas. The study come out with physical and Socio economic corridor for tiger conservation in Rajasthan. The research also describes Human Encroachment, Impact on Colonization, Breeding, Inter-breeding and Migration on integration of all subjected Tiger Reserves in biogeography of Rajasthan.

Impact of Clean Development Mechanism (CDM) Projects On Environment: A Case Study of Chamba District of Himachal Pradesh

Kumar Prashant, Ahlawat Monica

University of Delhi, New Delhi, prashantdsedu@gmail.com

Abstract

In the era of modernization and Industrialization, population and pollution is major area of Concern. Here, when the entire world is out to tackle pollution coupled with other environmental problems, initiatives like Clean Development Mechanism (CDM) can provide a viable solution. CDM allows emission-reduction projects in developing countries to earn certified emission reduction (CER) credits. It stimulates sustainable development and emission reductions in developing countries also giving developed countries some flexibility in how they meet their emission reduction targets. Presently there are 12 CDM hydropower projects of different magnitude in Chamba and they are in different stage of completion. Simple random sampling was used as a tool for conducting primary survey of 300 households to take the opinion of local population about these projects. This hydropower project served the purpose of reducing carbon emission but in matters of improving local environmental conditions things did not look good. It was concluded that, most of the villagers were not satisfied with the contribution of CDM projects towards the preservation of local environment and biodiversity. Forests were cleared for making the dams for hydropower projects and locals were also not given electricity which compounds the problem as it increases their dependency on fuel wood. Lack of sensitivity towards local environment is a major area of concern and can be tackled by involving local population in decision making.

Key words:

clean development mechanism; carbon emission reduction; biodiversity; environment

Impact of Climate Change and Human Encroachment On Wetlands: A Case Study of Unnao District of Uttar Pradesh, India

kashif imdad

PPN PG College, CSJM University, Kanpur, India, kashifimdad@gmail.com

Abstract

Wetlands are one of most productive environments and provide a wide variety of benefits. They are important repositories of biodiversity and play a critical role in the health, livelihood and economic prospects for the nearby rural population. Wetlands are under imminent threat by nature in form of global warming and by civilization in form of encroachments and reclamation of wetlands for farming and settlement. Along Indo-Gangetic plain wetlands have receded more than half of its size in last 50 years. Present paper attempts quantitative segregation of all factors responsible for receding wetland including climate change and encroachment by humans. Study is based on wetlands of Unnao district of Uttar Pradesh, India. Methodology included analysis of temporal mapping of wetlands, climatic data of area and ground verification for encroachment impacts. Results indicate that climate change is not the only responsible factor for diminishing wetlands but encroachment by human is also largely responsible.

Key word:

Wetland; Climate Change; Encroachment; Biodiversity and Rural Population.

Landscape Changes of Abha Urban Area, KSA, Using Remote Sensing Techniques

Adel Moatamed abdul hamied

geography department, king Khalid University, KSA., adeleco111@yahoo.com

Abstract

Abha urban area is a part of Aseer area. Aseer area is located at southwest of Saudi Arabia. Aseer area is considered an ecological exception in Saudi Arabia, because it contains biotic components, such as flora and fauna. Therefore, Aseer area can be considered an area does not dominated by the desert features, while the most of Saudi Arabia lands are. This study investigated Abha urban area which stretching between latitudes 17° 57 18.9 N, and longitudes 42° 16 39.8. This study aimed to detecting the land use/ land cover changes that occurred in Abha urban area between 1980-2015 depending on the satellite images. Interpretation of the satellite Images were used mainly to recognize types of changes that happened throughout of the study area during past 35 years, between 1980 and 2015, in each of the vegetation cover and urban buildup area.

Key words:

Mangrove Ecosystem of Sundarban in West Bengal, India - Plant Biodiversity and Its Conservation

Sankar Narayan Sinha, Karabi Biswas and Dipak Paul

Department of Botany, University of Kalyani, Kalyani 741235, West Bengal, India, sinhasn62@yahoo.co.in

Abstract

The Indian part of Sundarban region is situated in West Bengal, India covering the lowest part of the Gangetic delta which has been fragmented by several distributaries. This littoral tract, which is under tidal waves from the Bay of Bengal at regular interval, has provided congenial hydrogeomorphologic conditions for the development of wild mangrove ecosystem with a great diversity of flora and fauna. The sundarban region of India is famous for a combination of estuarine and mangrove forest ecosystem dotted with freshwater bodies. It is sandwiched between shallow marine water bodies in the south and agricultural landscape in the north. As a result, it is exposed to natural hazards like cyclone, tidal surge and tsunamies while suffer from excess utilization of natural products in the forest-society interface; hence all ecosystems are fragile in nature. For the last few decades' diversity is at the climax of decline in sundarban ecosystem, particularly in Indian Sundarban. In this area river delta principally facing the hazard of sea level rise and climate change. These fragile ecosystems in this area is being swallowed everyday by gradual rise in sea level, coastal erosions and tropical cyclones. Apart from the global cause of rise in sea level that is thermal expansion of sea water, anthropogenic pressures are also found to be responsible for the gradual degradation of such ecosystem. This paper focuses the conservation of mangrove biodiversity which controls the climatic extremes in these areas.

projo.danoedoro@geo.ugm.ac.id

Abstract

Javan rhino (*Rhinoceros sondaicus sondaicus*) is a unique, endangered species with a single horn that could only be found in the west tip of Java Island, Indonesia. There are only about 50 individuals surviving in their natural habitat, i.e. Ujung Kulon National Park. Amongst many problems identified, the increasing distribution of an 'invasive' species called langkap palm (*Arenga obtusifolia*) becomes prominent in relation with the decrease of natural vegetations that serve as rhinos' food. The langkap palm has been spreading out over the past 30 years, and its distribution needs to be mapped efficiently and accurately, since the palm's spatial distribution may help habitat management policies. This study tried to map the *A. obtusifolia*'s spatial distribution using two approaches, i.e. landscape-ecological and spectral approaches. The landscape ecological approach was carried out by collecting field data of the langkap palm frequency in relation with several terrain characteristics. Spatial interpolation techniques were explored to map the spatial distribution of the terrain characteristics, and the results were correlated with the species frequency distribution. The spectral approach made use of multispectral classification. This study found that the multispectral classification method could map the *A. obtusifolia* spatial distribution accurately, i.e. 91%. The classes were grouped into open langkap palm, langkap palm under other vegetation canopy, mangrove, and other vegetation structure. The other method did not successful due to the number and distribution of samples, as well as the characteristics of the invasive species, which are not highly correlated to the terrain characteristics in the study area.

Arenga obtusifolia; invasive species; Ujung Kulon; javan rhino; multispectral classification

Moroccan Forest Ecosystem Services and Local Populations

Mohammed Sghir Taleb

Institut Scientifique, Université Mohammed V de Rabat, Avenue Ibn Battouta, B.P. 703, Rabat, Morocco ,
talebmsg@yahoo.com

Abstract

Located at the northwest corner of the African continent between 21 ° and 36 ° north latitude and between the 1st and the 17th degree of west longitude, Morocco with a total area of 715,000 km² enjoys a privileged position with a coastline of 3 446 km long opening to the Mediterranean and the Atlantic Ocean.

Its privileged location with a double coastline and its diverse mountain with four major mountain ranges: The Rif, Middle Atlas, High Atlas and Anti Atlas with altitudes exceeding 2000 m in the Rif, 3000 m in the Middle Atlas and 4000 m in the High Atlas.

Morocco is characterized by an important forest genetic diversity represented by a rich and varied flora and many ecosystems: forest, preforest, presteppe, steppe, Sahara that spans a range of bioclimatic zones: arid, semiarid, subhumid, and humid.

The vascular flora of Morocco has 3913 species and subspecies in 1298 (including 426 sub-species types), distributed among 155 families and 981 genera. The number of endemic species amounted to 640 (16%) and 280 subspecies (32%). The rare or endangered flora species is estimated to be 463 and 1284 subspecies.

Forest species and ecosystems provide important services to populations represented by grazing, timber harvest, harvesting of medicinal and aromatic plants...

This presentation will be focused on the Moroccan flora and forest ecosystem services and on the interaction between local populations and ecosystems.

Key words:

Morocco; forest; flora; ecosystem; services; population

Mount Abu Wildlife Sanctuary Rajasthan India: A Socio-Ecological Dilemma

kumar kartikeya

Department of Geography, M.L.V Government College Bhilwara Rajasthan India, drkkmlv@gmail.com

Abstract

Mount Abu wildlife sanctuary of Rajasthan is situated in the southern part of the state in Sirohi district. It is situated between 24° 30' and 24° 43' North and 72°38 ' and 72°53` east co-ordinates. Flora and Fauna of the sanctuary were studied and analysed through regular visits in different seasons. The dominance of teak, dhok and Tendu tree indicates the tropical moist and humid climate. This sanctuary has some rare and endangered species which needs conservation and Mount Abu hills have a number of medicinal plants, ferns and bryophytes which have considerable importance. For assessment of socio-ecological impacts a Survey of sample villages was conducted in core and buffer areas.

Today, the Sanctuary is under heavy pressure due to increasing populations. The Town and villages in and around Mount Abu wildlife Sanctuary puts tremendous pressure on existing resources. The main problems include illicit felling, illicit grazing, pressure due to encroachment of land, deliberate forest fires, poaching activities, and pressure due to fuel wood, fodder and herb collection. These activities lead to rapid deforestation in buffer areas of the Sanctuary and are constantly building heavy biotic pressure in core area. A proper environmental management plan for the Sanctuary is needed to bring out useful association of those conditions needed by species to reproduce and survive.

Endangered Species; Socio-Ecological Impacts; Illicit Felling and Grazing; Biotic Pressure; Environmental Management

Rethinking Community Conservation in South Africa: What Shapes Local-Level Decision-Making in The Hluhluwe-Imfolozi Park, Kwazulu-Natal, South Africa?

Nsukwini, S.B., Bob, U.

University of Mpumalanga, Mbombela, 1200, South Africa, nsukwini.sakhile@gmail.com

University of KwaZulu-Natal, Westville, Durban, 4001, South Africa

Abstract

The article reports on a study that critically examined community conservation in post-apartheid South Africa. Based on literature review and a case study of a community living adjacent to the Hluhluwe-iMfolozi Park (HiP) in northern KwaZulu-Natal, South Africa, the article examines the processes that shape local-level decision-making in the study area. The study employed the triangulation method to examine the extent and the nature of interaction between the park management and the communities adjacent to the park, to examine attitudes and perceptions of the communities towards HiP, including resources within the Park that are likely to impact on the lives of Nompondo community as well as the role of communities in the development and promotion of tourism in HiP. The study of the Nompondo community adjacent to HiP indicates that this community benefits in various ways but not to their level of satisfaction. The study indicates that members of the Nompondo community are allowed access to resources such as venison, thatching grass, firewood and water. Participation in the operation and management of HiP was yet another benefit that was identified. However, this was limited, with a few households and community leaders generally participating. Furthermore, the results show that a range of opportunities for positive interactions with the Park's management include job opportunities through the expanded public works programme.

community conservation; Hluhluwe-iMfolozi Park; post-apartheid; communities; expanded public works

Studies of Biofabricated Nanoparticles in Bioremediation of Arsenic from Arsenic Contaminated Aquenvironment

Tapan Kumar Das, Triparna Mukherjee

Department of Biochemistry and Biophysics, University of Kalyani, Kalyani-741235, India, tapandas@klyuniv.ac.in

Abstract

The present study involves the development of adsorbent containing silver nanoparticles for arsenate removal using silver reducing property of a novel fungal strain *Aspergillus foetidus* MTCC8876. Biological reduction of silver by the isolate has been deduced at various time intervals. The fungal biomass after biological silver reduction were harvested and subjected to carbonization and its properties were analyzed using Fourier Transform Infra-Red spectroscopy, X-ray diffraction, scanning electron microscope attached with energy dispersive spectroscopy, BET surface area analysis, field emission scanning electron microscope and transmission electron microscope. The average size of the silver nanoparticles presents on the surface of the carbonized silver containing fungal cell (CSF) was 35 nm. The carbonized control fungal cells (CCF) did not contain any particles on its surface. As (V) adsorption efficiency of CCF and CSF was deduced in batch mode by varying parameters like contact time, initial concentration, and pH. Desorption studies were also carried out by varying the pH. The CSF was proved to be exceptionally efficient in arsenate removal when compared to CCF.

The Functional Analysis of Landscape Connectivity at The Landscape, Component and Patch Level: A Case Study of Mingqing County, Fuzhou City, China

Ke QI, Yujing XIE

Fudan University, Shanghai, 200433, PR China, xiejy@fudan.edu.cn

Abstract

Maintaining forest landscape connectivity is one of the effective ways to alleviate the natural forest fragmentation and biodiversity loss problems. Recently, graph theory based metrics are often used as powerful tools in the assessment of landscape connectivity. However, the functional features of the landscape units according to different structure levels, by which the outcomes could be enriched and advices could be given for the practical application, are overlooked. In this study, a series of graph-based connectivity indices were implemented to 1) evaluate the optimal threshold distance; 2) identify the key landscape units in component level and patch level; 3) classify the functional types of components and patches, and analyze the functional patterns in different structure levels. The argument about the relation between the patch importance and patch area was discussed and explained depending on functional types. With a natural forest area in Mingqing County of China as the study area, advices about forest conversation and connectivity enhancement were given referring to the research conclusions. The study would provide a way to comprehensively analyze habitat fragmentation and functional pattern for the local forest conservation.

Key words:

landscape connectivity; graph theory; functional analysis; threshold distance; component

The Impact of Climate Change On the Migration of Birds and Biodiversity in The Bharatpur Bird Sanctuary, Rajasthan, India

Lal, Vipin Chandra

Department of Geography, Delhi School of Economics, University of Delhi, Delhi, India, vipin.chandralal30@gmail.com

Abstract

The induced human interference has led to many unprecedented changes in landuse/landcover of biosphere which is home to all the species. During the last century, bird populations have been affected by different kinds of disturbances and impacts due to man-made structures such as highways, television, radio and cell phone towers, wind farms, glass windows, and also due to human activities such as fishing and illegal shooting. The increasing mortality of birds by human cause has generated an important literature evaluating the impact of these elements on bird populations and developing the application of protective measures. The present study highlights the problem associated with the migration of birds in the Bharatpur bird sanctuary and is home to many foreign birds during winter for breeding and other purposes. The main causes in Bharatpur sanctuary is related to shrinking water bodies which are essential for habitat development. The study aims to highlight the nature of effective ecotonal imbalances and also to measure its rate towards future prospects. Bharatpur is on a major migration route between the Southern regions (particularly South Asia occupied by birds during winter, and the North where more than 30 species of raptors come to breed in Western India. Because of the position of the Arabian sea, the Indian ocean and the Arawali range, Bharatpur is one of the points where the birds concentrate during these complex migration paths. Although known as the 'Semi arid zone', it hosts major migratory bird gliders concentrations during the spring, winters and the autumn

Key words:

Bharatpur; sanctuary; Land use / land cover change; Migration; Ecotonal

Wildlife Damage in Wolong Natural Reserve: A Systematic Analysis and Typical Characteristic Identification

Jianying XU

College of Resource, Environment and Tourism, Capital Normal University, China, xu-jianying@163.com

Abstract

Wildlife damage is a universal phenomenon in and around natural reserve, which leads to human-wildlife conflict and seriously affects the effectiveness of biodiversity conservation. The paper gave a systematic investigation about wildlife damage in Wolong Natural Reserve and identified typical characteristics of farmland suffered wildlife damage. The results showed that local human-wildlife conflict has increased rapidly in recent years due to ecological restoration and relocation policies. Local spontaneous preventive measures were unsustainable and less effective. For damage mitigation, we identified typical characteristics of shared landscape between wildlife and local people, i.e. farmland, by Binary Logistic Regression model and Akaike Information Criterion (AIC). The results found significant correlation between wildlife damage and the following farmland characteristics: crop types planted on the farmland, distance from farmland, distance from farmland road, and whether use of fences or no (with values of P less than 0.01). What's more, the reasons and affecting mechanisms were discussed subsequently. Finally, wildlife damage mitigation measures were put forward. Integrative compensation and development plans should be undertaken to resolve and mediate human-wildlife conflict. Local people should adjust or change their crop structure and grow some unpalatable crops. Local manager should plan and manage damaged farmland in a unified way to increase effectiveness of mitigation measures. In the long term, it is necessary to alleviate local dependence on agriculture and transform their focus to alternative economic activities, such as tourism or nonfarm activities.

Key words:

Human-wildlife conflict; farmland characteristics; Wildlife damage; Wolong Natural Reserve

Women Participation in Sustainable Livelihood and Development through Community Forest Management: A Case Study of Jim Corbett National Park

Pandey, B. W.; Kalwar, Jagriti

Department of Geography, Delhi School of Economics, University of Delhi, India, bwpdsegeo@gmail.com

Abstract

In many developing countries women are responsible for the collection and management of forest products essential to the daily lives of their household sustainability. Despite they have stronger interests than men in ensuring the availability of these products; women are often neglected from the decision-making process that sets out the rules to access and collect forest products within a Community Forest. The study area is located in Foothills of Nainital district of Uttarakhand, India. This paper analyses the women's Participation in Community Forest Management and examines women's involvement in community forestry management, especially, in implementing programs, making decision, sharing, managing community forest resources and livelihood. The study is based on both the primary and secondary data sources. The primary data were collected through household survey with a set of questionnaires prepared, tested and used for interviewing along with PRA approach. Women users from each household selected randomly and treated as a unit of analysis. The paper focuses the active and interactive participation of women, secures women's rights to control and access over the forest resources and provides many opportunities to lead in the community forest and various activities related to Forest Management, Livelihoods, Drinking Water and Sanitation, Health Care, Women's Development and Education. By adopting JFM (Joint Forest Management) programme, Community Forest management, Social Forestry, Van Panchayat, ensure the socio-economic status of villagers particularly the people of weaker section of the society who are more dependent on it.

Analysis of The Environmental Consequences of the Geography of Hamoun Lake(Iran)

Ghasemi, A, Ali Ghasemi

The Geographical Society of China, Beijing, 100101, P. R. China, igc2016@igsnr.ac.cn

Islamic Azad University from Iran, Tehran, Iran, Ali Ghasemi

Abstract

Hamoun is the largest Iranian freshwater lake, located in the eastern part of Iran which plays an important role for livelihood of the local people. During last decade, however, due to the reasons including low rainfall, construction of multiple dams on Hirmand River which is regarded as the main source of feeding for Hamoun lake, transfer of contaminated water of industrial, mining and domestic factories into the lake, entering agricultural sewages contaminated with chemical composts, throwing cane eater fish called Amour into the lake and as a result destruction of canebrakes, we are observing bio-environmental contaminations along with serious economic damages to agriculture, horticulture, animal husbandry and fishery (because of drought) which the important ones are as follow: immigration of villagers and Flat settlers, extinction of marines and emigrant birds, destruction of farm lands surrounding lake .

Key words:

Hamoun Lake; Takhtak settlers; Hirmand; Drought; Ecology; Sistan; Economic Consequences

Anthropogenic Activity and Its impact on Hydrological Hazards, Mountain Biodiversity and Sustainable Development: A Case Study of Alaknanda River Basin, Uttarakhand, India

Prasad, Abhay Shankar*, Pandey, B. W.

Department of Geography, Delhi School of Economics, University of Delhi, Delhi, India, abhaydsegeo@gmail.com

Abstract

Anthropogenic activities are continuously disturbing the natural system and its impact on the hydrological behavior of river. The important factor causing a flood and also accelerate several hydrological hazards during monsoon periods are heavy rainfall, cloud burst, GLOF, landslides, Slope failure, deforestation, drainage congestion due to urbanization. Natural hazards have had significant impacts on life, livelihood and property in areas with high population density and land use intensity. These hydrological hazards are mainly responsible for several socio-economic consequences (cultivated land degradation, infrastructure loss, human casualties, loss of transmission lines, and so on). Factors causing these changes have been attempted to be understood through the use of GIS. Geospatial technique is used to find out the land use/cover change detection for three time periods. Secondary data has been taken for to carry the analysis work. Preliminary studies conducted on this subject indicate that human interference, unscientific developmental activities, agriculture extension and road construction are some of the activities which are creating the hydrological imbalances. The mountains biodiversity provides important values of agriculture, medicine, food security, and industry, besides spiritual, cultural and aesthetic and recreational values. In order to meet the present and future challenges meeting sustainability criteria, the traditional systems need to be adapted in ways which enhance crop yields but not at the environmental and social costs. This paper has identified to Vulnerability issues and suggested to adaptation method for sustainable development strategy for the development.

Key words:

Anthropogenic Activity; Mountain Biodiversity; Geo-hydrological Hazards; Sustainable Development

Assessment of Effectiveness of Nature Reserves on the Tibetan Plateau Based on Net Primary Production and the Large Sample Comparison Method (LSCM)

Abstract

Twenty-one typical coupled large samples were chosen from areas within and surrounding nature reserves on the Tibetan Plateau using the large sample comparison method (LSCM). To evaluate the effectiveness of the nature reserves in protecting the ecological environment, the alpine grassland net primary production (NPP) of these coupled samples were compared and the differences between them before and after their establishment as protected areas were analyzed. The results showed that: (1) Of the 11 typical nature reserves selected, the positive trend in the NPP for Manzetang was the most significant, whereas there was no obvious trend in Taxkorgan. (2) There were notable findings in 21 typical coupled samples: (a) After the establishment of the nature reserves, the annual rate of increase in the NPP in 76% of samples inside nature reserves and 82% of samples inside national nature reserves was higher than that of the corresponding samples outside nature reserves. (b) The effectiveness of ecological protection of the Mid-Kunlun, Changshagongma, Ruoergai and Selincuo nature reserves was significant; whereas in south-east Manzetang and north Taxkorgan the protection effectiveness was not obvious. (c) The ecological protection effectiveness was significant in nature reserves consisting of alpine meadow, but was weak in nature reserves covered by alpine steppe. This study also shows that the advantages of LSCM in evaluating regional ecology change. Careful design of the samples used, to ensure comparability between the samples, is crucial to the success of this LSCM. (This paper has been published in J Geogr Sci, Jan. 2016)

Biodiversity of Todgarh Raoli Wildlife Sanctuary Rajasthan India

Loyal Vijay Kumar

Department of Geography, M.L.V Government College Bhilwara Rajasthan India, vijay.loyal123@gmail.com

Abstract

Conserving biodiversity is especially crucial in developing countries where people's livelihoods are directly dependent on natural resources such as forests, fisheries and wildlife. With the increasing pressure and demand for land and unplanned land use of various landscapes, for majority of the biodiversity, protected areas have become the main abode for survival. Assessment of local biodiversity incorporates two related issues. The **first** concerns the intrinsic diversity of an area i.e. the area with higher diversity may be deemed more important than the one with lower diversity. The **second** concern is the assessment of the contribution of any given area to the overall diversity of a larger geographic region such as district, state, country, continent or ultimately, the world overall. From this perspective some areas with lower intrinsic diversity may be more important than others with high diversity.

Todgarh Raoli wildlife sanctuary located on the northern part of Rajsamnad, in addition to forming an Ecotone between hilly forests of Aravallis and Thar Desert, is the southernmost limits for teak and home for threatened and rare flora and fauna. The hills of this Protected Area are catchment for many rivers and nullahs that provides service to the human and bovine population in addition to irrigating the agriculture land in the Ajmer and Pali district. Further, with its diverse habitat and highly undulating terrain, is comparatively less disturbed that ensures better setting for the biodiversity surviving in it.

This Protected Area is unique as it forms the distribution limit for many of species that has moved from Himalayas, Indo-Malayan and African regions, in addition to the elements from Western Ghats. All these necessitates an in depth biodiversity assessment that could lead to preparing a comprehensive conservation plan for Todgarh Raoli, which is presently not available. With the increasing pressure for exploiting all sorts of natural resources and land for development, it is very imperative to collate/gain knowledge on the biodiversity and its distribution within this ecologically important and sensitive area, unique with its respective landscape diversity and location in the Aravallis. This prompted to carry out an intensive field based biodiversity assessment of this Sanctuary.

Local Biodiversity; Ecotone; Intrinsic diversity; Catchment; Conservation Plan

Classification and Ecological Restoration Measures for the Littoral Zone of Lake Taihu

Geng RM, Xu QJ, Hu XZ, Zhang WH, Wang X

Chinese Research Academy of Environmental Sciences, Beijing, 100012, P. R. China, gengrongmei1988@163.com

Abstract

Present situation of littoral zone of Lake Taihu were investigated according to administrative area on April, 2015. According to the survey, about 60% length of littoral zone of Lake Taihu was restored currently, in contrast to this, unrepaired section were mainly in mountain areas of Zhushan Bay and Meiliang Bay, aquaculture areas of East Taihu and upright embankment area of Yixing. According to whether restored, the littoral zone of Lake Taihu is classified. Based on ecological function, the restored littoral zone of lake classified as near-natural wetland type, landscape type, habitat-improved type and mountainous type. While based on the existing land use types and topography, the unrepaired littoral zone of lake classified as aquaculture-type, dike-type, estuary-type and steephill-type. According to the above classification, several ecological restoration measures are proposed, which may have some implications for the ecological restoration of other lake littoral zone.

Key words:

Ecological restoration; littoral zone; Lake Taihu; classification; restoration measures

Distribution and Diversity of Nitrite-Dependent Methane-Oxidizing Bacteria in Sediments of the Miyun Reservoir, Beijing, China

LIU Yang¹, CHEN Yongjuan¹, WANG Xiaoyan^{1,2*}, DU Yi¹

¹ College of Resource Environment and Tourism, Capital Normal University, Beijing 100037;

² Research Center of Aquatic Environment in the Capital Region, Capital Normal University, Beijing 100048, China, wangxy@cnu.edu.cn

Abstract

Nitrite-dependent anaerobic methane oxidation (n-damo) is performed by “*Candidatus Methyloirabilis oxyfera*” (*M. oxyfera*), which connects the global carbon and nitrogen cycles. However, the distribution and diversity of n-damo bacterial in reservoir and its influential factors is not well understood. In this paper, both 16S rRNA and *pmoA* gene-based PCR primers were employed successfully to study the distribution and diversity of *M. oxyfera* bacteria in sediments of Miyun Reservoir, Beijing, China. Results suggested that the structure and diversity of sediment *M. oxyfera-like* bacteria showed a profound spatial variation. Based on 16S rRNA, Community structures of the *M. oxyfera-like* bacteria in middle and rim of reservoir were similar to those of freshwater or wetlands. In contrast, structures in middle of the reservoir *M. oxyfera-like* bacteria based on *pmoA* gene group with freshwater ones were clearly distinguished from those near rim of Reservoir. *M. oxyfera-like* bacteria sequences analysis based on 16S rRNA gene revealed greater diversity compared with the *pmoA* gene. And the diversity of *M. oxyfera-like* bacteria in reservoir area to Chaohe River was greater than that in Baihe River. A correlation analysis showed that nitrate (NO₃⁻-N), nitrite (NO₂⁻-N), total phosphorus (TP) and pH had influence on the distribution and community structures of *M. oxyfera-like* bacteria in the Miyun Reservoir. These findings will aid in understanding the *M. oxyfera-like* bacteria pattern as well as their correlation with surrounding environmental factors in reservoir ecosystem.

Key words:

M. oxyfera-like bacteria; 16S rRNA; *pmoA*; Distribution; Diversity; Miyun Reservoir

Does Agroforestry Protect Tree Species Diversity and Reduce Soil Erosion Risk? A Comparative Study from The Mid-Hills of Nepal

Schwab N, Schickhoff U

Physical Geography, Center for Earth System Research and Sustainability (CEN), University of Hamburg, Hamburg, Germany; niels.schwab@uni-hamburg.de

Abstract

In order to quantify and assess effects of the transition to agroforestry practices we studied three agrosystems: (i) a mature, fully developed agroforestry system (AF); (ii) the predominant conventional system (CS) characterized by monocropping; and (iii) a system that has been in transition to AF for two years (TS). We compared species numbers, abundances and vegetation cover between agrosystems. We found significantly higher species numbers, abundances and vegetation cover in the AF and TS compared to the CS. There were also more fodder tree species in the AF and TS compared to the CS. The higher vegetation covers of AF and TS point to substantial smaller erosion risks in the modernized agrosystem. Reduced erosion contributes to the more fertile soil status of the AF and TS systems. Considering that the Nepalese agro-biodiversity is seriously threatened and that the mid hills are not sufficiently represented by the protected areas of Nepal the modernized land management practice comprises a rewarding potential to contribute to efficient in-situ biodiversity conservation. Moreover, the increased diversity diversifies food options of the farmer families and improves their self-sufficiency and food security. From both perspectives, socio-economic and ecological, the AF exhibited more favourable vegetation related properties than the CS.

Key words:

fodder trees; food security; in-situ biodiversity conservation; mountain agriculture; phytodiversity; species richness; splash erosion; sustainable land use; trees on farmland

Effect of Salt On Photosynthetic Characteristics of Bamboo Willow Introduced to North Xinjiang

Dou Xiaojing^{1,2}, Han Wei^{1,2}, Wu Shengli^{1,2,3}, Fang Liang^{1,2}, Liu Qiangji^{1,2}

¹ The School of Geographic Sciences and Tourism, Xinjiang Normal University, Urumqi Xinjiang 830054, China;

² Key Laboratory of Arid Area of Lake Environment and Natural Resources of Xinjiang, Urumqi Xinjiang 830054, China;

³ International cooperation and exchange department of Xinjiang Normal University, Xinjiang Urumqi 830054, China

Abstract

In order to ascertain the physiological responses to salinity, we measured the photosynthetic characteristics of Bamboo willow in different salinity gradients, which was introduced to Urho District of City Karamay in north Xinjiang. We chose some healthy Bamboo willow one-year seedlings in one sample area salinity by four salinity gradients, nothing (as CK), $0\text{g}\cdot\text{L}^{-1}$ (S1), $5\text{g}\cdot\text{L}^{-1}$ (S2) and $10\text{g}\cdot\text{L}^{-1}$ (S3) and measured by Li-6400XT, a portable photosynthesis system. The results indicated that the diurnal variation curve of net photosynthetic rate showed a "bimodal curve" and had obvious "midday depression" In each four of salt concentration; The net photosynthetic rate of Bamboo willow with the salinity concentration by $5\text{g}\cdot\text{L}^{-1}$ (S2) was the highest one ($19.9\mu\text{mol}\cdot\text{m}^{-2}\cdot\text{s}^{-1}$) among all the four gradient conditions, higher than the second one, $17.8\mu\text{mol}\cdot\text{m}^{-2}\cdot\text{s}^{-1}$ (S1), the last one $17.6\mu\text{mol}\cdot\text{m}^{-2}\cdot\text{s}^{-1}$ (S3). And water use efficiency (WUE) of the Bamboo willow was 4.7%, still the highest one in four conditions. Bamboo willow has a good adaptability, and the optimal salinity concentration was $5\text{g}\cdot\text{L}^{-1}$ (S2). According to this test, it can provide a theoretical basis for cultivation techniques of Bamboo willow in Urho District.

introduced Bamboo willow; photosynthetic characteristics; salinity gradient; eco-tourism; arid region

Estimating Relative Abundance of Tree Species for Heavy Metal Assessment in A Semi-Arid Context

Kebonye, N.M., Akinyemi, F.O.

Department of Earth and Environmental Sciences, College of Sciences, Botswana International University of Science and Technology (BIUST), otswana, ndiye.kebonye@studentmail.biust.ac.bw

Abstract

Plants, water, soils are widely used as bio-indicators of heavy metal contamination. Tree species abundance for Palapye, a coal-mining town in Eastern Botswana was estimated for assessing heavy metal concentration. The biophysical settings was assessed for three sites selected based on the presence of anthropogenic activities such as mining, waste water treatment plant, highway and brick manufacturing as potential sources of heavy metal pollution. Most recurring tree species observed at the sites included *Acacia tortilis*, *Terminalia sericea*, *Acacia erioloba*, *Colophospermum mopane*, *Dichrostachys cinerea* and *Grewia flava*. 27 sample points were selected for data collection based on soil type units (Leptosols, Arenosols, Lixisols and Luvisols), proximal distance, land use type (Bare land, rock outcrop, scrubland) and accessibility. A vegetation quadrant of 30m × 30m was delineated per sample point and the relative abundance of the six tree species was visually estimated using a Likert scale from 1 to 5, i.e. 1-very rare, 2-rare, 3-occasional, 4-frequent and 5-abundant. Description of each quadrant was made and photographs were taken for laboratory use in estimating relative tree species abundance. Kruskal-Wallis analysis shows significant differences in mean ranks between the species, with mopane having the highest rank, signifying it as the most relatively abundant species. This agrees with the literature as Palapye falls within the range of Mopane distribution in Southern Africa. Following in ranking are *Acacia tortilis* and *Dichrostachys cinerea* found mostly in disturbed areas. Why these species follow after *C. mopane* can be attributed partly to disturbances from anthropogenic activities at the sites.

Bio-indicators; Species; Abundance; Heavy metals; Pollution; Palapye

Fluvial Morphology Diversity in Relation to Fish Species Diversity in the Yellow River Source Zone

Huan HONG, Jinming HU

Institute of International Rivers and Eco-security, Yunnan University, Kunming, 650091, P. R. China, jhuynu@163.com

Abstract

Fluvial morphology diversity which reflects habitat diversity in one respect, is the basis of the diversity of species in a river basin. But research on the relationship between fluvial morphology diversity and fish species diversity in the Yellow River source zone (YRSZ) remains blank. Based on river patterns, the mainstream of the YRSZ between the Longyangxia and Huangheyuan reservoirs was divided into 14 sections. The fluvial morphology diversity of each section is quantitatively analyzed through GIS analysis and field survey in channel gradient, sinuosity, river width and inter-channel lands which are tied directly to fish habitat. The spatial distribution of fish species in the study area is presented via literature search and data organization. Results show that within these 14 sections, the section which stretches from Awancang Yellow River Bridge to Longka (near Mengtang Town) has the highest sinuosity, from Xierousang to Gebolonggeqia (near the Gangnagemacuo Lake) has greatest variation in river width, and from Qiaonangonggababu to Awancang Yellow River Bridge (near Awancang) has much more inter-channel lands. Overall greater morphology diversity is evident in the section from Xierousang to Gebolonggeqia, followed by the section from Requ to Huangheyuan Reservoir. However, the reach which has the highest fish species is from Yangqu to Jungong. Our results indicated that there is no significant relevance between fluvial morphology diversity and fish species diversity in the YRSZ. As fish diversity is influenced by many factors, the impact of fluvial morphology on fish diversity would be discussed more in the future.

Key words:

Yellow River source zone; fish species; fluvial morphology; diversity

Impact of Tourist Activities on the Wintering habitat of Black-necked Cranes

Wang Jinliang¹ Zhong Xingyao² Dao meibiao² Xiang Danfeng³

Abstract

Black-necked cranes (*Grus nigricollis* Przevalski) are known as the "Giant Panda" of bird, is an endangered species in the world, the national level protected animal of China. It is a breeding, overwintering species was found at the latest and unique in the Qinghai-Tibet plateau and the Yunnan-Guizhou plateau. It has important protection and scientific value.

In order to better protect the black-necked crane, first of all to protect their habitat. Take the Zhaotong Black-necked Crane National Nature Reserve as study, two typical habitat Marsh and alpine meadows as object of study, gradient plot, trample experiment, continuous observation, and physical and chemical analysis 4 methods have been used to analyze and value of the impact of tourism activities on the soil properties of black-necked cranes wintering Habitat based on 4 sites, 26 sample plots data. Results show that when the trampling number of tourists from 0 to 1000, the trampling number of horses from 0 to 210, the distance between plots and touring trails from 5 meters to 1 meters, soil properties have changed regularly. It is specifically manifested in the following areas:

(1) Soil water content. The water content of the sub alpine meadow soil and swamp soil decreased from 32.14% and 35.85% to 21.12% and 22.67% respectively, under tourists trampling. The water content of two soils decreased from 30.52% and 34.60% to 21.25% and 25.12% respectively under horses trampling. Two soil water contents where 1-meter distance from touring trails is 19.21% and 25.12%, respectively, 4.64% and 9.48% lower than that of the control plot, and when the distance from touring trails is 4 meter, soil water rate is almost the same as the control plot.

(2) Soil bulk density. The soil bulk density of the sub alpine meadow soil and swamp soil increased from 1.08g/cm³ and 1.128g/cm³ to 1.15g/cm³ and 1.163g/cm³, respectively, increased 0.17 g/cm³ and 0.083 g/cm³ compare to that of the control plot(0.98 g/cm³ and 1.08 g/cm³), under tourists trampling. The soil bulk density increased 0.167 g/cm³ and 0.177 g/cm³ compare to that of the control plots, under horses trampling. Two soil water bulk densities where 1 meter distance from touring trails is 1.231 g/cm³ and 1.237 g/cm³, 0.314 g/cm³ and 0.165g/cm³ higher than that of the control plots, respectively.

(3) Soil porosity. Capillary porosity of two soil decreased from 0.114 and 0.075 to 0.080 and 0.026, decreased 0.045 and 0.058, compare to that of the control plots (0.120 and 0.0840) respectively, under tourists trampling. Capillary porosities of two soil are 0.018 and 0.012, decreased 0.066 and 0.069 respectively under horse trampling, compare to that of the control plots. From the point of view of space, the closer to the tour road, the lower capillary porosity is. Variation of total soil porosity is similar.

(4) Soil structure and soil compactness. With the increase of trampling intensity, soil structure changed from aggregate structure to small structure and block structure, the compactness become much tighter, exposed soil area become higher, plant root contents in soil become less and less. There is the similar variation of soil structure and soil compactness with the decrease of distance from tour road,

(5) PH value. The pH value of the soil increased by 0.3 and 0.4 respectively, under tourists trampling. Soil pH values were 5.4 and 5.3, respectively, increased by 0.3 and 0.2 respectively, compare to that of the control plots. The shorter the distance from touring trails, the lower the pH values is.

In order to protect the habitat, we should reasonably plan the tour route, reasonably clear the peak passenger flow, improve the management system, improve the propaganda, build the observation platform, and set up the warning sign and so on.

Impacts of Yong River Sluice Gate Construction on the Hydrological Regime and Freshwater Fish Habitats of the Upstream Basin

Author WenHai Zhang, Author Peng Hu, Author YangWen Jia, Author GuangHeng Ni, Author Hao Wang

China Institute of Water Resources and Hydropower Research, Beijing, 100038, P.R. China, zwh8915@hotmail.com

Abstract

Construction of a sluice gate near a river estuary may alter the hydrological regime of the river, and thus may cause profound and accumulative impacts on the river ecosystem. Therefore, it has received an increasing attention to maintain the ecological habitat quality of a river upstream when construct a sluice gate to extend enough storage space for resisting sea tide and saving fresh water, and to improve the navigation conditions. In this study, we analyse impacts of various conditions of natural flow, gate locations at the river and gate opening degrees on the upstream Silver Carp habitat quality by taking the river section from the Feng Hua river to the Yong river estuary as a case, taking an indigenous cyprinid fish Silver Carp as a target species for fish habitat index, and using MIKE 21 to simulate two-dimensional flow fields. The study results show: 1) the sluice gate construction will reduce the mean velocity of the upstream flood and ebb, make the Silver Carp spawning physiological signal become weak to some extent, and the strength of its influence is related to the locations of the gate near the estuary; 2) different gate locations and gate opening degrees also have different effects on the quality of upstream spawning habitat of Silver Carp. The research conclusions may provide suggestions for the gate construction strategy and the ecological management schemes of the Yong river basin under the new situation.

Integrating The Landscape Connectivity into The Mapping of Soil Conservation Service Hotspots and Coldspots

Yingjie Li, Liwei Zhang, Junping Yan

Department of Geography, Tourism and Environment College of Shaanxi Normal University, Xi'an, Shaanxi 710119, P. R. China, lyj@snnu.edu.cn

Abstract

Soil conservation service (SC) is a critical regulating services supplied by terrestrial ecosystems. The spatially explicit identifying of hotspots or coldspots is the vital process in priority setting. However, few researchers integrated the landscape connectivity indicator into their prioritization process, which can weaken the protection efficiency of the reservation. In this study, the RUSLE model is used to mapping SC, and the Getis-Ord G_i^* statistics-based hotspot analysis method is tactfully used to improve the spatial connectivity in the hotspots and coldspots of SC in Shaanxi, China. The results indicate: 1) the Guanzhong basin and sand-windy plateau had low SC, while the Qinling-Daba Mountains zone held the highest SC; 2) the SC showed a significant increasing tendency at the rate of $0.47 \text{ t} \cdot \text{hm}^{-2} \cdot \text{a}^{-1}$ from 2000 to 2013; 3) the most significantly increasing area of SC was intensively distributed in the west of Qinling-Daba Mountains and sporadically distributed north of the loess plateau zone; and 4) the hotspots ($P < 0.05$) had the highest capacity of providing SC, with 29.6% of the area providing 59.7% of the total service of Shaanxi; whereas the coldspots occupied nearly 46.3% of the area of Shaanxi, but only provided 17.2% of the total SC.

ecosystem services; hotspots and coldspots; soil conservation; landscape connectivity; Shaanxi Province

Monsoon-Driven Hydrographic Features Affect Euphausiid Distribution in The Taiwanese Waters, Western North Pacific Ocean

Lo W.T.¹, Hsieh R.J.¹, Hsieh H.Y.²

¹Institute of Marine Biotechnology and Resources, Sun Yat-sen University, Kaohsiung, Taiwan, China, lowen@faculty.nsysu.edu.tw

²Institute of Marine Biodiversity and Evolutionary Biology, Dong Hwa University, Checheng, Pingtung, Taiwan, China.

Abstract

The mesoscale distribution of euphausiids associated with hydrographic conditions in the waters around Taiwan was investigated during two different monsoon seasons in 2004 to elucidate possible influences of hydrological conditions driven by seasonal monsoons on distribution patterns of euphausiids. In total, 35 euphausiid species, belonging to 6 genera and one family, were recognized. *Pseudeuphausia lalifrons*, *Stylocheiron* sp, *Stylocheiron suhmii*, *Euphausia pacifica* and *Stylocheiron carinatum*, were the five predominant species and contributed 55% to the total euphausiid count. Euphausiid abundance, species number and species diversity were significantly higher in summer than in winter. Cluster analysis revealed two station groups in both seasons. Higher abundance and lower species richness generally were observed in waters west of Taiwan where the lower-salinity and nutrient-rich China Coastal Current prevails, and a reverse trend was found in the waters east of Taiwan where the warm and highly saline Kuroshio Current dominates. The distribution patterns of euphausiid assemblages were closely correlated with hydrographic conditions, and well linked with zooplankton abundance and Chl a concentration. This study showed that the succession of water masses driven by monsoons affects seasonal and spatial distributions patterns of euphausiids in this study area.

Morphological Plasticity of *Carex* to Hummocks Micro-topography in an Alpine Swamp Meadow

Lili Li, Tingjun Zhang, Hong Guo, Huijuan Wang, Wanwan Shao

Key Laboratory of West China's Environmental Systems, College of Earth and Environmental Sciences, Lanzhou University, Lanzhou 730000 CHINA, licqsmqs@126.com

Abstract

Hummock micro-topography is common in alpine swamp meadow of the Qinghai–Tibetan Plateau; the physical environment of hummocks plays an important role in vegetation distribution and species pattern. There also, *Carex*, a Sedge species broadly distributed on the plateau inhabiting both hummocks and hollows, is one of major plant species that has caused great damage to the stability of grassland ecosystem and changed the structure and function of grassland community, induced grassland degeneration. In order to examine how the morphological features of *Carex* population respond to environmental variations of hummocks variation, leaf and stem traits were investigated in alpine meadow along the northern slope of Qilian Mountains, northwestern China. The preliminary results showed that 1) at a given slope aspect, the ratio of leaf number to leaf mass were larger, leaf area to leaf mass, leaf volume to leaf mass were smaller; 2) leaf number, leaf mass and leaf volume on the south-facing slopes of hummocks were larger than those on the north-facing aspect; 3) The grassland community coverage, height, aboveground biomass and soil moisture were larger on north-facing slopes than on north-facing slopes. The cooperation within leaves number, mass, area and volume produced a complex components system that provides greater facility for wide phenotypic plasticity of *Carex*. The varied allometric growth in the leaf traits among environmental gradients is related to many other components of plant life history strategy, including the well established plant branch growth trade-off between architecture geared towards rapid height-gain and one promoting lateral spread, which can be explained with reference to the different selective pressures in each environment.

Key words:

Carex; leaf; allometry; slope aspect; alpine swamp meadow

Phytogeographical Distribution of *Sida Alba* in Shekhawati Region, Rajasthan

Dharmender Singh Chauhan

Department of Geography, University of Rajasthan, Jaipur, dharmenderchauhan007@gmail.com

Abstract

The present paper discusses the potentiality of natural vegetation *Sida alba* in Shekhawati regions, located in the north-eastern part of Rajasthan state. The region is covered by arid and semi-arid bio-conditions. The study area has 15 tehsils in total with its total 15343 sq. km. geographical area which makes 5.6% of the state's total. Shekhawati region comprise of Churu (29%), Jhunjhunu (31%) and Sikar (40%) respectively. The Shekhawati natural ecosystem has great variety of climates (semi-arid and arid) due to biotic and edaphic conditions, physiography and diversity of natural vegetation.

The plant has wide range of phytogeographical distribution at global level. It covers tropical and subtropical regions of both hemispheres. In India, it is found throughout in hot areas especially in waste places, it is found as a common weed, in open and scrub forest areas.

This plant belongs to Malvaceae Family. It is a small and grass 1 to 2 meters in height. Many minute star-shaped hairs are present all over the plant, the base of plant usually woody.

Being a phyto-geographer, the best efforts have been made in this research paper to consume & analyze of decrease of natural vegetation and associated factors in Shekhawati region. Some efforts made by Department of Forest & Public awareness in aspect in enhancement of the land under green coverage through implementations of success

The results suggest to take up immediate steps to adopt the improved forest management technologies with people's participation to lack of effects of decrease of natural vegetation in the region unit. It is not possible to conserve completely.

Preliminary Study on Vegetation Index of Biotic Integrity (V-IBI) Assessment for Poyang Lake

Xu Liting

Ministry of Education Key Laboratory of Poyang Lake Wetland and Watershed Research, Jiangxi Normal University, China, 879085810@qq.com

Abstract

Assessing the ecological health of wetlands would provide resource managers and decision-makers with the critical information based on which strategic wetland protection and restoration policies were made. An index of biotic integrity (IBI) is a widely and frequently used approach for assessing ecological integrity of wetland. Fish and macroinvertebrates are mostly commonly used indicator taxa; Vegetation has been less commonly applied to wetland in China. Vegetation has the advantages including easy to identification, immobility and relatively inexpensive and easy to sample. Poyang Lake, as the Wetland Nature Reserve of Jiangxi Province, plays an important role in biodiversity protection by offering habitat for vegetation, fish, birds and macrophytes. In order to evaluate the health status of Poyang Lake Wetland. A preliminary vegetation based index of biotic integrity (V-IBI) was developed to evaluate the ecosystem health of Poyang Lake by means of data that was collected from 30 sites in Poyang Lake wetland between September 17 to October 15, 2015. To establish the V-IBI calculation, 48 candidate vegetation metrics based on species richness, abundance, ecological affinity and species tolerance were tested for their ability to discriminate between the least disturbed condition and impaired condition. 10 metrics were eventually selected based on the strength of their correlation with the human disturbance gradient. Including Number of vine species, exotic species, sensitive species and tolerant species. Percentage of phalaris species, aquatic guild species and annual, Coverage degree of perennial, sensitive species, tolerant species. They were selected with range test, box-and whisker analysis and pearson correlation analysis. These metrics were transformed into uniform scores using the ratio score method. The total V-IBI score was obtained by summing the scores from the 10 metrics. Based on the 95% percentile of value in all sites, the criteria of health ranking is determined. The distribution range below 95% percentile is divided into 4 quarters. According to the V-IBI assessment, 7 reference sites included 6 healthy sites, and 1 subhealthy site. 1 of 23 impaired sites were healthy, 5 were subhealthy, 6 were good-to-fair, 6 were fair and the other 3 sites were poor. The V-IBI value is related to water quality and habitat quality. The result suggested that the V-IBI approach was feasible for assessing the health of Poyang Lake Wetland.

Quantitative Classification and Ordination of natural colonized plant communities of the Bayinhua mining area in Inner Mongolia

Chunfeng

Geography department of Inner Mongolia Normal University, Hohhot, 010022, China, chunfeng07@126.com

Abstract

Through field investigation, two-way indicator species analysis (TWINSpan) and detrended correspondence analysis (DCA) were used for quantity distribution of natural plant community in Bayinhua mining area. According to the results of TWINSpan and in combination with the ecological characteristics of region, 18 quadrats were divided into 6 associations, and their community characteristics were described. The result of TWINSpan reflects the relation between natural plant community types and environment gradient in Bayinhua mining and was tested and verified in DCA. DCA ordination indicated the distribution pattern of natural plant community was closely related to soil nutrient and soil water.

Studies of Biofabricated Nanoparticles in Bioremediation of Arsenic from Arsenic Contaminated Aquenvironment

Tapan Kumar Das and Triparna Mukherjee

Department of Biochemistry and Biophysics, University of Kalyani, Kalyani-741235, India, tapandas@klyuniv.ac.in

Abstract

The present study involves the development of adsorbent containing silver nanoparticles for arsenate removal using silver reducing property of a novel fungal strain *Aspergillus foetidus* MTCC8876. Biological reduction of silver by the isolate has been deduced at various time intervals. The fungal biomass after biological silver reduction were harvested and subjected to carbonization and its properties were analyzed using Fourier Transform Infra-Red spectroscopy, X-ray diffraction, scanning electron microscope attached with energy dispersive spectroscopy, BET surface area analysis, field emission scanning electron microscope and transmission electron microscope. The average size of the silver nanoparticles present on the surface of the carbonized silver containing fungal cell (CSF) was 35 nm. The carbonized control fungal cells (CCF) did not contain any particles on its surface. As (V) adsorption efficiency of CCF and CSF was deduced in batch mode by varying parameters like contact time, initial concentration, and pH. Desorption studies were also carried out by varying the pH. The CSF was proved to be exceptionally efficient in arsenate removal when compared to CCF.

The Changing Wetland Birds and Waterbird Migration Flyway Issue on the Southwest Plateau China

Bai Haotian, Luo Kang, Wu Zhaolu, Zhao Xuebing, Shi Huiling, Fu Wei

Institute of Ecology and Geobotany, Yunnan University, Kunming, 650500, zlwu@ynu.edu.cn

Abstract

Wetland birds are significantly impact by global change and human disturbance. But there's little concerning on the wetland bird on the southwest plateau China.

More than 30 species of new recorded waterbirds appear on the plateau in the past 20 years. The reason may be the "chaos fly" led by global change, or the existence of good wetland. Asian Open-bill Stork (*Anastomus oscitans*), which used to distribute in south Myanmar and Thailand, occurred in southwest China since 2006; In Yuanjiang River (Red River) valley, more species and quantity of migrant birds found in southeast part than northwest; Black-necked Crane's (*Grus nigricollis*) wintering area shrink to northeast and northwest Yunnan; Black-headed Gulls (*Larus ridibundus*), wintering in Yunnan, fly to Bosten Lake and Baikal Lake through east foot of Tibetan Plateau. Black-headed Gulls banded in Kunming were found in Australia; Birds banded at Ailao Mountain were founded in Myanmar and Bangladesh; Some new Charadriiformes records appeared, which was used to thinking to travel along east coast.

Such phenomena implied a centralized shorebirds flyway across this region. Shorebirds fly from Siberia to middle Yungui Plateau though east foot of Tibetan Plateau, then travel to Beibu Gulf to the east though Red River, or travel to Bay of Bengal to the west across Ailao Mountain. That is to say, the plateau wetlands in southwest China plays an important role of global wetland bird's survival and breeding. It maybe the wintering region for some north Eurasia waterbirds, the spread region for some waterbirds of south Asia and southeast Asia.

The Characteristic of Soil Macrofauna Community in The No-Till Stover Mulch Under Different Frequency in The Black Soil Region of Northeast China

Jiang YF¹, Zheng S¹, Chen ZW¹, Xie HT²

¹Jilin Normal University, Siping 136000, P. R. China, jiangyf427@126.com

² Institute of Applied Ecology, CAS, Shenyang 110016, China

Abstract

No-till stover mulch has been paid more attention for seeking the balance of farmland productivity and environmental safety in recent years. To study the response of soil macrofauna to the no-till stover mulch, a survey of the soil macrofauna community was carried out in the Lishu site of Chinese Academy of Sciences in April, July and October of 2015. On each sampling visit, soil macrofauna were collected by hand sorting at no-till 3 years without stover mulch plot (NT-0), with 1 year stover mulch plot (NT-1/3), with 2 years stover mulch plot (NT-2/3), with 3 years stover mulch plot (NT-3/3) and a conventional tillage plot. The results showed that the dominant groups were Enchytraeidae in the all treatment plots. Soil macrofauna individual density, taxa richness and diversity index were higher in the no-till stover mulch plots than those in conventional tillage plots. The highest of soil macrofauna community individual density appeared in October for all study plots, whereas the highest of taxa and species diversity were in July. As the stover mulching frequency increasing, differences types of individual density change for different soil macrofauna groups. Compared with conventional tillage, no tillage stover mulch could increase the density of individuals Saprophagous, predatory and omnivorous species, but no obvious influence on herbivorous groups. In short, no tillage stover mulch can affect the farmland soil macrofauna community, but the response of different soil macrofauna groups to stover mulching frequency was not consistent.

No tillage; stover mulch frequency; soil macrofauna; community characteristics

The Contribution of Neogene Plateau Uplift and Quaternary Climate Fluctuations to Endemic Species Diversity in The Tibetan Plateau

Haibin Yu^{1,2}, Xinghua Sui^{1,2}, Fangliang He^{1,2*}

¹ SYSU-Alberta Joint Lab for Biodiversity Conservation, Sun Yat-sen University, Guangzhou 510275, China.

² Guangdong Key Laboratory for Biodiversity Dynamics and Conservation, and State Key Laboratory of Biocontrol, School of Life Sciences, Sun Yat-sen University, Guangzhou 510275, China, yuhb.10b@igsnrr.ac.cn

Abstract

According to the historical biogeographic and phylogeographic studies of several genus and species, there is a comprehensive conclusion that the extensive and rapid plateau uplift in the Neogene and subsequent Quaternary climate fluctuations are the major two drivers triggering the divergence and diversification of most species in the Tibetan Plateau. However, how much do the both factors contribute to the present species diversity of the Tibetan Plateau, we still unknown. In order to quantify the two factors, in this study we firstly identified seven sub-variables/hypothesis containing paleoclimate conditions, topographic complexity, geographic isolation, climate stability, glaciation refugia, disturbance-vicariance and dispersal corridor that closely related to the two factors. Next, we constructed large-scale patterns of species richness and phylogenetic diversity based on the distributions of 3783 endemic seed plants, and further explored the correlations between the diversity patterns and seven related variables. The results showed that most endemic species were located in the southeastern part of the plateau. From the southeast to northwest, species richness and phylogenetic diversity were reduced gradually; the seven variables showed strong correlations with diversity patterns, and the plateau uplift explained more variance. Above all, we concluded that compare to climate fluctuations in the Quaternary, the uplift of plateau made more contribution to the species diversity in the Tibetan Plateau. This conclusion would provide new insights for explaining why the formation of most species mainly occurred in the Neogene period.

endemism; biodiversity; phylogeography; vicariance; dispersal; alpine plants; Tibetan Plateau

The Formation Mechanism of Ecosystem Services: A Preliminary Review

Luyi Liu

Henan University, China, luyi_liu524@163.com

Abstract

As one hot topic of ecology in decades, the research on ecosystem services (ES) has been brought to a climax by Millennium Ecosystem Assessment (MA) in 2005. Pertinent studies such as ES classification, valuation, trade-offs and coordination, ES flow etc. have increased rapidly, which make ES research has entered a new phase. However, to know ES better and explore much deeper, it is essential to disentangle the formation mechanism of ES. From the statistical results of published papers, it can be found that although many researchers have already realized the importance of knowing the formation mechanism of ES, few papers documented their thoughts directly. Here, we suggested two types of mechanisms, which are theoretical mechanisms and executive mechanisms, and filled their contents by reviewing previous literatures after 2005. Moreover, there are also some problems need to be solved in further studies, like, the scale-dependence and hierarchy in the formation of ES, and how can we get the experimental evidence of these problems. We hope this article could attract more valuable systematic research efforts on the formation mechanism of ES, and thus forming a research paradigm of this area in the future.

Abstract

With the four different forest type of water conservation forests located in the Banchengzi Basin in Miyun County of Beijing as the object of study, by field survey we analyzed the characters of the forest vegetation communities. The results show that:(1)The main types of water conservation forest in the study area are Pinus forest, Quercus mongolica forest, Platycladus orientalis forest and Populus davidiana forest.(2) There are 98 species of undergrowth vegetation grow in the shade of four forest types in water conservation forests, the number of species of shrub layer is 29 and the herbaceous is 71.(3) The species richness of herb layer is higher than shrub, indicates that the herb layer of the four forest types is more developed. The trend of richness between shrub layer and herb layer are consistent. (4) The tendency of diverse indexes in shrub layer is similar with species richness, while the tendency of diverse indexes in herb layer has marked difference compared with species richness. The species richness and diversity index in coniferous forests are higher broad-leaved forests, and the diversity index of herb layer is opposite to shrub layer.

Abstract

The most widespread response to global warming among alpine treeline ecotones is not an upward shift, but an increase in tree density. However, the impact of increasing density on interactions among trees at treeline is not well understood. Here, we test if treeline densification induced by climatic warming leads to increasing intraspecific competition. We mapped and measured the size and age of Smith fir trees growing in two treelines located in the southeastern Tibetan Plateau. We used spatial point-pattern and codispersion analyses to describe the spatial association and covariation among seedlings, juveniles, and adults grouped in 30-year age classes from the 1860s to the present. Effects of competition on tree height and regeneration were inferred from bivariate mark-correlations. Since the 1950s, a rapid densification occurred at both sites in response to climatic warming. Competition between adults and juveniles or seedlings at small scales intensified as density increased. Encroachment negatively affected height growth and further reduced recruitment around mature trees. We infer that tree recruitment at the study treelines was more cold-limited prior to 1950 and shifted to a less temperature-constrained regime in response to climatic warming. Therefore, the ongoing densification and encroachment of alpine treelines could alter the way climate drives their transitions towards subalpine forests.

Abstract

Soil fungi are an overlooked hyper-diverse group of microorganisms considered as the main drivers of forest ecosystem processes and with historical bonds with human culture, health and economy. In this 4 year study ~15,000 soil samples from 365 sites (4 from climate contrasting and geographically distant Neotropical forests of Mexico) around the world were obtained. We use 454 pyrosequencing and multiple regression- and structural equations models to unravel the roles of biotic and abiotic parameters and the effect of the geography and climate on soil chemistry, vegetation and fungal communities. Phylogenetic and functional fungal groups were related with global terrestrial biomes using a network approach and an area-based clustering. A total of 45,000 fungal (nonsingleton OTUs) soil inhabitants were revealed, representing half of the described species worldwide. In Mexico, a total of 10,014 fungal species were discovered. Globally and locally climate was the best predictor with direct effects on plants, fungi and indirectly altered soil conditions. These findings challenge the paradigm supporting the notion that plant richness shapes fungal diversity and community assemblage, because it was found that the plant to-fungi richness ratio declined towards the poles. Furthermore, soil fungi inhabitants complied with Rapoport's rule as stated in animals, plants and marine bacteria. Fungal functional groups richness peaked in tropical forest and exhibit strong trends of endemism although it was observed that multiple fungal taxa are cosmopolitan. The impact of this global metadataset can be useful as a base line at local-national-and transnational-level monitoring strategies, and relevant for better decision-making.

Abstract

Relative pollen productivity (RPPE) and relevant source area of pollen (RSAP) are very important parameters in quantitative vegetation reconstructions. RPPE and RSAP are estimated in the Guancenshan Mountains Area were done with 3 ERV models using ERV-Analysis.v1.2.3 Program. Pollen sampling was performed at 30 random sampling sites. The results show that *Artemisia*, *Asteraceae*, *Poaceae*, *Pinus*, *Picea*, *Quercus*, *Betula*, *Hippophae* dominate the pollen assemblages. The RSAP is about 600m based on ERV sub-model 3 with Prentice's distance-weighting method. The results of RPPE suggest that the values of *Pinus*, *Hippophae* are 10 times higher than *Poaceae* and the RPPE of *Picea* and *Betula* are about 5 times higher than *Poaceae*. But the RPPE of *Artemisia* is only about 3-4 times higher than that of *Poaceae*, which is much lower than that in the steppe area. The RPPE of *Quercus* is about half of *Poaceae*. After that we quantitative reconstruct the vegetation cover with REVEAL model, and the results show that correlation coefficient between observed values and reconstructed values is more than 0.8, indicating that the reconstructed results is basically reliable.

Abstract

Accurate and updated time series maps of paddy rice distribution and planting intensity will greatly improve our knowledge. Unfortunately, spatiotemporal explicit information on rice fields is relatively limited and considerable uncertainties still exist as regards to its inter-annual variations in China. In this study, an improved rice mapping methodology was proposed through combined consideration of vegetation phenology and surface moisture variations from different seasonal rice. This method was applied to Southeast China based on 500 m 8-day composite Moderate Resolution Imaging Spectroradiometer (MODIS) Enhance Vegetation Indices with two bands (EVI2) during the period 2001-2013. Its efficiency was validated with 763 ground survey sites, with an overall accuracy of 95.02% and the kappa index of 0.9217. Spatiotemporal analysis indicated that rice cropping density and intensity lessened in Southeast China during the period 2001-2013. Particularly, the paddy rice planted areas reduced by 30.09%, changing from 231,005 km² to 161,484 km². Among them, the planted areas of double rice decreased by 49.34%, changing from 34,215 km² to 17,335 km². Therefore, averaged rice cropping intensity Southeast China decreased from 1.148 to 1.107. The primary dynamic patterns were from single rice or a rotation of rice plus other crops to non-rice (93,386 km²) and double rice to non-double rice (24,132 km²). When analyzed at provincial and altitudinal gradient levels, it was obvious that areas with greater rice cropping density or intensity were associated with more remarkable reductions.

Sensitivity of The Forest-Steppe Ecotone to Postglacial Climate Change

Liu H

College of Urban and Environmental Sciences, Peking University, Beijing, 100101, P. R. China, lhy@urban.pku.edu.cn

Abstract

Estimating vegetation sensitivity to past climate change will improve the predictions of future vegetation dynamics. We first reconstructed the LGM refugee of main tree genera (*Pinus*, *Quercus* and *Betula*) in the current forest-steppe ecotone in China through combining palaeoecological, phylogeographical and ecological methods. Our results suggest that northern China was very likely LGM refugia for these tree genera. We further compiled 52 pollen sequences from the monsoon-influenced northern China to reconstruct the Holocene dynamics of three forest types, as well as steppe and desert indicated respectively by *Artemisia* and *Chenopodiaceae*. Our results show that the Holocene vegetation dynamics differed across vegetation types, with *Pinus* and *Quercus* at lower elevations more sensitive to monsoon-induced precipitation changes and *Betula* at higher elevations more sensitive to temperature changes at the beginning of the Holocene. We also found an increasing sensitivity for forests and steppe within different groups following evident reduction in monsoon intensity since 5 ka BP, caused most probably by climate drying in this drought-determined forest-steppe in northern China. Besides regional scale forest migration caused by climate change, elevational movement as well as site expansion and decline are also suggested and tested by our palynological works within the current forest-steppe ecotone. Our study provides insights into the mechanisms of individualistic responses of plant taxa as well as the asymmetrical response of ecotonal vegetation to the Holocene monsoon development in China.

Similarity of Landscape Structure and Floras of Landscape Microregions in Heterogeneous Catchments (Altai Krai, Russia)

Zolotov D.V.¹, Chernykh D.V.^{1,2}

¹Institute for Water and Environmental Problems of Siberian Branch of the Russian Academy of Sciences (IWEP SB RAS);

²Altai State University (ASU), Barnaul, Russian Federation, zolotov@iwep.ru

Abstract

The landscape map of the Kasmalinsky (K=6624 km²) and the Barnaulka river (B=5863) adjacent basins-twins was constructed at the level of types of terrain groups. The catchments inherit the ancient flow gullies crossing droughty steppe (I), temperate-droughty steppe (II) and southern forest-steppe (III) subzones of the Ob plateau. With allowance for zonal-climatic, morpholithological and basin organization, the landscape microregions representing the fragments of natural subzones within the catchments were defined: KI=1875, KII=1467, KIII=3281; BI=1727, BII=1209, BIII=2927. The similarity of landscape structure (quantitative) and flora of higher vascular plants (qualitative) of these microregions were calculated using the Czekanowski measure. The sets of specific types of terrain groups were used for comparison of two adjacent microregions of the same subzone, but belonging to different catchments. For comparison of contiguous microregions of the same catchment but from different subzones we used landscapes-analogues, i.e. morpholithologically similar types of terrain groups. It is shown that the catchments, and the pairs of their adjacent microregions demonstrate high similarity: K, B=0.79; KI, BI=0.78; KII, BII=0.70; KIII, BIII=0.83. Within the basins the situation is different: KI, KII=0.73; KI, KIII=0.70; KII, KIII=0.52; BI, BII=0.78; BI, BIII=0.65; BII, BIII=0.58. Steppe (I+II=6278) and forest-steppe (III=6208) zones show high similarity: I+II, III=0.78; KI+II, KIII=0.78; BI+II, BIII=0.73. The similarity of the native flora of higher vascular plants (F) in the Barnaulka river basin is presented as follows: BFI, BFII=0.86; BFI, BFIII=0.75; BFII, BFIII=0.78; BFI+II, BFIII=0.80. It is evident that floristic diversity varies more smoothly and regular than the landscape one: the distant microregions (BFI, BFIII) are weaker connected than the adjacent ones. *The work is supported by the RFBR 15-05-01760-a.*

types of terrain groups; higher vascular plants; Czekanowski similarity measure

To The Study of Influence of the Enhanced Surface Infrared Radiation On Ecosystems in Southern Baikal Region (Eastern Siberia)

Vilor, M.A.¹, Vilor, N.V.², Chepinoga, V.V.¹

¹The V.B. Sochava Institute of Geography SB RAS;

²A.P. Vinogradov Institute of Geochemistry SB RAS, mvilor@rambler.ru

Abstract

In south of the Baikal region, mainly along the seismic active faults, are known linear and broader ranges with enhanced surface infrared (IR) radiation (Vilor et al. 2015). To study genesis and dynamics of outgoing IR radiation, we used different remote sensing methods, i.e. the brightness temperature estimation, the heat flux density and capacity, the chlorophyll distribution, and NDVI estimation. The brightness temperature and NDVI estimation methods are found to be the most effective ones. The selected study area (model polygon) is located in foothills of Khamar-Daban Ridge along the margin part of South Baikal rift. For estimation we used night images of September and December 2012–2013 from radiometer MODIS. For verification of the analysis results, we used also information from field investigations (data sampled every 5" on seven profiles) as well as averaged IR satellite NOAA data from 1996–2006 in 8–11μm bands. Within the model polygon we revealed the large positive extrema of the brightness temperature values along the depression and local thermal lows along margins of the fault. The integral correlation of NDVI with brightness temperature and outgoing heat flux density is not available in the late autumn and early winter. This reflects endogenous genesis of the IR radiation. But on some profiles the correlation is revealed. The area of outgoing IR radiation coincides with center of nemoral refugium along foothills of Khamar-Daban Ridge (Chepinoga et al. 2015). The reported study was partly funded by RFBR according to the research project № 16-05-00783-a.

Trends in Terrestrial Biota of the Russian Arctic as the Effects of “the Greening” of Tundra

Tishkov A.A., Belonovskaya E.A., Krenke A.N.

Institute of Geography, Russian Academy of Sciences, Moscow 119017, Russian Federation, tishkov@biodat.ru

Abstract

The results of remote sensing and terrestrial investigation in 2000 and 2014 in Russian Arctic are presented. A progressive expansion of the forest vegetation at the northern limit due to the climatic changes (permafrost melting, changes in rainfall and snow accumulation) was revealed.

According to the analysis of satellite images the trend of growth of productivity (more than 25-30%) and increasing of herbaceous plants' share in the tundra communities were observed. Over the past decade the average value of the NDVI index increased, which reflected the degree of "greening" of the territory, due to an increase in the number and length of the growing period.

As for the structure of arctic vegetation communities the transformation of the life forms spectrum was observed. First of all, this process concerns the increasing of shrubs (biomass, abundance and cover). Then the reducing of lichens and mosses, and increasing of grasses coverage were recorded. The so called "greening" of tundra was also associated with fires and overgrazing of domestic reindeer.

Identified current trends in arctic vegetation coincided with the changes of distribution and abundance of indicators in terrestrial fauna of Russian Arctic (geese, sandpipers, reindeer, lemmings, polar fox), which could be interpreted as the effects of tundra habitat's "greening": for example, the increasing in the abundance and changes in migration routes for geese, stopping 3-4 years oscillates of the lemmings' population in some regions, the transformation of continuous distribution of reindeer. The obtained results are important for the Arctic biodiversity conservation.

biodiversity; tundra communities; biota changes; productivity; remote sensing

Typological Classification and Mapping of Terrestrial Landscapes at Global and Regional Scales

Alekseeva N.N., Romanova E.P., Arshinova M.A., Greenfeldt J.S., Klimanova O.A., Kondratieva T.I., Kovaleva T.A., Tretyachenko D.A.

Faculty of Geography, Lomonosov Moscow State University, Moscow, 119991, Russian Federation, nalex01@mail.ru

Abstract

Russian physical geography has wide experience of the global mapping of terrestrial landscapes based on holistic approach. Typological classification and the concept of the zonal taxonomy of terrestrial landscapes of the Earth became the basis for the series of maps. In 1960s maps of zonal types of landscapes were compiled for Physical-Geographical Atlas of the World. In 1980-1990 both natural and natural-anthropogenic landscapes were mapped at small scales for teaching purposes and for the digital atlas "Resources and Environment. World Atlas" (1998). Recent decades saw further development of the concept of "zone- sector-belt" pattern of landscapes which includes several hierarchically subordinated spatial strata. New theoretical studies and various global datasets allowed starting the elaboration of a new (third-generation) map of terrestrial landscapes at the scales of 1:15 Mln to 1:5 Mln. A new classification of landscape units was suggested based on the analysis of principal landscape-forming factors (climate, relief, lithology and biota including natural vegetation and soil groups). A new cartographical model was developed specifying the following hierarchical levels: geographical belts, sectors, natural zones and sub-zones, classes and subclasses of landscapes. Classification criteria used for landscape systematization and mapping include both natural parameters (heat and moisture supply, the vegetative period pattern, biological productivity, etc.) and anthropogenic indicators (land cover, population density, etc.) thus providing for the evaluation of the geoecological state of landscapes. Refined boundaries of geographical belts and natural zones are reflected at the generalized model of zonal pattern of the Earth's terrestrial landscapes known as an "Ideal continent".

Amorpha Fruticosa (Mill.) Invasive Plant Species in Comana Natural Park (Romania).

Environmental Conditions and Potential Distribution

Dumitraşcu M.¹, Kucsicsa Gh., Grigorescu I.¹, Doroftei M.², Năstase M.³, Dumitrica C.¹

¹Institute of Geography, Romanian Academy, Bucharest, Romania, stefania_dumitrascu@yahoo.com

²Danube Delta National Institute for Research and Development, Tulcea, Romania

³Romsilva, Romanian Forest Administration, Bucharest, Romania

Abstract

Invasive species are acknowledged as economic and environmental threats, becoming key components of global change through their high adaptive capacity which enables them to spread over wide territories. As a result, the assessment of invasive species in protected areas has become an important research direction due to their negative impacts on native species and ecosystems.

Understanding the relationships with their environmental conditions had led to the development of various approaches and methodologies able to assess different aspects related to the occurrence, dynamics, current and potential distribution, potential impact on the environment and economy, etc.

The current study proposes a geographical GIS-based quantitative and qualitative analysis of one of the most invasive species in Europe (*Amorpha fruticosa* Mill.) in a Romanian protected area, i.e. Comana Natural Park (V IUCN category, Natura 2000 site, as well as wetland of International Importance – Ramsar) which was carried out in the framework of the EU FP7 – Building Capacity for Black Sea Catchment Observation and Assessment System supporting Sustainable Development (EnviroGRIDS).

The authors focused on the current state and potential distribution of this species in relation to its main natural (e.g. relief, soils, hydrology) and anthropogenic (e.g. transport network, agriculture) driving factors based on field surveys and geospatial data. The current approach is an important step in spotting areas with potential occurrence of this invasive plant species as a tool for decision-makers in biodiversity conservation and invasive species monitoring.

Biodiversity in Chinese Loess Plateau during late Cenozoic

Yiyin Li and Fei He

College of Urban and Environmental Sciences, Peking University, Beijing 100871, China lyy@urban.pku.edu.cn

Abstract

To explore the development history of biodiversity in Chinese Loess Plateau and provide a unique perspective on biodiversity conservation, two late Cenozoic loess profiles (Fugu, FG and Tanyugou, TYG) were selected to extract pollen. Rich pollen with diverse taxa was present. The main pollen types contain *Artemisia*, *Chenopodiaceae*, *Typha*, *Urticaceae*, *Pinus*, *Betula*, *Quercus* and *Ulmus*. Palynological richness analysis shows that biodiversity of TYG was higher than FG. However, biodiversity present variable patterns in different periods. FG has a decreasing trend during 8.5-2.9 Ma, but it changed with time: increased during 8.5-8.2 and 3.7-3.5 Ma, decreased during 8.2-7.3 and 3.5-2.9 Ma, and fluctuated during 7.3-3.7 Ma. Biodiversity of TYG present an increasing trend during 6.7-2.2 Ma, with an increase during 6.7-6.0 and 3.5-2.5 Ma, a decrease during 6.0-5.2 and 2.5-2.2 Ma, and frequent changes during 5.2-3.5 Ma. By comparing palynological richness curves of the FG and TYG profiles, we found that they have common peaks and share the same trend during 6.7-5.2 Ma. Whereas, when palynological richness of FG decreased during 3.5-2.9 Ma, that of TYG increased. Such a difference is likely due to geomorphology of these two places: TYG profile is located in the valley, which provides a suitable habitat for plant growth.

Abstract

The Angkor complex is mainly constructed in the 9~13th century by Khmer dynasty and was designated as a world cultural heritage by UNESCO in 1992. Angkor Wat temple, constructed of sandstone and laterite, is one of the most popular temples in the complex. The French School of Asian Studies (Ecole française d'Extrême-Orient, EFEO) had performed conservation work in early 20th century. However, it was in poor condition after the Cambodian civil war. During the period of 1986 to 1993, Archaeological Survey of India (ASI) contributed to the Angkor Wat's conservation including reconstruction of the building itself, replacement of blocks, and removal of vegetation. After completion of the cleaning procedures by ASI, the original color, gray to yellowish brown, of the Angkor Wat sandstone was restored. However, after two years, cyanobacteria have colonized large portions of the surface of Angkor Wat temple. We categorized surface of the first gallery wall into four types: 1) area covered by cyanobacteria; 2) un-covered area; 3) erosion from surface peeling; and 4) re-covered area after peeling off. We measure the hardness of the first gallery wall by Schmidt rock hammer.

The hardness of the surface is in the order of Re-covered, Exfoliated, Uncovered and Covered. Cyanobacterial colony may play a surface hardening in the earlier stage, however, it lowers the rock surface hardness in longer period (ca. 20 years). Average rebound value of exfoliated area is 3.7 times higher than cyanobacteria covered area. In Un-covered area, it is 3.6 times harder than covered one.

Angkor Wat temple; Biological weathering; Cyanobacteria; Stone cultural heritage

Changing Pattern of Crop Fraction in Late Blight Induced Potato Crops in West Bengal by using Multi-Temporal Satellite Data

Kundu R, Chakrabarty A

Dept. of Remote sensing & GIS, Vidyasagar University- Midnapore, W.B.-721102, India,

abhisek@mail.vidyasagar.ac.in

Abstract

Crop fraction is the ratio of crop occupying a unit area in ground pixel, is very important for monitoring crop growth. One of the most important variables in crop growth monitoring is the fraction of available solar radiation intercepted by foliage. Late blight of potato (*Solanum tuberosum*), caused by the oomycete pathogen *Phytophthora infestans*, is considered to be the most destructive crop diseases of potato worldwide. In this study different crop fraction estimation method like linear spectral un-mixing, Normalized difference vegetation index (NDVI) based DPM model, Ratio vegetation index based DPM model, improved Pixel Dichotomy Model were evaluated using multi-temporal IRS AWiFs data in two successive potato growing season of 2012-13 and 2013-14 over the study area and compared with measured crop fraction. The comparative study based on measured healthy and late blight affected potato crop fraction showed that improved Pixel Dichotomy Model maintain the high coefficient of determination ($R^2= 0.835$) with low root mean square error (RMSE=0.21) whereas the correlation values of NDVI based DPM model and RVI based DPM model is 0.763 and 0.694 respectively. It showed that the healthy potato crop fraction profile maintained the normal phenological trend whereas the late blight affected potato crop fraction profile suddenly fallen after late blight disease attack. Therefore, it can be concluded that based on the result of this study the improved Pixel Dichotomy Model is the most convenient method for crop fraction estimation for this region with satisfactory accuracy.

Distribution of Bacterial and Archaeal Communities in the Sediment of a Drinking Water Reservoir

CHEN Y J, WANG X Y*, LIU Y

College of Resource Environment and Tourism, Capital Normal University, Beijing, 100048, China,

chenjuancnu@126.com, wangxy@cnu.edu.cn

Abstract

Sediment microbial communities play important roles in biogeochemical cycles of aquatic system. However, few studies have been performed to investigate the composition and variability of the bacterial and archaeal community in the sediment of a drinking reservoir. In this paper, we investigated the bacterial and archaeal community in the Minyun reservoir, Beijing, China by using quantitative PCR and Illumina MiSeq sequencing techniques. The results illustrated that the abundance of bacteria was much higher than that of the archaeal community and the abundance of microorganism was regulated by nitrite-nitrogen, pH and water depth. Bacterial diversity in most of the sediments outnumbered archaeal diversity and nitrate-nitrogen was suggested as an important determinant of bacterial diversity. Phylogenetic analysis revealed that the dominant bacterial phyla across all sediments were Proteobacteria, Bacteroidetes, Chloroflexi, Nitrospirae, Acidobacteria and Verrucomicrobia. Particularly, proteobacteria predominated in all the sediment samples, is mainly consisting of classes Betaproteobacteria, Deltaproteobacteria and Gammaproteobacteria. While, Euryarchaeota was the dominant archaeal phyla across all of the samples, but its percentage had a large variation. Methanomicrobia was the largest euryarchaeal class across all the summer samples. Halobacteria dominated in the autumn and spring samples. Redundancy analysis (RDA) and Canonical correspondence analysis (CCA) was further carried out to determine the relationships between environmental variables and bacterial and archaeal community structure, respectively. Nitrite-nitrogen, nitrate-nitrogen, ammonia-nitrogen and water depth were considered to be the key factors of driving the changes in the composition of bacterial and archaeal communities.

Archaea; Bacteria; Reservoir sediment; Microbial community structure; Microbial abundance; Microbial diversity

Preliminary Evaluation on The Use of Homing Pigeons as a Biomonitor of Affects of Atmospheric Metal Exposure

Cui J, Zang SY, Halbrook RS

Key Laboratory of Remote Sensing Monitoring of Geographic Environment, Harbin Normal University, Harbin, Heilongjiang, 150025, P. R. China, ccc13936400919@163.com

Abstract

Biomonitoring provides direct evidence of the bioavailability and accumulation of toxic elements in the environment and in the current study, homing pigeons were used as a biomonitor of atmospheric pollution in Beijing and Guangzhou, China. And 1-2, 5-6, and 9-10+ year old homing pigeons collected from Beijing. Cadmium, lead, and mercury concentrations were measured in lung, kidney, and liver tissues of homing pigeons. There were differences of metals concentrations in lung tissues among age groups and Gray/black lung margins observed in lungs of monitored pigeons are thought to result from chronic exposure to particulate matter. Cadmium concentrations in all tissue and lung Pb concentrations were significantly greater in pigeons collected from Guangzhou compared to those from Beijing. Lung Cd and Pb concentrations corresponded to differences in ambient air concentrations between the two cities, suggesting that homing pigeons are valuable biomonitors of atmospheric metal contamination. Liver and kidney Hg concentrations were significantly greater in pigeons collected from Beijing compared to those collected from Guangzhou, while Hg concentrations in lung tissue were not significantly different. Results of the current study support a conclusion that homing pigeons provide valuable data for evaluating exposure and potential effects to environmental metal concentrations.

Spatially-explicit Quantifying of the Trade-offs Among Multiple Ecosystem Services

Yingjie Li, Liwei Zhang

Department of Geography, Tourism and Environment College of Shaanxi Normal University, Xi'an,
Shaanxi 710119, P. R. China, lyj@snnu.edu.cn**Abstract**

Natural ecosystems are increasingly dominated by humans, whose demand preference have tremendously aggravated the imbalance of our dependent ecosystem. Traditionally, worldwide attention has been drawn to focus on the amelioration of deteriorating eco-environment, and remarkable achievements has been done for the sustainable development. However, with the rapid changes of climate, population, and land use, a lacking in clarity of the interaction among multiple ecosystem services (ESS) will intensify the current environmental problems. Thus, based on remote sensing data and ecosystem services modeling, we propose a model for spatial-explicitly assessing of trade-offs and synergies among multiple ESS. Three special important ESS for Shaanxi Province of China are selected: soil conservation (SC), Net Primary Productivity (NPP), water yield (WY). The results show that: (1) The spatial patterns of SC, NPP and WY are all approximately increase from north to south; (2) All three ESS increased in northern Shaanxi, but the spatial concordances in our framework revealed that synergies only exist in SC-NPP and SC-WY, but NPP-WY presents trade-offs. (3) Besides, the significant trade-offs presented among all three ESS in the middle Shaanxi. Therefore, after the spatially explicit mapping of the relationships between these three ESS, we suggest that the insightful forest-water interaction should integrate both climatic conditions and physical geography, especially land use changes, into detailed analysis. The framework proposed will facilitate the interpretation of spatial-explicit ESS trade-offs and synergies for regional scale and help in targeted policy-making.

The Combined Effect of Enzymolysis and Aeration on Controlling Vertical Flow Constructed Wetland Clogging

Ni LX¹, Li DY¹, Li SY², Su L¹, Rong SY¹

¹A Key Laboratory of Integrated Regulation and Resource Development on Shallow Lakes, MOE, School of Environment, Hohai University, Nanjing, 210098, P. R. China, nilixiao@gmail.com

²School of Environment, Nanjing Normal University, Nanjing, 210097, P. R. China

Abstract

Because of its ability to removing excess nutrients and certain pollutants from wastewater, vertical flow constructed wetlands have been applied to domestic and industrial wastewater treatment for many decades. The biggest drawback of VFCWs is clogging. This study mainly focuses on the effects of polysaccharide hydrolase and oxidation on clogging conditions. At the same time, this study also investigates the microstructure and characteristic of extracellular polymeric substances (EPS) and the removal rates of different pollutions when oxygen and enzyme were added into reactors. The results show that enzymolysis had no significant effect on micro organic environment. Aeration can promote the removal efficiency and improve microorganism environment. Hence, the content distribution and total quantity of upper and lower matrix layer was kept stable. Furthermore, aeration induced the quantity of many anaerobiont and fungus. After enzymolysis, the reactors run well and removal rate of pollutions kept stable or higher. In a word, adding β -glucanase and aeration can effectively improve the wetland environment and keep it's running more persistent.

A Climatic Regionalization of The Balkan Peninsula Under Conditions of Climate Change

Peter Nojarov

National Institute of Geophysics, Geodesy and Geography, Bulgarian Academy of Sciences, Bulgaria, pnojarov@abv.bg

Abstract

Sea Level Pressure (SLP) data for the period 1950 - 2012 at 61 stations located in or around the Balkan Peninsula was used in this study. The main concept is that intra-annual course of SLP represents the best different air masses that are situated over the Balkan Peninsula during the year. The method for differentiation of climatic zones is cluster analysis. A hierarchical clustering technique - average linkage between groups with Pearson correlation for measurement of intervals was employed. The climate of the Balkan Peninsula is transitional between oceanic and continental and also between subtropical and temperate climates. The main research period 1950 - 2012 was divided into two sub-periods: 1950 - 1986 and 1987 – 2012. The goal was to see changes in position of the borders between different climatic zones. The first sub-period can be defined as generally cold, the second - as generally warm. Several major changes in atmospheric circulation over the Balkan Peninsula have happened over the period 1950 - 2012. There is a serious increase of the influence of the Azores High in the period January - March, which leads to an increase of SLP and enhances oceanic influence. There is an increase of the influence of the north-west extension of the monsoonal low in the period June - September. This leads to more continental climate, but also to more tropical air masses over the Balkan Peninsula. Accordingly, the extent of subtropical climate widens in northern direction. There is an increase of the influence of the Siberian High in the period October - December. This influence covers central and eastern part of the peninsula in October and November, and it reaches western parts in December. Thus, the climate becomes more continental.

Climatic regionalization; Balkan Peninsula

A New Method for Generating the Thermal Growing Degree Days and Season in China during the Last Century

Yin YH*, Deng HY, Wu SH

Institute of Geographic Sciences and Natural Resources Research, CAS, Beijing 100101, China, yinyh@igsnr.ac.cn

Abstract

Changes in the thermal variables of growing degree-days and season have substantial effects on vegetation growth and distribution. The magnitude and spatial distribution of changes in growing degree-days and season in China during the past century are still uncertain, mainly due to limited daily observations before 1950. In this study, a site-specific multiple linear regression method is developed based on the homogenized daily temperature data of 536 meteorological stations in China for 1960–2010, in order to estimate the annual variables of growing degree-days and season with only monthly temperature. The method is robust for all stations and interannual variability. Since it could accurately simulate the observed values in 2011, with relative errors of -0.02% and 0.96% for growing degree days and growing season, respectively. We simulated the thermal variables based on this method using gridded monthly temperature data for 1901–2010. The interannual variations of simulated growing degree days and growing season matched well with that of observed values from 1960 to 2010, with high correlation coefficients of 0.99 and 0.92 respectively. Overall, the growing degree-days and season showed significant ($p < 0.01$) increasing trends of $11.88\text{ }^{\circ}\text{C}\cdot\text{d}/10\text{yr}$ and $0.69\text{ d}/10\text{yr}$, respectively, in China as a whole, with the trends increasing from 1991 to 2010. Moreover, all eco-geographical zones showed positive trends during 1901–2010. The growing season was more prolonged in northern zones, and degree-days was more increased in north-subtropical, south-subtropical, and tropical zones. However, both the growing degree-days and season have decreased in part of Southwest China in the mid-subtropical zone over the past century.

Atmospheric Teleconnection for Ice Cover Phenology on Lake Ladoga

Naumenko M, Karetnikov S, Guzivaty V.

Limnology Institute of Russian Academy of Sciences, St. Petersburg, 195105, Russian federation,

Naumenko@limno.org.ru

Abstract

The Northern Hemisphere's upper air general circulation pattern, which controls the origin, frequency, and duration of winter air mass movements over Lake Ladoga, largest lake in Europe - Lake Ladoga ($S = 17670$ sq.km, $V = 848$ cu.km), situated at 60° N latitude is an important global factor affecting the lake ice cover, as evidenced by teleconnections. Winter conditions play an important role for the lake and serve as a climate change indicator. The ice cover lasts for 171 ± 3 days on average from the early November until the mid-May. The study focuses on interannual variability from 1943 to 2014 of Lake Ladoga ice cover and relationship to atmospheric teleconnection indices. More than 1,300 surveys of the lake's ice cover were collected by using aircraft surveys and satellite images for winters of different types of severity. Since ice phenology records show considerable year-to-year variation we have used six teleconnection indices (NAO, AO, SCAND, EA, EA-WR, POL) for the period from October to May for understanding the drivers influencing the change in Lake Ladoga ice condition. We selected representative parameters for further detection of climate change. We believe that nonlinear relationships take place between teleconnection indices, which resulted in Lake Ladoga ice condition. We have developed multi-regression models to estimate the Relative Ice Cover Index (RICI) for overall winter condition and other ice characteristics as dates of first and last ice and maximum of accumulated freezing degree days (AFDDs).

Atmospheric teleconnection; ice cover phenology; Lake Ladoga

Changes of Glaciers and Glacial Lakes Implying the Corridor-Barrier Effects and Climate Warming in Hengduan Mountains, Southeast Tibetan Plateau

Chai K., Wang X.

Hunan University of Science and Technology, Xiangtan, 411201, P. R. China, chaikaiguo@163.com

Abstract

The changes and implications of glacier and glacial lake were discussed in Hengduan Mountains based on the remote sensing images of LandsatTM/ETM+/OLI during 1990-2014 in this paper. The area of glaciers decreased greatly at an average rate of $-0.40\%/a$ while the glacial lakes expanded slowly at an average rate of $+0.12\%/a$ during the past 24 years resulted from a observably temperature rising and slightly precipitation increasing in Hengduan mountains. The decade changing differences of glacier-fed lake and non-glacier-fed lake were the direct signals on inter-decadal fluctuations of temperatures (responded by glacier melting) and precipitation over Hengduan Mountains. The special corridor-barrier effect formed by range-gorge terrain in longitudinal has significant impacts on the distributions and changes of glacier and glacial lake. Mainly due to the barrier effect of the ridges for southwest oriented moisture, Ningjingshan-Yunling where glacier and glacial lake were sparsely distributed was found as an important geographical boundary in Hengduan Mountains. In the mountains of west side of the geographical boundary, the glaciers and glacial lakes were well developed with the widely rapid expansion of glacial lakes, while the glaciers and glacial lakes were scattered in the east mountains of geographical boundary where the glacial lakes were dominantly shrinking. On the other hand, insignificant differences were found with respects to the distribution and change of glacier and glacial lake due to the north-south corridor effect for water and heat transport and diffusion through the longitudinal gorges in Hengduan Mountains.

Key words:

Changes of glacier and glacial lake; corridor-barrier effect; climate warming; Hengduan Mountains

Climate Change and Water Resources: Impacts and Responses within River Kaduna Basin

Egbinola C. N, Salami A. T

Climate Impact Research Fellow, Obafemi Awolowo University, Ile Ife, Nigeria, christy_emu@yahoo.com

Abstract

The study here reported was carried out in the Kaduna drainage basin within the northern Guinea Savanna ecological zone of northern Nigeria. The aim was to examine temporal trend in climatic and its impact on water resources. Daily rainfall, maximum and minimum air temperature data for five weather stations within the study area for the period between 1974 and 2013 were analysed. Linear trends were generated from regression equation, and the Mann-Kendall non-parametric test was used to detect significance of trend. Several measures of rainfall change including number of events over time in the accumulation of rainfall of different thresholds at a weather station in a 24-hour period; change in top one per cent of 24-hour precipitation and changes in the number of rain-days for two equal study periods was used. Information on perceived impacts of climate change on water resources and the adaptation methods in communities was got through analysis of questionnaires administered in fifteen local communities within the drainage basin. Results revealed a 0.92% and 1.2% increase in maximum and minimum temperature. There were also rising trend in occurrence of 'heavy rainfall' and a falling trend in numbers of rain-days. Questionnaire analysis revealed increased flooding, increased rate of drying up and pollution of water sources as well as increase in water borne diseases as the main impact of climate change as perceived by respondents. The study therefore called for improved water resources management in Nigeria to stem the effects of climate change on water resources.

Key words:

Drainage basin; climate change; water resources; communities; adaptation methods

Climate Change Effects on Rice Yield in Zhejiang, China

Guo Yahui

The Geographical Society of China, Beijing, 100101, P. R. China, guoyahui2010@163.com

Abstract

Recent years, the climate change have been much more obvious than ever before, influencing the human society in many aspects. Rice is a staple and important food in China, it is also believed that the rice is far more sensitive to the climate change than other crops. It has the significance of the regional and national to study the inner connection between the climate change and rice yield. The study area of this study is selected as Zhejiang province, for the large area of rice cultivation in China. Here we simulate the rice yield on the newest released Crop Estimation through Resource and Environment Synthesis software with CERES-rice model, besides the observation sites are carefully selected for the simulation. The data we use are obtained from Chinese agro-meteorological experimental stations and the data are perfect recorded by professional workers. The results of our simulation indicate the continuing decrease of the rice yield and CO₂ fertilization effect could relieve the effect to some degree but CO₂ fertilization couldn't offset it. Due to this situation, we provide three adaptive measures: 1) advance the planting data 2) breed new rice type 3) change the planting area to the high altitude.

Climate Change in La Paz, Bolivia during the 20th Century Based on the Jesuit Meteorological Records.

Zaiki M, Mizuno K, Tsukahara T

Seikei University, Tokyo, Japan, mzaiki@econ.seikei.ac.jp

Abstract

The city of La Paz has developed by population growth and industrial modernization through the 20th century. We examined characteristics of climate change in La Paz based on the long meteorological records taken by the Society of Jesus covering the periods 1918-1948 and 1962-1979.

Mean temperature has increased 0.29 degrees Celsius per decade for the whole data period in La Paz, besides 0.10-0.11 degrees Celsius per decade (1939-1988) in the tropical Andes region. The warming trend in the latter period was especially remarkable. Although significant long-term trend was not detected in the annual rainfall series, a periodical variation was observed with some dry periods in the middle 1920s, the later 1930s and 1960s-1970s. Comparison of hythergraphs for 1918-1948 and 1962-1979 revealed that dry season (May, June, July and August) has become warmer and slightly drier, and wet season (December, January, February and March) has become warmer and wetter. As the other analysis based on the modern records (1976-2013) in La Paz has also reported a drying trend in the dry season, the trend has been continuing since the early 20th century.

Climatic Variability and Food Grain Production in Satara District**Parag A. Khadke**

Assistant Professor and Research Guide, School Of Earth Sciences, Swami Ramanand Teerth Marathwada University, Nanded, Maharashtra, 431606. Email- pakhadke@gmail.com

Abstract

The Indian agriculture is the gamble of monsoon. The rainfall and temperature variability and drought have been historically major causes of low agriculture production in India. The agriculture is the major primary activity of Satara district. The extreme changes of climatic phenomena increased of food insecurity. In the Satara district is observed many of the fluctuation of climate parameter on spatial and temporal scale. The heaviest rainfall received in the western part, highest temperature recorded in the western part. The occurrence of deferent climatic season in the district is created specified pocket of climate. The agriculture of Satara district has classified into two main seasons Kharif and Rabi. The Kharif agriculture season is from Jun to mid of October during the period of southwest monsoon season and the Rabi agriculture season is from mid-October to February during the post monsoon and cold season. Some parts of district grow crops during summer season. The climatic variability of the district affected the agriculture production. The high frequency of drought is increased in the eastern part of the district (Khandala, Phaltan, Man, Khatav and Koregon) during the last few decades. The rainfall distribution during crop sowing period has also become responsible for the reduction of agriculture production. The year 2003 has a good example to show the agriculture production mainly depending on the annual rainfall. This study analyzed the climatic variability and food grain crops (production, area and productivity) of Kharif, Rabi and annual of the Satara District During 1983-2012. Karl Pearson's method of correlation is used for the analyze of correlation of the food grain. The annual food grain production and area shows decline trend. The average annual area under food grain is 473890 hectors and production is 445790 tones.

Climatic Variability; Food Grain; Seasonal Change; Rainfall and Temperature

Comparison of Improved Empirical Models and Artificial Neural Network Model for Global Solar Radiation Estimating in China

Ling Z, Aiwen L, Zhenzhen Z, Hongji Z, Qian Y,

School of Resource and Environment Science, Wuhan University, Wuhan, Hubei Province 430079, P. R. China,

cheryl_zou@wh.edu.cn

Abstract

Solar radiation plays an important role in climate change, energy balance and energy applications. In this work, two improved empirical models (the expanded Bristow-Campbell model (E-IBC) and improved Yang Hybrid Model (IYHM)) and an artificial neural network (ANN) are proposed to predict global solar radiation (Hg). Meteorological data such as :daily sunshine duration (SSD), air pressure (AP), precipitation (Pre), relative humidity (Rh), daily mean temperature (T), daily maximum/minimum temperature (Tmax/Tmin) and solar radiation data from 1992 to 2011 are used in this study. The model performances were evaluated through root mean square errors (RMSE), mean absolute errors (MAE) and determination coefficient (R^2). The results showed that all improved empirical models provide better modeling accuracy than basic ones in estimating daily global solar radiation, for example, the average RMSE values of E-IBC, IBC, IYHM and YHM model are 3.78, 4.55, 3.31 and 4.37 MJ m⁻² day⁻¹, the MAE are 2.67, 3.41, 2.52 and 3.51 MJ m⁻² day⁻¹, and R^2 are 0.78, 0.66, 0.84 and 0.77. We also find that improved empirical models and ANN model can estimate Hg with satisfactory accuracy at three stations, the ANN model provides better accuracy than empirical models, for example, average RMSE between monthly Hg are 1.86, 1.71 and 1.44 MJ m⁻² day⁻¹ for E-IBC, IYHM and ANN model, MAE are 1.43, 1.23 and 1.04 MJ m⁻² day⁻¹ and R^2 are 0.88, 0.86 and 0.91 for E-IBC, IYHM and ANN model, respectively.

Enhanced or Weakened Western North Pacific Subtropical High Under Global Warming?

Chao He^{1,*}, Tianjun Zhou², Ailan Lin¹, Bo Wu², Dejun Gu¹, Chunhui Li¹, Bin Zheng¹

¹ Institute of Tropical and Marine Meteorology (ITMM), Guangzhou, China, hechao@mail.iap.ac.cn

² LASG, Institute of Atmospheric Physics (IAP), Beijing, China

Abstract

The Western North Pacific Subtropical High (WNPSH) is a large scale high pressure system over the subtropical western North Pacific, which greatly regulates the East Asian climate in summer. The future change of WNPSH in response to global warming is concerned by Asian people. Although previous studies claimed enhanced WNPSH in a warmer climate, we show evidences that WNPSH weakens in the mid troposphere but changes little in the lower troposphere under global warming scenarios, based on 31 models from the Coupled Model Intercomparison Project Phase 5 (CMIP5). The weakened meridional temperature gradient on the northern flank of WNPSH is responsible for the weakened WNPSH in the mid troposphere. In the lower troposphere, the future intensity change of WNPSH is regulated by the zonal gradient of Sea Surface Temperature between tropical Indian Ocean (TIO) and tropical Pacific Ocean (TPO). Greater warming of TIO than TPO favors enhanced WNPSH and vice versa. The discrepancy between our results and previous studies originates from how to measure WNPSH. Traditional metrics on the WNPSH based on geopotential height is not suitable in a warming climate, since the systematic increase of global geopotential height misleads people on the intensity of WNPSH.

Western north Pacific subtropical high; global warming

Environment Variability Archived by Color of the Drill Core Beihuqiao in Hangjiahu Plain during the Early-Mid Holocene, China

Zhang YX¹, Ye W², Ma CM²³, Zhu LD¹, Li FQ¹, Wang TY¹

¹ College of Geography and Environmental Sciences, Zhejiang Normal University, Jinhua 321004, P.R. China, lyg129@zjnu.cn

² College of Geographic and Oceanographic Sciences, Nanjing University, Nanjing 210046, P.R. China

³ Climate Change and Collaborative Innovation Center Jiangsu Province, Nanjing 210093, P.R. China

Abstract

An improved predicting of future climate variability and change relies on high-quality data sets from the past. Hangjiahu Plain, which is located in the eastern coastal areas of China, is sensitive to climate changes. A drill core was obtained from the BeiHuQiao (BHQ, 30°22.443'N, 119°56.237'E) in the Hangjiahu Plain, Zhejiang Province. Based on color, granularity and total organic carbon (TOC) of 535 samples, climate and environment of the Hangjiahu Plain region during Early-mid Holocene was reconstructed. The color results were compared with clay and TOC, which shows that yellow degree index (b^*) is negative correlating with clay and TOC, so higher b^* indicates the lower effective humidity. In addition, in the water environment, higher brightness index (L^*) infers drier and colder environment. Results of color analysis show that, the study area has undergone significant environmental changes. During 11400-8700cal aBP, in the early of this stage the climate was a bit of cold and dry. In the late it gradually turned to warm and wet. During 8700-8400cal aBP, the climate turned to dry and cold, which lasted about three hundred years. During 8400-7900cal aBP, the climate was warm and moisture, indicating that the study area entered the Holocene Megathermal about 8400cal aBP. During 7900-4200cal aBP, in the early of this stage (7900-5700cal aBP), the climate become warmer and wetter, indicating that this period is the warmest period in the Holocene Megathermal. What is more, a cold event appeared approximately 5500cal aBP and it lasted about two hundred years.

Lacustrine and paludal sediment; color; Early-mid Holocene; environment variability

Extreme Summer Climates in Japan after Large Volcanic Eruptions during Historical Times

Mikami T

Teikyo University, Hachioji Tokyo, Japan, mikami@tmu.ac.jp

Abstract

We have often had extreme weather events in Japan, such as cool summers and severe floods, after large volcanic eruptions in the world. For example, extremely severe famine occurred in 1783 and 1786, during which we had unusually cool summers particularly in northern Japan. In 1783, Mt.Laki in Iceland and Mt.Asama in Japan made explosive eruptions which might have related to the unusual weather events in Japan. It should be noted that summer climates of European countries in 1783 were rather hot and muggy. On the other hand, in 1816, which was just one year after the extremely large eruption of Mt.Tambora in Indonesia, opposite climate anomalies appeared in Northern Hemisphere. This year is well-known as “The Year without a summer” in Europe and the eastern part of Canada and USA, whereas we had a hot summer climate in Japan. Also in Indonesia, an extremely explosive eruption of Samalas volcano in 1257 have been noticed among climatologists. We have found some evidence for extreme weathers, such as cold summers and severe floods in Japan during 1257-1258, by examining several historical disaster records and documents. We plan to analyse more in detail the relationship between large volcanic eruptions and their climatic impacts in global scale.

Key words:

Extreme weather; volcanic eruption; Indonesia

Frost and Ice Days in Turkey

Barbaros Gönençgil¹, Zahide Acar Deniz², Burcu Mestav²

¹ Istanbul University, Faculty of Letters, Istanbul-Turkey, barbaros@istanbul.edu.tr;

² Canakkale Onsekiz Mart University, Faculty of Arts and Sciences, Canakkale-Turkey

Abstract

The study area is located within 36°N to 42°N latitudes and longitudinally lies between 26°E and 45°E. Daily maximum and minimum temperature data of Turkey meteorological stations were used in the period of 1966-2014 in this study. The numbers of frost and ice day have determined with daily maximum and minimum temperature data in winter season. Criteria were defined the temperature indices, which referred to the frost day and ice day reaching <0°C in minimum and maximum temperature in winter, respectively. *Mann-Kendall rank test* is applied to determine any possible trend in the annual numbers of both frost and ice days. Cluster analysis is applied to classify the time series to find out the similarities in the stations.

The analysis demonstrates a decrease in frequency of frost and ice days in Turkey. Especially in 2010, it is the warmest year in Turkey from the records of the stations. In 2010, at the very least frost days have been during the past 50 years. The very least ice day events have been experienced in 1999, 1984, 2010, 2011, during the past decade.

In this study, we represent geographical distribution of frost and ice day indices, each index computed for each station. The aim of this study is to analyze long-term variability and trends of temperature indices.

This study is supported by the Turkish Scientific and Technical Research Institute (Project number: 114Y417).

Gendered Analysis of Climate Change Impacts on Water

Roy, S. Sen

Department of Geography and Regional Studies, University of Miami, Coral Gables, FL 33146, USA, ssr@miami.edu

Abstract

The right to safe, clean drinking water and adequate sanitation is a human right, essential to the full enjoyment of life and all other human rights, as recognized by the UN General Assembly in July 2010 (resolution 64/292).

However, this essential human right is in jeopardy from the impending impacts of climate change. Specifically, the impact of climate change will be greater on the more vulnerable sections of the population, which include people living in poverty, children, and the elderly. 70% of the people living in poverty are women, who also are the main caregivers at home for children and the elderly. In addition due to restrictive social and cultural norms, women often are less educated and have limited access to resources and decision-making powers. The present study examines the relationship between vulnerability to climate change and gender inequality/inequity at the global scale, with particular focus on water. The two regions that stood out in terms of both vulnerability to climate change and gender gap, include the Sub Saharan Africa and South Asia. Both of these regions also had the highest proportion of unimproved sources of drinking water and sanitation. In view of the predicted disproportionate impacts of climate change on water resources, women and girls are at greater risk due to climate change in these regions.

3. Academy of Disaster Reduction and Emergency Management, Ministry of Civil Affairs & Ministry of Education, Beijing 100875, P. R. China.

Abstract

The impact of climate change can be divided into three parts: climatic tendency, fluctuation and extreme events. It is benefit to put forward targeted policies and strategies on adaptation, resilience and mitigation of the impact of climate change if we try to understand this issue at different spatial-temporal scale. This paper studies the impact of the tendency, fluctuation and extreme events of mainly climatic factors (temperature, precipitation and radiation) on early rice yield in Wulin, Changde, Hunan Province, and China during 1981-2012. This is a site scale research and DSSAT cropping system model has been used to get quantitative effects from each part of climate change. The results indicate that the impact of climatic extremes include high temperature events, heavy rain events and drought events which are sorted by influence level from high to low. Moreover, the trend of temperature has negative impact on early rice yield. On the contrary, the trend of precipitation and radiation have positive impact. However, the total effects of climatic tendency is adverse on early rice yield. In addition, the influence from climatic fluctuation which surpass the “variability threshold” has negative impact on early rice yield and the largest impact factor is precipitation, then it is followed by radiation and temperature. At last, the yearly impacts of climatic tendency, fluctuation and extreme events on early rice yield are -81.75kg/ha、-120.00kg/ha and -49.41kg/ha.

Indigenous Knowledge of Climate Change Adaptation in Desert Prone Front States in Northern Nigeria

Salisu Lawal Halliru, Kassim B. Sekabira

Geography Department School of Arts and Social Sciences Federal College of Education Kano

P.M.B 3045 Kano State Nigeria lhsalisu09@gmail.com

Abstract

Adaptation to climate change which is the adjustments in the practices, processes, or structures in response to projected or actual changes in climate is a contemporary issue in today climate and its changes. At the local level, some farmers have come up with strategies such as conservation of carbon through zero tillage practices, using mulches to reduce soil temperatures and conserve soil moisture and use of organic manure to increase the ever decreasing soil fertility. This paper presents the indigenous knowledge related to the climate change adaptation strategies in desert prone front line states in Nigeria. Mixed method of research (Qualitative and quantitative) was adopted in the study. The instruments used; includes interviews guide, a questionnaire survey, observations and photography. The analysis was based on a sample of 384 respondents. The qualitative data was analyzed by means of coding using matrix form, descriptions, and visual presentations. On the hand, the quantitative data was analyzed through the statistical package for social sciences (SPSS) 16.0 for windows and complimented by Microsoft Excel to generate frequencies and percentages. The findings revealed that others adapted differently while others migrated to other places as an adaptation strategies. In conclusion the results revealed that communities in the desert prone front line states in Nigeria have low adaptation strategies related to climate change.

Issues of Land Degradation in the Darhad Depression, Mongolia

Enebish B¹, Dagvadorj Ts²

¹National University of Mongolia, bayarjargal_e@yahoo.com

²University of the Humanities, Mongolia

Abstract

The paper describes multi-year trend of climatic factors such as mean air temperature, precipitation amount, evaporation and aridity index which highly affect to land degradation in the Darhad Depression. Also, changes of a number of livestock and its composition were discussed. Air temperature during the warm season (May-September) increased by 1.70C with a rate of 0.040C per year in the Darhad Depression between 1974 and 2014. This increase has been occurred more intensively since 1994. As seen this result, global warming is occurred in the Darhad Depression clearly. The maximum temperature was recorded as 34.90C in the air and 62.00C at surface. Annual total surface evaporation is increased by 85 mm with a rate of 2.1 mm per year in the Darhad Depression.

Khuvsugul forest area is rich by larch and willow. In the last years, soil degradation has been increasing due to warming and aridity. Furthermore, major reasons of land degradation are extending sand area, and degenerate new sand area. Pasture carrying capacity exceeds since a number of livestock increased and composition of herds escaped and it is one of the main causes for land degradation.

Key words:

Climate change; Darhad Depression; land degradation; pasture carrying capacity

Linking Inter-annual Streamflow Variability to Southern Annular Mode, Regional Climate and Weather Regimes in New Zealand, 1979-2011

Li N, McGregor GR

Department of Geography, Durham University, Durham DH1 3LE, UK, ning.li@auckland.ac.nz

Abstract

River flow across New Zealand demonstrates considerable inter-annual and geographical variability. While large scale modes of atmospheric circulation such as ENSO are known to influence hydroclimate variability little is known about the influence of the Southern Annular Mode (SAM) on climate and river flow across New Zealand. The purpose of this paper is to present results from an analysis of SAM river flow associations across with the influence of ENSO and river flow trend removed for the period 1979 – 2011. A river flow regionalization is presented as a spatial framework for the analysis of river flow SAM associations. Results demonstrate considerable seasonal and geographical dependency of river flow on SAM; some cases the association reverses with season. Large scale climate based explanations are presented in order to explain SAM river flow associations.

Hydroclimatology; climatic variability; riverflow; Southern Annular Mode; New Zealand

Modeled Responses of Summer Climate to Realistic Land Use/Cover Changes from the 1980s to the 2000s over Eastern China

Yang Hu^{1,2}, Xue-Zhen Zhang^{3,4}, Rui Mao^{1,2}, Dao-Yi Gong^{1,2}, Hong-bo Liu⁵, and Jing Yang^{1,2}

State Key Laboratory of Earth Surface Processes and Resource Ecology, Beijing Normal University, Beijing, 100875, P. R. China, mr@bnu.edu.cn

Abstract

Eastern China has experienced substantial agricultural expansion and deforestation in recent decades. We modeled the influence of land use/cover changes (LUCCs) over eastern China on the regional climate using the Weather Research and Forecasting model with the Noah-multiparameterization land surface scheme. Two 21 year (1980–2000) experiments were performed using the same settings, except for the land use/cover data for the 1980s and the 2000s. The results showed that in northern China, decreases in the surface air temperature of approximately 0.3–0.5°C and decreases (increases) in rainfall over the lower reaches of the Yangtze River valley (southern China, northeastern China, and the Korean Peninsula) of approximately 3% (6–7%) in the summer were associated with LUCCs in eastern China from the 1980s to the 2000s. The cooling effect in northern China, which was primarily attributable to an increase in the surface latent heat flux of approximately 7.3–9.6Wm², weakened the land-ocean thermal contrast, suggesting the presence of a weaker summer monsoon over eastern China. As a result, rainfall over the lower reaches of the Yangtze River valley (southern China) tended to decrease (increase). In addition, the cooling effect may have produced an anomalous cyclonic circulation from the surface to the midtroposphere over northeastern China and the Korean Peninsula, resulting in increased rainfall over this area.

Land use/cover changes; eastern China; regional climate model;

Persisting Climatic Warming at High Elevation Sites across the Globe in the Post-1998 Period

Wang M, Wang Q, Fan X

Institute of Loess Plateau, Shanxi University, Taiyuan 030006, P. R. China, mbwang@sxu.edu.cn

Abstract

Although the 2000s are by far the warmest decade on record, the rate of increase of global mean temperature since 1999 has slowed. Here, based on a dataset of mean temperature series (1961-2010) from 2104 global stations (majority of the data are from the GHCN, and each of the station series has at least 40 years of records during the period 1961-2010), we examine the temperature trends for all the 2104 stations as a whole as well as for the 1219 low-elevation stations ($\leq 500\text{m}$ above sea level) and the 225 high-elevation stations ($>1500\text{m}$ above sea level), respectively. Our results show that the warming is slowdown for all the stations and for the low-elevation stations as well in the post-1998 period and the pause is particularly evident in winter; consistent with the global-warming hiatus observed in the previous studies. Despite this fact, however, a persistent warming in annual mean temperature is found for the high-elevation stations during the recent period. The high-elevation stations also show continued warming in spring (MAM), summer (JJA) and autumn (SON) during the recent period. Given that the hiatus in global mean temperature rise has been strongly influenced by the negative phase of the Pacific Decadal Oscillation (PDO) since 1999, our findings indicate that the warming in the high-elevation sites deviates from the PDO pattern to a great extent, especially in the spring, summer and autumn seasons. The important physical mechanisms for why the warming trends appear in this way remain to be investigated.

Key words:

Surface warming; low-elevation; high-elevation; Pacific Decadal Oscillation; persistent warming

Precipitation Changes over the Past 110 Years in Central Asia

Zengyun Hu^{1,2}

¹State Key Laboratory of Desert and Oasis Ecology, Xinjiang Institute of Ecology and Geography, Chinese Academy of Sciences, Urumqi 830011, China

²Department of Geography, Hong Kong Baptist University, Kowloon Tong, Kowloon, Hong Kong,
huzengyun@ms.xjtu.ac.cn

Abstract

As one of the largest arid regions in the world, the ecosystem in Central Asia is vulnerable and sensitive to the arid and semi-arid climate. However, the spatial-temporal variations of the long term precipitation over this region are still unclear because of lack rain gauge observations. This study examines the temporal variations and spatial distributions of the precipitation over Central Asia during 1901-2010 by using the three recent gridded datasets: the Climatic Research Unit (CRU) datasets, the Global Precipitation Climatology Centre (GPCC) datasets and the dataset developed by Willmott and Matsuura (WM) by University of Delaware. Major results show that similar variations of the annual precipitation of the three datasets were found over Central Asia during 1901-2010. CRU and GPCC have a positive trend for the annual precipitation with the rate of 1.42mm/decade and 0.57mm/10a over Central Asia, respectively. However, the linear trend of the WM dataset is negative trend. Further, these tendencies may be continuous into the future. The annual precipitation has a 3-years and 6-7 years multi-periods which displayed the nonlinear characteristics of the precipitation during the past 110 years. All the three datasets have the similar spatial patterns of the annual precipitation trend with the high center in mountainous areas which is consistent with EOF-1 results. However, the northern Kazakhstan experienced the largest decreasing of the precipitation. Moreover, the precipitation is negatively correlated with the global land precipitation and positively correlated with the 30N-60N areas of the Northern Hemisphere. At last, the Pacific Decadal Oscillation (PDO) has a positive influence on the annual precipitation significantly ($p < 0.01$) over this region.

Prediction of the Twenty-First Century's Climate of Extreme Wind Speed Regime in the Arctic Region

Larisa Sokolova, Galina Surkova

Lomonosov Moscow State University, Faculty of Geography, Department Of Meteorology, Moscow, Russian Federation,
sokolova.larisa@hotmail.com

Abstract

Extreme surface wind events over the Arctic (60-90N, 0-360 E) are studied for the modern climate and for its future possible changes on the base of ERA-Interim reanalysis data and CMIP5 scenario RCP8.5. Horizontal surface wind speed (10 m) probability distribution functions in every grid point of reanalysis and models data over the Arctic were evaluated as well as wind speed for 50, 95, 99, 99.9 percentiles (V0.50, V0.95, V0.99, V0.999). At first, changes of V0.50, V0.95, V0.99, and V0.999 were studied on the base of ERA-Interim reanalysis for 1981-2010. Results showed regional inhomogeneity of wind speed trend intensity. Also, analysis was made for zonal means and separate sectors of the Arctic. To study climate projection of high wind speed there were taken u, v values from CMIP5 numerical experiments for 1961-1990 (Historical) and 2081-2100 (RCP8.5). RCP8.5 scenario was chosen as having the most pronounced response in the climate system, which gave more statistical significance to the calculated trends. Modeled extreme wind speeds for the total Arctic and zonal means show rather good agreement with reanalysis data (compared for decades 1981-1990, 1991-2000). At the same time regional intermodel variability of wind speed is revealed. Trend of extreme surface wind speed in 21 century and for 2081-2100 over the Arctic are analysed for each model.

Pre-Instrumental Weather Record from Personal Diaries: Precipitation Distributions in Response of El Nino Events

Xie Wenjing, Gao Shu

School of Geographic and Oceanographic Sciences, Nanjing University, Nanjing, 210023, P. R. China,

xiewenjing@nju.edu.cn

Abstract

Ancient climate patterns could be recovered from many types of human records. In this contribution, a detailed and continuous time series of daily weather records between 1870 and 1890 are recovered from the diary of Zeng Jize, an official in the Qing Dynasty. The time series of precipitation and cloud cover within the space and time extensions of the diary are derived and analyzed on the basis of semi-quantitative coding. The results reveal different rainfall and cloud cover patterns among the regions of Beijing, Changsha and Nanjing. Further, the climate events as identified for Beijing and Changsha indicate that these two regions had responded differently to El Nino events. This case study demonstrates that it is feasible to obtain detailed and continuous time series of pre-instrumental ancient weather records from personal diaries; a synthesis of the diaries scattered over the world would provide a high quality data set for ancient climate change studies.

Projection of IPCC AR5 Coupled Climate Models for Multitimescale Temperature Variation in Red river basin (China) from 1960 to 2050

LI Shaojuan*, YIN Fangli, LI Mengchun, LI Wei

School of Urban and Environment, Yunnan University of Finance and Economics, Kunming 650221, China, 1171600908@qq.com

Abstract

As an important international river in the Southwest Asia, the climate in most of the Red River (China) basin is mainly influenced by the unique monsoon, stereoscopic climate background and the effect of the special corridorbarrier function in Yunnan, which make synchronization between precipitation and temperature and the annual average precipitation unevenly distributed. Especially influenced by global climate change, the uneven distribution of annual climatic elements in different parts of Red river basin has become greater than ever before and has resulted in a higher frequency of extreme meteorological disasters, which threatened the harmony between humankind and nature around this region. With the recent fast development of the important regional cooperations in economy and scientific technology between China and Vietnam, the development tendency and effects of extreme climate events in the basin have received remarkable attention under the background of global change.

Based on gridded data of daily mean (highest, lowest) temperature record with $0.25^{\circ} \times 0.25^{\circ}$ from 1961 to 2005 in Red River basin (China), and the surface temperature simulated by the World Climate Research Programme's (WCRP's) Coupled Model Intercomparison Project phase 5 (CMIP5) multi-model dataset and four IPCC AR5 climate Models (BCC_CSM, GISS2, Inmcm4, MIROC5), a quantitative examination was undertaken into the characteristics of multi-timescale temperature (annual mean temperature (AMT), dry season mean temperature (DMT) and wetseason mean temperature (WMT), annual highest temperature (AHT), dry season highest temperature (DHT) and wetseason highest temperature (WHT), annual lowest temperature (ALT), dry season lowest temperature (DLT) and wetseason lowest temperature (WLT)) variation in Red River basin (China). The simulation abilities of the models were evaluated with the normalized root mean square error (NRMSE), Mann-Kendal test statistic methods and correlation analysis. The results showed that as for AMT, the projected result (anomalies) variations of MIROC5 climate model are more similar to observed ones than other models in the basin. GISS2 model has better simulating effect on anomaly WMT in most area of Red river basin (China), except in the west part of midstream and downstream where MIROC5 model shows better

simulating effect. As for anomaly DMT, in mcm4 model has better simulating effect on in most area of the basin, except for MIROC5 model shows better simulating effect in the upstream basin. As for anomaly variations of AHT and WHT, MIROC5 and GISSER2 models have better simulating effects in the area. And MIROC5 and BCC_CSM models show better simulating effects on the anomaly variations of ALT, WLT, and DLT in the region. The variations trends of AMT, DMT, WMT, AHT, DHT, WHT, ALT, DLT, and WLT over the next 40 years in the region were predicted and the reason of different simulating effects on those characteristics temperature variations were also discussed.

Red river basin (China); multi-timescale temperature; normalized root mean square error; projection of IPCC AR5 Coupled Climate Models

Sensitivity of Tree Growth to Temperature in the Southeastern China and the Potential for Spatial Temperature Reconstruction

Shi J, Shi S, Zhao Y, Lu H

School of Geographic and Oceanographic Sciences, Nanjing University, Nanjing, 210023, P.R. China, shijf@nju.edu.cn

Abstract

Tree-rings play an important role in reconstructing past temperature in high-latitude and high-elevation regions where they are stressed by the growing season temperature. However, little tree-ring research has been done in the subtropical southeastern China, an East Asian monsoon region with high temperature and precipitation in the growing season. Recent studies show that coniferous tree growth in the region is limited by temperatures in prior winter and the current growing season (i.e., prior November to current July) at high elevation sites. Higher temperature in the dormant season means less damage to leaves and roots, and less consumption of previously stored carbohydrates and starches that can be used for tree growth in the coming year. The mechanism of positive relationships with the growing season is the same as that in high-latitude and high-elevation regions. The new temperature reconstructions match each other very well at decadal to multi-decadal scales during the past 150 years at a large spatial scale, that is, of 700 km, even though there are some discrepancies in the early part of the comparisons. Possible reasons for the discrepancies include local temperature differences, small sample depth in the early part of the reconstructions, and/or juvenile effects. Regardless, the agreements among reconstructions indicate the potential to develop a large tree-ring network to reconstruct temperature over the southeastern China. However, generally weak temperature signals in tree-ring chronologies at small spatial scales mean that special data analyses methods might be needed.

Palaeoclimatology; tree rings; temperature; Southeastern China

Simulating Climate Change Impacts on Rice Yields Using Oryza v3.0 Model in the Sichuan Basin, China

Chenchen Xu

Institute of Geographic Sciences and Natural Resources Research, CAS, Beijing, 100101, P. R. China, xucc.14s@igsnrr.ac.cn

Abstract

The crop model is a suitable tool for assessing the climate change impacts on crop production. In this study, the Oryza v3.0 crop model was used to evaluate the impact of elevated temperature and carbon dioxide (CO₂) on rice (Oryza) yields and several adaptation measures effectiveness during future periods (2020s (2011-2040), 2050s (2041-2070), 2080s (2071-2099)) under the newly released Representative Concentration Pathway (RCP) 4.5 scenario in the Sichuan Basin, China. For calibrating and validating this crop model precisely, high-quality meteorological, soil and agricultural experimental data were evaluated.

The modeling results indicated a continuing rice yield reduction (6.5% in 2020s, 7.0% in 2050s and 14.5% in 2080s) in the future periods due to increased temperature. When considering the CO₂ concentration increases, rice yields decreased by 4.3% in 2020s, 5.2% in 2050s and 13.2% in 2080s, respectively, indicating that CO₂ fertilizer effect could mitigate but still not totally offset the negative impacts of climate change on rice yields. Moreover, it appears that the negative impacts on rice yields may be mediated by appropriate adaptive measures such as adjusting planting dates, switching rice varieties and breeding new rice varieties. Our results presented yield increases with various degrees for those adaptive measures. The experient findings presented here contribute to gain insight into the mechanism of rice yields to climate change and inform appropriate adaptive strategies.

Climate change; Oryza v3.0 model; adaptive measures; rice production; Sichuan Basin

Spatial Pattern of Recent Rainfall Trends in Serbia (1961–2009)

Lukovic J, Bajat B, Blagojevic D, Kilibarda M

University of Belgrade, Faculty of Geography, Belgrade, 11000, Serbia jlukovic@gef.bg.ac.rs

Abstract

This study examines a spatial pattern of annual, seasonal and monthly rainfall trends in Serbia. The study used data from 63 weather stations between the periods of 1961–2009. The rainfall series was examined by applying the nonparametric method of the Mann–Kendall test and Sen’s method to determine the significance and magnitude of the trends. Significant trends have not been detected for the whole country at an annual scale. Seasonal trends at the confidence level of 97.5 %, however, indicate a slight decrease in winter and spring precipitation and an increase in autumn precipitation. Results for monthly rainfall trends also generally showed a nonsignificant trend with the exception of a negative trend in May and positive trend for October. To visualize rainfall trends web mapping techniques were in terms of *plotGoogleMap* package. Further spatial analysis has incorporated a spatial autocorrelation statistic (Moran’s I) that indicated a random spatial pattern of rainfall trends on annual, seasonal and monthly timescales with exceptions for March, June and November. Overall, results suggest that only weak, mostly nonsignificant trends are present in Serbia in the period 1961–2009. In addition to this, the spatial pattern of relationships between rainfall in Serbia, and the North Atlantic Oscillation (NAO) for the has been examined too, suggesting a strong impact of a large scale atmospheric mode throughout a wet season in Serbia. Moran’s I indicated significant clustering at all temporal scales.

Tree-Ring Recorded Drought Variability on the Tibetan Plateau over the Last Millennium

Xiaohua GOU, Yang DENG

Key Laboratory of Western China's Environmental Systems (Ministry of Education), School of Earth and Environmental Sciences, Lanzhou University, Lanzhou 730000, China

Email: xhgou@lzu.edu.cn

Abstract

Tibetan Plateau is the headwater region of Asia major rivers, knowledge about its hydroclimate variability is very important for ecological conservation, water resource management and social development. Radial growth of trees in this region is generally limited by moisture, especially that at May and June, which is supported by correlation analysis, model simulation and Intra-annual radial growth monitor. Thus, tree-ring data in this region have the potential to provide information on hydroclimate variation. Tree-ring data were used to reconstruct the streamflow variation of the Upper Yellow River over the last 1234 years, and the drought variation of the Eastern Qilian Mountains during the last millennium. These reconstructions are generally synchrony with other millennium-long moisture sensitive tree-ring chronologies and other type of proxy data from the northeastern Tibetan Plateau. The latter 15th century drought is the most prominent feature in these reconstructions, and was prevalent in the northeastern Tibetan Plateau and nearby regions. The leading mode of drought variation for the eastern and western part of the high Asia have been reconstructed, and asynchronism in drought variation were found between these two regions. The point-by-point reconstruction method is also applied to reconstruct the May–July drought variation at each grid point in the eastern Tibetan Plateau, which has well captured the spatial and temporal feature of regional drought variation. The drought variation in the south and north of 32.5°N shown notability difference, and with the drought variation in the northeastern Tibetan Plateau may have been influenced by the solar activity.

Tree-ring; drought variability; Tibetan Plateau; last millennium

Unusual Heavy Rainfall in 1868 Observed by J.C. Hepburn at Yokohama

Hirano J, Mikami T, ZAIKI M, NISHINA J

Teikyo University, Tokyo, Japan, jhirano06@gmail.co.jp

Abstract

Reliable meteorological data in the past is essential to investigate features and mechanism on long-term climate variations in detail. In Japan, official meteorological observation by the Japan Meteorological Agency (JMA) has been started in the 1870s. Recent climate data rescue activities in Japan have recovered several old pressure and temperature instrumental series prior to the JMA observation. However, a few precipitation series have been recovered until recently. We have newly found out monthly precipitation data series 1863-1869 observed at Yokohama city, near Tokyo. This series was observed by an American Christian missionary, J.C. Hepburn. A table of meteorological data is presented in bulletin of the Asiatic Society of Japan entitled "The transactions of the Asiatic Society of Japan". This series includes monthly maximum, mean, minimum temperature, monthly precipitation, and number of rain days for each month. By investigating monthly precipitation series, we have detected unusual heavy rainfall during May to September of 1868. We consider that this unusual rainfall was reliable because frequent heavy rainfall during warm season of 1868 were reported in several historical weather documents around Tokyo. We consider further studies are needed to clarify possible cause and spatial extent of this unusual heavy rainfall.

Wet Stages Indicated by the High Levels of the Daihai Lake in Inner Mongolia over the Past 2000 Years

Fang X Q, Lian PL, Ye Y, Wei X Q

School of Geography, Beijing Normal University, Beijing, P.R. China, 100875, xfang@bnu.edu.cn

Abstract

The Daihai Lake in Inner Mongolia is an inland lake located in the semiarid area as well as the margin of summer monsoon climate. Based on the ancient shorelines of the Daihai Lake identified out in the field and dated by calibrated ^{14}C age, 13 steady high lake level stages during the past 2000 years were reconstructed. The high level stages were compared with wet/dry periods of the sub-regions of monsoon climate in eastern China. The main conclusions are as follows. (1) The heights of the high lake levels decreased in general with fluctuations during the past 2000 years. There are 2 high lake level periods around cal. 2027—2055aBP and 689—1173aBP, and 2 low lake level periods around 1294—1709aBP and since cal. 689aBP in the Daihai Lake. (2) The high level stages in the Daihai Lake indicated the wet climate, when were the warm or relative warm periods in China on centennial scale. It means that precipitation increased in warm period in the marginal zone of summer monsoon on centennial scale over past 2000 years. (3) The high lake level stages in the Daihai Lake were basically the periods when the East Asian summer monsoon was relatively strong and stable.

A Review of Rapid Climate Change in China Around 5500 Years before Present

Mei Hou

Institute of Geographic Sciences and Natural Resources Research, CAS, Beijing, 100101, P. R. China,
houm.15s@igsnr.ac.cn

Abstract

We present an extensive review of the eye-catching “5.5 ka” event identified in different parts of China based on multi-proxies record from lacustrine sediment, speleothems, ice core, peat core, giving deeper sight into this abrupt climate event. The majority of records show an abrupt shift to cold and dry climatic conditions superimposed on the slow trends attributable to orbital forcing, however a wetter environment is recorded in several westerlies-dominated sites. Its onset and duration are slightly different from site to site due to local climate system responding to regional climate variations and the resolution of proxy under examination. The abrupt environmental shift is significantly interest of researching, as accompanied by abandonment of nomadic lifestyles and rapid development of the world’ s first civilization of large, complex, organized societies forming. This abrupt climate event is globally widespread rather than regional phenomenon, consistent with the minor variations in solar radiation reaching the Earth. But it is likely that small solar radiation variations lead to changes in atmospheric or oceanic circulation that amplify this initial input affecting summer monsoon in China. The climate mechanism and further understanding of this abrupt climate change still need the development of high-resolution palaeoclimate studies and climate modelling.

Advances in the Study of Radiative Forcing Due to Black Carbon from Land Use and Land Cover Changes in Kenya

Mbithi D. M, Prof. Muthama J. N, Prof. Ininda J. M, Dr. Onwonga R.

University of Nairobi– Ph.D Thesis Scholar, Department of Meteorology, Nairobi, Kenya, mbithi_d@yahoo.com

Abstract

The study aims to review studies about radiative forcing due to black carbon (BC) associated with land use land cover (LULC) activities over Kenya. Black carbon aerosols can strongly absorb solar radiation in very broad spectral wavebands, from the visible to the infrared. As a potential factor contributing to global warming, BC aerosols not only directly change the radiation balance of the earth-atmosphere system, but also indirectly affect global or regional climate by acting as cloud condensation nuclei or ice nuclei to alter cloud microphysical properties. Here, recent progresses in the studies of radiative forcing due to BC and its climate effects over Kenya are reviewed. Current methods of estimating BC and corresponding radiative forcing are also investigated.

An EEMD and BP Neural Network Hybrid Approach for Modeling Regional Sea Level Change

He L^{1,2}, Li GS³

¹ Ministry of Education Key Laboratory of Poyang Lake Wetland and Watershed Research/School of Geography and Environment, Jiangxi Normal University, Nanchang, 330022, P. R. China, hlei1986@163.com

² School of Geography and Environment, Jiangxi Normal University

³ Institute of Geographic Sciences and Natural Resources Research, CAS, Beijing, 100101, P. R. China

Abstract

Sea level prediction is essential and complicated in the context of climate change. Conventional methods developed for the prediction are still considered insufficient due to the complexity of the nonstationary and nonlinear sea level change. To improve the prediction accuracy of the sea level, this paper proposed a methodology combining the ensemble empirical mode decomposition (EEMD) and the back propagation (BP) neural network. The results show that the EEMD can extract the signals with physical meanings according to their unique frequencies. The inputs of the BP, defined by the preprocessing of the original time series, turn out to be smoother and more regular, influencing the prediction in a positive way. The good performance of the hybrid method, with higher correlation coefficient ($R=0.89$) and lower root square mean error ($RMSE=28.16\text{mm}$), suggest an improved accuracy on sea level prediction than using the BP directly (with $R=0.76$ and $RMSE=36.74\text{mm}$). This hybrid method can be further applied to sea level prediction in other region. The results of the study also suggest that the preprocessing of the original time series such as smoothing and denoising is significantly improving the prediction.

Analysis of Future Climate Scenarios over Central Uganda Cattle Corridor

Nimusiima Alex

Department of Geography, Geo-Informatics and Climatic Sciences, Makerere University, Uganda,
animusiima@gmail.com

Abstract

The study employed a Regional Climate Model (RCM), Providing Regional Climates for Impact Studies (PRECIS), to examine the future climate scenarios over the central Uganda cattle corridor districts. The study was guided by two questions (1) what are the projected temperature and rainfall values for the central Uganda cattle corridor in relation to IPCC SRES A2 and A1B for the near future (2021-2050) and far future (2051-2080)? (2) How do these projections compare with the Representative Concentration Pathways (RCPs) in the same area for the same period? RESULTS: SRES A2 and A1B project annual temperature increase of 2.5 to 4.4 °C in the near future and 4.5 to 6.0 °C in the far future relative to the 1981-2010 respectively. The same trend is observed for RCP 4.5 and RCP 8.5 but the increments are lower. Projections for rainfall show a slight increase in annual rainfall in both SRES and RCPs. However more rainfall is projected for the second rainfall season of September to November compared to the usual known season of March to May (MAM). The projections also show a shift in rainfall with the usual dry season of December to February (DJF) now becoming wetter than the 1980-2010 average

Analysis of the Temporal and Spatial Variation Characteristic of Precipitation in the Lancang River Basin over the Past 55 Years

Chen Sujing^{1,2}, Li Lijuan¹, Li Jiuyi¹, Liu Jiaxu^{1,2}

¹ Key Laboratory of Water Cycle and Related Land Surface Process, Institute of Geographic Sciences and Natural Resources Research, Chinese Academy of Sciences, Beijing 100101, China;

² University of Chinese Academy of Sciences, Beijing 100049, China

Abstract

Based on the monthly precipitation data of 30 meteorological stations in and surrounding the Lancang River basin, we analyzed the temporal and spatial characteristics of precipitation from 1960 to 2014 using the climate tendency rate and Mann Kendall trend test, Morlet wavelet analysis, interpolation co-Kriging, and the gravity center model methods. The results showed that (1) in the analysis period, the precipitation in region, northern and central showed rising trend, but decreasing trend in southern precipitation occurred. The region, northern, central and southern precipitation showed an increasing trend in spring, while in summer showed a decreasing trend. In autumn, there was a decreasing trend of precipitation in the region and in the south. The northern and central parts of the region were increasing. The precipitation in the region, the middle and the southern showed a downward trend in the winter except the northern. (2) There were 29 years, 22 years and 5~10 years cycles in the region including northern, central and southern precipitation in the past 55 years. The three cycles in the analyzed period performance was very stable, with a domain-wide. There were still significant period of about 13 years in the region, north and south. Before the middle of 1975, and after 1995 there was also a period of about 13 years in the central area. In the north area before 1975 and 1995 years later, there was a 7~10 year cycle. The first main period of precipitation was 29 years, and the second main cycle was 22 years. (3) The average annual precipitation decreased in the Lancang River basin from the south to the north. The precipitation in the southern basin was most, with average precipitation in more than 1200mm. The average annual precipitation in the middle was 800~1100mm, while the average annual precipitation in northern part was usually less than 800mm, mostly in 400~800mm; the annual and monthly precipitation gravity center of the Lancang River Basin were concentrated in the central region. The precipitation gravity center of November had the largest migration distance, which migrated to southeast with 131.82km. From the seasonal point of view, spring, summer and autumn precipitation gravity center migrated to the southeast, while, migrated to the northwest in winter. The precipitation gravity center in rainy season relatively concentrated, the situation in dry season was relatively dispersed.

Assessment of Impacts of Climate Change on the Water Resources of the Transboundary Jhelum River Basin, Pakistan and India

Rashid Mahmood, Shaofeng JIA

Institute of Geographic Science and Natural Resources Research / Key Laboratory of Water Cycle and Related Land Surface Processes, Chinese Academy of Sciences, Beijing, 100101, China, rashi1254@gmail.com

Abstract

Pakistan's economy is significantly reliant on agriculture. However, Pakistan is included in the most water-stressed countries in the world and its water resources are considerably vulnerable to climate variability and climate change. Therefore, in the present study, the water resources of the Jhelum River basin, which provides water for 6 million hectares of land of Pakistan and hydropower production, were assessed under the scenarios of HadCM3 (A2 and B2). The HEC-HMS (Hydrologic Engineering Center-Hydrologic Modeling System), a hydrological model, was developed for the Jhelum basin and streamflow was simulated for the period of 2011–2040, 2041–2070 and 2071–2099 and compared with baseline (1971–2000) to find out the changes in different indicators i.e., mean flow, low flow, median flow, high flow, temporal shift in peaks, and center-of-volume dates (CVDs). An average annual flow of 34–37% was projected to rise in the basin under both scenarios. Summer and autumn showed noticeable increase in streamflow, but spring and winter showed decrease at most of the sites. Autumn showed more than 100% increase in the basin. Low and median flows would increase in the basin, but high flow was likely to decline in future under both scenarios. Peak flows were projected to shift from Jun to July in the future, and CVDs showed delay about 9–17 days in the basin, under both A2 and B2. On the whole, the Jhelum basin would face great temporal and magnitudinal variations in high, low and mean flows. This shows that without consideration of climate change impacts, it will be relatively more difficult for proper water resources' utilization and management in the basin.

Changes in Rainfall Distribution in the State of São Paulo, Brazil

Gabriel, G.H., Nunes, L.H., Marengo, J.A.

University of Campinas – UNICAMP, Campinas, Brazil, guihg@hotmail.com

Abstract

Part of an international consortium (Metropole, Belmont Forum, Fapesp Proc. 2012/51876-0 and 2015/11035-5), the study aimed to identify recent changes in the rainfall pattern in the state of São Paulo. One of the 26 Brazilian states, São Paulo alone concentrates 22% of the population and accounts for 32.1% of the Brazilian GDP, so that any change in the precipitation pattern might impact not only the state, but the whole country. Rainfall in the area presents high natural variability and contrasts due to the complex arrangements of physical features, atmospheric and oceanic dynamics and geographical position. Summer precipitation is highly convective and modulated by the South Atlantic Convergence Zone, while during winter precipitation occurs as a result of outbreaks of cold polar air interacting with the warm air associated with the permanent Tropical South Atlantic High.

Parametric statistics and percentile analyses were combined to evaluate changes of precipitation distribution along 40 years at annual and seasonal bases, considering 79 rain gauges spread over the state. Spatial distribution of the shape and the scale parameters of the gamma distribution and the 95th percentile were applied for two periods compared between them: 1973 to 1992 and 1993 to 2012. Results indicated consisted changes in both the rainfall distribution and in the values of extreme events, with an increase in the irregularity of rainfall distribution and a raise in the number of extreme events, patterns which might be related to remote teleconnections beyond the local and regional scales.

Rainfall variability; Climate Change; Extreme Events; Gamma Distribution

Changes in Storminess in the Northeastern Baltic Sea Region During the Holocene: a Case Study from Coastal Areas of Estonia

Vaasma T, Vandel E, Sugita S, Tõnisson H, Vilumaa K, Anderson A, Pensa M, Kont A,

Terasmaa J, Kangur M, Küttim L, Küttim M, Puusepp L

Institute of Ecology, Tallinn University, Tallinn, Estonia, vaasma@tlu.ee

Abstract

This project aims to reconstruct the late-Holocene changes in storm regimes and evaluate their effects on the coastal evolution, vegetation and land use in Estonia. We present preliminary results of the changes in mineal matter contents, especially aeolian sand, preserved in coastal bog sediments as an indicator of the past storminess in the region. Four peat bogs were cored along the coastal areas of Hiiumaa and Saaremaa islands in the west and at Juminda Peninsula in the north. The sediment chronologies are established with >70 AMS dates in total. In the west, (1) high peaks of aeolian sand occurred at ca. 3500, 3000 and 2500 cal yrs BP at Hiiumaa, and 2100, 1600 and 1000 cal yrs BP at Saaremaa, indicating strong storm events, (2) mineal matter contents declined gradually and consistently from the beginning of the bog formation until 1500 cal yrs BP, suggesting the increased distance from the shoreline due to the isostatic land uplift, and (3) concentraion of aeolian sand was relatively high over the last 500-700 years, indicating the period stormier than the previous millennia. In the north, the mineral matter contents are consistently low (< 2% in weight) over the last 8000 years, and significant peaks of aeolian sand are rare. The dissimilarities in the results reflecting past storminess among sites suggest that site-specific characteristics, such as the exporuse to open sea, and changes in the directions and magnitude of storm winds are the main factors affecting the coastal environments.

Key words:

past storminess; aeolian sand in bog sediments; coastal environment dynamics

Climate Significance of Tree-ring Stable Carbon Isotope of *Pinus massoniana* in Southeastern China

Zhao Y

School of Geography Science, Nanjing Normal University, Nanjing 210023, China, zhaoyesi@126.com

Abstract

There is still lack of knowledge about the climate significance of stable carbon isotope ($\delta^{13}\text{C}$) of tree-rings in southeastern China. In this study, $\delta^{13}\text{C}$ of tree-rings obtained from *Pinus massoniana* in Jiuling Mountain of Jiangxi Province, southeastern China, were analyzed with instrumental meteorological data for the period of 1964-1983. The results indicate that: (1) the first principle of $\delta^{13}\text{C}$ ($\delta^{13}\text{C}_{\text{PC1}}$) can effectively represent the common signal of regional tree-ring $\delta^{13}\text{C}$ variation; (2) Correlation analysis shows that $\delta^{13}\text{C}_{\text{PC1}}$ is significantly negatively correlated with the August-September precipitation and SPEI index and positively correlated with the August temperature; (3) The transfer function for August-September precipitation based on $\delta^{13}\text{C}_{\text{PC1}}$ reaches the significant level and can represent the large part of the middle-lower reaches of Yangtze River; (4) The impact on the regional August-September precipitation posed by sea surface temperature and Pacific Decadal Oscillation can also be reflected in the $\delta^{13}\text{C}_{\text{PC1}}$ series; (5) The $\delta^{13}\text{C}_{\text{PC1}}$ is well correspond to the regional mean drought index during the summer-autumn with a significant positive correlation. In all, it is capable to reconstruct and analysis the past information of summer-autumn drought based on the tree ring $\delta^{13}\text{C}$ of *Pinus Massoniana* growing in Jiuling Mountain of Jiangxi province.

Climate Variability in the Iberian Peninsula Since 1700 AD Inferred from Tree-ring Records and Documentary Sources

Tejedor E, de Luis M, Barriendos M, Saz MA, Cuadrat JM

Environmental Research Institute of Aragon (University of Zaragoza) Pedro Cerbuna 11, 50009, Zaragoza, Spain

imcuadrat@unizar.es

Abstract

The IPCC report (IPCC, 2013) highlighted a likely increase of average global temperatures in upcoming decades, and pointed particularly to the Mediterranean basin, and therefore in the Iberian Peninsula (IP), as a region of substantial modelled temperature changes. Therefore, it is particularly important to study the evolution of the climate to be able to predict the future climate with greater accuracy. In this communication, we present a new climatic database for the northeast of the Iberian Peninsula based on tree-ring records, documentary sources and instrumental data. On the one hand almost 800 tree-ring width series from oldest trees in the study area (*Pinus uncinata*, *Pinus sylvestris* and *Pinus nigra*) have been analysed extended back to 1510 AD. We generate a new standardization method which maximizes the inter-annual to multicentennial tree-ring width variability and develop a new maximum temperature reconstruction for the Iberian Peninsula. On the other hand, the documentary records of 16 locations within the Ebro Valley have been carefully examined to identify the so called 'rogations'. In continue periods of severe droughts or wet event rogations were made to ask God for rain or to stop it. We identified 3 levels depending on the importance of religious acts which, in turn, identified the severity of the drought or wet event. A drought index has been developed within these documentary sources and for the first time tree-ring records, documentary sources and instrumental data have been combined to study the evolution and trends of the northeaster Iberian Peninsula since 1700 AD.

Climate Warming in Southern Romania in the Past Half Century. Spatio-temporal Analysis and Assessment of Some Economic and Ecological Consequences

Prăvălie R.¹, Bandoc G.¹, Dragomir E.¹

University of Bucharest, Faculty of Geography, Center of Coastal Research and Environmental Protection, 1 Nicolae Bălcescu str., 010041, Bucharest, Romania, pravalie_remus@yahoo.com

Abstract

Climate changes, especially global warming, currently represent a critical global environmental issue. This study's first phase covers the temporal analysis (between 1961 and 2009) of the air mean temperatures ($T - ^\circ\text{C}$) recorded by 23 meteorological stations located in southern Romania, the country's region which is at present the most drastically affected by climate change. Thus, by using well established statistical instruments, T trends were analyzed on annual and seasonal scales, and for the main agricultural crops' growing seasons (maize and wheat). The second phase was based on the impact analysis of T dynamics on economic (agricultural) systems, considering the case study of maize yields (t/ha/yr) recorded in the 1991-2000 decade. The paper's last phase covers the analysis of certain ecological consequences, and consists of the case study analysis of the ecosystems' phenological changes. The climatic results indicated a general progressive climate warming on all analyzed temporal scales, especially over the past three decades (maximal T increase rates were recorded in summer, i.e. $0.09 ^\circ\text{C/yr}$, or $2.5\text{--}3 ^\circ\text{C}$ net warming). The agro-climatic analysis indicated that, in 83% of the study area (which totals $> 60000 \text{ km}^2$), a $1 ^\circ\text{C}$ T increase determined maize productivity losses of up to 1.7 t/ha/yr . Ecologically, considering the example of the 1991-2009 interval in relation to the climatic setting of 1961-1990, it was noticed that climate warming is responsible for significant disparities (even more than 50%) between the various phenophases' periods, especially for flowering, fruit development, and fruit ripening.

Climate warming; Romania; impact; agricultural crops; phenological changes

Climatic Characteristics of Dry and Wet Season in the Southeast Side of the Tibetan Plateau under Southwest Water Vapor Channel and Its Causes

DUAN Wei, DUAN Xu

Yunnan Institute of Meteorological Sciences, Kunming, 650034, P. R. China, duanwain@hotmail.com

Abstract

Based on the monthly precipitation and evaporation data from 139 meteorological stations in the southeast side of the Tibetan Plateau and NCEP reanalysis data with $2.5^{\circ} \times 2.5^{\circ}$ spatial resolution, the characteristics of dry and wet season and its causes in the southeast side of the Tibetan Plateau were analyzed by diagnosing the seasonal water vapor flux, distribution of total atmospheric precipitable water and water vapor divergence. The results showed that there were the southwest water vapor transports in four seasons in the southeast side of the Tibetan Plateau, and that in winter and spring were still strong. However, the water vapor divergence existed over the southeast side of the Tibetan Plateau in four seasons, which wasn't conducive to the occurrence and sustaining of precipitation, especially were stronger and broader in winter and spring. Meanwhile, the atmospheric column in the southeast side of the Tibetan Plateau was shorter than the surrounding area under the influence of plateau topography, which leded to the total atmospheric precipitable water less than the surrounding area, and the seasonal variation of total atmospheric precipitable water was obvious, that in winter and spring was only 1/3 to 1/2 of the summer. Therefore, the seasonal drought in the southeast side of the Tibetan Plateau was subject to the less total atmospheric precipitable water and stronger and boarder water vapor divergence in winter and spring.

Estimation Dynamics Change of Temperature of Atmospheric Air in Context of Climate Change in Syunik Region of the Armenian Republic

Margaryan V.G.

Yerevan State University, Faculty of Geography and Geology, Department of Physical Geography and Hydrometeorology, Yerevan, Armenia, vmargaryan@ysu.am

Abstract

The goal of this work is to clarify and analyze the dynamics change of annual air temperature, estimate the vulnerability and risk of studying territory. For solving of these problems as a theoretical base are conformable studies, especially, work about climate change. As a methodological base has been used in the work: general scientific, characteristic, analyses, statistical analyses, mathematic, extrapolation and correlation methods. As a basic material have been used actual data of air temperature (1935-2014) of meteorological station of Syunik, which are kept in the Armstatehydromrt.

Researchers showed that during last 80 years in studying area observed an increase of average annual values of air temperature, which is 0,2-1,2 °C. Maximum value of variation of air temperature observed in 2010 and was 1, 9-2, 5 °C. This year is the hottest year during all period of observation in the republic, and in Syunik also. In this region was observed absolutemaximum temperature of Armenia (43, 7 °C, Meghri), which observed in 31 of July in 2011. It is on 0, 7 °C exceeds to observed values in past.

In study area predicts an increasing of average annual temperature to norm: in 2030 - 0,04-0,17 °C (or 0,58-6,18 %), in 2050 - 0,09-0,36 °C (1,32-13,1 %), in 2070 - 0,14-0,54 °C (2,05-19,6 %) and 2100 - 0,21-0,82 °C (3,07-29,8 %). Vorotan pass and Kapan regions are more vulnerable and risky to air temperature.

So, in Syunik will observe continuous increasing of average annual values of air temperature. Is necessary to work out and realize complex arrangements for softening of effects.

Key words:

Air temperature; dynamics change; increase; realize complex arrangements; softening of effects; Syunik; the Republic of Armenia

Exploring Spatio-temporal Patterns of Rainfall Using Co-clustering Algorithm

Shulin Deng^{1,2,3}, Manchun Li^{1,2,3,*}, Yanming Chen^{1,3}, Lei Ma^{1,2,3},

¹ Jiangsu Provincial Key Laboratory of Geographic Information Science and Technology, Nanjing University, Nanjing, 210093, China

³ GEOGRAPHIC AND OCEANOGRAPHIC SCIENCES, Nanjing University, Nanjing 210093, China

Abstract

Exploring the spatio-temporal patterns of rainfall is important for understanding of water cycle and evaluation of flood and drought risk. Currently, many researches mainly focus on using statistics and interpolation methods to analyze the spatio-temporal patterns of rainfall. However, these methods can just separately analyze spatial or temporal patterns of rainfall. In this study, the method of integrating a co-clustering algorithm, Bregman block average co-clustering algorithm with I-divergence (BBAC_I), which can analyze the spatial and temporal patterns of station based rainfall data simultaneously, and two geo-visualization technologies (Heatmap and Small multiples) was proposed to explore and visualize the spatio-temporal patterns of rainfall. A case study of analyzing the spatio-temporal patterns of rainfall in Guangxi of China, which is based on daily rainfall data collected at 77 rain gauges from 1981 to 2010, was carried out to testify the validity of this proposed method. The results show that (1) stations categorized into each station cluster are geographically adjacent and years/months with different rainfall patterns can also be classified automatically using BBAC_I algorithm, (2) Heatmap and Small multiples can visualize co-clustering results of rainfall successfully. This study proves that may be BBAC_I algorithm is another effective method for analyzing spatio-temporal patterns of rainfall.

Co-clustering; rainfall; geo-referenced time series; spatio-temporal patterns

Impact of Climate Change and Extremes on Ecosystem in Hubei Province, China during 1951-2015

Dongmei Li, Lunche Wang, Chunju Huang

School of Earth Sciences, China University of Geosciences, Wuhan, 430074, P. R. China, huangcj@cug.edu.cn

Abstract

Terrestrial ecosystems and the climate system are closely coupled. As an essential component of terrestrial ecosystems, vegetation plays an import role in global change, net primary productivity (NPP) is most widely used ecological indicators to understand the carbon cycle and to evaluate the sustainable development of terrestrial ecosystems. In this paper we use meteorological date at 35 stations in Hubei province, China during 1951-2015 to investigate the climate change, and the result shows that temperature is increased 1.2°C at a rate of $0.13^{\circ}\text{C}/\text{decade}$, while the precipitation shows a fluctuating trend. Here, we based on improved CASA (Carnegie-Ames-Stanford Approach) model, using MODIS as remote sensing date to establish the model to estimate the NPP in Hubei province, China during 2000-2015, it's discovered that NPP is increase at the rate at 1 TgC/y per year. In order to reveal the ecological response to the climate in Hubei province and find the dominant factors that driving NPP change, we analyses the correlation between climatic parameters and ecological indicators, the result indicate that air temperature and precipitation are the main factors to drive the NPP change, while the precipitation shows a stronger effect on the NPP than air temperature in Hubei province. And we also compare the NPP between the period of extreme climate events and normal year to analysis the impact of extreme climate events on NPP in Hubei province.

Key words:

Climate change; ecological response; CASA model; NPP; correlation analyses; extreme climate events

Issues of land degradation in the Darhad Depression, Mongolia

Enebish B¹, Dagvadorj Ts²

¹National University of Mongolia, bayarjargal_e@yahoo.com

²University of the Humanities, Mongolia

Abstract

The paper describes multi-year trend of climatic factors such as mean air temperature, precipitation amount, evaporation and aridity index which highly affect to land degradation in the Darhad Depression. Also, changes of a number of livestock and its composition were discussed. Air temperature during the warm season (May-September) increased by 1.70C with a rate of 0.040C per year in the Darhad Depression between 1974 and 2014. This increase has been occurred more intensively since 1994. As seen this result, global warming is occurred in the Darhad Depression clearly. The maximum temperature was recorded as 34.90C in the air and 62.00C at surface. Annual total surface evaporation is increased by 85 mm with a rate of 2.1 mm per year in the Darhad Depression.

Khuvsugul forest area is rich by larch and willow. In the last years, soil degradation has been increasing due to warming and aridity. Furthermore, major reasons of land degradation are extending sand area, and degenerate new sand area. Pasture carrying capacity exceeds since a number of livestock increased and composition of herds escaped and it is one of the main causes for land degradation.

Key words:

Climate change; Darhad Depression; land degradation; pasture carrying capacity

Mineralogical Evidence of the Existence of Two Mass Sources along a Traverse Route from Zhongshan Station to Dome a, Antarctica

Zhou, L. Y.¹, Zhang, W.¹, Hou, S.¹, Li, Y. S.², Pang, H.¹

¹Key Laboratory of Coast and Island Development (Nanjing University), Ministry of Education, Nanjing University, Nanjing, 210093, China, liyazhou@nju.edu.cn

²Polar Research Institute of China, Shanghai, 200129, China

Abstract

In the Antarctic summer of 1998/1999, the third Chinese Trans-Antarctic inland scientific expedition successfully entered Dome A area and extended its research to the site of 79°16'S, 77°00'E, 3,931 m.a.s.l., 1,128km away from Zhongshan station. In former studies, we have presented the results of chemical analysis of surface snow samples collected from the traverse route. These results provide an evident transitional site (DT263, 76°32.5'S, 77°1.5'E, and 2800 m.a.s.l.) approximately located at 820km away from Zhongshan Station with the elevation of 2800m. Meanwhile, climatic record study of an 80 meter ice core drilled at this site also suggests the site is influenced by interaction of maritime and continental climates.

By using scanning electron microscopy equipped with energy dispersive X-ray detector, analyses the individual particle characteristics and mineral composition of insoluble particles in surface snow along the same traverse route. It is revealed that the insoluble particles are mainly composed of "Si-rich" particles with the irregular shape. The content of "Si-rich" particles in surface snow collected from high altitude region is high, but that in surface snow collected from low altitude region is relatively low. This difference is due to atmospheric circulation. The high altitude region is affected by large-scale circulation with longitude-direction, and that insoluble particles in surface snow come from faraway sources. The low altitude region is mainly affected by strong cyclones at peripheral region of the ice sheet, and insoluble particles mainly come from coastal area. The demarcation area is approximately equivalent to the transitional site discovered by our former studies. This further confirms the existence of the transitional site.

³ Assistance Professor, Department of Geomorphology, Faculty of Literature and Humanities, University of Urmia, Urmia, Iran

Abstract

Maharloo Lake as one of the great lakes located at southwestern Iran near Shiraz station is currently facing the threat of drought. It is worth noting that the lake dryness could affect the surrounding areas including the changes in Aridity Index (AI) component and indirectly affect the quality of access to water resources over the region. In this study, TAPM software was used to simulate, high-water scenario (the real condition of the lake) and drying lake scenario. In addition, the aridity index for Shiraz city which is located in the vicinity of the lake was changed. Actual daily data (1965-2014), monthly aridity index trend of the city was collected and analyzed for verification purposes. According to the long-term observations, it was shown that there is a declining trend for the aridity index among different months. Significant increase of about $r = 0.26$ can be seen during November only. Based on dry scenario, it was found that at most months with increasing temperature and decreasing precipitation will come from the other side. During summer, the lake experienced a significant decrease in rainfall. The Simulation showed an increasing AI values for both scenarios during all months of the year. More significant increase was seen during cold season. Increasing AI value implies wetter conditions in the region. Global warming and its opposite effects on arid and semi-dry areas like Lake Maharloo and Shiraz station, it is expected that Maharloo Lake will experience a drying condition, decrease precipitation and increase in temperature.

Perturbation Characteris of the Carbon Flux Change in the Poyang Lake Wetland

Tao Yang, Lili Wang

Key Laboratory of Poyang Lake Wetland and Watershed Research, Ministry of Education, Jiangxi Normal University, Jiangxi, 330022, P. R. China, youngspigger@163.com

Abstract

Location as well as the tight river-lake bond contribute the unique lake wetland ecosystem. Based the Flux data observed in southern rim of Poyang lake (April to August in 2015). These are founded: 1) Sunny and windless days with shallow water are the best CO₂ flux observation time, which is July 9th to 15th during the stuy period. On the contrary, Bad weather and the low amount may cause bad signal strength of the flux observing equipment, which is August 9th to 31th. 2) During April to August, from midnight to 3 o'clock, signal strength shows better than other time in a day. Before sun rises and after sun falls always be the low CO₂ flux signal strength. Air humid might be the cause of this phenomenon.

Poyang Lake Wetland; Flux Observation; Signal Strength

Remote Response on the two Types of El Niño in Coupled Model Intercomparison**Project Phase 5 models**

Zheleznova I.V., Matveeva T.A., Gushchina D.Yu.

Lomonosov Moscow State University, Moscow, Russian Federation, ijeleznova@gmail.com

Abstract

El Niño - Southern Oscillation is one of the most drastic climate anomalies occurring in tropical regions of our planet. Researches of the last decade revealed that there are two different types of El Niño (Central Pacific and Eastern Pacific), and the effect of these two phenomena on meteorological anomalies differs significantly. The impact of El Niño is primarily manifested in the anomalies of temperature and precipitation, whereas disturbances in the circulation of the major atmospheric circulation cells are considered in less detail. These cells form the so-called “atmospheric bridges” providing a conduit for the transport of heat and moisture anomalies induced by El Niño outside the tropical Pacific.

The increase in global temperature determines the importance of studying the changes in the remote response mechanism on the two types of El Niño in the 21st century. However, not all climate models reproduce the correct structure of the El Niño teleconnections. The present study was carried out the validation of 20 models included in the project CMIP5. Validation allowed to define best models, which can be used for estimation changes of the El Niño teleconnections to various scenarios of climate warming in the 21st century. The study was supported by the Russian foundation for basic research (projects № 15-05-06693, 16-35-00394).

Research on Ecological Environment Stress Effect of the Urbanization Process in Xianning, Hubei Province, China

Tian Lixue

School of Geography Sciences, South China Normal University, Guangzhou, China, li-xue.tian@m.scnu.edu.cn

Abstract

With the rapid development of urban economy and the rapid increase of city population, the ecological environment stress effect of the urbanization process is increasingly prominent. The article is based on 2007-2012 statistical yearbook of Xianning City, Hubei Province, China, and two subsystems of urbanization development and ecological environment are established respectively. The principal components analysis (PAC) is taken to determine the comprehensive level of both systems, and to determine the relative changes during these years by comparing the comprehensive level of them. Regression analysis method is used to calculate the related indices between urbanization rate and ecological environment, such as discharge amount of sewage, production of solid waste and amount of exhaust emission, and to explore the urbanization concrete stress effect on the ecological environment, namely the concrete stress effect of urbanization development on the water environment, soil environment and atmospheric environment. Results show that there is linear correlation between urbanization rate and ecological environment. The increase of urbanization rate brings seriously negative impact on ecological environment. And based on this, the article makes some scientific suggestions for the coordinate development between urbanization process and ecological environment.

Abstract

This paper presents a precipitation interpolation method for the Loess Plateau using geographically weighted regression (GWR) and incorporating elevation and terrain roughness as variables. The method was applied to observation data collected at meteorological stations across the Loess Plateau. The mean annual precipitation in the Loess Plateau has varied between 125 and 760 mm in the last three decades. The assessment of the spatial distribution of precipitation revealed a general increase from northwest to southeast. The validation results for the four seasons suggested that the GWR-based interpolation method was more accurate than other methods. The mean absolute error of the GWR results was 36.4 mm, which was significantly lower than the classical and global regression interpolation methods. Additionally, we analyzed the spatiotemporal variation of annual and seasonal precipitation from 1981 to 2010. The results show precipitation in the second decade (1991–2000) was lower than in the first decade (1981–1990), but precipitation in the third decade (2001–2010) increased slightly. In general, precipitation in 1980s and 1990s was more variable, with an alternating occurrence of high and low precipitation years. The annual precipitation became stable in the 2000s with the exception of a high precipitation year in 2003.

Spatial Variability of Potential Evapotranspiration and its Climatic Drivers in the Northern Loess Plateau of China

Tingting Ning¹, Wenzhao Liu²

¹State Key Laboratory of Soil Erosion and Dryland Farming on the Loess Plateau, Institute of Soil and Water Conservation, Chinese Academy of Sciences and Ministry of Water Resources, Yangling, Shaanxi 712100, China, ningting2012@126.com

Abstract

Potential evapotranspiration (ET_0) is an indicator of atmospheric evaporative demand, it is necessary to investigate the spatiotemporal variation in ET_0 to explain the changes in hydrological cycle. However, the quantitative attribution of spatial variability of ET_0 is still a gap. Focused on the northern Loess Plateau of China, the spatial layers of ET_0 and four climatic factors (wind speed, U_2 ; solar radiation, R_s ; mean temperature, T_{mean} ; actual vapour pressure, e_a) were firstly generated using data from 34 stations; Then 30 points of each maps were sampled with an interval of 10 km along three transects to represent the spatial variation in ET_0 and four variables along the transects. Finally, using distance as an independent variable, the contributions of four climatic factors to the spatial variation in ET_0 were calculated by a differentiating method. The results illustrate that: In the direction of 110° E, ET_0 gradually decreased—then increased—and decreased again from north to south, and the dominant factors controlled the ET_0 variability were T_{mean} in first stage and U_2 in the other two stages; In the direction of 39° N, ET_0 gradually decreased—then increased from west to east, which were all controlled by U_2 ; From Wushen Banner of Inner Mongolia to Xi County of Shanxi Province, ET_0 showed a downward trend and the dominant factor was R_s . The above results implied that the dominant factor for the spatial variations in ET_0 differed for different areas.

The Research on $\delta^{18}\text{O}$ Change of Precipitation in Different Time Scales in Honghe Hani Rice Terraces

Yanxiaojing

Yunnan Normal University, Kunming, 650500, P. R. China, yanxiaojing407@163.com

Abstract

Based on the 161 precipitation samples collecting from the field trips in Honghe Hani Rice Terraces during July 2014 and December 2015, analysis $\delta^{18}\text{O}$ change of them from Malizhai River Basin in different time scales. The results showed that: under the day scale, $\delta^{18}\text{O}$ had the obvious amount effect and altitude effect; in the same rainfall, the more rainfall increased abidingly and the more amount increased, the less $\delta^{18}\text{O}$ changed; for a certain time one day, the entire day and several days, $\delta^{18}\text{O}$ values of precipitation showed a significant negative correlation to altitude, that was to say $\delta^{18}\text{O}$ values decreased with altitude increasing; under seasonal scale, during the rainy season, $\delta^{18}\text{O}$ values had a significant amount effect and temperature effect with no abnormal values; during the dry season, $\delta^{18}\text{O}$ value had no connection to amount of precipitation ;at the same time, it was no change in the law with the temperature increasing, and $\delta^{18}\text{O}$ values were at a higher value.

Tree-ring based December-February Temperature Reconstruction since 1718 for the Hengduan Mountains, southwestern China

Shi S, Li J, Shi J, Zhao Y, Huang G, Lu H

School of Geographic and Oceanographic Sciences, Nanjing University, Nanjing, 210023, P.R. China,

shisy23@foxmail.com

Abstract

Long and high-resolution proxy records containing cold season temperature signal are still scarce in southwestern China, limiting our understanding of the climate variability and its potential driving forces. In this study, we developed a 296-year tree-ring width chronology of *Pinus yunnanensis* Franch from two high altitude sites in Shangri-La, a hinterland of the Hengduan Mountains, southwestern China. The chronology showed a significantly positive response to winter (December-February) mean temperature during 1959-1998, however, the temperature sensitivity decreased afterwards. Hence, we reconstructed the December-February mean temperature for the period 1718-2013 based on the calibration period 1959-1998, during which the reconstruction accounted for 59.22% of the instrumental temperature variance. Spatial correlation analyses showed that our reconstruction represents large-scale regional temperature variations in southwestern China and eastern Tibetan Plateau (TP). The reliability of the reconstruction was confirmed by the comparison with other temperature reconstructions of nearby regions based on tree-ring or historical documents. Our reconstructed December-February mean temperature also showed a close association with the Atlantic Multidecadal Oscillation (AMO) over the past 3 centuries, indicating that AMO may be an important forcing of winter temperature variations over southwestern China.

³ Direction de la Climatologie. Météo France, France

Abstract

The aim of this study is to detect climate trends and variability from temperature and precipitation observations in Pyrenees range for the period 1950–2010 at seasonal and annual time scale. Within the framework of the Pyrenean Climate Change Observatory, OPCC, a cross-border database was created to obtain a global climatic diagnosis on the Pyrenees common to both sides of the mountain range. Sixty six long series of minimum and maximum monthly temperatures and one hundred thirty nine series of monthly precipitations were selected then homogenized by means of one single statistical tool HOMER (Action COST-ES0601).

Results showed a solid description of climate dynamics over the past six decades and provide an insight into the variability and climate change in the Pyrenees. Thus, an increase in temperatures of 0,2° C per decade on the whole mountain area was detected, with a significant rise during the last three decades. A more pronounced warming in summer than winter was detected since the 1950s. These results are largely consistent with those observed in neighbouring regions and the general trend of the climate in Western Europe. The analysis of precipitation trends indicates a high spatial and temporal variability. Small negative trends were found in annual and summer rainfall, but changes in precipitation are less consistent and the trends are generally weak.

Abstract

Climate is one of the most significant determinants of agriculture. Being a climate sensitive sector agriculture is extremely vulnerable to unfavorable climatic conditions. Climate change is an issue of great concern to an agrarian state like Chhattisgarh, where agriculture is the main source of livelihood for more than 60% of its population. The purpose of the study is to assess the impact of climate change on rice production in Raigarh district of Chhattisgarh, located between 21°9' N to 21°54'N latitude and 83° 4'E to 83° 24'E longitude. Agro – climatically it is the part Chhattisgarh Plain Region. Agriculture is mainly rain fed here. Only 28.5% area is irrigated. About 83% farmers belong to small and marginal categories, they are mainly dependent on monsoon rainfall for the agriculture. For the present study meteorological parameters such as rainfall, temperature for the last 30 years have been collected from Indian Meteorological Department and non- meteorological components like crop area, production, availability of irrigation facilities, fertilizers etc have been taken from Directorate of Economics and Statistics. The study has been analyzed by using running mean, least square technique and regression model. The study reveals that variation in temperature and rainfall pattern would affect the crop yield adversely and specially the effects of climatic variability is more vulnerable in case of majority of farmers belong to small and marginal categories.

Abstract

Chennai, formerly known as Madras is the fourth largest metropolitan area of India and the capital city of the Indian state of Tamil Nadu. The 2015 South Indian floods resulted from heavy rainfall generated by the annual northeast monsoon between 8th November to 14th December 2015. The monsoon affected the Coromandel Coast region of the South Indian states of Tamil Nadu and Andhra Pradesh, and the union territory of Puducherry. The city of Chennai particularly devastated by the flood. More than 421 people were reportedly lost their lives and over 18 lakh (1.8 million) people were displaced. With estimates of damages and losses ranging from ₹50000 crore (US\$7 billion) to ₹100000 crore (US\$15 billion), the floods were the costliest to have occurred in 2015, and were among the costliest natural disasters of the year. The flooding has been attributed to the El Niño phenomenon. Natural and complex disasters dramatically increase the morbidity and mortality due to communicable diseases. The present paper indicates the efforts taken to prevent the outbreak of diseases. Several measures were taken and the main objectives were management of population displacement, provision of temporary relief camps, provision of safe drinking water and sanitation, and health services for the population. These objectives were carried out by various methods like organizing Medical Camps, Chlorination of Drinking water, Solid Waste Disposal, prevention of sewer overflow besides control measures to prevent outbreak and spread of water borne and vector borne diseases. A native herbal decoction was provided to all the flood affected people to enhance their immunity against seasonal diseases.

Abstract

The characteristics of summertime heat waves (HWs) in South China were studied by using both observational and reanalysis datasets. We found that HW characteristics exhibit substantial increases throughout the study period (i.e., 1979-2010) in terms of the frequency of HW occurrence (0.34 per decade), number of HW days (2.81 days per decade), and severity (0.067 °C per decade). HWs derived from observational dataset exhibit even more substantial increases than that from reanalysis dataset. These increases in HW characteristics are more prominent in Pearl River Delta (PRD), i.e., the center and the most densely urbanized area of South China, and urbanization contributes no less than 25% in average to the increasing HWs frequency in PRD.

Synoptic characteristics and the associated atmospheric circulation patterns responsible for HWs in South China were also revealed. It is found that the westward movement of the western North Pacific subtropical high (WNPSH) should be responsible for HWs occurring in South China. When HW occurs, the region is covered by hot and dry atmospheric column. HWs are accompanied by anomalous high pressure and anticyclone, which blows northwesterly winds from the land to the sea, thus reducing the moisture transportation from ocean to the land and drying the atmosphere over the land. The evolution of the strengths of positive pressure center and high temperatures is reminiscent of the westward displacement of WNPSH, with a prominent positive anomaly in 500-mb height movement from east to west. We also showed that HW is linked to a planetary-scale wave train and the successive downstream development of this wave train is likely an indicative of Rossby wave dispersion. These features associated with HWs in South China also characterize the high temperature extremes in the whole region of South China and parts of Indochina Peninsula.

Extreme weather events; Heat waves; Climate change; South China; Urbanization

Modeling of Extreme Wind Velocities in The Western Sector of the Russian Arctic.

Platonov V., Kislov A.

Lomonosov Moscow State University, Faculty of Geography, Department of Meteorology and Climatology, Moscow, 119991, Russian Federation, vplatonov86@gmail.com

Abstract

Extreme winds in coastal areas has fine structure and are strongly depend on shoreline configuration and local land surface properties, especially in the Arctic. Therefore, correct simulation of these wind patterns is possible using high-resolution modeling only. It allows detailed reproduction of low-troposphere atmospheric flows and taking into account many boundary layer properties.

In this study, the climate version of COSMO model (COSMO-CLM) was used. It is well-known non-hydrostatic regional atmospheric model developed by German Weather Service (DWD) and CLM-Community. The COSMO-CLM model was applied for many case-studies simulation of the most extreme winds observed over the Russian Arctic basin during the last 15 years. These extreme cases were sorted out previously from observations samples, based on the 0.99 quantiles of Weibull and Pareto distributions, i.e. the wind speed exceeded 20 – 25 m/s. Three cases were presented for further modeling: 29 – 30.10.2000, 26.01.2002 and 12.12.2013.

Model runs were performed for the unified ‘large’ domain with spatial resolution of 0.12° , covered the Barents Sea, part of Kara Sea, northern European territory of Russia and the surrounding water areas. Driving conditions came from ERA-Interim reanalysis ($\sim 0.75^\circ$ resolution). After that, the downscaling technology was performed for the different ‘small’ domains (resolution of ~ 2.8 km), inside the ‘large’ domain. Standard configuration of COSMO-CLM model (version 5.0) was applied: Runge-Kutta integration scheme with 5th advection order; 50 vertical levels for more detailed reproduction of boundary layer; prognostic TKE-based scheme for turbulence; standard Tiedtke convection scheme, etc. Runs continued for a week for the most cases including extreme situations observed near the middle of the period.

Analyze has shown that model reproduces the synoptic-scale dynamics and general wind velocity patterns well as both with the 0.12° km, and 2 – 3 km resolutions. However, model with 0.12° resolution has captured the fine structure of wind velocity pattern poorly, while model with 2.8 km succeed to reproduce detailed spotty wind pattern, caused by local orography or/and dynamic factors. On the one hand, the model underestimates observed mean values and wind gusts over seashores up to 4 – 5 m/s systematically. On the other hand, it could be interpreted as follow: such extreme speeds of air particles (15 – 20 m/s and more) does

not make much physical sense for wind velocity at a certain point. Therefore, we can consider wind velocity values for some area, according to the distance, corresponding to wind velocities.

Taking into account these reasons, we can ascertain, that COSMO-CLM model reproduces wind velocity pattern quite adequately, but using the resolution 5 km and less, only.

Key words:

extreme wind velocity; Arctic basin; COSMO-CLM model

On the Observed Trends in Temperature and Rainfall Extremes over Southern India

Dhorde A G

Department of Geography, Savitribai Phule Pune University, Pune, 411007, Maharashtra, India,
amitdhorde@unipune.ac.in**Abstract**

This research attempts to investigate changes in the indices of climate extremes, on the basis of daily maximum and minimum temperature at 62, and precipitation at 61 meteorological stations over southern India, during the period 1969–2006. Thirteen indices of extreme temperature and six indices of extreme precipitation were examined. Indices for extreme temperature depicted a warming trend, statistically significant at number of stations. The regional occurrence of extreme cool days (night) decreased by –1.24 days (–0.8 nights) per decade. Over 71% of the stations showed a decrease in the annual occurrence of cold nights and an increase in the annual occurrence of warm nights. Regional occurrence of extreme warm days (nights) increased by 1.79 days (0.98 nights) per decade. Maximum temperature extremes had widened the range through increase in maximum in maximum and decrease in minimum in maximum temperature. Whereas, decrease in extreme range was observed in minimum temperature by increase in minimum in minimum and decrease in maximum in minimum temperature extremes. Overall diurnal temperature range has increased slightly during study period. Low precipitation events have decreased whereas high precipitation events showed increasing trends. But total annual rainfall showed decreasing trend over the region. In contrast to the temperature indices, very few significant changes have been observed in the precipitation indices. On an average, regional maximum 1-day precipitation, annual total wet day precipitation, number of heavy precipitation days and consecutive dry days showed insignificant decrease.

Projections of Temperature and Rainfall Extremes over Southern Pakistan Using Peaks-Over-Threshold Approach

Zahid¹ Maida, Lucarini^{1,2} Valerio

¹ Meteorological Institute, University of Hamburg, Germany, maida.zahid@uni-hamburg.de

² Department of Mathematics and Statistics, University of Reading, UK

Abstract

Recently, temperature and rainfall extremes are more evident in southern Pakistan (Sindh), particularly during summer season damaging property, crops, infrastructure and human lives almost every year. This region has become 'hot spot' of climate extremes in South Asia. Therefore, it is very important now to study these extremes and provide reliable future predictions for improved rural and urban planning. In order to investigate and manage the risks of extremes, the extreme value theory (EVT) is a quite popular and most relevant approach in the climate science. But this is not yet been applied in Pakistan to predict the extremes. In this study, we used daily maximum temperature and rainfall data of nine meteorological stations of Pakistan Meteorological Department from 1981 to 2013. The summer season is preferred for the analysis as both temperature and rainfall extremes cause most of the casualties during this period. We apply peak over threshold (POT) method of extreme value theory to model both temperature and rainfall above a selected threshold for each station. Then, we estimate the return levels (RLS) of maximum temperature and precipitation for the next 5, 10, 25 and 50 years. The RLs for maximum temperature are expected to increase by 2°C in Mohenjo-daro (MJD), Nawabshah (NWB), Karachi (KHI), and by 1°C in the rest of the stations. In case of rainfall, the return levels (RLs) show rainfall events greater than 150 mm are likely in Karachi, Badin, Chhor, Hyderabad and Nawabshah.

Key words:

Extreme temperature; return levels; peaks over threshold; extreme value theory and extreme rainfall

Research on Climate Change and Extreme Aridity Index in The Loess Plateau

Wen M.¹, Song, J.X.^{1,2*}, Zhang, G.T.¹, Lai, W.L.³, Jiang, W.W.¹

³ College of Water Sciences, Beijing Normal University, Beijing 100875, China.

Abstract

The Loess Plateau is the transitional zone of the wet and dry land, with the global climate changes, the regional climate changes should have a significance influence on the regional hydrology cycle and the variation of the dry and wet land. Aridity index (AI), as a ratio of potential evapotranspiration and precipitation, can be regarded as a useful indicator to reflect the regional climate change, used to judge the dry and wet land. The minimum value of AI presents the driest of the regional climate. In this study, based on 51 national meteorological stations data during 1961-2014, adopted the Penman-Monteith model to estimate the potential evapotranspiration, precipitation divided by potential evapotranspiration to reveal the AI changes. In the whole study area, the AI shows a downward trend in time. Adapted scenarios analysis to find out that the majority factor contributes to the AI extreme value happened is the temporal-spatial variations of precipitation. Detrended the evapotranspiration and precipitation of each station, revealed the extreme value of AI happened most probability relative with fluctuation of the two factors of AI instead of the trend.

Spatiotemporal Characteristics of the Urban Extreme Climate in China's Instant City, Shenzhen

TANG Yucong, WANG Yanglin, ZHAO Zhiqiang, CHANG Hsiaofoei, SONG Zhiqing, LIU Yanxu
China University of Geosciences, Beijing, 100083, P.R. China, tangyucong@cugb.edu.cn

Abstract

An urban area has large population, resource consumption, and environmental pollution. Extreme climate can bring huge losses to an urban resident's productivity and life, and it is a serious threat to the survival of human beings. Shenzhen is a typical area witnessing rapid urbanization in China. Researching the extreme climate spatiotemporal characteristics in Shenzhen has important significance for disaster prevention and mitigation in urban areas. In this study, we summarized more than 60 years of meteorological data from Shenzhen with the software-based R language RCLimDex 1.0 to analyze climate extremes. We then calculated the spatial variation of the data using the meteorological interpolation software, ANUSPLIN. The results showed that the climate was warming in Shenzhen based on the extreme precipitation index, with obvious signal shock at an inter-annual scale. The extreme heat index had increased, while the extreme cold index had decreased. However, over the past 10 years, the local temperature warming trend has slowed, and the extreme climate index has developed obvious spatial heterogeneity.

extreme climate; spatiotemporal characteristics; urban; Shenzhen

Temporal and Spatial Analysis of Extreme Temperature and Precipitation Events in Hanjiang River Basin During the Past 50 Years

WAN Luwen, ZHANG Zhengdong

School of Geography, South China Normal University, Guangzhou 510631, 784917373@qq.com

Abstract

Based on daily data for temperature and precipitation from China Meteorological data service shared network and Guangdong Province Meteorological of 13 meteorological stations in Hanjiang River Basin, China from 1965 to 2014 and used extreme event defined method, linear tendencies estimated, Mann-kendall mutation test and IDW plug value to calculate spatio-temporal changes features of extreme temperatures and precipitation, which were related directly to vegetation growth of water hot conditions and cold dry disaster. Results showed that: ① High temperature event index, such as Summer days(SU25), warm days(TX90P) and warm nights(TN90P) are significant upward trend, while low temperature event index like Frost days(FD0), Cool days (TX10P), Cool nights(TN10P) in Hanjiang River Basin are significant downward trend, which reflect the climate warming trend; ② trends in extreme precipitation indices showed no significant change, apart from the average daily rainfall intensity SDII, the other extreme precipitation indices showed only weak upward trend; ③ Frost days (FD0) started mutation in 1977, other indices of extremes temperature and precipitation indices showed a trend of fluctuations during the past 50 years, no obvious mutation; ④ extreme high temperature event index and hot continuous index sustained upward trend as a whole, extreme low temperature index and cool continuous index showed downward trend on the overall, which showed a good consistency in the Hanjiang River Basin; ⑤ the spatial distribution of the extreme precipitation indices showed some differences, but the distribution pattern was "gradually decreasing from northeast to Southwest" on the whole.

extreme temperatures; extreme precipitation; change features; Hanjiang River Basin

A Study on Characteristics of Drought-Flood Based on Precipitation Data in Yunnan Province over the Past 61 Years

LIU Jiaxu^{1,2}, CHEN Sujing^{1,2}, LI Lijuan^{1,*}

1.Key Laboratory of Water Cycle and Related Land Surface Processes, Institute of Geographic Sciences and Natural Resources Research, Chinese Academy of Sciences(CAS), Beijing 100101, P. R. China; 2. University of CAS, Beijing 100049, P. R. China, liujx.12b@igsnrr.ac.cn

Abstract

Based on monthly rainfall data from 1954 to 2014 collected from 32 meteorological sites in Yunnan province, the spatio-temporal variability and periodicity of drought-flood were analyzed using SPI, EOF, RBF spatial interpolation, wavelet analysis. The results show that there is a tendency of drying in Yunnan province during the last 61years (the slope of SPI is -0.0091/year). General flood year, normal year and general drought year account for 88.52% in the 61 years, and great drought year, extreme drought year and great flood year account for 4.92%, 3.28%, and 3.28%, respectively. There are two regions that droughts come more often than other regions in Yunnan province. In addition, there are three regions where floods come frequently. The probability of drought and flood events have a good correspondence, but the probability of drought is slightly higher than flood. The first modal of EOF analysis reveals that Yunnan province present the consistency of flood or drought, moreover, this modal may be affected by the large-scale climate characteristics. The second modal may be controlled by topographical factor, and the third modal may result from comprehensive function of multiple factors, such as longitude, monsoon. Furthermore, the time coefficient of first three modals also confirm the trend of drought in Yunnan province. Finally, the periodic oscillation of SPI series is concentrated in expectant 2 years, 6 years, 8 years, 18 years and 28 years, and especially in expectant 28 years which has the strongest energy.

Agricultural Perspectives for Steppe Area of Ukraine in a Changing Arid Climate

Semenova I.G.

Odessa State Environmental University, Odessa, Ukraine, innas.od@gmail.com

Abstract

The Steppe area is the main agricultural region in Ukraine with rich black soil, where grows the high grain yields and develops gardening. But almost every year this region is exposed the drought of different intensity and duration.

Distribution of droughts in modern and future climate periods was studied using the Standardized Precipitation Index (SPI), which correspond to anomalies of precipitation relative to the norm. Analysis of drought index SPI at different time scales during period 1950-2012 showed, that in the Western Steppe 2-3 drought cases were observed in the 1950's and the 1960's. In the Eastern Steppe a period of the 1950's to the mid 1970's was drier in comparison with the Western Steppe. After 1980's a long dry period began and extended till the present time. In current century the main drought events were observed from 2005 to 2012.

Using the multimodel CMIP5 data, was analyzed future spatiotemporal distribution of precipitation in the Steppe area. According to the climate scenarios RCP2.6 and RCP8.5 amount of precipitation will be slightly increased during some time slices of 2020-2050, but in full period will observe the negative anomalies.

Analysis of drought frequency during the vegetation period using SPI3 showed that expected an increasing of the total number of seasonal drought. The drought will be observed one per every 2-3 years in each season. In the Steppe is increased the probability of occurrence strong and extreme drought, that will result to deterioration of the conditions of growing crops.

Change Features of Precipitation Events in Hainan Island from 1959 to 2013

Sun Rui, Wu Zhixiang, Chen Bangqian, Lan Guoyu, Qi Dongling

Rubber Research Institute, Chinese Academy of Tropical Agriculture Sciences, Danzhou, 573717, P. R. China,

sunrui_85@163.com

Abstract

The features of precipitation days and intensity including climate characteristics, trends, contribution rate, variation field, abrupt change and periodicity were analyzed based on daily precipitation data of seven weather stations in Hainan Island from 1959 to 2013. The results indicated that annual precipitation intensity showed an obvious increasing trend with a significant decrease of annual precipitation days during the past 55 years. For heavy rainfall, the days increased while the intensity presented a decreasing trend. Both the days and intensity of extreme rainfall had become higher apparently. Heavy and extreme rainfall days on a small proportion, however contributed significantly to the annual precipitation. With relative steady heavy rainfall intensity, the heavy rainfall days as well as extreme rainfall days and intensity has a considerable inter-annual variability. The heavy rainfall intensity, extreme rainfall days and intensity mutated in 1984, 2004 and 1998 respectively. Heavy rainfall and extreme rainfall days had variation major periods of 12 years and 7 years respectively, and precipitation intensity of different grades had periods of 21 years and 7 years respectively. Furthermore, the days of annual precipitation, heavy rainfall and extreme rainfall were more in middle mountain area of the island than in the western part. Annual precipitation intensity presented evident zonal distribution and gradually decreased from southeast to northwest. Precipitation intensity of heavy rainfall in various places was more uniform, meanwhile extreme rainfall intensity was highest in the western part of the island.

Diurnal Cycles of Precipitation in Observed Data and Regional Climate Model Simulations

Kysely J, Beranova R, Hanel M

Institute of Atmospheric Physics CAS, Prague, Czech Republic, kysely@ufa.cas.cz

Abstract

The study compares characteristics of observed sub-daily precipitation extremes in the Czech Republic with those simulated by HadRM3 and RCA4 regional climate models (RCMs) driven by reanalyses, and examines diurnal cycles of hourly precipitation and their dependence on precipitation intensity and surface temperature. Warm season (May–September) maxima of 1h to 24h aggregations are analyzed. The observed maxima of short-duration events (1h, 2h and 3h amounts) show one diurnal peak in the afternoon, which is simulated reasonably well by RCA4, although the peak occurs too early in the model. HadRM3 provides an unrealistic diurnal cycle with a peak during the night-time and a minimum in the afternoon coinciding with the observed maximum for all 3 ensemble members, which suggests that convection is not captured realistically. Distorted relationships of the diurnal cycles of hourly precipitation to daily maximum temperature in HadRM3 provide further evidence that the underlying physical mechanisms are misrepresented in this RCM. The analysis of the GEV distribution for short-duration precipitation maxima shows that the RCMs are not able to capture the range of shape parameter estimates realistically, either leading to too many or too few grid boxes in which the shape parameter estimate corresponds to a heavy tail. This suggests that the distributions of maxima of sub-daily precipitation amounts are severely distorted in the RCM-simulated data and do not match reality well. Analyses of projected changes of sub-daily precipitation extremes in climate change scenarios based on RCMs may therefore be misleading and need to be interpreted with caution.

Identifying and Qualifying Past Extreme Hydrological Events Based on Documentary Proxy Records in the UK

Marie-Jeanne S. Royer, Sarah Davies, Cerys A. Jones

Department of Geography and Earth Science Aberystwyth University, Aberystwyth, United Kingdom,

mar71@aber.ac.uk

Abstract

Climate change research in the UK has put into sharp focus the need for a strong understanding of flood events and their impacts on communities and individuals. Long term data on the frequency, intensity and impacts of past extreme hydrological events can be used in conjunction with future climate change projections to develop targeted mitigation strategies. Past flood events are difficult to identify from instrumental data alone as daily precipitation (if available) can be an unreliable indicator of an extreme event. Using documentary proxy records to identify and qualify extreme hydrological events can give us more detailed information than could be gathered from instrumental data alone. Based on DEFRA's 2012 'Climate Change Risk Assessments' for the UK we have targeted five UK case study regions (i.e. Wales, East Anglia Coast, Northwest Scotland, Central England, Southwest England). For these regions, a systematic search through available archive records was conducted to identify flood proxy records. These records were then analysed and compared to known flood events. Preliminary results from text analysis indicate a link between benchmarking and the identification of extreme hydrological events. This approach also allows singling out events that instrumentally are less important but that had severe consequences on the impacted communities (e.g. death, destruction of property). The combination of documentary proxy data with instrumental data can deepen the understanding of extreme hydrological events and their impacts on an individual or community.

Luminescence Chronology and Palaeoclimate Implication of Palaeoflood Deposits in the Middle Reach of Yongding River, China

ZHAO XH, et al.

College of Resource Environment and Tourism, Capital Normal University, Beijing 100048, P. R.

China, 2130901002@cnu.edu.cn

Abstract

Flood is a kind of natural hazard and usually associated with climate change. It records environmental history at event scale. Floods had happened frequently in Yongding River in history and had caused serious losses. This study presents investigation of palaeoflood deposits in the middle reach of Yongding River and identifies seven episodes of palaeoflood events at Tanmugou profile. Optically stimulated luminescence (OSL) dating method is applied to establish the chronology of palaeoflood deposits. Both the improved single-aliquot regenerative-dose (SAR) protocol and the standard growth curve (SGC) method were employed for equivalent dose (D_e) determination. For each sample, comparison of D_e s determination and corresponding ages of large aliquot and small aliquot were also conducted. The dating results reveal that the SGC method is suitable for D_e determination of palaeoflood deposits in Yongding River. The results of large aliquot and small aliquot are basically consistent. The identified palaeoflood events mainly occurred in Holocene and were concentrated around 1 ka, 3 ka and 8.5 ka. According to some continuous high-resolution climate records in East Asian monsoon region, climate had changed around 1 ka, 3 ka and 8.5 ka. These palaeoflood events mainly occurred in the climate conversion period and were closely related with climate change.

palaeoflood; OSL dating; climate change; Holocene; Yongding River

The Four Giant Planets Convergence in the Winter Causing the Climate Cold

Ouyang Chuntao, Yi Qingchuan

Yichun University, oyct1122@163.com

Abstract

In three thousand years ago, there was a recording "Star like wind, star like rain", "moon from the star, with the wind and rain" in China. The winter solstice index (k) was calculated on the basis of the moment effect of four giant planets from 1000 AD to 2030 AD taking the earth as the center. The results are as follows: (1) when $k > 2.1$, 13 years; (2) there is a quasi period of 140-180 years; which indicates that there are very good relationship with the temperature change in China; (3) Most of them correspond to Wolf Minimum Period, Sporer Minimum Period, Maunder Minimum Period, and Dalton Minimum Period. The Planets geocentric convergence effect on the earth's climate, belongs to the centennial and millennial scale, is not the gravity torque effect, but mainly lies in moment effect. Because the earth revolves not around the sun centre, but around the center of the solar system. Planets convergence can make the center of the solar system is far away from the center of the sun up to 1.5 million kilometers, is about 1% of the sun-earth distance. When the four giant planets assemble at winter solstice, will inevitably lead to the revolution radius of the earth getting longer and velocity.

Minimum Period; planets convergence; the climate cold in winter

The Three-dimensional Joint Distributions of Rainstorm Factors in Kuandian County Based on Copula Function

LiYing, Wang Cailin, Ren Xuehui,

School of Urban and Environmental Sciences, Liaoning Normal University, Dalian 116029, China, bbtly@163.com

Abstract

Taking Kuandian county in Liaoning province as an example, extracted four rainstorm factors: the annual rainstorm days, annual of rainstorm depth, annual average rainstorm intensity and rainstorm contribution through the daily precipitation data from 1955 to 2012. Optimal probability distribution for each single factor was determined by K-S method. Three-dimensional joint distribution for multifaceted rainstorm factors was built by Copula Function, and AIC and RMSE was used to confirm the best fitted Copula. The probability of rainstorm and characteristics of return period with many combined factors were analysed. Research shows that: (1) annual rainstorm days fit Poisson distribution, and annual average rainstorm intensity, rainstorm depth and rainstorm contribution fit Generalized Extreme Value distribution; Frank copula was suitable for reflecting the occurred probability rainstorm under the background of multiple-factor.(2) Joint return period of rainstorm factor in Kuandian county was well reflected by multiple-factor connection of the joint of annual rainstorm days, annual of rainstorm depth and annual average rainstorm intensity. Joint return period is short and distribute on 0-2 years, while cooccurenc return period was concentrated in around 200 years; the change trend of two kinds of return period was consistent, it has synchronization effect, this reflect inseparable of rainstorm factor.(3) the univariate reflect just one factor of information in rainstorm and doesn't involved in the relationship between multiple-factor; Three-dimensional copulas joint can present the internal information between heavy elements from three aspects and closer to the actual; Multiple factors of rainstorm, as copulas function on the rainstorm analysis provides a broad prospects.

Key words:

Copula function; three-dimensional joint; rainstorm factors; return period

Variational Merged of Hourly Gauge-Satellite Precipitation in China: Benefits to Data-sparse Regions and to Heavy Rainfall Events

Huan Li

State Key Laboratory of Resources and Environmental Information System, Institute of Geographic Sciences and Natural Resources Research, Chinese Academy of Sciences, Beijing, 100101, P. R. China, lih@igsnrr.ac.cn

Abstract

The article describes a variational scheme for the analysis of high-resolution hourly precipitation from CMA gauges and NOAA CMORPH satellite products in China and tests their impact on data-sparse regions and the heavy rainfall occurrences during the July, 2009. In the variational scheme, a cost function is defined to measure the distance between analyzed precipitation field and observed rainfall quantity. A recursive filter is incorporated into the cost function which helps spread the observations to nearby grid points. Then a quasi-Newton method is used to solve the optimal estimation problem by minimizing the cost function. The adjoint technique is used to derive the gradient of cost function with respect to analysis precipitation. A series of experiments are performed to inter-compare the variational analysis with the original CMORPH satellite products (CMP) and the bias-adjusted satellite products (Adj-CMP) against the observations. The best overall performance is from the variational analysis especially rainfall intensity by more than 10 mm hr⁻¹ with a prevailing mean relative spatial bias nearly reduction zero and the correlation coefficient is almost around 0.5 in convection active areas. Ground Cross Validation experiments in which each affected station is withdrawal at once indicated that the variational analysis can particularly be beneficial and subsequent investigation of heavy rainfall events. It also reveals that the precipitation analysis field has the ability to improve the accuracy of rainfall estimation and capture the spatial precipitation pattern agreements in relatively data-sparse regions.

A Development of Mobile Monitoring System for Urban Climatology

Ichinose T, Likhvar V, Matsumoto F

National Institute for Environmental Studies / Nagoya University, Tsukuba, 305-8506, Japan, toshiaki@nies.go.jp

Abstract

We developed a real-time mobile monitoring system on air quality and thermal environment at the city block scale. This system helps designing the city blocks to locally improve outdoor comfort and provides access to a high resolution spatio-temporal environmental database, which includes information on the fine-scale outdoor thermal environment, air pollution, magnetic field intensity, etc. Based on a citizen participation approach, this system provides an opportunity for citizens to collect data in the area where they live, work or exercise. To test and validate the system we performed several participatory experiments providing participants with portable sensors connected to their mobile devices through Bluetooth, who walked in the city blocks of interest and collected information on the surrounding them environments. The information was displayed on their mobile devices and uploaded to a server via WiFi in real-time. We also used this system during local sport activity events (Tokyo Marathon, Tsukuba Marathon, etc.) to obtain physiological responses in participants to potential environmental exposure. Indeed, using this fine scale monitoring we could identify areas in city blocks with low air quality, which could be dangerous for continuing human health activity events and should be re-constructed. Now we have kicked-off a new project on mobile monitoring of urban environment referring to this achievement. My lecture will focus on the review of relevant researches including our own and the expected outcomes from our on-going project.

An Assessment of Diurnal Air Heat Stress Conditions in Urban Core of Kano Metropolis, Kano Region of Nigeria

Alhaji, M; Buba, L.F

Geography Department, Faculty of Earth and Environmental Science, Kano university of Science and Technology,
Wudil , Kano State of Nigeria, Malhaj44@yahoo.com

Abstract

The Research assessed diurnal heat stress condition in urban core of Kano Metropolis. Nine sites were selected by cluster sampling method. The Meteorological data were collected simultaneously across the sample sites at interval of 3 hours (i.e. 3 am, 6 am, 9 am, 12 noon, 3 pm, 6 pm, 9 pm and 12 mid-night) each in the months of April, August, October and December. Heat stress condition was calculated by using Discomfort Index (D.I): $0.5T_w + 0.5T_a$. The result indicates heat stress existence in the study area with hottest points found in the city centers. The out-door mean seasonal / Diurnal Heat stress condition D.I ranges revealed as follows: 16-37.5 for urban core. The patterns of the stress indicated that the industrial and densely populated axes experienced more of the stress than the sparsely populated and institutional centers. A three ways Analysis of Variance revealed a significant differences between seasons and hour of the day. Its suggest: Intercity Street and houses spaces for effective ventilation, massive afforestation of city streets and initiating public heat stress detecting, monitoring and disseminating system for heat stress alert to the public should be done to improve the city habitat.

Estimation of Urban Heat Island with Urban Innovation to Mitigate Local Climate Change: A Case Study of Delhi

Mina Babazadeh

Ph.d Scholar Centre for the Study of Regional Development, Jawaharlal Nehru University, New Delhi. India

Mina58_ssf@jnu.ac.in

Abstract

Developing countries are actually suffering from the concrete effects of local climate change. They are part of the local climate change problem; however they've also been an integral part of the solution. Therefore, there have to be a simultaneous study of both the local climate change and the city systems. This research is to respond to the need for exploring how information and communication technologies and urban physics are well positioned to provide key-contributions to the current urban problems in Delhi.

This paper presents a systemic modelling methodology with help of analysing 72 satellite images of Landsat (5, 7 and 8) from 1998-2015 to provide some primary information into the relationships between local climate change and city structures. This relationship can identify the significance of biodiversity in stabilizing the local climate which can be approached with SSO, NDVI, TDVI and emissivity. Analysing LST spots for enhanced disaster risk management, secondly, Modelling small-scale obstacles (SSO) to improve city strength and adaptive potential and finally, (SSO) for informed adaptation decision making. In fact UHI possessed a strong seasonality, with the highest LST in summer, which shows for first time several UHI spots across city in unrespectable places in Delhi. Sensible heat flux tended to change largely with surface physics, while latent temperature was generally modulated through the change in vegetation density abundance and vigour and the accompanying emissivity condition. We also access framework to support Delhi in the challenging process of adapting to local climate change. This technical methodology also helps to recognize local climate change adaption plans along similar lines.

Investigating the Properties of Aerosols during Intense Haze Events over Pakistan Using Remote Sensing

Salman Tariq, Zia ul-Haq

Remote Sensing and GIS Group, Department of Space Science, University of the Punjab, New-Campus, Lahore, Pakistan, salmantariq_pu@yahoo.com

Abstract

Aerosols released from biomass burning affect the tropospheric chemistry, radiation budget and cloud processes and hence can cause significant climate modifications. Due to rapid increase in industrialization and urbanization, megacities of Pakistan are facing intense haze events causing important effects on the regional environment and climate. In the present work we have analyzed the properties of aerosols during intense haze events over Pakistan. The data from ground based Aerosol Robotic Network (AERONET), satellite based MODIS and CALIPSO remote sensing instruments have been used for the characterization of aerosols during intense haze events of October 2010 and 2013. HYSPLIT model was also used to estimate the transport of air pollutants during high aerosols optical depth (AOD) days. The maximum AOD values were found to be 2.75 and 2.36 on 20 October, 2010 and 9 October, 2013 in the central regions of Pakistan. Cluster analysis was performed by utilizing the scatter plot between AOD and Angstrom exponent, and absorption Angstrom exponent AAE (440-870 nm) and extinction Angstrom exponent (440-870 nm) (EAE) to classify the dominant aerosol types such as biomass burning, dust and urban-industrial aerosols during the heavy aerosol loading periods over Pakistan. Aerosol sub-types were investigated further with the help of CALIPSO data. High values of single scattering albedo were observed during both the events (~ 0.95). MODIS fire activity image suggests that the areas in the southeast of Lahore across the border with India are dominated by biomass burning activities.

Satellite-Based Assessment of Urban Sprawl and Its Impact on Land Surface Temperature (LST) over Pune City, India

Dhorde A A

Department of Geography, Nowrosjee Wadia College Pune (Savitribai Phule Pune University), 411001, Maharashtra, India, anarghawakhare@gmail.com

Abstract

Pune city, like many other cities across the globe has witnessed rapid urbanization and industrialization. This has resulted in increased economic productivity and rise in the living standard, but has also lead to many environmental problems. The current research focuses on the effect of urbanization on Land Surface Temperatures (LST). Research on very few studies in India has been done in this regard and there is need to investigate such issues since the cities of India are growing very fast. The main objective of the research was to investigate the changing land use pattern and its impact on surface urban heat island of Pune city by analysing LST. This was done by using remote sensing data acquired by Landsat series of satellites which are capable of collecting thermal data. Two images, spanning over 19-year period (1990-2009) were utilized for which LSTs were derived by applying standard algorithms. An analysis of land use change and Normalized Difference Vegetation Index (NDVI) accompanied this procedure. A model was prepared to derive LST in ERDAS IMAGINE, a satellite image processing software. The results confirmed rapid expansion of Pune city indicating doubling of built-up area and reduction in vegetation cover. This has resulted in intensification of surface urban heat island and its expansion too. LST has increased by 8-12 °C in the city core. The peripheral parts of the city have also witnessed increase in LST.

Land surface temperature; urbanization; land use; surface urban heat island; Pune

Spatial Patterns of Urban Heat Island

Arellano, B. & Roca, J.

Technical University of Catalonia (Center for Land Policy and Valuation), Barcelona, 08028, Spain,

blanca.arellano@upc.edu

Abstract

The specialised literature has devoted many efforts to analyse the contribution of urban systems to climate change and has developed different tools for studying the climate impact of urban areas (urban climate zones or "climatopes"). In such studies, the urban heat island (UHI) plays an important role. In this sense, the use of remote sensing technology has allowed detailed mapping of land surface temperature (LST) for urban and metropolitan systems.

These studies have demonstrated the key role played by vegetation, impervious surface and built-up area to explain the differences in the spatial distribution of LST. However, does not seems to have been a similar attention for studying the morphology of the UHI spatial patterns. Most of the studies in metropolitan areas attribute a progressively decreasing gradient of the UHI from the city center to the rural periphery. The maximum LST is often found in Central Business District (CBD), decreasing towards the rural periphery according to different land uses. In contrast, our research on the spatial distribution of the LST for the metropolitan area of Barcelona suggests a different morphology of the gradient of the UHI. On the one hand in Barcelona the highest temperatures in the daytime are not obtained in the CBD but in more peripheral areas specialized in economic activity (industrial parks), producing a "donut" in the spatial distribution of the LST. On the other hand, the nighttime temperatures were been determined or conditioned by geographical factors, such as proximity to the sea or altitude.

This paper aims to show the spatial patterns of LST in different cities, studying the differences according to the distribution of land use, quantity and quality of the vegetation, intensity of urban sprawl, spatial distribution of economic activity and type of urban structure.

UHI; climate change; remote sensing; LST; NDVI; land use; impervious surface

Synoptic Variability of Vertical Distribution of Aerosols and Cloud Condensation Nuclei in Moscow Region.

Asarbaev A.A., Danelyan B.G., Kirin D.V., Sazhin I.V., Zakharova E.V.

¹ Central Aerological Observatory, Dolgoprudnyi, Moscow region, 141700, Russia,

² Moscow State University, Moscow, Russia, ivsazhinmeteo@gmail.com

Abstract

Atmospheric aerosols play an important role in global climate system influencing on radiative forcing, clouds and hydrological cycle. Aerosols can serve as cloud condensation nuclei (CCN) that have a great effect on processes of rainfall. This research is focused on influence of Moscow city air pollution on vertical distribution of aerosol and CCNs.

For the first time, unique aircraft measurements of aerosols and CCNs were made over the eastern part of Moscow region. Spectral characteristics and vertical distribution of aerosols in different synoptic situations were analysed. Aerosol number concentration counted by two aerosol spectrometers – UHSAS and PCASP with spectral range from 60 up to 3000 nm, and number of CCNs from DMT CCN-counter were used for analysis. Spectrometers obtaining data of aircraft measurements were compared with ground-based aerosols and particulate matter measurements in Moscow city and Moscow agglomeration.

Vertical profiles taken from forty flights in different seasons were generalized for high-pressure and low-pressure situations. Aerosol number concentration exponentially decreased with altitude. Inversion layers form aerosols and CCN accumulation zones varied in contrast synoptic conditions. The matter of discussion is existence of differences of aerosols number size distribution at different heights depending on synoptic situation.

Further results of research help to quantify the effects of aerosols in megacities and to improve aerosol blocks in models of general circulation of atmosphere and ocean.

The Built Surroundings Induced Urban Heat Island Consequence in Speedily Urbanizing Sub-Humid Region using LANDSAT ETM+ Sensors

Kumar, Pavan, Rani, Meenu

Remote Sensing and GIS, Kumaun University, Almora, Uttarakhand, India, pawan2607@gmail.com

ICAR-Project Directorate for Farming Systems Research, Meerut, U.P., India

Abstract

We are living in the age of a rapidly growing population and changing environmental conditions with an advance technical capacity. This has resulted in wide spread land cover change. One of the main causes for increasing urban heat is that more than half of the world's population lives in a rapidly growing urbanized environment. Satellite data can be highly useful to map change in land cover and other environmental phenomena with the passage of time. Among several human induced environmental and urban thermal problems are reported to be negatively affecting urban residents in many ways. The built-up structures in urbanized areas considerably alter land cover thereby affecting thermal energy flow which leads to development of elevated surface and air temperature. The UHI for the temporal period is estimated using geospatial techniques which are then utilized for the impact assessment on climate of the surrounding regions and how it reduce the sustainability of the natural resources like air, vegetation. The present paper describes the methodology and resolution dynamic urban heat island change on climate using the geospatial approach for the Haridwar district of Uttarakhand. NDVI were generated using day time LANDSAT ETM+ image of 1990, 2000 and 2005. In Haridwar district the temperature is inversely related and negatively correlated with NDVI value. The industrialization and increasing comforts have the adverse effect on surface temperature which is increasing at a fast pace. The urbanization is the way to progress but we forget the environmental dimension which must be considered.

UHI; NDVI; Surface temperature; Dynamic changes

The Effect of Different Ground Surfaces on the Thermal Radiant Environment and Human Thermal Comfort: Comparisons between Monitoring Results and Different Model Simulations

Chen, L., Wen, Y., and Yu, B.

School of Geographic Sciences, East China Normal University, Shanghai, 200241, P.R. China, lchen@des.ecnu.edu.cn

Abstract

This paper presents a study that examines the effect of different ground surfaces on the urban thermal radiant environment, which is described by air temperature, ground temperature, radiation flux densities and the mean radiant temperature (T_{mrt}). Case studies were carried out in different urban settings in Shanghai with various ground surface characteristics, including brick, tile, asphalt, concrete and grass. Three-dimensional radiation flux densities were monitored and the six-directional integrated radiation flux method was used to calculate T_{mrt} . Two computer models, ENVI-met and SOLWEIG were employed to simulate the local thermal radiant environment. Simulation results were compared with monitoring results, and the models' sensitivity to different ground surface characteristics was tested. The human biometeorological index of PET was then used to evaluate the effect of different ground surfaces on human thermal comfort. Based on the findings, urban design recommendations were proposed to mitigate the urban thermal radiant environment and promote outdoor thermal comfort in heat days.

The Effects of Street Trees for Human Thermal Sensation in summer

Park S¹, Tuller SE²

¹Jeju National University, Jeju, Republic of Korea, sooland@jejunu.ac.kr

²University of Victoria, Victoria, BC, Canada

Abstract

Climate change has worsened human thermal environments in warm summer climates. Trees have an important role in urban thermal modification through their microclimate controls. This study investigated effects of five different tree species on human thermal sensation in summer. The tree species were popularly planted on urban streets in Jeju island, Republic of Korea: two tall deciduous broadleaf species (*Prunus yedoensis* and *Zelkova serrata*) and three broadleaf evergreen ones (*Catanopsis sieboldii*, *Elaeocarpus sylvestris* and *Ilex rotunda*).

Mean air temperature, relative humidity and wind speed were slightly different between sunny and shady locations: 0.2-0.7 °C, 0.9-5.3 %, 0.1-0.5 ms⁻¹ depending on the tree species, respectively. However, the overall mean radiant temperature difference between them was large, 27.1 °C: 62.5 and 35.4 °C in sunny and shaded locations, respectively. Evergreen species made more differences than deciduous ones. Shaded locations had cooler computed human thermal sensations than sunny locations: mean Physiological Equivalent Temperature (PET) 8.8-14.8 °C (21.2-31.3 %) lower (Max. 11.7-18.8 °C) PET and mean Universal Thermal Climate Index (UTCI) 5.0-8.5 °C (12.7-20.0 %) lower (Max. 6.1-11.0 °C) depending on the tree species.

The differences are equivalent to 1.5-2 heat stress levels in PET and 1-1.5 levels in UTCI. Evergreen species made mean 5 % more modification effects in PET than deciduous ones, but *Zelkova serrata* which had dense branches and leaves had a similar effect as evergreen species. Therefore, the density of tree crowns and mean radiant temperature were key controls of trees' thermal modification in human thermal sensation.

Urban Climate and Urban Heat Islands in Brazil

Mendonça F, Anunciação V S, Armanl G, Collishonn E, Costa R C, Nobrega R S, Roseghini W F F, Steinke E T, Tavares R, Zanella M E

The Brazilian Society of Climatology . UFPR/Centro Politécnico. 81531-970. Curitiba, Brazil. chico@ufpr.br

Abstract

Climate directly influences human societies, and it is heavily changed by them. The urban climate arouses special attention, particularly when we analyse the thermodynamic field (UHIs – Urban Heat Islands) because it is estimated (AR4 and AR5 IPPC Reports; PBMC Brazilian Report, 2015) that the heat conditions in large brazilian cities will more intense than today. Under the theoretical and methodological perspectives of Oke (1972) and Monteiro (1976), concerning the study of urban climate, brazilian cities have been studied since the 1970s. From that moment the brazilian population has become increasingly urban; actually about 85% of a population of 210 million brazilians live in cities. In this study, we present results concerning ten major brazilian cities distributed throughout the country, located in five different climatic regions. In the study, it was analyzed meteorological and climate data, and satellite images, with statistical and graphical approach. In all cities we observed the UHIs formation from low to high magnitude within the *urban boundary layer* (1°C to 20°C), the same occurring within the *urban canopy layer*, having recorded the formation of various simultaneous islands, including urban cooling islands (UCI). The most significant UHIs was formed on the evening in large urban areas (especially over São Paulo and Rio de Janeiro), although they were also strong in other cities (Campo Grande, Brasília, Porto Alegre and Curitiba); the islands had a lower intensity in the coastal cities in the Northeast and North regions of the country (Recife, Fortaleza, Manaus and São Luis).

Abstract

The urban spatial pattern and morphology do have important effects on UHI (urban heat island). Different land use types with different thermal properties and radiation features make different contributions to the UHI. Recently, studies on the relationship between urban land use changes and UHI attract much attention. Advances in the datasets used for characterizing land use will allow us to better describe the urban spatial patterns. Moreover, the landscape ecology approach had been used to explore the relationship between urban patterns and urban thermal environment. Using time series Landsat TM/OLI imagery and very high spatial resolution images SPOT5 and GF-2 of Changchun for 2002 and 2015, the relationship between land use changes, land surface descriptors and UHI were quantitatively examined with the technology of remote sensing and statistical analysis. Accurate retrieval of LST is the basis to have a better understanding of UHI, and mono-window algorithm was chosen in this study. Visual interpretation was used to obtain the information of the land use changes. The UHI effect will be a continuing challenge as the world continues to urbanize, cities grow in size and density. This study on the tem-spatial variations of UHI will enrich the theory and case study on the sustainable development and urban climate.

Abstract

We tested a relatively new effective CLIRAD (FC05)-SW radiation code [Tarasova, T.A., Fomin B.A., 2007] and the radiation block [Ritter, B., Geleyn, J.-F., 1992] of the COSMO non-hydrostatic mesoscale model of the atmosphere and soil active layer [Doms G., Baldauf M., 2015; Doms G. et al., 2011] against the measured radiative data at the Moscow State University Meteorological Observatory (MO MSU). The radiation components were measured by the Kipp&Zonen net radiometer CNR4 with estimating all possible uncertainties of measurements by this instrument. The aerosol and the water vapor were measured by the CIMEL AERONET sun photometer measurements at the MSU MO [Chubarova N. et al., 2011].

The comparisons between the long-term MSU MO aerosol dataset and the other widely used aerosol climatology were made for different months. We showed the significant AOT overestimating in the older aerosol climatology. For example, the [Tegen et.al, 1997] AOT dataset is twice higher than real data for many months and 50% higher for annual means values. This bias provided a strong error in the calculation of the downward shortwave radiation. The uncertainty of the COSMO RT code was made against the new CLIRAD (FC05)-SW radiation model for different aerosol conditions. The application of various aerosol in COSMO RT codes has led to a pronounced temperature effects. We showed that in clear sky conditions the sensitivity of air temperature is about 0.5-0.8°C to the 100 W/m² shortwave net radiation changes due to variations in typical aerosol over Moscow. The reported study was partly funded by RFBR (research project № 16-05-00985a).

Abstract

Since 2006, we have conducted high density meteorological observations in Tokyo Metropolitan Area with 130-200 data loggers settled in the Stevenson screens located on the primary schoolyards. We named this observation system as E-METROS. Basically, air temperature (and partly humidity/pressure) observations have been made with the interval of 10 minutes, and have been stored in the memory of data loggers continuously. The purpose of E-METROS is to clarify the mechanisms of urban heat island phenomena by analysing the temporal and spatial variations of temperature and humidity in relation to local circulation system (e.g., sea breeze) in Tokyo Metropolitan Area. The results show typical diurnal variations in summer temperature patterns, which is specific to Tokyo Metropolitan Area, where huge amount of anthropogenic energy consumptions and densely built high-rise buildings might accelerate urban heat island effects. In summer, although highest temperatures are distributed in central Tokyo from mid-night to early morning, they move to northwest-ward in accordance with the penetration of sea breeze from the Bay of Tokyo. In recent years, torrential summer rainfall over 50 mm/hr increased in north-western area of Tokyo, where daytime temperatures are highest in Tokyo Metropolis. These facts suggest that daytime urban heat islands may intensify the cumulonimbus which trigger torrential rainfall in Tokyo.

Review on the Effect of Urbanization on Extreme Precipitation

ZHAO J, WANG L C, ZENG C F, BIAN Z H, LI Y T

Geographic and Oceanographic Sciences Department, Nanjing University, Nanjing 210023, China,

njuzhaojing_wrr@126.com

Abstract

In recent years, urban rainstorm and flood disaster frequently occurred, bringing serious social and economic losses, more and more attention has been paid to the study of urban extreme precipitation. Overall, based on the data of measured meteorological station and regional rainfall estimation of satellite remote sensing and weather radar, combined with experimental plot and high resolution remote sensing image data, the main content of studying urbanization impact on extreme precipitation is the analysis of extreme precipitation temporal and spatial variation trends in the process of urbanization and the regional differences by observational analysis and numerical simulation. The research conclusion is relatively consistent, namely the extreme precipitation in cities take an intensified trend, and the probability of extreme precipitation was significantly higher than that in city suburbs. However, the impact mechanism of urbanization on extreme precipitation in city is relatively complex, current research focus on the underlying surface changes, which may be one of the main reason for the increase of city rainstorm. In addition, the variability of large scale climate system, local topography and aerosol are also the influence factors, which need an in-depth analysis to perfect the influence mechanism. Future study should focus on the improvement of temporal and special observations and extreme precipitation forecasts accuracy, perfecting urban extreme precipitation numerical simulation, comprehensively identifying and quantitatively analyse the increased city extreme precipitation probability causes in order to further explore the influence mechanism of urbanization on extreme precipitation.

The Effect of Nocturnal Cold Drainage on Pressure Distributions on Urban Area in a Basin

Yasushi SAKAKIBARA, Ryutaro SEKI, Yoshio HANAI

Shinshu Univ., Nagano, 380-8544, Japan, ysakaki@shinshu-u.ac.jp

Abstract

Heat island phenomenon can be seen not only in flat plain areas but also in basin areas (Sakakibara and Matsui, 2005). Generally speaking urban temperature is higher than rural. The heat island occur at calm clear nights distinctly. Oke (1982) showed the schematic image of urban atmosphere as 'urban circulation' at clear and calm nights. Winds blow from rural to urban. The upward current occurs in the central urban area and wind blows from over the city to rural. A cold air drainage flows along the mountain slope in the calm clear night. Both heat island and cold air drainage occur clearly at night with the same meteorological conditions. The objectives of this study are to show the pressure distribution on the urban in the basin and clarify the mechanism of nocturnal urban atmosphere formation on the basin city. The travelling observation of car with a high accuracy digital barometer and SAT was used, and automatic interval observation with temperature data loggers and weather station loggers was conducted in this study. The result shows that the pressure in alluvial (way out) area where cold air drainage blew was higher than other. High pressure zone was extended over the urban. There was a relatively higher air pressure zone on the route the cold air drainage passed through in the urban area.

Urban Heat Island and Outdoor Thermal Comfort Indices Research in Kazakhstan

Pavel Konstantinov, Alina Akhmetova, Diana Tattimambetova

Lomonosov Moscow State University, Faculty of Geography, Meteorology and climatology, Moscow, Russian Federation
kostadini@mail.ru

Abstract

Current research presents investigation of UHI phenomenon and outdoor thermal comfort indices, calculated with Rayman model (Matzarakis et al., 2010) in the steppe zone on the example of Kazakhstan big cities. Current investigation covers the ten-year period from 2003 to 2012. This period is representative for the study because during this short time the city area and its population rapidly increased (from 250 000 to 835 000 within the city).

Research area is quite interesting domain because Kazakhstan's capital city, Astana is the second coldest capital city in the world after Ulaanbaatar, Mongolia. So, the main purpose of the research is to study the UHI phenomenon in Astana and the surrounding steppe areas. The average annual value of the UHI intensity (approximately 1, 26°C) is the indicator of high-intensity urban heat island for the steppe zone, and detected the positive trend of UHI intensity. The population growth of the Astana (mainly due to labor migration) raises the question of the expansion of the area of the city and the construction of new buildings.

Also analysis of several biometeorological indices, particularly PET (physiological equivalent temperature) and WBGT during summer heat waves showed significant differences between urban and rural outdoor thermal comfort conditions.

2D hydrodynamics of Pearl River Estuary using D-Flow Flexible Mesh

Li Li ¹, Qinghua Ye ², Jürgen Böhner¹

The Geographical Society of China, Beijing, 100101, P. R. China, igc2016@igsnr.ac.cn

Institute of Physical Geography, University of Hamburg, 20146, Hamburg, Germany;

Deltares, 2600 MH, Delft, the Netherlands.

Abstract

We apply a hydraulic model called D-Flow Flexible Mesh, to analyse the hydraulic processes between River Estuaries and the Marine System in Pearl River Delta. Pearl River Delta is one of the most complicated river networks and the most developed megalopolises worldwide. The coastal area of the Pearl River delta is more vulnerable to the natural disasters, such as flooding, landslides and weather extremes.

We have set up the D-Flow model for the Pearl River Delta, covering the domain between 15.54 - 23.94°N and 108.95 - 117.07°E. Our domain includes the Pearl River distributaries and approximately 100 km sea area. We simulate the hydraulic interaction process in wet and dry season of the year 1999, 2002 and 2009. We choose different roughness scenarios as the sensitive test of the model in order to calibrate the model performance.

Research results show that the discharge distribution depends strongly on temporal hydrodynamic processes varying with seasons. The model performance differs in the upstream area depending on the roughness, however, modelling results distinctly underestimation direct flow in the largely sealed upstream area. Instead, the modelling of the sea side tidal variations yields proper estimations and suggest, that tidal propagation can also have an effect on floods in the Delta. Wet season has much influence on the subtidal discharge in the upstream part of the Pearl River Delta and in case of relative high lateral sources of river discharge on the downstream bays.

D-Flow Flexible Mesh; the Pearl River Delta; hydrodynamics; modeling

An Evaluation Study on Maturity of China's Modern Marine Industry System Based on Improved Catastrophe Progression Method

WANG Zeyu, CUI Zhengdan, Sun Caizhi, Han Zenglin*, Guo Jianke

Center for Studies of Marine Economy and Sustainable Development of Liaoning Normal University, Dalian

116029, hzl@lnnu.edu.cn

Abstract

The construction of the modern marine industry system has important strategic significance for leading the optimization and upgrading of China's marine economy structure, and for enhancing the comprehensive strength of China's marine economy. In this study, beginning from the perspective of maturity, we proposed the concept of modern marine industry system maturity; constructed the modern marine industry system maturity evaluation index system; evaluated the modern marine industry system maturity of 11 China's coastal provinces and municipalities (excluding Hong Kong, Macao and Taiwan) through the improved catastrophe progression method; conducted a grade division according to the maturity model. The study results are as follows: The modern marine industry system maturity of Guangdong, Shandong and Shanghai is at the near-mature period; the modern marine industry system of Zhejiang, Jiangsu, Liaoning, Fujian and Tianjin is at the development period; the modern marine industry system of Hebei, Hainan and Guangxi is at the starting period. The influence factors of our country's modern marine industry system maturity differences include resources endowment, location conditions, industry system foundation, national policy, innovation capability and talent, among them, the national policy, innovation capability and talent are the decisive factors for the differences in the future. Finally, we put forward the corresponding countermeasures and suggestions for each province, thereby providing a strong scientific basis for formulating the marine economy development strategy necessary for achieving the phased goals of being a strong oceanic country. (Foundation item: Under the auspices of Youth Project of National Natural Science Foundation of China (No.41301129), New Century Excellent Talents in University (No. NECT-13-0844))

Anthropogenic Activities Impact Assessment in the Coastal Zone Considering Spatial Heterogeneity

Lin Yi, Fang Zhu, Jinsong Chen, Pengpeng Han, Yu Han.

Shenzhen Institutes of Advanced Technology, Chinese Academy of Sciences, Shenzhen, 518055, P. R. China,
lin.yi@siat.ac.cn

Abstract

Anthropogenic activities intensified in coastal zone has been increasingly causing severe ecological and environmental problems. Quantifying human activities intensity is crucial to the analysis of eco-environment degradation drivers. Existing efforts in quantifying human activities intensity give less consideration to spatial heterogeneity in their methodology development. In this paper, we combine landscape metrics and spatial gradient method to analyse the influence of spatial heterogeneity on anthropogenic activities, and then develop a new method to evaluate the anthropogenic activities impact. With recent land use data for Shenzhen, China, we explore the spatial heterogeneity of ecosystems in coastal zone, and evaluate the anthropogenic activities impact. The results illustrate that in the study area, the spatial distribution of anthropogenic activities impact is more specific and objective than other methods. We believe the proposed approach will have significant implications for similar human activities assessment research.

Key words:

Anthropogenic activities impact; spatial heterogeneity; coastal zone; human activities

Evolution of Cusps on a Gravel Beach

Sherman, D.J., and Wang, J.

Department of Geography, University of Alabama, Tuscaloosa, AL, 35487 USA, sherman@ua.edu

Abstract

Field experiments were conducted on a gravel foreshore at Portmore Beach, Ireland, to test edge wave vs. self-organization hypotheses. Gravel beaches are ideal for testing the hypotheses because the edge wave model predicts greater cusp spacing with increased beach slope whereas the self-organization model indicates that spacing decreases. We also evaluated the Sunamura (2004) model for cusp spacing. The gravel foreshore comprised 20-250 mm particles, and cusps are ubiquitous thereon. The foreshore is fronted by a sandy (0.15-0.25 mm) nearshore. Waves and currents were measured with seven Marsh-McBirney model 511, bi-directional current meters, and eleven KPSI pressure transducers, hard-wired to a shore-based data acquisition system. Prior to the experiment, the study area was graded to remove existing cusps and a video camera installed to monitor morphological change.

Beach cusps formed within a few hours of inundation by the rising tide, with $H_s = 0.66\text{m}$, $T = 12.2\text{s}$: breaker heights exceeded 1.1 m and the surf similarity parameter was 0.83 for the foreshore. Mean cusp spacing and width were 7.6 m and 3.6 m. Phase relationships between waves and currents and the cross-shore structure of spectra indicated the presence of a mode 1, synchronous standing edge-wave that should generate cusp spacings of 130 m. Analysis of video data indicated a mean swash excursion length of 4.66 m that should have generated cusp spacing of 7.9 m. The results support the self-organization hypothesis and, to a lesser extent, the Sunamura model. Although edge waves were present, they did not form the beach cusps

Key words:

Self-organization; edge waves; reflective beach; run up model

Fluctuations in Water Level of Caspian Sea and Geomorphology Changes of its Southeast Coast

Karami parivash

Ph.D student of Kharazmi University of Tehran .IRAN. karamiparivsh@yahoo.com

Abstract

Due to the heterogeneous morphology of coastal areas, the impact of fluctuations in the Caspian Sea in the coastline of Iran is not the same. While the middle parts are ending to the beaches of the coastline with a high slope, Iran's northeast coast reached to the coastline with a mild slope. Because of the special circumstances and morphology of the Southeast coast of the Caspian Sea, it has been considered as one of the most important areas to reconstruct the balance of the Caspian Sea in response to the fluctuations of the sea. The purpose of this study was to assess changes in water level of the southeast coast of the Caspian Sea using satellite imagery, historical maps and field observation in its last cycle. The results show that, the coastal morphology in the northeast of Iran is affected by changes in water level.

Geomorphology changes, Fluctuations in Water Level, Caspian Sea, Water progression

Green GDP Accounting of Marine Industries in Bohai Rim, China

Feng Z, Xu X

College of Urban and Environmental Sciences, Peking University, Beijing 100871, P. R. China, fengzhe@pku.edu.cn

Abstract

In this work, environmental accounting method was used to adjust the value of gross domestic product (GDP) of marine industries in Bohai Rim. The green GDP which was defined as GDP account deducts values of marine resource loss, marine environmental degradation and the products related to the environment was calculated. The results are as follows: 1. The Green GDP of marine industries in Bohai Rim is 1848.65 Billion Yuan in 2013, which is equal to 93.68% of marine GDP. 2.70% of marine GDP is deducted to compensate marine resource loss, and 1.47% of marine GDP is deducted for environmental degradation, 2.15% of marine GDP is related to marine environmental management. 2. The amount of fishing in Bohai area is approximately equal to fish population growth in 2013, without causing fishery resource loss. The oil and natural gas loss in this area is valued as 50.21 billion Yuan, whereas the ecosystem loss caused by sea reclamation is 3.11 billion Yuan. 3. The main pollutants generated by the marine industry is COD. The environmental degradation in 2013 is valued as 28.93 billion Yuan caused by sea-farming, offshore oil exploration and development, river transportation and sewage outlet. 4. About 4.42 billion Yuan is spend by national and provincial government departments, while 38.08 billion Yuan is invested in marine environmental researching. This research is supported by the NSFC Project (No.41271102).

Key words:

Green GDP; environmental-economic accounting; marine industry; Bohai Rim

Low-Lying Coastal Plains of the Indo-Pacific Region and Their Vulnerability to Sea-Level Rise

Woodroffe, C.D.

School of Earth and Environmental Sciences, University of Wollongong, NSW 2522, Australia, colin@uow.edu.au

Abstract

There are extensive low-lying plains along many of the coastlines across the Indo-Pacific region. They have formed over the past 7000 years during a period of relatively stable sea level. The topography of these plains reflects the geomorphological processes that formed them. Many are the focus of increasing populations. Sea-level rise poses a threat that will be experienced differently in particular settings. This paper examines the vulnerability of deltas, estuaries and strandplains in the region and considers the opportunities for adaptation.

Abstract

Export from mainland China is a significant source of mercury (Hg) in the adjacent seas (Bohai Sea, Yellow Sea, East China Sea and South China Sea) near China. A total of 240 ± 23 Mg was contributed in 2012 (30% from natural sources and 70% from anthropogenic sources), including Hg originating from rivers, industrial wastewater, domestic sewage, groundwater, non-point sources and coastal erosion. Among the various sources, Hg from rivers amounts to 160 ± 21 Mg and plays the dominant role. Hg exported from mainland China increased from 1984 to 2013; the contributions from rivers, industrial wastewater, domestic sewage and groundwater increased, and the contributions from non-point sources and coastal erosion remained stable. A box model is constructed to simulate the mass balance of Hg in these seas and quantify the sources, sinks and Hg biogeochemical cycle in the seas. In total, 150 Mg Hg was transported to the Pacific Ocean from these seas through oceanic currents in 2012, which could have negative impacts on the marine ecosystem. A prediction of the changes in Hg export through 2030 shows that without effective pollution reduction measures, the impacts of terrestrial export might increase, and the Hg load in these seas will increase, especially in the seawater of the Bohai Sea, Yellow Sea and East China Sea and sea margin sediments of the Bohai Sea and East China Sea.

Abstract

A coastline is a random fractal object in a geographical system whose length is uncertain. To determine the coastline length of a country or a region, the scaling region and fractal dimension of the coastline is first calculated, and then, the length of the coastline is measured using the scale at the lower limit or near the limit of the scaling region. For this study, the scaling region of the continental coastline of China is determined. The box counting dimension is calculated with ArcGIS software using thirty-three scales and a map scale of 1:500,000, and the divider dimension is manually calculated. Moreover, the reliability of the Chinese coastline length value that is currently widely used is discussed in this paper. The results show that the scaling region of the continental coastline of China is from 0.1 to 400 km. In the scaling region, the box counting dimension and the divider dimension of the coastline are 1.2004 and 1.0929, respectively. According to fractal theory, the divider dimension more accurately represents the irregularity of a coastline. The length of the continental coastline of China is approximately 21,900 km when the measurement scale is 0.1 km; however, the length is 18,214 km when the scale is 0.25 km, and this value approaches the continental length of China (18,400 km) in popular use today. Although the coastline length is shorter than 21,900 km, the length is acceptable because the measurement scale (0.25 km) is close to the lower limit of the scaling region.

Research into Marine Ecological Suitability Assessment and Zoning Based on Spatial Analyst Model: A Case Study in Dongtou County

XIANG Y.Y., YANG H.

Second Institute of Oceanography, State Oceanic Administration, Hangzhou, 310012, P. R. China, xiangyunyun@126.com

Abstract

As one of the important parts of the global life supporting system, marine ecosystem has gradually become an important basis providing natural resources and environmental conditions for human survival and socio-economic development; meanwhile, the complexity of human activities has exerted increasingly negative impacts on marine ecosystem, intensifying the contraction of marine resources utilization and regional development. Given the complexity and mobility of marine ecosystem, ecological suitability analysis can reflect the advantages of regional marine resources and the potential of socio-economic development. Thus, it could provide scientific evidence for environmentally marine spatial planning in coastal cities. This research chooses the island county DongTou as the research area, using the multi-temporal remote sensing data, field-research, interviews with expert, the "3S" technology, statistics, indicators and other methods to construct a comprehensive evaluation model of ecological suitability of the region, then to designate its ecological function areas. The results illustrate that in the study area, marine resources utilization can be clearly divided into four categories: key protected zone, buffer protected zone, moderate developed zone and optimized developed zone; the first two are always sensitive to the environment and thus are considered to be the important ecological restoration areas of the county, while the latter two are buffer areas for future marine resources utilization and marine engineering. This study has significant implications for the coordination of the contradictions between the marine resources conservation and exploitation, thus achieving the integrity of the marine ecosystem and the sustainability of regional development.

Spatial Distribution Characteristics of Soil Salinity in Coastal Reclamation Area, Eastern China

Xuefeng XIE, Lijie PU*, Yan XU, Ming ZHU

School of Geographic and Oceanographic Sciences, Nanjing University, Nanjing, 210023, P. R. China,

xiexuefeng2008@126.com

Abstract

The content and spatial distribution of chemical substances in soil is the key to understand the law of water and salt transport in porous media and then put forward the improvement measures of saline soil. This study collected 30 samples of top soil in Rudong coastal reclamation area to measure total salt content, Ca^{2+} , Mg^{2+} , Na^+ , K^+ , CO_3^{2-} , SO_4^{2-} and Cl^- , then the Pearson correlation analysis, principal component analysis and grey correlation analysis were adopted to analyze the characteristics of soil salinity, the ordinary Kriging interpolation method was used to study the spatial distribution pattern of soil salt ions, SAR, $\text{Cl}^-/\text{SO}_4^{2-}$ and salt content. The results showed that soil salt content in top soil was $0.41\sim 27.96 \text{ g}\cdot\text{kg}^{-1}$ with the average content of $8.35 \text{ g}\cdot\text{kg}^{-1}$, and Na^+ and Cl^- are the main salt ions, the type of soil salinization belongs to chloride saline soil. Soil salt content was extremely significant correlated with salt ions except CO_3^{2-} , while the correlation coefficient of Na^+ and Cl^- have reached more than 95% ($p < 0.01$); Principal component analysis and gray correlation analysis obtained similar results. The content of soil salt and salt ions have declined significantly with increasing of reclamation years, and also with descending order of Halophyte > Sesbania > Cotton > Aquaculture pond > Corn under different vegetation. The interpretation map of K^+ , Na^+ , Mg^{2+} , SO_4^{2-} , Cl^- , SAR, $\text{Cl}^-/\text{SO}_4^{2-}$ and soil salt content showed a similar spatial pattern which the higher areas are mainly in YD and DL, while lower areas are in LBK and XBK.

Key words:

Soil salinity; coastal reclamation area; principle component analysis; eastern China

Spatial-temporal Analysis of Shoreline Change along Andhra coast: An Analytical Approach of Remote Sensing and Statistical Techniques

Tyagi SINDHU, Rai. Dr S.C

Department of Geography, Delhi school of Economics, Delhi University, New Delhi, 110007,
India,sindhutyagi14@gmail.com

Abstract

Due to global warming, sea level rise and its impact on shoreline became a burning issue in all over world especially low laying coast like Maldives and East Indian coast. There are number of reports and studies on sea level rise and its impact on shoreline changes. Shoreline is highly productive and most dynamic zone because of interference of three processes namely terrestrial, atmospheric and marine, acting on the earth surface. Due to this it's becoming an area of development like rapid urbanization and industrialization in the world. This is also an area which is very sensitive to sea level rise along coast. So as level of sea is increasing, the population of the coast becoming very Vulnerability to natural phenomena. So analysis of shoreline changes and relation with sea level rise becomes very important due to its importance in the coastal management and planning program in all over the world.

Therefore, the present study is focusing on the effect of sea level change on shoreline position along Andhra coast. Because Shoreline change study helps to understand provides useful data on predicting the future trend which is useful in further planning.

Key words:

Study on the Evolution of the Pearl River Delta, China: 6-2.5 ka BP and Recent 100 aWu, C.Y.¹, Wei, X.^{1,3}, Ren, J.¹, Bao, Y.¹, He, Z.G.¹, Mo, W.Y.¹, Liu, B.¹¹ Center for Coast Ocean Science and Technology Research, Sun Yatsen University, Guangzhou, China, 510275² Department of Mechanics, Sun Yatsen University, Guangzhou, China, 510275³ State Key Laboratory of Oceanography in the Tropics, South China Sea Institute of Oceanology, Chinese Academy of Sciences, Guangzhou 510301, China**Abstract**

Since the end of the eustatic rise about six thousand years before the present, based on both the natural processes, the proper method of survey and disciplines evolved, the development of the Pearl River delta (PRD) can be distinguished into four substantially different episodes. From 6-2.5 ka BP, tidal and riverine energy as major driving forces were redistributed and flow currents were separated by the convoluted coastline and the hundreds of rocky islands in the paleo-estuarine bays of the PRD. The application of a hybrid process-based long-term morphodynamic model verified by sediment cores gives more temporal and spatial details to the development of the PRD. Morphodynamics and sedimentology analyses are conducted to justify and explain the output of the model. Based on its genetic evolution, the PRD can be divided into a number of sub-deltaic plains (SDP). Each SDP consists of several individual deposition bodies. A hierarchical structure of deposition of the PRD is revealed through an interdisciplinary approach. The evolution of the PRD is different from most deltas facing open continental shelf. The approach developed in this study reveals some important aspects and more morphodynamic details of the evolution of the PRD which could not be provided by previous studies. Modelling of delta development in the scale of thousands and of hundreds of years is different at least in two aspects: the techniques of surveys and the scale/capability of human activities. The overall effect of human activities on the PRD has been exceeding natural processes since some hundred years ago, especially after the 1970's in China. A decadal morphodynamic model is developed to simulate and predict the development of PRD in different scenarios which consider both decision/policy making and natural processes. In the present work scale crossing methods and interdisciplinary approach are necessity rather than option. The present study provides a case study which may indicate a possible paradigm shift of delta research.

Key words:

Delta evolution; long-term; morphodynamics; modelling; Pearl River delta; human activities paradigm shift.

Using Benthic Foraminiferal Assemblages as Bio-indicator to Assess Environmental Stress, a Case Study in Zhoushan Port, China

Gui F, Wang LZ, Zhao S, Zhu WY, Zhao XH

Marine Science and Technology College, Zhejiang Ocean University, Zhoushan, 316022, P.R. China,

guifeng77@vip.126.com

Abstract

Forty three surface samples were collected from the central part of Zhoushan Port, China. As well as a monthly sample collection was taken at a tidal flat near Zhoushan Port. Benthic foraminiferal studies were carried out and environmental parameters, including heavy metal Hg, Cr, Cu, Pb, Cd, Zn, TOC in sediment, and nutrients concentration in water were measured to determine the anthropogenic effect on local assemblage characteristics. A total of 33 genera and 60 species were identified. The results showed that the local benthic foraminiferal assemblages were dominated by hyaline tests, with an average percentage of 86.7%, and an average abundance of 1676 individuals per 50 g dry sample. The study area assemblages were mainly dominated by the marginal marine environmental species, *Ammonia beccarii* vars. *Ammonia maruhasii* and *Epistominella naraensis*. Compared with previous studies, new characteristics were determined as follows: (1) an increased percentages of agglutinated species, with the highest value of 15.9%; (2) appearance of some pollution-tolerant species, e.g. *Fursenkoina schreibersiana*; (3) relative higher ratio of deformed individuals (up to 8.5%) in the well-sheltered harbor area; but (4) the Foraminiferal Abnormality Index (FAI) and H(s) should be used with great caution, because of the strong dynamic transport, and similar ratio of deformed individual found in near intertidal flat. In coastal area, foraminifera can be used as a good bio-indicator to assess environmental stress, but new foraminiferal index should be designed.

Key words:

Benthic foraminifera; bio-indicator; environmental stress; coastal area

Adaptability Assessment of Marine Industrial Ecosystem in Bohai Region

LI Bo, ZHANG Zhiqiang, HAN Zenglin

Study Center of Marine Economy and Sustainable Development, Liaoning Normal University, Dalian 116029, Liaoning, China, libo_ok@126.com

Abstract

Adaptability analysis is one of the frontier and hot pot of current global environmental change and sustainable scientific research. It provides a new research paradigm for the study of the coupling mechanism of industrial ecosystem from the theory and methodology. The industrial ecosystem is introduced into the ocean research, putting forward the concept of marine industry ecosystem adaptability. The paper establishes an adaptability assessment index and uses the variance weighting method for weight assignment. Based on the data of marine industry and environment in Bohai region, the paper analyzes the marine industry ecosystem characteristics, types, and influencing factors in Bohai region. According to the model, the paper obtains the adaptability characteristic of marine industry ecosystem in Bohai region. (1) From a view of overall, the difference of adaptability of marine industrial system in Bohai region is relatively large. (2) From a view of space, the feature of adaptive spatial distribution in marine industry ecosystem shows the adaptive spatial distribution of Shandong>Liaoning>Tianjin>Hebei; In the industrial subsystem, it presents the adaptive spatial distribution of Tianjin>Shandong>Liaoning>Hebei; In the environmental subsystem, present the adaptive spatial distribution of Shandong>Liaoning>Tianjin>Hebei. (3) From a view of time, 2006-2012, the adaptability of marine industry ecosystem in Bohai region increased, rising with fluctuate. Comprehensive index of adaptation have a trend of expanding, for this trend, the main reason is that the difference of the industrial system in adaptive growth. (4) From a view of specific provinces and city, according to the development of time, it is concluded that the characteristic of the development in specific province and city in marine industry ecosystem, analyzing the advantages and disadvantages of development. Then, the marine industry ecosystem is divided into six grades. The rating criteria are as follows: (<0.215) extremely weak adaptability; (0.215-0.225) weak adaptability; (0.225-0.235) weaker adaptability; (0.235-0.245) stronger adaptability, (0.245-0.255) strong adaptability, (>0.225) extremely strong adaptability. From the overall perspective, the adaptability is enhanced, the level of adaptation is promoted. The paper by analyzing the coupling of Bohai marine industry and environment subsystem obtain the marine industrial ecosystem level and adaptive characteristics, analyzing the advantages and disadvantages of the marine industry ecosystem in Bohai region, thereby for the sustainable development provides countermeasures and suggestions in Bohai region.

An Evaluation of Chinese Marine Economy Efficiency Based on SBM and Malmquist Productivity Indexes

ZHAO Lin, ZHANG Yushuo, JIAO Xinying, WU Di, WU Dianting

Beijing Normal University, School of Geography, Beijing, 100875, P. R. China, zhaolin19880112@126.com

Abstract

This paper is based on consideration of undesirable outputs from the SBM model and Malmquist productivity index model when, measuring marine economic efficiency values for 11 coastal provinces in China from 2001 to 2012 and analyzing dynamic changes. We found that the marine economic efficiency value of inconsideration of undesirable output was higher than the one for consideration of undesirable output; undesirable output has a significant effect on marine economic efficiency. The spatial pattern of marine economic efficiency shows that the efficiency of northern and southern China is high, and the middle area is low in the initial stage, in 2012, the spatial pattern shows three poles. Chinese marine economic efficiency showed a fluctuating upward trend from 2001 to 2012. The regional absolute and relative gap of marine economic efficiency in coastal provinces shrank and then expanded. Inter-provincial variation of marine economic efficiency varied from province to province. Eleven coastal provinces can be divided into four patterns: leveling, increasing, descending and fluctuating. Total factor productivity, technical efficiency and technological progress efficiency slowly increased. Technological advances play an important role in enhancing total factor productivity. The evolution of marine economic efficiency can be divided into three stages since 2001: a declining and fluctuating stage (2001-2005), transformation stage(2005-2008) and improving stage(2008-2012). The driving mechanism in these three stages are marine resources, policy, market and technology, respectively.

³ China Science and Technology Exchange Center, Beijing 100045

Abstract

Water resources are highly exploited and utilized in the Haihe River Basin on the west coast of Bohai Bay. Studying the dry-wet change in this region is of practical significance for reasonable utilization and scientific management of water resources there. Precipitation for 1961-2010 is analyzed according to the monitoring data provided by meteorological stations, potential evaporation is figured out by use of the Penman-Monteith model (P-M model) and dry-wet index is calculated via Vysotskii model on the basis of precipitation and potential evaporation obtained. Research findings indicate: (1) average annual precipitation of the Haihe River on the west coast of Bohai Bay is between 378.26mm and 711.01mm and is on a decline, with the range of decline decreasing progressively from the southeast to the northwest and getting maximized in the lower reaches; (2) average annual potential evaporation is between 476.26mm and 937.96mm, with the maximum in Tanggu Meteorological Station and the minimum in Chengde Meteorological Station; the potential evaporation increases in some areas; (3) the dry-wet index varies apparently from an area to another; most areas getting dried extend to Tanggu in the southeast, to Fengning in the north and to Weixian and Shijiazhuang in the southwest, with the center in Beijing, and the Beijing-Tanggu region witnesses the most serious drying. Multiple approaches should be adopted to increase water resource supply, raise rain and sewage utilization rate, implement water conservation measures and reduce water consumption in agriculture and daily life.

Assessment of Land- sea Coordination Based on the Principal Component Analysis: A Case Study of Qinzhou, China

Meng Li, BaoQing Hu, Yuchu XIE

Guangxi Teachers Education University, Key Laboratory of Environment Change and Resources Use in Beibu Gulf, Guangxi
Key Laboratory of Earth Surface Processes and Intelligent Simulation, Guangxi Nanning, 530001, hbq1230@sina.com.

Abstract

The strategy of Land- sea coordinate have a great significance for economic-social development and China's ocean superpower dreams. However, with the rapid economic development and population growth, the contradictions among resources and environment are becoming seriously and prominently in the Beibu Gulf Economic Zone, southern China, especially understand the strategy of the Belt and Road Initiative of China. Hence, it has become increasingly importance in assessment of Land-Sea Coordination in the national economic development zone. This paper attempts to quantify land-sea coordination theory and apply it to regional economic development more accurately. Taking Qinzhou gulf as a case, and according to the characteristics of the two systems of sea and land, this study quantitatively evaluate the degree of land - sea co-ordination based on combining principal component analysis (PCA) and a indicator system. The evaluation indicator system included resource, economy development, scientific innovation and environmental management four level. The results showed that: the comprehensive ability of land and marine economy increased in Qinzhou, and relation with the resource development. However, the growth trends of land and marine economy were different, and the ability to use land resources is downward trend. Moreover, the land-sea coordination increased as regional economic growth, and the change trend was fluctuations. (Foundation: National Natural Science Foundation of China (41361022), the scientific and technological development projects of Guangxi zhuang autonomous region (2014DD29090), the Natural Science Foundation of Guangxi (2014GXNSFDA11803).)

Beach Morphodynamics and Impact Factors on the Beaches of Shandong Peninsula

Baojing Yue, Maosheng Gao, Liangyong Zhou, Jing Liao, Xue Ding

Qingdao Institute of Marine Geology, Qingdao, 266071, P. R. China, selinayue1022@hotmail.com

Abstract

Types of beach morphodynamics are divided for the typical beaches along the coasts of Shandong Peninsula based on beach flat forms, wave sediment parameters (Dean Parameters) and five repeated beach profile surveys carried out from 2012 to 2014. Relationships between the beach morphodynamical types and the wave conditions are also discussed by comparing the differences in seasonal changes of beach profiles in the north with those in the east. The results show that: 1) according to the wave sediment parameters, which are indicative of division of beach morphodynamical types in the studied areas, the beach along the northern coast of the peninsula are dominated by a dissipative type and a transition type, whereas along the eastern coast of the peninsula the beaches are mainly composed of a transition type and a reflective type; 2) the forms of beach bars and beach profiles indicate that the beaches along the northern coast of the peninsula have a changing tendency opposite to those along the eastern coast of the peninsula in summer and winter, with the beach bars occurring frequently on the former profiles in summer and on the latter profiles in winter due to small waves; 3) although the northern coast of the peninsula is mostly subjected to the actions of waves and tides at the same time, the seasonal changes in wave conditions have played an more important role to the beach morphodynamics of the beaches.

shicuicui1985@163.com

Abstract

The characteristics of surface sediments are studied with the 158 bottom samples taken from the inner Lingdingyang Firth of the Pearl River Estuary. Sediment transport trends are identified by the USTA model. The results indicate that there are six types of bed deposits in the inner Lingdingyang Firth, with clayey silt being the dominant. The sediment transport pattern in the inner Lingdingyang Firth is complex. Regarding the sediment migration trend, the firth could be divided into three subareas. In the subarea I, or in the east part of the firth, sediments move from the east to the west. In the subarea II, sediments move in a pattern from northeast to southwest due to the effect of strong reciprocating flow and deep brine water wedge caused by the Coriolis force. In the subarea III from the Hengmen Gate to the Jinxinmen Gate, sediment move from distributaries to the coastal beaches. Around the Qiaodao Isle, however, sediments move in a clockwise pattern driven by the local circulation.

Key words:

surface sediments; sediment transport trend; Pearl River Estuary; inner Lingdingyang firth

Chinese Marine Economy Development: Dynamic Evolution and Spatial Difference

Abstract

Chinese coastal areas are the research object of this study, which established a kernel density function model based on the marine economic per capita index to depict the distribution of the marine economy in 1996–2013. A large quantity of sample data is needed in the application of kernel density estimation. In order to make up for the lack of information, information diffusion technology is used to deal with the data. The marine economic distribution function was decomposed and the influence of growth and inequality in the process of the development of the marine economy was analyzed. This study shows that the development of the Chinese marine economy presented a single-peak distribution trend and marine economy development is more harmonious and balanced in coastal areas; the greatest impact on the distribution function of the marine economic growth was the mean effect, followed by the variance effect, and last, the residual effect. The mean effect is the same as the direction of the distribution of the annual density difference. The relative development rate was introduced to analyze the spatial difference of the development of the marine economy. Therefore, space and time dimensions fully characterized the evolution of the Chinese marine economy. The results favor the Chinese coastal areas formulate long-term planning of the ocean and provide theoretical guidance for the rapid development of the marine economy.

Chinese Marine Ecosystem Services Value: Regional and Structural Equilibrium

Analysis

Caizhi Sun ^{a,*}, Song Wang ^a, Wei Zou ^{a,b}

^a Center for Studies of Marine Economy and Sustainable Development, Liaoning Normal University, 850 Huanghe Road, Dalian 116029, China;

^b School of Foreign Languages, Liaoning Normal University, 850 Huanghe Road, Dalian 116029, China

Abstract

The ocean is the regulator of the Earth's environment, and the value of the marine ecosystem services is the concrete embodiment of human enjoyment of marine ecological resources. In this paper, we combine past research and statistics to calculate the value of marine ecosystem services and to achieve dynamic measurement of these values with minimal subjective factors, and measure the marine ecosystem services value for 11 coastal provinces and cities in China. In view of the difference between the marine ecosystem services value foundation and the speed of development, we performed regional and structural equilibrium analysis of the marine ecosystem services value using an improved Gini coefficient. In the region, the overall equilibrium was found to have improved over time, and the contribution rate and share weights of the Northern region increased significantly. As for the structure, the overall Gini coefficient decreased due to an improvement in a sub-part of the marine ecosystem service value equilibrium. We can improve the equilibrium according to the marginal effect of Gini coefficient. The idea that ecosystem service values can be calculated based on data rather than opinion, and breaking ecosystem services into components allows for detailed analysis in this paper, will be still valid in the worldwide.

Effects of Storm Waves and Heavy Rainfall Events on Topographic Changes at Jinshawan, Northeastern Taiwan

Ho, Y-W, Lin, T-Y

Department of Geography, Taiwan Normal University, Taipei, 10610, Taiwan, China, aeolin@ntnu.edu.tw

Abstract

Taiwan, located in west Pacific Ocean, is very often attacked by typhoons. The storm surge and waves associated with typhoons can cause severe erosion at sandy beaches and sand dunes. Monitoring the topographic changes of beaches and dunes can help predict the topographic change in future typhoons, which may alert coastal residents and local governments of the need to prepare appropriate plans for potential typhoon hazards along the shoreline.

According to statistical analysis of typhoon paths between 1897 to 2014, the Central Weather Bureau in Taiwan found that 28 percent of the paths are in path types 2 and 6, which are the typhoon paths that may affect the Jinshawan area the most. Typhoons in these path types, if accompanied by the northeastern monsoon, may cause extremely heavy rainfall in the eastern and northern coasts of Taiwan. Jinshawan beach is, therefore, an ideal place to observe the effects of storm waves and heavy rainfall events.

By using the RTK (Real-time kinematic) technique to survey the topography of Jinshawan beach before and after typhoons and heavy rainfall events, we found that typhoons could cause shoreline retreats at Jinshawan beach for about 3 to 5 meters and the dune vegetation line to retreat about 1 meter. A heavy rainfall event may cause numerous sediments to be transported to the sea from the Jinshawan river while large amounts of gravel pile on the berm.

Key words:

Beach erosion; beach topography; RTK; storm waves; heavy rainfall

Estimating the Efficiency of Complex Marine Systems in China's Coastal Region using a Network DEA Model

Caizhi Sun^a, SongWang^a, ZouWei^{a,b}

^a Center for Studies of Marine Economy and Sustainable Development, Liaoning Normal University, 850 Huanghe Road, Dalian 116029, China;

^b School of Foreign Languages, Liaoning Normal University, 850 Huanghe Road, Dalian 116029, China, suncaizhi@lnnu.edu.cn

Abstract

Marine economies have become the hotspot, while coastal social and ecological problems are gaining increasing attention worldwide. Previous studies have focused on the economic, social, and ecological efficiency of single and dual systems in a composite system, thus ignoring the impact of other subsystems. Drawing on the theory of system, this study constructs a ring structure of a complex marine system and then selects a corresponding decision-making unit on the basis of labor and capital circulation in each subsystem to calculate the efficiency of the chain structure using a network DEA model. The results revealed that while social-ecological-economic efficiency increased, social-economic-ecological and ecological-social-economic efficiencies remained stable. By contrast, economic-social-ecological and ecological-economic-social efficiencies showed a downward trend, whereas economic-ecological-social efficiency demonstrated varying changes. The overall efficiency of the chain is highly similar to that in the first stage, although there are differences in numerical values. The study also demonstrates that the network DEA results based on the theory of system do not deny those of previous studies, but contribute to the accuracy of efficiency calculation. The differences between the overall efficiency and that in the first stage indicate that previous studies have underestimated socioeconomic and socioecological efficiencies but overestimated ecological efficiency.

Evolution of the Tidal Flats in Yangtze Estuary under the Influence of Deep-water Navigation Channel Project

Xianyun Qi, Bo Tian, Xing Li, Wenting Wu, Chunyan Zhu

State Key Laboratory of Estuarine and Coastal Research, East China Normal University, Shanghai, 200062, China,

qxybeijing0319@hotmail.com

Abstract

Of great amount of sediment and discharge, Yangtze estuary has three-order bifurcations and four-branch channels. Under the influence of the Deep-water Navigation Channel project (DNC), tidal flats (JIUDUANSHA shoals and Hengsha shoals) become highly susceptible to anthropogenic disturbances instead of a natural state of growth. We collated remote sensing (RS) data, such as SPOT-7, FORMOSAT-2, GF-2, aerial images, and the nautical charts, spanning before and after three stages of the construction of DNC. We used geological information system (GIS) and RS technique to acquire geometric characteristics so as to analyze the trend and extent of erosion and deposition in tidal flats. Moreover, geomorphological change was analyzed by assessing the variation of surface suspended sediment concentration (SSC) in channels. The results indicated that tidal flats in both sides of channel increased by 171.89 km² in total after completion of the DNC. The Jiangya Shoal (JYS), the Upper Shoal (US) and the Middle-Lower Shoal (MLS) showed different responses to the DNC. Instead of severe fluctuation during the DNC, JIUDUANSHA shoals leveled off after the project and have continuous change and periodic change in a slowing velocity of increase recently, including broadness of the island area, siltation of the tail of tidal island and swaying to south periodically. Hengsha shoals significantly silted eastward along the northern dike of channel, which has certain influence on navigation safety. The SSC showed no evident correlation with either variation of siltation and erosion in tidal flats or siltation of channels, which deserves more attention in further study.

Key words:

DNC project; tidal flats; JIUDUANSHA shoals; Hengsha shoals; siltation and erosion

Impact of Landscape Pattern on Ecological Vulnerability and Ecosystem Services

Value: An Empirical Analysis of Yancheng Nature Reserve in China

Zheng ZANG¹, Xinqing ZOU^{1,2,*}

¹ School of Geographic and Oceanographic Sciences, Nanjing University, Nanjing 210023, China

² Collaborative Innovation Center of South China Sea Studies, Nanjing 210093, China

Abstract

In this study, an ecological vulnerability assessment indicator system was constructed using the “exposure–climate sensitivity–adaptive capacity” framework with reference to the theory of ecological vulnerability. An improved ecosystem services value calculation model was proposed based on empirical parameters. Using Yancheng Nature Reserve in China as an example, we employed remote sensing data to conduct an empirical analysis of the changes in the spatiotemporal pattern, ecological vulnerability, and ecosystem services value of typical landscape types over the period 1987–2013. The results showed that during the investigation period, the fragmentation of three natural wetland landscape types (i.e., *Spartina alterniflora*, *Suaeda glauca*, and *Phragmites australis*) gradually increased in the study area. The ecological vulnerability scores of major landscape types were, in descending order, *P. australis* (0.053), farmland (0.047), *S. alterniflora* (0.042), *S. glauca* (0.031), and bare mud flat (0.002). From 1987 to 1997, the ecosystem services values of *S. glauca* and *P. australis* wetlands decreased, while that of *S. alterniflora* wetland increased continuously. From 2002 to 2013, the ecosystem services values of all three types of natural wetland showed a downward trend. In conclusion, the combined effect of human and natural factors, including the expansion of farmland and aquaculture waters and changes in seawater erosion and deposition, led to changes in the landscape pattern, ecological vulnerability, and ecosystem services value of Yancheng Nature Reserve during the investigation period. It is recommended that a “dual adaptive” management system based on natural succession and supplemented by appropriate manual intervention be implemented to improve management efficiency and flexibility and to adapt to landscape pattern changes.

Research on Time-Space Differentiation of the Vulnerability of Marine Economy System Based on BP Neural Network: The Case in Chinese Coastal Areas

PENG Fei, HAN Zenglin

Research Center for Marine Economy and Sustainable Development, Liaoning Normal University, Dalian, Liaoning 116029, China, pfly324@163.com

Abstract

The research on the vulnerability of marine economy system aims for the vulnerability's reduction and the realization of the sustainable development of marine economy. Based on the conception of the vulnerability of marine economy system, this paper established an assessment index system from its sensitivity and response capacity, then used the BP artificial neural network model with vulnerability index and the formula of obstacle degree evaluation to analyze characteristics and the mechanism of spatial and temporal evolution, as well as the influence factors of marine economy system in 11 provinces and cities in China's coastal regions during 2006 to 2011 (not including Hong Kong, Macao and Taiwan regions). The results showed: (1) The response capacity and sensitivity of Chinese marine economy system kept the same tendency, indicated a slow-declining trend as a whole with partial mutation and a gently change in the vulnerability. (2) The spatial distinction type of the vulnerability of China's coastal areas showed overall dispersion, partial concentration and distinctive spatial differentiation, while the vulnerability in northeast and east China coastal areas was gradually reduced and extremely differentiated in north and south coastal region. (3) The vulnerability of Chinese marine industry system showed three phase characters, which consist of increasing vulnerability type (Guangxi, Hebei, and Fujian), lower vulnerability type (Guangdong, Tianjin, Shanghai, and Liaoning) and steady vulnerability type (Shandong, Jiangsu, Hainan, and Zhejiang). Lastly, through the analysis of the impact factor of the vulnerability of Chinese coastal areas' marine economy system, pertinent directions of the marine economy development were put forward.

marine economy system; Vulnerability; BP artificial neural network; spatial-temporal variation; China coastal area

Response of Soil Quality to Different Vegetation Types on Coastal Sandy Land of Hainan Island

ZHAO Congju, ZHUO Zhiqing, XU Wenxian

School of Geography and Tourism, Hainan Normal University, Haikou, 571158, P. R. China; congjuzh@hainnu.edu.cn

Abstract

To evaluate the effect of different vegetation types on soil quality in coastal sandy lands, several vegetation types, including pure forest of *Casuarina equisetifolia*, shrub mixed forest, grassland and bare land were taken as the research subjects in east coast of Hainan Island. The indicators such as alkali hydrolysable nitrogen, available phosphorus, available potassium, organic matter, soil moisture, and soil density in topsoil (0-30 cm) and subsoil (30-60 cm) were selected as the evaluation factors. In addition, the weight value of each evaluation factors was identified by principal component analysis (PCA) and the response of soil quality to different vegetation types were evaluated by gray relational analysis and soil degradation index. The results show that: there is significant difference in soil quality of different vegetation types, and the order of weighted degree of association is that: shrub mixed forest (0.7028) > grassland (0.6916) > forest (down slope, 0.6893) > forest (up slope, 0.6816) > forest (middle slope, 0.6637) > bare land (0.6524). Moreover, during the recovery of degraded sandy soil, the study suggests that shrub mixed forest of *Casuarina equisetifolia* gave priority to restoring soil quality, and followed by grassland. However, the effects of slope position and altitude on improvement of soil fertility are also significant. Based on the landform features, only reasonable allocation of vegetation types in degraded sandy soil can optimize the model on vegetation and soil restoration. This study can provide scientific reference for soil fertility reconstruction and vegetation restoration in the coastal zones under similar condition.

Soil quality; vegetation types; grey relation analysis; soil degradation index; East coast of Hainan Island

Sedimentary Environment Change in a Semi-Enclosed Embayment and Its Response to Fast Urbanization Process

Aijun WANG, Binxin ZHENG, Xiang YE, Jianyong FANG, Liang WANG

Third Institute of Oceanography, State Oceanic Administration, Xiamen, 361005, P. R. China, wangaijun@tio.org.cn;

ajwang@163.com

Abstract

Coastal embayments, as an important type of coastal system, are undergoing a heavy influence by strong human activities. Tongan Bay is a typical semi-enclosed embayment adjacent to Xiamen Island, southeast China. Due to construction of the Gaoji Seawall, the Tongan Bay have occurred a heavy accretion from 1950s', and the hydrodynamic processes were changed obviously, and the fine fraction of the sediment increased. Since 2005, the coastal area around the Tongan Bay was experienced a fast urbanization process, and hydrodynamic processes were changed again, and associated suspended sediment and bedload transport patterns were also altered, and then the new sediment distribution pattern and geomorphology structure were established correspondingly. The sedimentary environment and evolution of geomorphology in Tongan Bay are experiencing the adjustment from naturally developed pattern to artificial pattern. After the complicated rearrangement, it will be fashioned into a set of new geomorphology pattern which is the net effects of physical hydrodynamic processes and human activities.

³Department of Marine, Earth and Atmospheric Sciences, North Carolina State University, Raleigh, NC 27695, USA

Abstract

Based on the high quality and high resolution shallow seismic profiles in the Abandoned Yellow River subaqueous delta (AYRSD) and northern radial sand ridge field (NRSRF) off the north Jiangsu plain coast, synthesized studies on the seismic stratigraphy since the last deglaciation have been done. It could be clearly seen that, in the AYRSD area, the sequence boundary was fairly uneven, buried in the depth of ca. 20-50 m bpsl from west to east, with a compound clinoform deposits overlaying on it. The clinoform deposits varied in reflection configurations, showing parallel or sub-parallel, low angle to high angle progradational patterns from west to east. On the contrary, in the NRSRF area, the sequence boundary was pretty even, buried in the depth of ca. 30-35 m bpsl in the nearshore, with a compound deposits overlaying on it, which was relative to the AYRSD area, however, with remarkable regional differentiation. In the area north of ca. 33°19' N, the deposits varied in reflection configurations, showing parallel or sub-parallel, complicated progradational patterns from bottom to top. Even the high angle progradational pattern could be seen in the topmost part, interpreted as tidal sand ridges. In the area south of ca. 33°19' N to Jianggang, the layer with parallel or sub-parallel reflection configurations was missing, while it was a key seismic reflection layer distributed commonly in the nearshore north of ca. 33°19' N and likely to be derived from the Holocene Yellow and Huaihe River deltaic deposits.

Key words:

Seismic profile; clinoform deposits; Abandoned Yellow River subaqueous delta; Northern radial sand ridge field

Spatial Agglomeration of Marine Industries and Region Coordinated Development in China

GAO Yuan, HAN Zenglin, YANG Jun, GUAN Chao

School of Urban and Environmental Sciences, Liaoning Normal University, Dalian, Liaoning 116029, P. R. China,
gyis1213@163.com

Abstract

This article analyzes the spatial structure gradation of regional marine industrial agglomeration of China and considers that the interprovincial scale research should be regarded as playing the role of “nexus”. Then it has measured the agglomeration degree of marine industries in 11 coastal provinces (Hong Kong, Macau and Taiwan excluding) by employing location quotient during 1996-2012. As a result, the differentiation of agglomeration degree appeared in the first stage of 1996-2000, and increased gradually during the second stage of 2001-2005, and in the recent seven years: 2006-2012 was very remarkable. One half of the coastal areas, Tianjin, Shanghai, Fujian, Hainan, Shandong and Guangdong, has been growing up into agglomeration areas. The former four areas has been showing the higher location quotient value and the tendency of agglomeration enhancing. According to the literatures, a model has been made to study quantitatively the coupling coordination degree of two systems in Tianjin, Shanghai, Fujian and Hainan: the marine industrial agglomeration system and the marine resources and regional environment system (a compound system). The study has indicated that during 2001-2012, the coupling coordination degree of the compound system in the four agglomeration areas has been rising constantly and showing an upward tendency. According to the grade of coupling coordination degree, the compound systems of the four areas are all in the condition of incoordination before 2006 and in the condition of coordination after 2006. At present, all of the compound systems of the four agglomeration areas are being in the stage of medium coordination.

Spatial Evolution of Container Shipping Network: Evidence from China

Fei Fan

Institute for the Development of Central China, Wuhan University, Wuhan 430072, China, ffan@whu.edu.cn

Abstract

In order to depict the spatial evolution of container shipping network, based on the estimated value of the trade volume of container transportation in the port, the international space distribution of container transportation trade is analyzed. Evidence from China (2000-2010), it discusses the mechanism of the international space layout of China's port container transportation system. Result display: Global container ports' distribution, Top 100 ports are gradually fastening on the three maritime regions (developed or rapid-developing economies): Asia-Pacific (East Asia, Southeast Asia and East Australia), North America and Europe Unions, driven by the big-three forces as China, the USA and West Europe. On the other hand, with respect to China, besides continuous increasing in container ports throughput in whole, a parallel growth in the centralization in part is also observed, especially in Southeast part coastal belts of China. In the sorting with China's container ports, a shifting process of transiting position from lower to higher level during one decade. The ports of Shanghai, Hong Kong and Shenzhen are of the highest three ones that well above average with an excellent accessibility and transport capacity that hold a pivotal position. The formation and change of the international space of China's port container transportation system has been influenced by many factors, such as scale economy, industrial structure, port management system and so on. These findings are meaningful to understand the spatial evolution of container shipping network and China's status and role in the structure of the world ocean transportation, for decision makers to develop a comprehensive, strategic sea transport scheme.

Spatiotemporal Analysis of Nutrients Concentrations Based on ArcGIS, a Case Study in Zhoushan Coastal Area

Zhu WY, Wang LZ, Gui F

Marine Science and Technology College, Zhejiang Ocean University, Zhoushan, 316022, P.R. China, mail2wlz@126.com

Abstract

Eutrophication caused by over enrichment of nutrients has been a long time environmental problem in China's coastal area. Zhoushan, located near the estuarine of Yangtze River and Qiantang River, is a typical zone under the interaction between land and ocean. To improve the water quality, great effects have been taken, including various monitoring work to find the contribution from different pollution source, i.e. territorial pollution and local point source, et al. In this study, spatial and time analysis were carried out using ArcGIS software to show relative high-resolution distribution of inorganic nitrogen and reactive phosphate concentrations and their changes with time. The study was based on collected environmental monitoring data between 2006 and 2014, as well as with investigation data in 1990s. All the data collected were processed using ArcGIS to build the database. The study showed (1) an increase trend in eutrophication from 1990s to 2014. (2) A relative serious pollution in the western part of study area. And besides regional distribution, we also find some sub-regional "hot-spot", which indicate a possible pollution source tracing method. (3) A black-box model was described in our study to show the dual forcing from territorial extraneous and local nutrients inputs. With further study and application, our study may improve the utilization and sharing of monitoring data, and provide basic research work for pollution source management.

Abstract

With the vulnerable ecological environment of sea islands, protecting the ecosystem of islands as well as their surrounding waters, reasonably exploiting and utilizing the natural source of sea islands, and promoting the sustainable development of island economy and society have become basic purpose of *Legislation of Sea Island Protection of PRC*. This essay attempts to refer to the idea of land area sustainable development index system, select indexes in terms of four aspects including survival support, ecological environment, economical development, social and intellectual support, integrating the natural environment of islands and the particularity of society and economy, determine the weight of evaluation index of island sustainable development with the integration of entropy weight method and the nonstructural decision fuzzy set theory model, and build the index system of island sustainable development; the essay also further import variable fuzzy evaluation method of the unity of the opposites and quality interaction law set up the comprehensive evaluation model of island sustainable development based on the theory of variable fuzzy set, evaluate and verify the condition of sustainable development in Changhai County from 2001to2013,and identify key factors, existing problems and restrictive factors affecting the capability of sustainable development. This provides scientific analyst data for improving the level of sustainable development of economy and society.

The Study of the Yao Sandbank's Geomorphological Evolution Based on the Remote Sensing

Jiale Wu, Min Xu

Nanjing Normal University, Nanjing, 210046, China, wujiale6koala@sina.com

Abstract

Yao Sandbank (YS) is the largest sand bar of south wing of tidal systems in the South Yellow Sea. It has complex shoal, rich deep water coastline and development potential. Research on the geomorphological evolution can support the further development and utilization of construction in the complex dynamic environment of the YS. Landsat images in 1987, 1995, 2000 and 2008 and survey data of beach profile were interpreted and analyzed to obtain the typical geographical features. After geometric calibration and overlay, the positions of beach ridge, channel axis and shoreline during 4 different periods were compared and their changes were analyzed.

The results showed that: The basic combination form of "water channel-sandbar system" was at the status of stability. The relative scale of tidal flat was decreased with the current situation of east-outside part silting while north part washed. The north part and the south part differ in the forms and the evolution trends. The Xiao Miao Hong channel's dynamic axis of flow was migrating southward.

Wetland Dynamic and Ecological Compensation of the Yellow River Delta in China

Han Mei

Shandong Normal University, Jinan, 250014, P. R. China, hanmei568568@126.com

Abstract

As a new type of resource and environmental management, ecological compensation has increasingly become a concern among Chinese and international scholars. In the past 20 years, many domestic and foreign scholars have studied a lot of work on the concept, mechanism and mode, standard, and benefit evaluation of ecological compensation. However, the study on eco-compensation has significant discipline overlapping and regional differences, causing some divergences in the above mentioned study contents, so it needs further improved. The essay tries to explore the eco-compensation standard based on the value loss of ecological function and the loss of marketable value with the hope of supplying scientific evidences for the researched areas' carrying out the eco-compensation as well as methods' reference for the related research of other areas. Ecological function value of wetland unit area in the study area is higher than the national and global average level. The material production function and the degradation pollutants function have the maximum value. Natural wetlands value is much higher than artificial wetlands. This study was supported by the Natural Science Foundation of China (41371517).

Key Words:

Wetland dynamic; ecological value; compensation standard

Adaptive Realities of Single-Industry Communities of Murmansk Region in the Changing Arctic

Zaika Yu.V.

Khibiny research station, The Faculty of Geography, Lomonosov Moscow State University, Kirovsk, Murmansk region, Russia, yzaika@inbox.ru

Abstract

Among other Arctic territories of Russia, Murmansk region holds the first place by the number of single-industry cities (8: Polyarnie Zory, Kirovsk, Nikel, Zapolyarniy, Tumanniy, Monchegorsk, Revda, and Kovdor). At present 23% of the region's population (over 150000 people) live and work in single-industry cities and set up the greatest industrial potential for further socioeconomic and sustainable development of this area. The most part of regions' single-industry cities has a mining profile.

Arctic resource stocks are expansive due to the new exploration possibilities opened by the human-driven climate and environmental change. But resource markets and political situations dictate their own demands through the historic period from Soviet times to nowadays. These demands place new economic realities to the industries allocated in the region to which they should be adaptive and resilient.

The exceptional socioeconomic and environmental factors which contribute to sustainable development balance of single-industry cities mostly are structural and paradigm changes in economy and functionality of enterprises after collapse of Soviet Union; the triple contradictions of interests: enterprise owner – regional government – local workers; downsizing and depopulation; domestic and foreign market conditions; pollution; the quality of life of local population, and other key factors.

The rapidly changing resource, political and military role of the Arctic and its economy nowadays brings in new challenges and benefits to the sustainable development of the region and its mining communities. An ineffective governmental strategy for social services, human capacity building, socially-oriented regional budget and world/domestic demand for particular resource are therefore the major milestones.

Key words:

Sustainable development; Arctic; extractive industries; mining; adaptation; strategy

Abstract

The Belmont Forum project “ASUS: Arctic SUSTainability: A Synthesis of Knowledge” brings together an international team of experts from seven Arctic countries to develop an interdisciplinary synthesis and assess the state of knowledge about Arctic sustainability and sustainable development. A special domain of this ASUS project is “Monitoring of sustainability and sustainable development”. The aim of this activity is to assess what has been already done in monitoring Arctic sustainability and sustainable development at different scales, what approaches and methods were implemented to delineate and monitor trends, both positive and negative on the way towards sustainability in the Arctic. The focus on creating knowledge infrastructure for multi-scale socially-oriented observations and assessments of Arctic socio-ecological systems sustainability and resilience in changing natural and living environments is of great importance. A design of the suitable monitoring frameworks of sustainable development and resilience of complex socio-ecological systems is one of the project’s goals to be discussed. We envision integration of the established indicators frameworks developed by the Arctic Social Indicators (ASI) and Integrated Arctic Socially Oriented System (IASOS) network projects, putting main focus on quality of life, human and social capital development in the Arctic. The presentation is going to be based on the results of the wide stakeholder discussion during the Arctic Observation Summit in March 2016.

Developing Sustainable Development Indicators for Monitoring of Industrial Development Impacts in Northern Communities

Andrey Petrov

University of Northern Iowa, United States, andrey.petrov@uni.edu

Abstract

This paper develops a multilayered system of indicators designed to assess and monitor socio-economic impacts of resource activity on northern communities in respect to sustainable development. The proposed monitoring system is based on existing data available to communities at no or little cost, incorporates baseline and regional comparisons as well as “slow” and “fast” variable components. We use the case of Inuvialuit Settlement Region in northern Canada to implement this system. The results indicate that ISR underwent considerable improvement in the years since finalizing its Land Claim Agreement and subsequent resource-related activities. However, the gap with reference regions still persists.

indicators; sustainable development; Arctic

Environment Response of the Yenisei Siberia Mid -Taiga to Global Warming at the edge of the Millenium

Medvedkov A.

Lomonosov Moscow State University, Moscow, 119991, Russia, a-medvedkov@bk.ru

Abstract

Results of long-term investigations on middle taiga ecosystems response to climate warming since early 80-s , 20th c. are presented. The author demonstrates original data on modern middle taiga ecosystems characteristics in one of the less explored regions of the Central Siberia. It was made clear that these natural complexes are particularly vulnerable to any external impact and are the most important indicators of modern climate changes. These data promoted development of a scientific basement of ecosystems differentiation regarding response degree to climatic signal as well as elaboration of taiga nature management diversification for different ethnic aborigine population groups and forest conservation measures.

climate change; permafrost landscapes; exodynamic processes; Siberian taiga; traditional knowledge; adaptation strategies

Geographical Aspects of Spitsbergen Environment Transformation after the Little Ice Age

Ziaja W

Institute of Geography and Spatial Management, Jagiellonian University, Krakow, Poland, wieslaw.ziaja@uj.edu.pl

Abstract

Intensive environmental transformation occurs in Spitsbergen due to global and local climate warming. Dramatic transformations of all the environmental components lead to significant changes in functioning of environment. The snow line (together with the glaciers' firn and equilibrium lines) is being uplifted due to the temperature increase (the same refers to the upper limit of vegetation). Hence, accumulative zones and extents of glaciers, especially in their lower parts, become smaller and smaller. Glacial recession generates big changes in the coastline and coastal topography. New deposits, landforms and water bodies appear in areas abandoned by glaciers if their bedrock is situated above the sea level (their bedrock below this level is being flooded by the sea). New unglaciated landscapes undergo pioneer animal colonization and plant succession, and soil formation begins there (the same refers to areas free of glaciers but devoid of plants due to severe climatic conditions before). The glaciers located newly below their equilibrium lines (after its uplift) begin to decline. A lot of glaciers change their type into a more simple one, e.g. valley glaciers into cirque or slope (hanging) ones. Spitsbergen becomes much less glaciated. Some of its mostly glaciated regions are being transformed into mostly unglaciated ones. The active layer, thawing on permafrost in summer, is deeper and deeper. All these changes will lead to development of continuous tundra vegetation on the eastern coast and transformation of the southern Spisbergen peninsula into a new island (if a cold climatic fluctuation will not appear).

Key words:

environmental and landscape transformation; new landscapes

Naskapi Observations on Changes in Caribou and Related Impacts on Wildlife Food Security and Health in Northern Quebec, Canada

Marie-Jeanne S. Royer, Thora Herrmann, Nicolas Brunet, Nathalie D'Astous, George Guanish, John M. Mameamskum

Department of Geography and Earth Science Aberystwyth University, Aberystwyth, United Kingdom,
mar71@aber.ac.uk

Abstract

The George River caribou (*Rangifer tarandus* L.) herd in northern Quebec (Canada), one of two active herds in the area, has declined from a high of about 800,000 heads in 1993 to 14,200 heads by the summer of 2014. Caribou has always been very important to the Naskapi Nation of Kawawachikamach in Subarctic Quebec. Still today the Naskapi depend on caribou for meat and other raw material. Caribou population declines are thus increasing food insecurity for the Naskapi. Here we presents the outcomes of the Naskapi Climate Change Adaptation and Caribou Project, a participatory methods (i.e. community workshops, community caribou surveys, questionnaires and interviews) based community-led study; which had as aim to document Naskapi observations on changes in caribou population and the resulting impacts on Naskapi traditional activities and health. Results show that the size and abundance of caribou has decreased, and that caribou behavioural and migratory patterns have changed due to mining, outfitters and climate change. Diverse actions have been taken by the Nakapi Nation to adapt to these changes and to improve food security such as: modifying their traditional hunting practices, encouraging the use of other food source (e.g. moose or fish). The integration of the documented observations by the Naskapi of Kawawachikamach can help community members and policy makers develop appropriate adaptation and mitigation measures to socio-environmental changes occurring in the area.

Permafrost in Beiluhe Basin, Qinghai-Tibet Plateau by Ground-Based and Satellite-Based Methods

Guoan Yin, Fujun Niu

Cold and Arid Regions Environmental and Engineering Research Institute, Chinese Academy of Sciences, China,
yinguoan12@mailsucas.ac.cn

Abstract

Beiluhe basin, in the central Qinghai-Tibet Plateau, is an ideal area for monitoring permafrost characteristic and response to climate change. This paper is to provide a synthesis on the thermal state, influencing factors and recent evolution of permafrost conditions in Beiluhe basin. Satellite-based method is used to classify the vegetation type and geomorphic unit. The analysis is based on ground temperatures and soil samples from 21 boreholes and field investigation. The results show that the vegetation can be classified as four units and vegetation unit is one of the indicators of the spatial distribution of permafrost conditions. The ground surface thermal state is significantly influenced by the ground surface characteristics.

Projected Climate Change Impacts on Urban Infrastructure: Quantitative Assessment for Russian Permafrost Regions

Shiklomanov N.I., Streletkiy D.A., Swales T.B., Kokarev V.,

The George Washington University, Washington, DC, 20052, USA, shiklom@gwu.edu

Abstract

Planned socio-economic development during the Soviet period promoted migration into the Arctic and work force consolidation in urbanized settlements to support mineral resources extraction and transportation industries. One of the most significant impacts of climate change on arctic urban landscapes is the warming and degradation of permafrost which negatively affects the structural integrity of infrastructure. In this paper we focus on quantitative assessment of potential changes in stability of Russian urban infrastructure built on permafrost in response to projected climatic changes using permafrost - engineering model. To address the uncertainties in climate projections produced by state-of-the art General Circulation Models (GCMs), we have utilized results from six GCMs participated in most recent Climate Model Inter-comparison Project (CMIP5). The analysis was conducted for entire extent of the Russian permafrost-affected area and on several representative urban communities. Our analysis demonstrates that significant climate-induced reduction in urban infrastructure stability throughout the Russian permafrost region should be expected by mid XXI century. Although high uncertainty, resulted from GCM-produced climate projections, prohibits definitive conclusion about the rate and magnitude of potential climate impacts on permafrost infrastructure, the results presented in this paper can serve as guidelines for developing adequate adaptation and mitigation strategy for Russian northern cities.

Road Infrastructure and Sustainability in the Sayan Mountain Region of Russia

Vera Kuklina

V.B. Sochava Institute of Geography SB RAS, Russian Fed, vvkuklina@gmail.com

Abstract

In harsh natural conditions of the Arctic and mountainous regions construction of road infrastructure is usually related to extraction of resources and presented by policy makers as part of economic development. In the article I will discuss the challenges brought by road construction in the Sayan mountain region where one might observe diversity of perception of sustainability among local communities, policy makers, extractive industries, and tourists. Traditionally the whole region has been settled by nomadic reindeer breeding indigenous groups of Soyots (Okinskii raion of Republic of Buriatia), Tozhu (Todzha kozhuun of Republic of Tyva), and Tofalars (Tofalarskoie municipality of Irkutskaya oblast). While Okinskii raion, connected with the outer world by automobile road since 1970s, hosts number of extractive companies operating in the area with the use of long-distance commute workers, in the Todzha area the Chinese-owned company “Lunsin” has just built the road a few years ago and started exploration of ore, and in Tofalaria exploration of rare metals is on a stage of geological surveys, and connection is limited by winter roads and air-transportation only. The risks for environment and sustainability of traditional indigenous ways of life; opportunities for economically prosperous sustainability with the resource extraction, tourism development and road maintenance; and the ambiguities of social sustainability related to the co-presence of different interests for the future of the region will be discussed based on field studies (interviews and observations in Okinskii raion in 2012, in Tofalaria and Todzha in 2013) and secondary data.

The 2030 Agenda for Sustainable Development: Implications for the Arctic Ocean and the Circumpolar Region

Doubleday, N.C.¹; Vlasova, T.²,

¹McMaster University, Hamilton ON, Canada, doublen@mcmaster.ca

²Vlasova, T., Moscow State University, Moscow, RU, vlasova@gmail.com

Abstract

Transforming Our World, the 2030 Agenda for Sustainable Development, opens a new chapter in integration of human and natural sciences and indigenous and local knowledges. It calls for integration across domains of research, and for participatory methods of developing policy. Here we take a polar perspective on the multiple stressors and changes affecting Arctic Peoples and polar environments, beginning with the Arctic marine and coastal areas, and including tundra, taiga, and high altitude environments, with a view to advancing the integrative approach to interpreting scientific findings and policy innovation in support of adaptive responses that is advocated by the UN General Assembly resolution 70/1 Transforming Our World? We review the key features of this Resolution, in terms of its impacts and potential as a policy watershed for the Arctic and for Arctic Peoples and States.

Permafrost Thawing and CO₂ Efflux of Frozen Peatlands: Relationship, Spatial Variability, Trend of Climate Change (Western Siberia, Russia)

Bobrik A.A., Matyshak G.V., Gonchahrova O.Y.

Department of Soil Science, Lomonosov Moscow State University, Moscow, 119992, Russia, ann-bobrik@yandex.ru

Abstract

Global warming, recorded in recent decades in the North West Siberia, leads to a change in soils temperature regime, changing plant associations, gradual degradation of permafrost and changing landscape as a whole. We investigated the spatial and temporal variability of active layer thickness and CO₂ efflux of CALM R1 grid. The research CALM site R1 (Nadym Grid) (N65°20', E72°55') is located on north of West Siberia (Russia) within the zone of sporadic permafrost of north taiga. Soil carbon dioxide emission is low and does not differ from year to year (156 ± 21 – 2013; 132 ± 17 – 2014; 170 ± 30 – 2015) mgCO₂m⁻²h⁻¹. Average content of TOC in the upper 15 cm of soil is high ($34,24 \pm 1,92\%$). The climatic record (weather station “Nadym”) indicates a progressive warming of annual air temperatures of ~2°C over the past 17 years (an average of -6°C to -4°C). For last 17-years period of CALM R1 measurements was determined that active layer thickness is characterized by high spatial and temporal variability. Area with small active layer thickness (<50 cm) decreased from 14% to 0% in this period. Areas with deepest thaw (more than 200 cm) increased from 16 to 56%. Average active layer thickness increases from 119 ± 6 to 166 ± 8 cm from 1997 to 2014. The values of microbial biomass are high, but permafrost and hydrothermal conditions inhibit soil biological processes. So the main factor, which determines the soil carbon efflux, is the depth of permafrost table; it determines the organic matter transformation processes.

Abstract

Nepal, mountainous country, covering two-thirds of the Himalayan region, where the main economic activities are based on agriculture was selected as the study area. The objective of this study is to assess the spatial patterns of cropland changes and their changing relationship analysis with climate change and human activities in past over 30 years status. Aerial photographs and remote sensing images based datasets of 1978 and 2010 were obtained to assess the spatial pattern of cropland changes. Expansion and contraction were determined by cover changes in cropland. Logistic regression analysis were used to analyze the impact of topographic, neighborhood, socio-economic and climatic related variables on cropland changes. The spatial results showed that cropland area between these periods increased by 3891 km². The expansion rate is noticeably higher on the flat area, lower slopes and also in areas closer to rivers and roads, while most contraction was found on the steep slopes, high altitude areas and faraway from roads, and streams. It was found that the climatic conditions was also play significant driven factor for contraction. Cropland expansion and contraction in Nepal were mainly affected by population, temperature and precipitation. The results, on socio-economic based house hold survey in 15 different places of Nepal shows that in recent decade, drought had significant effects on cropland contraction but not on expansion. Similarly, the increased GDP, migration of young people as a foreigner labors, shifting occupation and, development of infrastructure and market centers were major driving factors of cropland change in Nepal.

Abstract

Plant phenology is one of the best indicators of climate change and its impacts on vegetation ecosystem. Elevation is known to play an important role in the change of plant phenology and surface warming. Therefore, assessing the relationship between phenology change of the alpine grassland and elevation is of great significance to the research of vegetation ecosystem change over the Tibetan Plateau. Based on SPOT-VGT-NDVI dataset from 1999 to 2012, DEM, physic-geographical regions and grassland vector data, the elevation dependency of the alpine grassland phenology were examined. The results showed that: (1) the alpine grassland phenology at different physic-geographical regions, except for Southern Tibet mountain shrub-steppe zone, had significant elevation dependencies ($P < 0.001$). With increasing elevation, the spring phenology and autumn phenology of the alpine grassland were delayed and advanced by 0.76~1.50 days per 100m and 0.37~0.79 days per 100m, respectively. The standard deviations of the alpine grassland phenology at high altitude areas were smaller than that at low altitude regions. (2) The alpine grassland phenology change was more sensitive to the variations of elevation in southeast with wetter areas than in northwest with dryer areas. (3) Opposite trends of alpine grassland phenology change were observed between the high and low elevation in the most of the physic-geographical regions, which suggests that the alpine grassland phenology change derived from remote sensing could not directly verify the elevation dependency in surface warming across the Tibetan Plateau. Our results demonstrate there are remarkable discrepancies among the whole plateau and the different physic-geographical regions in the relationship between the alpine grassland phenology and elevation, and further suggest that more attention should be paid to the scale in the investigation of regional differentiation characteristics.

Changes in Urban Green Spaces of Kolkata

Praveen Mishra

Department of Geography, Miranda House, University of Delhi, Delhi – 110007, India, mishra.geo@gmail.com

Abstract

Green spaces play important functions in urban environments. Reducing air pollution, providing shade and habitat for arboreal birds, producing oxygen, providing shelter against winds, recreational and aesthetic qualities and architectural applications are the main functions of urban green spaces. With the rapid change of urban area in Kolkata city during the past decades, green spaces have been scrappy and isolated causing destruction and dysfunction of these important urban elements. The objective of this study was to detect changes in extent and pattern of green areas of Kolkata city. In this research, we classified a Landsat TM and an Landsat ETM image belonging to the years 1993 and 2015, respectively. I then used a post-classification comparison to determine the changes in green space areas of Kolkata city during the 22 years covered by the images. The results showed that during 22 years from 1993, a significant decrease had occurred in the extent of urban green spaces with a concomitant fragmentation resulting in downgrading and destruction of the functions and services these areas provide. We conclude that the general quality of life in the central parts of the city has been diminished. We also state that a combination of remote sensing image classification, landscape assessment and vegetation indices can provide a tool for assessing life quality and its trend for urban areas.

Changing Agriculture Landuse in Response to Environmental Change in Cold & Dry Agro-climatic Zone of Himachal Pradesh

Singh, I.J, Pratap, T.

University of Jammu, Jammu, 180006, India, indergeogju@gmail.com

Abstract

Himachal Pradesh is a mountainous state of India lies in the North West Himalayan Region. State exhibits a complex mosaic of Hills Mountains and river valley. The state has diverse climatic conditions ranges from sub-tropical to temperate, therefore it has been divided into four agro-climatic zones and these zones are known for the cultivation different agricultural as well as horticultural crops. Among these zones Cold & Dry zone was once known for the cultivation of peas, potato and dry fruits but since last three decade this zone has experienced a drastic change in agriculture land use. Many new crops such as apple, tomato, hops have replaced area under potato and peas and large number of farmers have brought the grass land under apple plantations. This change in agriculture landuse is largely attributed to the changing climatic conditions of the area. It is clearly evident from the metrological data that precipitation in the form of snowfall has reduced during winter season and on the other hand rainfall has increased, at the similar fashion mean minimum temperature has decreased and mean maximum temperature has increased. Farmer's perception has also supported the fact that changing climatic conditions are responsible for change in agriculture land use of the study area.

Agro-climatic; landuse; precipitation; temperature; rainfall; snowfall; farmers

Climate Change and Earthquake Effects to Natural Springs of the Melamchi Watershed of Nepal Himalayas

Prem Sagar Chapagain, PhD

Central Department of Geography, Tribhuvan University, Kathmandu, Nepal., Ps.chapagain@gmail.com

Abstract

The Middle Hill is one of the three geographical regions of Nepal where climate change effect on water resources has been so severe. Natural springs and the small rivers are the major sources of water for drinking, livestock, irrigation and other purposes at there. Melamchi watershed lies in the north eastern part of Nepal from where the river water is piping to Kathmandu city for the purpose of drinking. The recent study shows that temperature in this region has increased by about 1.2 degree C in last 30 years and draught frequency has also increased. The detail GPS survey of springs has been conducted in March-April 2016 with respect to spring types, location, ownership, purpose of water utilization, changing water volume, management practices and effects of April 2015 earth quake in Nepal. The analysis shows that 70 percent of the springs are used for multiple purposes such as drinking, livestock, irrigation and cleaning at households. The remaining spring's water is used for either drinking or for livestock or irrigation. It is critical that the water volume of about 30 percent springs have decreased with in last decade. Out of such water decreasing springs, 37 percent springs' water has decreased by 50 percent and above within last decade. Importantly, the 2015 April earthquake has severely affected the springs and 13 percent springs have been dried after the earthquake that has increasing time distance and workload to women as women are the primarily responsible for managing water for drinking, livestock and cleaning at household.

Key words:

climate change; water resource; springs; Melamchi watershed; water utilization; 2015 earthquake effect.

Coverage Changes of Forest and Grassland of Transitional Areas of Farming and Pasturing in Northeast Qinghai-Tibet Plateau during Qing Dynasty

Wu ZL, Liu FG, Zhang YL, Chen Q, Zhou Q, Yang DX

Qinghai Normal University, Xining, 810008, P.R. China, wuzl32@163.com

Abstract

Yellow River-Huangshui River Vally where located in the Northeast of Qinghai-Tibet Plateau is a typical farming-pastoral area. Since the Qing Dynasty, the expansion of cultivated land have led to the obvious changes of forest and grassland coverage. This study, which is based on reconstruction of original forest and grassland structure and combines with the rebuilt results of farmland changes in Qing Dynasty, calculates the coverage changes of forest and grassland in YHV by historical literature data and representing historical scence. The results show that the boundary of the natural vegetation distribution today is consistent with the boundary before the farmland expansion of Qing Dynasty. The range of forest was slightly larger, the continuity of the brushwood was more obvious on the space and the distribution of grassland was wider than early years of Qing Dynasty. It estimated the areas of forestland, brushwood and grassland were $0.28 \times 10^4 \text{ km}^2$, $0.93 \times 10^4 \text{ km}^2$, $2.1618 \times 10^4 \text{ km}^2$ before reclamation activities in Qing Dynasty and have decreased by 441.31 km^2 , 1330.35 km^2 , 5180.41 km^2 because of serious farmland reclamation activities at the end of Qing Dynasty. The grassland was occupied the largest (52% of potential grid of grassland was occupied for cultivated cropland)and deepest (the average reclamation area of grid for grassland was 0.1 km^2) area among them. The differences of original plant cover types that have been reclaimed by human being in YHV in Qing Dynasty not only influenced by natural environment factors but also affected by social policies.

Key words:

Qinghai-Tibet Plateau; Yellow River-Huangshui River Valley; transitional areas of farming and pasturing; coverage changes of forest and grassland

Current State and Changes of Glaciers in the Tavan Bogd Mountains (Mongolia)

Ch.Lhagvasuren¹, M.V.Syromyatina², Ch.Ayurzana¹

¹ Khovd state university, Khovd province, Mongolia;

² Saint-Petersburg state university, Russia

Abstract

Current state and dynamics of main glaciers on the eastern slopes of the Tavan Bogd mountain massif is investigated on the basis of results obtained in 2013 field survey with use of remote sensing as well. According to our estimates, areas of these glaciers did not significantly changed since 1989 however a certain regression of the glacier tongues had been fixed. Ablation-accumulation value amounts to 110g/cm^2 at mean summer temperature on the equilibrium line of 1°C

This study is the first stage of detailed investigation of large glaciers located in the Tavan-Bogd Mountains. The main task of this work is to estimate a current state and dynamics of glaciers and to update glacier and rock-glacier inventory. Basing on results of 2013 field survey together with remote sensing data the main glaciers located on eastern slopes of the Tavan Bogd mountain massif in the Tsagan-Us and Tsagan-Gol river basins are described (these glaciers are Potanin, Alexandra, Grane, Kozlov, and Krylov ones). In order to monitor regime of glacier systems the geodetic survey of glaciers and rock-glacier edges was carried out using Trimble GNSS system and the ranging mark system. The Landsat satellite images made taken in August-September of 1989, 2006, and 2013, their spatial resolution 15-30 m, were used to map areas of debris-free glaciers and to estimate the glacier changes between 1989 and 2013.

Pictures were taken from the USGS site, the ArcGIS software was used for this work. In addition, the high-resolution satellite pictures with resolution of 0.5-2.5 m made at the end of the ablation season if 2008 (CARTOSAT-1) and 2010 (Geoeye-1 and SPOT-5) were also used to analyze current conditions and changes of the above glaciers and to improve visual estimation of the Landsat imagery. In 2013, the study included 26 glaciers with the debris-free glacier area of 67 km^2 in the Tsagan-Gol river basin and 37 glaciers with area of 30 km^2 in the Tsagan-Us river basin. According to our estimates, areas of these glaciers did not significantly changed since 1989 however a certain regression of the glacier tongues had been fixed.

The Kozlov glacier retreated with average rate of 21 m/year between 2001 and 2013. Retreat of the Potanin glacier was slower and between 1989 and 2001 the average rate was equal to 5 m/year, but between 2001 and 2013 it became more active and its average rate reached 24 m/year. One of the largest One of the largest rock-glacier of the Tavan Bogd Mountains was found in the Tsagan-Us valley on its south-eastern slope, its area was estimated 1.2 km^2 , length -3 km, steep front height -20-25 m. Indirect indicators of its activity such as transverse and longitudinal furrows were noticed. Using data of

local weather station data we calculated some climatic characteristics needed to monitor equilibrium line for end of the 2013 ablation season. Mean summer temperature on the weighted mean equilibrium line of five glaciers (3250 m a.s.l.) was defined as 1.0 °C. Ablation-accumulation value was estimated 110 g/cm² and the mean annual snowfall on the equilibrium line as 785 mm.

Glaciers; USGS site; the ArcGIS; Ablation-accumulation; monitor; Tavan-Bogd Mountains; these glaciers are Potanin; Alexandra; Grane; Kozlov; and Krylov

GIMMS NDVI-based Vegetation Changes in the Korean Peninsula from 1982 to 2012

Kang Chol Hyok^{1,2}, Zhang Yili¹, Wang Zhaofeng¹, Liu linshan¹ and Zhao Riguang²

¹ Institute of Geographic Sciences and Natural Resources Research, CAS, Beijing;

² Institute of Remote Sensing and Geoinformatics, DPR Korea Academy of Sciences, Pyongyang

Abstract

Study on Normalized difference vegetation index (NDVI) change is one of the important steps for understanding vegetation growing conditions and regulating the terrestrial carbon cycle and the climate system. In this paper, using the maximum synthesis method, mean method, slope analysis, based on the GIMMS NDVI of Korea Peninsular region during 1982 – 2012, we analyzed the spatiotemporal changes in the region. The results have showed that: (1) The spatial distribution pattern of cumulative average of NDVI from 1982 to 2012 presented a gradual decrease from the southeast to northwest in Korea Peninsular, a decrease from the east to west is obvious. (2) The vegetation growing season on the Korean peninsula had been assessed as from April to October by using the three points smoothing method. (3) From 1982 to 1991 and from 1992 to 2002, the average annual NDVI changes for the growing season have the trends of increase. But its change from 2003 to 2012 is not obvious. Although the average annual NDVI change from 1982 to 1991 has the trend of increase, but its change during 1982 - 1988 has a trend of obvious decrease. (4) From the slope analysis, over the past 31 years, the slope of vegetation changes in Korea peninsular has obvious regional difference. It has obvious increase trend in the south area of the peninsular, but it has decrease trend in north area of the peninsular.

Key words:

GIMMS NDVI; Vegetation change; Korea peninsular

Habitat Loss Assessment of the Key Species from 1992 to 2010 in Koshi River Basin, Central Himalaya

Linshan Liu, Yili Zhang, Zhilong Zhao, Xue Wu

Institute of Geographic Sciences and Natural Resources Research, Chinese Academy of Science, Beijing, 100101, P. R. China, liuls@igsrr.ac.cn

Abstract

Koshi River Basin is one of the areas with great abundance in species diversity in the world because of its great landscape heterogeneity. Land use is very important factor for the biodiversity stability. The existing materials of vegetation, animal, ecology and geography were collected, coordinated and analysed. Maxent model was chosen to simulate the potential habitat of the key species in Koshi River Basin. The environmental layers "Bioclimatic Variables" supplied by World Climate Project were used in the predicting procedures. We take the land cover data as one of the environment layers for the habitat estimation. The research area include the entire KRB (including China, Nepal and India three countries), the main data sources are 1992 and 2010 land cover data in KRB. The overall accuracy of the model was high, implying that the Maxent-derived distributions were a close approximation of the distribution probability that represents the reality. Comparing the distribution data of the keys species in 1992 and 2010, we found that for all of the key species we selected in this research work, their habitat changed a lot during these years. If we look from the decrease rate, the habitat of *Alcimandra cathcartii* is most serious, it decreased almost 15%. And the habitat area of *Pseudois nayaur* also decreased 11%. Similarly, the habitat of *Panaxpsqudo ginseng* is most stable, only decreased 2%. As for the area changed most, the habitat area of *Pseudois nayaur* and *Tetraogallus tibetanus* decreased 475km² and 335km² separately. *Trillium govanianum*'s habitat only decreased 1.78 km².

Maxtent model; Koshi River Basin; Land use; Habitat; Key species

Investigation and Estimating the Storage of Glacial Lakes Based On Remote Sensing Data in Western China

Liu Qionghuan^{1,2}, Wang Xin¹

¹ Department of Geography, Hunan University of Science and Technology, Xiangtan 411201, China

² Institute of Geographic Sciences and Natural Resources Research, Chinese Academy of Sciences, Beijing 100101, China

Abstract

A large amount of meltwater was retained as glacier meltwater continuously flows into glacial lake, which resulted in lake area expansion and water level rising. This has motivated the development of empirical relationships to predict lake volume given a measurement of lake surface area obtained from satellite imagery and analyzed the meltwater retention effect by computing the increment volume of glacier-fed lake based on Landsat TM/ETM⁺/OLI imagery and SRTM DEM, aerial survey topographical map and field surveyed data. The results through research show that the total meltwater storage of glacial lakes is $9.26 \pm 0.05 \times 10^9 \text{ m}^3$ around the year 2013 in glaciated zone, and during the past 23 years, the lake storage has expanded at an average rate of 17.9 % or 0.78 %/a. Furthermore, glacial lake volume of various types, drainage basin, elevation and mountain was calculated and heterogeneity of lake storage distribution and changes and its controlling factors were discussed in this paper. Discrepant water storage expansion of different types of glacial lake implies contrasting signals of climate change in western China. Ice-contacting lakes characterized by the fast expansion rate (1.57 %/a) depicts accelerated glacier shrinkage caused by climate warming. Non-glacier-fed lakes expansion at the rate of 0.54 %/a reflect an apparent increase of precipitation western China.

Land-Cover Structure Changes Due to Recreational Development on Lake Baikal

Vanteeva, J.V.^{1,2}, Solodyankina, S.V.^{1,2}

The V.B. Sochava Institute of Geography SB RAS¹, Irkutsk State University², Irkutsk, Russia, ula.vant@mail.ru

Abstract

Land-cover structure of Lake Baikal surrounding landscapes varies in depend on local climate, relief, geological structure, human activity. Also recreational development has a significant impact on the landscapes. The number of tourists in the Baikal region has increased during the last 10-15 years. The aim of this research is investigation the land-cover structure of study areas and its changes. We analyzed three study areas which are located in different parts of Lake Baikal (on the east-northern – “Khakusy”, 69.1 km²; the western – “Kurkutskiy bay”, 19.9 km²; and southern shore – part of Khamar-Daban range, 125.3 km²) and exposed to different degree of impact. For these areas the land-cover maps were compiled using landscape approach, and the information about land use was analyzed. We used the following data: fieldwork, DEM, and remote sensing. Fieldworks were conducted in summer seasons from 2010 to 2015 years. The study shows different degree of changing in land-cover structure on the study areas. In the “Khakusy” area new recreational facilities were constructed on narrow coastal area and around hot springs. It was observed that lichen cover (*Cladonia* spp.) was trampled in surrounding landscapes. The study area “Kurkutskiy bay” is affected by land cover change due to tourism and urbanization, for example, loss of plant biomass can have a dramatic effect on hydrological functions, with consequential erosion in a whole mosaic of habitats. The transformed area has increased by 6.3%. Forest cutting and mountain tourism development are main reasons of land-cover changing in the Khamar-Daban study area.

Present State and Dynamics of Glacio-Nival Systems of Tavan Boghd Mountain Massif (Altai Mountains).

Chistyakov K.V., Ganyushkin D.A.

Saint-Petersburg state University, The Russian Geographical Society, Saint-Petersburg, Russian Federation,
k.chistyakov@spbu.ru

Abstract

Saint-Petersburg geographers study glaciation of the northern slope of Tavan Boghd since 1999. According to the results of in situ observations of 2015 and delineation of satellite imagery in 2015 the glaciation there was represented by 13 glaciers with total area 21.66 km². Slope glaciers prevail, there are also 2 valley glaciers with area 4.77 (№10) and 3.32 km² (№13). Generally the rate of degradation of the glaciers decreases. In 2009-2015 the total area of the glaciers lost 0.6%, consequently about 0.1% per year, in 2002-2009 the total glaciations area lost 9% (1.3% per year). Slowing down of glacial retreat can be explained by the growth of snow accumulation observed in the area of research since 2009. Increase of snow accumulation leads to intermittence of uncovering of high altitudy ice divides and rocks and decrease of melting of glacial termini. The valley glaciers behave in a different way. The rate of retreat for glacier №13 increased from 15.3 m/year in 2006-2009 to 22.3 m/year in 2009-2015. Glacier №10 in 2009-2015 rapidly retreated (248 m, 41.3 m/year), in 2006-2009 the retreat was much slower (7.5 m, 2.5/year). This can be explained by the local morphology of subglacial relief: the glacial snout withdrew to a steep rock-bar, it cut off the former marginal part of the glacier which partly deraded, partly became debris-covered. At the same time relatively large valley glaciers are more inert and react slower on the increase of snow accumulation.

Socio-Economic Analysis of Land use Land Cover Change: A Geo-spatial study of Hangrang Valley, Himachal Pradesh

Husain Md. Arif, Kumar Pankaj

M.phil Research Scholar, Department of Geography, Delhi School of Economics, University of Delhi, Delhi 110007, India.

E-mail: mdarif391@gmail.com

Abstract

Land use/land cover (LULC) although words very frequently used interchangeably signifies two different aspects, land cover says how much of a region is covered by forests, wetlands, impervious surfaces, agriculture and water while Land use shows how people use it for socio-economic activity. They have a significant role to play in the socio-economic development of any region. The paper deals with relationship between land-use/cover change and its socio-economic impact in Hangrang Valley, Himachal Himalaya. Unlike other cold deserts Hangrang has vegetation's cover around the villages which is the major resource of the region and the source of livelihood to the people. Land use/cover changes in the past few decades have bearing on the socio-economic pattern of the valley dwellers. The snow cover is only source of fresh water which provides water for drinking purposes and also for irrigation but the study revealed that snow cover has been decreasing. Here Geo-Spatial tools in the form of remote sensing, GIS software, ERDAS Imagine 14 and Arc-GIS 10.1 have been effectively used to analyze LULC. The assessment of land use/cover change was performed using Land-sat TM/ETM images of the year 1990 and 2015. Both supervised and unsupervised classification was to classify images. Land use cover change matrix was prepared to know the shift of land from one to other uses. Normalised Difference Vegetation Index (NDVI) and Normalised Difference Snow Index (NDSI) were used to demarcate vegetation and snow area for the same period. The study revealed that the area of snow cover has been decreasing and on the other hand agricultural land or horticulture activities are on increase in last few decades. Increase in horticulture activities providing more economic activity to remote village dwellers primarily in the form of Apple, Pea, and Almond cultivation.

Spatial-temporal Dynamics of Cultivated Land in Recent 35 Years in the Lhasa River Basin of Tibet

BAI Wanqi¹, YAO Lina¹, ZHANG Yili¹, WANG Chunlian²

¹ Institute of Geographic Sciences and Natural Resources Research, CAS, Beijing 100101, China;

² College of Architecture and Landscape Architecture, Peking University, Beijing 100871, China

Abstract

Based on satellite remote-sensing images of 1976, 1988, 2006 and 2011, and DEM data with a resolution of 30 meters, the spatial-temporal dynamics of cultivated land in recent 35 years in the Lhasa river basin of Tibet has been analyzed with GIS and statistic methods. The results show that: (1) between 1976 and 2011 cultivated land increased from $5.63 \times 10^4 \text{ hm}^2$ to $6.56 \times 10^4 \text{ hm}^2$, and its proportion to the total area of the Lhasa river basin increased from 1.71% to 2.00%. The process of cultivated land expansion within 35 years can be divided into three periods with slow (1976-1988), fast (1988-2006) and radical (2006-2011) increasing, and the average annual increasing rates are respectively 0.09%, 0.59%, and 0.86%. The increased cultivated land is mainly from grassland, and the decreased mostly resultant from construction land expansion. (2) From downstream to upstream in the Lhasa river basin, there is a decreasing level of cultivated land contagion, and the cultivated land in Lhasa city has the highest but fastest declining contagion. The spatial dynamics in cultivated land has been on the trend of increasing in middle reaches and decreasing in lower reaches. Maizhokunggar County which is located in middle reaches owns the highest relative changing rate, and thus with maximum regional difference. (3) Cultivated land expansion has been reaching to higher altitude and greater slope, of which 4000~4200 m and $5^\circ \sim 10^\circ$ slope have the most net gain in area of cultivated land.

Temperature Dependence of Variations in the End of the Growing Season from 1982 to 2012 on the Qinghai–Tibetan Plateau

Mingjun Ding, yili Zhang, lanhui Li, qian Chen, linshan Liu, zhaofeng Wang

Jiangxi normal university, China, dingmingjun1128@163.com

Abstract

A growing number of studies have focused on variations in vegetation phenology and their correlations with climatic factors. However, there has been little research on changes in spatial heterogeneity with respect to the end of the growing season (EGS) and on responses to climate change for alpine vegetation on the Qinghai–Tibetan Plateau (QTP). In this study, the satellite-derived normalized difference vegetation index (NDVI) and the meteorological record from 1982 to 2012 were used to characterize the spatial pattern of variations in the EGS and their relationship to temperature and precipitation on the QTP. Over the entire study period, the EGS displayed no statistically significant trend; however, there was a strong spatial heterogeneity throughout the plateau. Those areas showing a delaying trend in the EGS were mainly distributed in the eastern part of the plateau, whereas those showing an advancing trend were mostly scattered throughout the western part. Our results also showed that change in the vegetation EGS was more closely correlated with air temperature than with precipitation. Nonetheless, the temperature sensitivity of the vegetation EGS became lower as aridity increased, suggesting that precipitation is an important regulator of the response of the vegetation EGS to climate warming. These results indicate spatial differences in key environmental influences on the vegetation EGS that must be taken into account in current phenological models, which are largely driven by temperature. (This paper had been published in *GIScience & remote sensing* (2016))

³ University of Chinese Academy of Science, Beijing 100049, P. R. China

Abstract

The Tibetan Plateau (TP) is particularly sensitive to the influences of climate change. As the indicators of climate change, lakes on the TP play a key role in the earth's climatic system. Lake Yazi (LY), Lake Tuohepingco (LT) and Lake Changtiao (LC) in the Tuohepingco Basin are three inland lakes on the plateau. Using object-based image analysis for remote sensing and 22 images from the Landsat satellites (from September to December between 1972 and 2015), the extents of LY, LT and LC were obtained. The inter-annual changes in the extent of LY, LT and LC were then analyzed. The results show that the total area of the three lakes changed from shrinkage to expansion during the 1972 to 2015 period. In general, there was a trend towards shrinkage during 1972 to 1999, distinct expansion during 2000 to 2007 and slight expansion during 2008 to 2015. Moreover, we found that 14 other lakes have also expanded dramatically since 2000. Some lakes at 30°N and 35°N (LY, LT and LC are also located in this region) exhibited the same dramatic expansion period between 2000 and 2005. In other words, 2000 appears to be a critical transition point for changes to lake size on the Tibetan Plateau. Although increased precipitation, decreased lake evapotranspiration, caused by climate change contributed to the expansion of lakes to a certain level, the growth of lakes in the Tuohepingco Basin is primarily due to warming-triggered deglaciation on the plateau. Given the importance of wetlands to human society, these are no trivial issues and we now need accelerated research based on long-term and continuous remote sensing.

Abstract

Land use and land cover change is not only the main cause to the global environment change and also the main content to the global change research. with the rapid development of the computer science, using computer technology to analyze and simulate the practical issue has become more and more extensive. ABM (Agent-based Model) is widely used in studying the LUCC in recent years, the paper introduces the background of the proposal and basic concept about ABM/LUCC and employs Citespace software to map the research front about the ABM/LUCC by using the “ABM” and “LUCC” as research word. We analyse the main application about this model and try to find the research hotspot by using Citespace software. So we think it does help to our research about ABM/LUCC.

³ College of Urban and Environmental Sciences, Northwest University, Xi'an 710127, China

Abstract

Archaeological excavations have exposed a shocking picture of the prehistorical calamities in the Lajia Ruins in the Guanting Basin along the Yellow River. The destruction reasons has been a hot and focus issue in recent years. Geological records of the major disasters in relation to the devastation of this prehistorical settlement were investigated by detailed field observations, sedimentological analysis, Quaternary Geology, Geomorphology and Palaeoflood hydrological analysis. More importantly, we made a comparative study of the conglomerated red clay, the gully deposit at the foot of the Great Red Hills where the Ganggou gullies emerge onto the Guanting Basin, and the palaeoflood slackwater deposits of the Yellow River in the barrier lake in the Jishixia. The results show that at ca. 3950 a BP, immediately followed by a major earthquake, the settlement was overtaken by immense mudflows coming along the tributary gullies from the hillsides behind. The enormous mudflows suddenly buried and destroyed the dwellings, which led to the prehistorical calamities in the Lajia Ruins. These results are of important implications in understanding the prehistorical environmental change in the environmentally sensitive zones over the world. It has very important reference value for the further studying of man-land relationship. (Foundation: National Nature Science Foundation of China, No.41261010, No.41271123)

Determination of the Temperature Effect on the Structure of Landscapes near Lake Baikal with using the NOAA Data: First Results

Vanteeva, J.V.¹, Vilor, M.A.¹, Solodyankina, S.V.^{1,3}, Vilor, N.V.²

The V.B. Sochava Institute of Geography SB RAS¹, A.P. Vinogradov Institute of Geochemistry SB RAS², Irkutsk State University³, Irkutsk, Russia, ula.vant@mail.ru

Abstract

Scientifically Lake Baikal is a very interesting object for investigation of environment and landscape structure due to special geological peculiarities (the rift zone) and climate. Model area “Khakusy” (69, 1 km²) is located on the east-northern shore of the Lake Baikal. For the area is characterized by presence of powerful hot mineral springs (40 dm³/s). The purpose of the study is determination of temperature effect impact on the shore area. The temperature effect on the landscape structure consists of several factors: main of them are general climate conditions and influence of water mass of the Lake Baikal. We tried to find the ratio of these factors for 23 landscape types identified on the landscape map of model area (1:50 000). The landscapes of this area are mainly represented by light coniferous forests. Dark coniferous forest occupies restricted territory. For GIS analysis we used remote sensing data (brightness temperature, DEM), which was verified by fieldwork investigation. Swamped areas are found near the river mouths. To consider of the temperature effect we estimated brightness temperature from the average nighttime winter NOAA data images (1996-2006). According to primary results the temperature is almost unchanged (by 0.8 K) in river valleys (on the distance 5 km). Near the hot mineral springs the brightness temperature 247.5 K. For instance, in the same landform and distance from shore of Lake Baikal like hot mineral springs the brightness temperature is 0,2 K.

Farmers' Perception to Farmland Conversion: A Questionnaire Survey in Xining City, Qinghai Province, China

Chen Qiong^{1,2,3}, Cai Yunlong^{1,2}, Liu Fenggui³, Zhou Qiang³, Zhang Haifeng³

¹ Center for Land Study, College of Urban and Environmental Sciences, Peking University, Beijing 100871, China;

² Laboratory for Earth Surface Processes, Ministry of Education, Beijing 100871, China;

³ School of Life and Geography, Qinghai Normal University, Xining 810008, China

Abstract

China is experiencing a fast process of farmland conversion which is conducted mainly by local governments to fuel economic development. Social tension is aroused and policy makers take great concerns on coordinating interests among different stake-holders, especially for increasing farmers' interest. The purpose of this study is to get some insights related to land acquisition institution by exploring farmers' perception to farmland conversion. Participatory Rural Appraisal (PRA) was applied for the investigation in peri-urban area, of Xining City, Qinghai Province, China. The total of 519 householders from 15 villages completed valid questionnaire survey from July to November, 2012. The results indicate that farmland conversion has several impacts on farmers' life. Most farmers are gradually adapting to city life. Higher living expenses and more income are perceived by farmers with average score of 4.21 and 2.69, respectively. The average scores of 2.38 and 2.46 are for improvement of life security and more job opportunities. Farmers expect to get some stable ways of compensation in addition to lump-sum compensation in cash. Stable subsidies every year and obtaining same number of land received strong proposal. And these two options are cited by 49.6% and 43.9% of respondents. Farmland conversion brings about cleaner living condition and more amenities, but lower air visibility and drier air. Results reflect landless farmers' economic and life pressures and various demands. Local government should pay more attention to increase farmers' income and improve rural security system.

⁴ Obukhov Institute of Atmospheric Physics of Russian Academy of Sciences, Moscow, Russia

Abstract

Mosaic structure of the underlying surface in major mountain systems such as the Caucasus, determines the characteristics of the radiation fluxes and, as a consequence, forms a sophisticated mode of the whole complex of meteorological elements. In this regard, the quality of weather forecasts of global and even mesoscale models in mountainous areas is often unsatisfactory. Modern complex studies of the radiation regime in the Caucasus and the factors that determine it are quite rare, especially for winter season. So the main goal of the expedition was to obtain rather unique data about the distribution of radiation fluxes and the properties of aerosols in various contrasting geographical conditions of the North Caucasus.

In order to achieve the stated goal, three measuring complexes have been deployed: 870 m (Kislovodsk), 2070 m (IAP RAS Kislovodsk high-mountain scientific station) and 3500 m (Mount Elbrus). At each point, regular measurements of shortwave and longwave radiation, aerosol optical thickness, moisture content, UV radiation, air temperature, atmospheric pressure, integral and surface ozone concentration were carried out.

As a result of the conducted research, the altitude dependence of the aerosol optical thickness and radiation characteristics, as well as regional characteristics of the radiation regime were revealed. The measured values of aerosol optical thickness and the integral ozone concentration were compared with the data obtained by satellite remote sensing and aerosol climatology [2, 4]. A relatively new effective CLIRAD (FC05)-SW [3] radiation code, the radiation block [1] of the COSMO-Ru1 model and CFSv2, NCEP/NCAR, FNL, ERA-Interim reanalysis were tested against the measured values.

The reported study was partly funded by RFBR (research project № 16-05-00985a).

Impact of Mosses on Water Flux in an Alpine Shrub Site in the Qilian Mountains of China

Zhangwen Liu

Qilian Alpine Ecology and Hydrology Research Station, Key Laboratory of Inland River Ecohydrology, Cold and Arid Regions Environmental and Engineering Research Institute, Chinese Academy of Sciences, Lanzhou, 730000, P. R. China, zwliu@lzb.ac.cn

Abstract

With a warming climate, cold regions ecosystems undergo significant ecological changes including the spread of canopy-forming shrubs into tundra communities (termed as *shrubification*) over past decades. Based on field and laboratory experiments from July to September, 2012, taken the typical mosses under alpine shrubs in Qilian Mountains as test objects, Controls of mosses on water fluxes were investigated and analyzed. The results indicated that mosses under alpine shrub had a strong water holding capacity, and can reduce evaporation flux. The maximum water holding capacity per unit area of mosses under shrubs varied from 13 790 g•m⁻² to 18 980 g / m². The mosses could absorb water that exceeds its own weight from 386.94 % to 782.51 % times. Water holding capacity increased with time immersed in water in laboratory experiment, and the relationship between water holding capacity and time immersed in water could be fitted with logarithmical curve. Water absorption rates of mosses under all shrubs decreased according to power function curve with time immersed in water. Compared to the control experiment, remove the green moss layer increased evapotranspiration by 29% in shrub ecosystem in Qilian Mountains during from July to September, 2012. The effects canopy cover on evapotranspiration moss layer is not significant. The most of the water vapor came from the evaporator of organic layers under mosses. Controls of mosses on water fluxes may influence the soil temperature and water moisture in seasonal frozen soil in alpine regions.

Alpine shrub; Mosses; Qilian Mountains; water fluxes; Seasonal frost soil

Isotopic Content of the Snow-firn Thickness and Meltwater in the Tavan-Bogd Mountain Massif.

Bantcev D.V., Ganyushkin D.A., Ekaykin A.A, Chistyakov K.V.
Saint-Petersburg state university, Saint-Petersburg. Bantcev-d@yandex.ru

Abstract

The isotope-geochemical research was carried out in the different parts of the Tavan Bogd mountain massif during the SPbSU expeditions. This massif is located on the border between Russia, Mongolia and China. Field work was carried out in Mongolia in 2013 and 2014 and in Russia in 2015.

The task was to obtain the isotopic characteristics (deuterium and ^{18}O concentrations) in different parts of glacio-nival systems. The main objects of the research were: precipitations, glacier runoff and snow-firn thickness. More than 300 samples had been collected during 3 years.

The average melting water d^{18}O in Mongolian part of the massif was $-17,3\text{‰}$. The analysis of the water samples showed, that the isotopic content of Tsagan-Us river water didn't change along 30 km from the edge of the glacier. In river water from Russian part of the massif isotopic content is different.

Stable isotope records in snow and firn may present information about accumulation and about the origin of precipitations. For this kind of research the samples were collected from 4 snow-pits at different altitudes.

The fluctuations of water stable-isotope records partly show preserved seasonal variations. Therefore, it is possible to establish annual accumulation and the main precipitation source. Annual accumulation in Russian and Mongolian parts of the massif is different.

The autumn snowfalls take the biggest part in the accumulation and main source of precipitation is Inner Asia. At this moment the further analysis of the collected samples is in process.

Glaciers; Isotopes; Inner Asia; Accumulation; Meltwater

Recent Glacial Fluctuations and Control of Non-Climatic & Climatic Parameters in Sikkim Himalaya

Parvendra Kumar

Dr. Harisingh Gour University, Sagar, Madhya Pradesh, India, kumar_parvendra@yahoo.co.in

Abstract

Glaciers being one of the highly sensitive indicators of climate change, produce a huge repository of landforms which can be used as proxy data source to assess magnitude and frequency of the processes over time and space. We assessed 26 glaciers based on geospatial data sets (1975 to 2014) and several field visits to the glaciers in the Sikkim Himalaya. In addition, we present an assessment of climatic parameters from 1957 to 2005, along with non-climatic parameters on glacial terminus behavior. On an average, glaciers retreated at 6.89 m yr^{-1} from 1975 to 2014 which is lower than other parts of the Himalaya as reported. Contrary to this, annual average temperature decreased ($-0.24 \text{ }^{\circ}\text{C}$) and precipitation increased (19.79 mm) during 1957-2005. Only two glaciers retreated continuously for the entire assessment period. At the same time, 15 glaciers remained stationary, and 11 glaciers retreated with varied rates. Temporally, the average rate of retreat increased from 6.60 m yr^{-1} (1975-1988) to 10.86 m yr^{-1} (2000-2005), which further reduced drastically to 1.47 m yr^{-1} during 2005-2009. It is followed by an increased average rate of retreat 7.66 m yr^{-1} between 2009 and 2014. Dissimilar patterns of glacial retreat for the entire Sikkim Himalaya, and within 10 km wide buffer zones, in particular, suggest a weak control of general climate on glacial fluctuations. Moreover, non-climatic parameters have shown a strong control on glacier fluctuations as the glaciers with glacial lakes, glaciers with simple form, glaciers with snout aspect to E, SW, and ES and glaciers with a length below 7 km show a higher rates of retreat than the others. In the Sikkim Himalaya, altitudinal variation with assumed normal lapse rate of temperature and the line of zero temperature (3990 m asl) make glacial processes and the response to climatic variation different. It implies that glaciers of this region cannot be concluded directly as the one's in retreat with reference to recent general climatic variations and glacier trends, without ascertaining response time of individual glacier in such a dynamic environment.

Key words:

Sikkim Himalaya; glaciers; non-climatic factors; climate change; lapse rate.

Reconstruction of Land Use Pattern of Typical Areas of Farming and Pasturing in Qinghai-Tibet Plateau during Qing Dynasty

Liu FG, Zhang YL, Luo J, Wu ZL, Chen Q, Zhou Q, Yang DX

Qinghai Normal University, Xining, 810008, P.R. China, liufenggui@igsnrr.ac.cn

Abstract

Yellow River-Huangshui River Vally where located in the Northeast edge of Qinghai-Tibet Plateau is a typical farming- pastoral region, due to its special geographical location, the expansion of cropland is affected by natural conditions constraint, because of large-scale immigration and Farming frontiers policy in Ming and Qing Dynasties, land use pattern has undergone major changes. By collecting the data of cropland, grassland, forestland in this region of the Qing Dynasty and representing historical scence, it reconstructed the area and spatial pattern change of cropland, grassland and forestland at five time sections during Qing Dynasty.The results show that: (1) The basic pattern of land use in Yellow River-Huangshui River Vally in the early Qing Dynasty is: area of cropland is 1426.68km^2 , forestland area is about 2752.75km^2 , area of grassland is about $2.168 \times 10^4\text{km}^2$, area of brushwood is about 9182.15km^2 . (2) Land Use Pattern of Yellow River-Huangshui River Vally has significant volatility during Qing Dynasty, cropland experienced four stages that wasteland reclamation stage, abandoned stage, reclamation stage and the stage of abandoning cultivation again. There are two significant increasing stages of cropland, simultaneously forestland and grassland has significant decreasing trend, the increased cropland mainly focused on reclamation grassland. (3) The changes of Tun, Ke, Qiu, Zhan, Ken land and Fan land are complementary, the relationship of them is as one falls, another rises. It shows that the scale of the cropland have tended to the limitation of reclamation in Yellow River-Huangshui River Vally during Qing Dynasty.

Department of Geography, Khovd University, Jargalant soum, Khovd province

Abstract

The mountain massif Tavan Bogd located on the border of Mongolia, Russia and China is a large modern glaciation centre, the watershed between the Arctic Ocean basin and Inner Asia closed drainage area. Still there are few data about the mass balance, modern morphometric features, glacio and hydro-climatic relations of large glaciers in the mongolian part of the region.

In august 2013-2015 Saint-Petersburg State University together with Khovd University carried out the reconnaissance investigations in the Tavan Bogd region and surrounding area.

The main goal of the expedition was to choose the representative glaciological basins for further several years' monitoring of the mass balance, glacio- and hydro-climatological relations, cryogenic forms, to expand sparse dendrochronological net and to make some primary measurements.

Currently the most underinvestigated and difficult to access Kozlov glacier in the Tsagaan-Us basin and Potanin-Alexandra glaciological complex in the Tsagaan Gol basin were chosen as a representative. We made visual estimation of the accumulation and ablation zones of the Kozlov, Alexandra, Grane and Krylov glaciers and several rock glaciers.

We are measuring the tree-ring width using Lintab 6 system with accuracy of 0,01 mm and are planning to estimate the natural factors which influence on tree-ring growth, make reconstructions of the climatic characteristics using meteorological data from the regional weather stations, and also make dendroglaciological and dendrohydrological analysis.

Abstract

Atmospheric dust plays a significant role on regional and global climate change. However, many uncertainties of their climatic effects exist due to the regional distribution and transportation system. Glaciers distributed in the Tibetan Plateau contain substantial dust deposition which provide an opportunity to reconstruct past continental aridity and atmospheric circulation. Visible dust layers (VDL) show excellent potential on environmental exploration. Additionally, their external appearances benefit researchers acquiring both dating and environmental coding as soon as they get the cores. Retrieved in 2012 from the Muztagh Ata Mts. in the eastern Pamir Plateau, the top 52 m of the Kuokuosele ice core was dating to 1900-2012 with ± 1 uncertainty via identifying stratigraphic markers of beta activity and counting seasonal cycles of $\delta^{18}\text{O}$ and VDL. After observed under natural light and floodlight in the cold room by three independent researchers, two indicators level (L_{VDL}) and thickness ratio (R_{VDL}) of visible dust layers were examined and calculated. The ice core contained 181 visible dust layers and can be classified to five different levels. Moreover, five-year average of R_{VDL} showed a decreasing trend, and illustrated vivid low values in 1900-1915, 1920-1930, 1990-2010 and high values in 1915-1920. Meanwhile, the comparison with Ca^{2+} and SO_4^{2-} suggested that arid areas of central Asia and northern Tibetan Plateau could be the sources of dust deposition. Increasing precipitation in the possible sources and the local region caused by the strength of Westerlies might be related to this trend, and decreasing wind speeds in the past cannot be ignored.

This paper has been accepted by Chinese Science Bulletin.

A Beer Index for International Food Security? A Stochastic Actor-based Modelling of Network Evolutions

Tiffany Tsui, Ronald Wall

Wageningen University, tiffany.tsui@matrion.nl

Abstract

This paper adopts a cross-disciplinary approach combining international economics and network theory to provide a new angle to the understanding of the dynamics of global networks, of how they evolve in interactions with their inherent network structures and with external factors, and how they interact with each other as interdependent networks. A stochastic actor-based modelling framework is used to analyze the dynamic evolution and co-evolution of global networks of trade and investment respectively as aggregated relational networks. The trade network is the global trading relations of beer, which represents a mature business network evolved through a long history, and the investment network is the emerging and dynamic investment relational networks in the food sector. The longitudinal time series data includes the period from 2003 to 2011 and covers the relational ties between the total of 178 world nations.

After controlling for 1) exogenous effects such as the impact of economic development, regionalism and urban growth; 2) endogenous effects such as reciprocity, preferential attachment and local clustering, the statistically significant results confirmed that the presence of trading relations in beer is a strong predictor for development of investment relations in the food sector. The reverse causality tests did not yield robust results. Based on our affirmative findings, we can conclude that the evolution of the mature beer network can be used to indicate the future evolution dynamics of the more volatile food investment network.

Analysis of Cyberspace Construction and Dynamic Mechanism of China's Coal

Resources Flow

Zhang Xinlin^{1,3}, Zhao Yuan^{1,2,3*}

¹ School of Geographic Science, Nanjing Normal University, Nanjing 210023, P.R. Jiangsu China, smilezhang89@163.com;

² Jinling College, Nanjing Normal University, Nanjing 210097, P.R. Jiangsu, China;

³ Jiangsu Center for Collaborative Innovation in Geographical Information Resource Development and Application, Nanjing 210023, P.R. Jiangsu China

Abstract

The characteristics of coal flow has been attracted more and more attention. Previous studies have focused on space characteristics. In this paper, we combine the characteristics of network and space to analyze the coal flow to reduce the attribute data's information loss using the methods of global spatial autocorrelation and social network analysis and so on, and analyze the dynamic mechanism using spatial econometrics model. (1) Spatial aggregating feature of source regions has increased firstly and then decreased, and showed stable state relatively in the end; That of terminal regions has decreased firstly and then increased. (2) Spatial distribution of terminal and source regions has showed the pattern of gradient distribution on the whole. (3) Network density of coal flow has been low; Shanxi and Hebei have been the core nodes in the network of coal flow; Shanxi、Hebei、Inner Mongolia have been the regions that node strength of coal flow was the strongest; Coal flow from Shanxi to Hebei has been the the main axis of flow network. (4) System of coal flow has showed the characteristics of internal condensation, and each subgroup was not a geographical area; both inside and outside contact of condensing subgroup have been weak relatively, and not formed a stable and interconnected network structure. (5) The influence of the traffic conditions has been the largest for coal flow; the influence of coal production on the source regions has been only next to the traffic condition; Coal demand and industrial structure has been the important driving forces.

Application of Spatial Econometric models in Regional Studies

CHENG Yeqing

College of Geography and Environmental Science, Hainan Normal University, Haikou, Hainan 571158, China,
34794249@qq.com

Abstract

With the rapid development of spatial econometrics, spatial theory and econometric models have achieved considerable application in economics to reveal the influence of spatial geographical distribution on economic phenomena. Moreover, the development of GIS provides powerful technical support for the application of spatial econometric model in regional studies of geography, and series of important theoretical and practical achievements have been made. This paper, taking urban-rural development, carbon emission and regional innovation as the examples, discusses the application issues of spatial econometric models such as exploratory spatial data analysis, confirmatory spatial data analysis and spatial panel model, aiming at illuminate the influence of spatial factors on geographical phenomena by spatial weighted matrix, and provide scientifically reference for the application studies of spatial econometric model in geography.

Cities and Sisterhood: Building Connections between Kolkata and Kunming

Basu, P.

University of Texas at El Paso, El Paso, USA, pbasu@utep.edu

Abstract

As cities across the world aspire to attract the 'creative class' or represent themselves as 'smart,' there is also a push to pair cities into so-called sisterhoods. However, within urban studies, the phenomenon of sister cities has attracted less attention, despite its possible theoretical and empirical value to extending the study of comparative urbanism. This paper attempts to reflect on the notion of sister cities based on a case study of Kolkata, India, and Kunming, China. Through a critical content analysis of governmental publications and pronouncements as well as transport and trade reports in India and China, this paper examines two significant aspects of the Kolkata-Kunming relationship. First, it analyzes how sister cities provide an insight into alternative forms of regionalization, enabling escape from the constraints of the national into both sub-national and trans-national realms. One way in which such escapes from the national are plotted is through access to airline connections, and the role of Kolkata and Kunming as global transportation hubs becomes useful to understanding their ability to link with one another. Second, the paper dwells on how the rhetoric of sister cities functions within the context of competition between cities imposed by the need to draw foreign investment. Thus, whether the rhetoric of sister cities translates into actual interactions and exchanges between cities needs to be considered. Overall, this paper seeks to contribute to the study of comparative urban and economic geographies by reflecting on how relationships between cities shape economic and political approaches to globalization.

Clusters, Industrial Districts and Local Productions Systems; Coincidences, Differences and implications on public policies.

Rocío Rosales Ortega

Metropolitan Autonomous University campus Iztapalapa, Mexico City, Mexico, rro@xanum.uam.mx

Abstract

The main objective of this paper is to analyse theoretical coincidences and differences among Clusters, industrial districts and Local production systems, in order to discuss his implications on public policies.

Even though these territorial agglomerations share several coincidences, his different theoretical backgrounds and methodologies have very heterogeneous public policy implications. On relation with that, recent concern on sustainable value chains has created new discussions about economic governance among enterprises on those territorial agglomerations.

On this paper we identify five axes to analyse theoretical differences and public policies implications of the aforementioned territorial agglomerations; concept of space, ontology of economic actors, interrelationship between scales, methodologies and adaptation through sustainable value chains.

Key words:

Cluster; Industrial district; local production systems; economic governance; multi-scalar interrelations; sustainable value chains

Comparative Analysis on Social Network of Korea-invested Enterprises in Jiangsu Province: Implications for Regional Development

Hai-ying Xu

Huaiyin Normal University, Huai'an, 223300, P. R. China, sqxhy@126

Abstract

This paper analyzes the nature of social network for Korean auto ventures in Jiangsu Province and discusses their implications for coordinated development among regions. We investigated 62 Korea-invested enterprises in Suzhou and Yancheng, based on large-scale questionnaires and face-to-face interviews, and make some comparative analysis between Subei and Sunan. In terms of social network pattern, we found significant differences between two regions. In subei, internal social network of Korean ventures are enclosed and hierarchical, which is not helpful to innovative activities. Moreover, in Subei, there shows unequal strong tie between Korean ventures and local government. Hostile and breakable relationships are harmful for long-term development for two parts. Comparatively speaking, in Sunan, Korean firms have open internal social relation network and relaxed social relationships with local government and other relevant actors. More efforts are still needed to better expand social network, integrating Korean ventures and local economies in Subei.

Key words:

Social network; Korea-invested enterprises; regional coordinated development; Subei and Sunan

Competing with the Global Economic Superpowers: Coping Mechanisms of Local Firms in Sub-Saharan Africa

Megento, TEBAREK

The Geographical Society of China, Beijing, 100101, P. R. China, igc2016@igsnr.ac.cn

Abstract

Drawing on insights from social network theory, the socio-economic and cultural dimensions of intra-ethnic business networks are examined for the *Gurage*, an ethnic group in Ethiopia, who have an overwhelming dominance in the footwear industry. This study also examines the extent of Chinese impacts on the footwear industry of Ethiopia. A qualitative approach based on in-depth interviews with owners and/or managers of footwear firms was utilized in order to assess intra-ethnic business networks, while a quantitative approach, based on a cross-sectional survey, was employed to collect background data which is needed to have a clear picture of the network, to assess the impact of Chinese imports on local footwear producers and to identify potential cases for in-depth interviews.

Gurage use ethnic networks to mobilize resources and opportunities, which in turn contributes to their success in the business. In response to the threats of Chinese imports on production activities and social capital /livelihoods of local footwear enterprises, quite a high number of respondents reported that they downsized their business (such as reduction in a firm's work force), stopped business and resorted to other alternatives of getting money such as repair of shoes, petty trading or went back to farming. However, some informants see Chinese imports as both a threat and opportunity for their competitiveness. They underline that they have learnt much from Chinese shoes as they are of superior design and better in quality to local shoes. This resulted in a better position of small and medium enterprises in the value chain in terms of finance, machineries and workshops as well as quality improvement and eventually reputation in the local market.

Key words:

intra-ethnic business networks; the Gurage; Chinese impacts; footwear industry; Ethiopia

Comprehending The Internal as Well as The Entrance-Exit Dynamics of GPN/GVC: Towards the Typology of Firm'S Repositioning Strategies

Blažek, J.

Charles University in Prague, Czechia, blazek@natur.cuni.cz

Abstract

This presentation examines various upgrading and downgrading repositioning firm strategies in order to underline the variegated and protean nature of global production networks (GPNs). It is argued that the existing dissonance in the literature over possibilities for functional upgrading can be attributed to the different modes of governance that can exist within a particular GPN and to the diverse nature of functional upgrading. A typology of functional upgrading is outlined, and it is argued that these different types vary significantly according to their probability and potential risk-benefit ratios. The presentation also distinguishes passive, adaptive and strategic downgrading and outlines their potential negative and positive effects on firms. Secondly, presentation points to a fundamental dilemma concerning the evolutionary dynamics of GPNs – the dilemma between their stability and flux. Consequently, borders of GPNs are necessarily permeable to allow the entrance of new suppliers with a superb cost-capability ratio, while discharging suppliers that fail to improve in sufficient time or those suppliers that do not fit the new organizational and management model. Therefore, in order to unravel intensity and key drivers of exit - entrance dynamics as well as the modalities of how the stability-flux dilemma is being addressed in practice, a qualitative, firm-level analysis, has been performed.

Coupling Relationship between Industrial Production Space Change and Industrial Structure Adjustment during the Transformation Period in Pearl River Delta, China

Jun Ding, Kaiyong Wang

Institute of Geographic Sciences and Natural Resources Research, CAS; University of Chinese Academy of Sciences; Beijing, 100101, P. R. China, dingj.14s@igsnr.ac.cn

Abstract

With the rapid process of industrialization and urbanization, the Pearl River Delta (PRD) faces a series of problems and is forced to transform and upgrade due to limited land, rising labour cost and constantly overloaded resource environmental bearing-capacity. Therefore the optimal regulation of industrial production space and the transformation and upgrading of industrial structure have become the urgent and significant task for the sustainable development of PRD. Based on the high resolution Google Earth image, this paper extracts the industrial production space information of PRD in 2007 and 2014, introduces the spatial integrated variation coefficient and structure adjustment index to analyse the change of industrial production space and industrial structure during the transformation period in PRD, and evaluates their coupling coordination degree by using the coupling model. The results illustrate that the industrial production space has an expanding trend from core area to periphery in PRD. The change degree in periphery is larger than that in core area of PRD. Industrial structure of PRD has been constantly optimized during the transformation period, but cities which are in different stages of industrialization development have different adjustment directions. The coupling coordination degree between industrial production space change and industrial structure adjustment in periphery of PRD is higher than that in core area. According to the coupling and coordination value, PRD can be divided into four types which are high coordinating and coupling area, high coordinating and gearing area, medium coordinating and coupling area and low coordinating and separate area.

Key words:

industrial production space; industrial structure adjustment; coupling; Pearl River Delta

Dynamic Diffusion of Technological Knowledge in Agri-industrial Clusters: Evidence from Japan's Wine Industry

FUJII T

The University of Tokyo, Tokyo, Japan, fujii@humgeo.c.u-tokyo.ac.jp

Abstract

Many studies about industrial clusters have clarified their static structure and/or interconnectivity among actors there, but dynamism or transformations of clusters have been less focused. This paper focuses the mechanism how competitiveness of individual actors leads to competitiveness of a cluster, and examines the dynamic diffusion of technological knowledge in Japan's Katsunuma, Yamanashi wine cluster which locates 100 km away from Tokyo. Since changes in agri-industry tend to be comparatively slower influenced by crop cycle, terms between 1980' and 2010' have been observed. Katsunuma is the pioneered and leading wine cluster in terms of both quality and quantity in Japan's wine production, and includes wide range of wineries from national enterprise-owned to smaller boutique-scaled, or from traditional co-operative style to new comers from other industries. During the term, the cluster has faced fierce competition against foreign wines which are, in general, better in quality but cheaper in price. Their wine used to be regarded as a poor substitute of foreign ones, but gradually succeeded to obtain the reputation to be competitive in quality by introduction and diffusion of some technologies. The three case studies selected are Sur Lie as oenology, rain protection system as viticulture and Kiiroka (yellow fragrance in English) as both technologies. The results show that (1) national wineries work as technological gatekeepers, (2) technologies tend to be diffused via locally embedded networks and (3) hierarchy of diffusion has become more flexible as local wineries gained their levels of technological knowledge.

Key words:

Industrial cluster; knowledge diffusion; social network; wine; oenology; viticulture; Japan

Economic New Normal and the Performance of Regional Economic Development in China

Changhong Miao, Wenying Shang, Jingjing Li

Henan University, China, 1460227870@qq.com

Abstract

China has experienced two stages of the planned economy and the transition economy. With the slowdown of economic growth from high speed to medium-high speed, China's development is coming to the new normal stage. This is a severe challenge for any city and region to improve the quality of economic growth, achieve a diversified growth momentum and promote the upgrade of industrial structure. In order to evaluate the performance of economic growth for different regions in the new stage, this paper, based on the five development concepts: innovation, coordination, green development, opening up, and sharing, this paper, construct a integrated assessment model with the four aspects of economic growth speed, structural adjustment, innovation driven and ecological civilization. Although the tertiary industry has developed rapidly in some provinces, the industrial structure is more unreasonable. The gap of the regional innovation capability and the ecological environment is getting large and large. The indexes of economic performance in Chinese 31 provinces shows that: (i) innovation is a new driver to accelerate economic growth; (ii) environmental governance shows the significant positive effect to the total economic scale, but has a negative impact on growth rate; (iii) the traditional industrial structure has become a strict constraint; (iv) government intervention has restricted the economic growth to some extent; (v) 31 provinces could be classified into five policy types: world city, innovation-driven, efficiency-driven, upgrading-structure, and transformation-revitalization.

new normal stage; regional economy, development performance, China

Exploring the Role of Epistemic Communities as Knowledge Creation and Creativity in Regional Path Creation in Korea

Lee, JW

The department of geography, Seoul National University, Seoul, Korea, 151-742, etincelante@snu.ac.kr

Abstract

Economic space has been changed dynamically. Especially, Declined industrial districts has transformed into creative space. Creative actors have begun to locate in old industrial facilities. Creative class that is new species in the regional ecosystem has been attracted in a certain area. The inflow of creative class contributes to overcome regional economic crisis resiliently while bring a particular artistic and liberal atmosphere to the region, which can be described as path creation in path theory. Creative actors try to share tacit knowledge and develop creativity through informal meetings. Epistemic communities which are one of the informal meetings play a pivotal role in dynamics of knowledge creation and creativity. In this regard, the primary objective of this study is to identify the role of epistemic communities as knowledge platform in a creative ecosystem from the perspective of regional path creation.

Key words:

epistemic communities; creative class; dynamics of knowledge creation; creativity; path creation; regional resilience

Features of the Model "Center-Periphery" In Yakutia: Continuing Transformation of Spatial Structure

Gavrilyeva T.N.^{1,2}, Bochkarev N.V.²

¹ The North-Eastern Federal University, 58 Belinsky STR, Yakutsk, Republic of Sakha (Yakutia), Russia, 677027, tuyara@list.ru.

² Yakut Filial of the Siberian Branch of the Russian Academy of Sciences, 2 Petrovsky str, Yakutsk, Republic of Sakha (Yakutia), Russia, 677980, nikboch@list.ru.

Abstract

The transformation of spatial structure in Russia in the 20th c. had its own peculiarities. The northern regions are different from other regions of Russia on the speed of the process and its intensity. The study is devoted to the transformation of spatial structure in Yakutia and Russia in the 20th - early 21st century. Standard statistical methods were used for analysis, including the calculation of the Theil index. Similar trends and regional features of transformation of spatial structure in Russia and Yakutia were identified. The base includes data of census in Russia in 1897 – 2010, and Soviet statistics. It is proved that the concentration of the rural population in Yakutia was forced and very intense in the 20th c. At the same time, urbanization in Yakutia corresponds the general trend in Russia. Results of the study confirm the findings of the new economic geography. Regional model "center-periphery" has a centripetal character. Yakutsk is the main core of the spatial system of the region. The transformation of spatial structure of region continues, a new spatial equilibrium has not yet been found. Yakutia needs the new spatial structure it can be both decentralized and more concentrated and linear. This task can be solved within the framework of the strategic spatial planning.

Key words:

urban; rural; settlements; Yakutia; census; transformation; spatial structure; sustainable development

Geography of International Trade: An Analysis of the Common Market of South 'MERCOSUR'

Dr. Purva Yadav

Assistant Professor, Centre for the Study of Regional Development (CSRD), Jawaharlal Nehru University, New Delhi-110067, India, purvayadav@hotmail.com, purvayadav@mail.jnu.ac.in

Abstract

Regionalization is a widespread feature of international trade. In Latin America, several efforts were made to create free trade areas at the sub-regional level. One of the most significant initiative is the formation of MERCOSUR by Argentina, Brazil, Paraguay and Uruguay. The origins of MERCOSUR can be traced to the July 1986 agreement between Argentina and Brazil. The MERCOSUR trade bloc's purpose is to allow for free trade between member states, with the ultimate goal of full South American economic integration. MERCOSUR's full members include Argentina, Brazil, Paraguay and Uruguay. The common market of the South 'MERCOSUR' is the largest trading bloc in South America. Yet experts say MERCOSUR has become somewhat paralyzed in recent years. The MERCOSUR economies are different in terms of their economic size, level of development as well as nature of their markets. At the same time, there are other structural and political differences which led to differential pattern of international trade of individual MERCOSUR member economies intra-regionally and inter-regionally. Hence, an attempt is made through this paper to compare volume of trade and commodity composition of export and import among MERCOSUR member countries, and MERCOSUR with the rest of the world, from 1990s onwards. Regression analysis with residual mapping is used to analyze relationship between trade and GDP, also between actual trade flows (trade ratio) and expected trade (ratio of gravity model estimates) flows between individual MERCOSUR partners with the 84 economies of the world. Data is mainly extracted from UNCTAD and World Bank.

Key words:

International trade; Regionalization; MERCOSUR; Merchandise trade; Gravity model; Regression; Residual mapping

Geopolinomic Analysis of Industrial Structural Changes of Countries based on a Multiple-country-sector General-Equilibrium Model

Hu Min, Zheng Wang

College of Urban and Environmental Science of Northwest University, China, minviolin@hotmail.com

Abstract

Based on a multiple-country-sector general-equilibrium model, this paper analyze the development and industrial structural changes of several main countries or regions. Taking geographic interaction into account, the world in this paper is divided into 10 countries and regions, and every country or region has 12 industrial sectors. And this paper also make different investment structures to analyze the changes of industrial structure. The results show that if China strengthen the development of the service sector, the development of China's and global economy will be better. If the USA and Japan strengthen the development of second industry, the economy of them will get bad influence, and this will also be bad to the economy of global economy.

Key words:

general-equilibrium model; international trade; industrial structure; investment structure

Global Megacity and Urban Restructuring: Jakarta Metropolitan Region under the Global Economic Flows

Galuh Syahbana Indraprahasta^{1,2}, Ben Derudder²

¹ PAPPITEK, Indonesian Institute of Sciences (LIPI), Jakarta 12710, Indonesia, galuhsyahbana.indraprahasta@ugent.be;

² SEG, Department of Geography, Ghent University, B-9000 Ghent, Belgium

Abstract

It is increasingly inevitable that the current process of urbanisation, including in the developing countries, has been to a larger degree attached to the wider spatial spectrum of economic globalisation. As in the case of Jakarta Metropolitan Region (JMR), foreign direct investment (FDI) has enabled this particular megacity to be globally connected and has therefore reshaped and reorganised its internal spatial-economic landscape. This paper aims to understand the role of FDI and state intervention in making JMR as a global city-region. In doing so, particular attention is devoted to exploring the intra-metropolitan restructuring process prior and subsequent to the advent of 1997-1998 Asian financial crisis and 2007-2008 global financial crisis. The result shows that FDI inflows into JMR have experienced a gradual structural and spatial shift during the past twenty-four years. FDI, coupled with several selective state interventions articulated through mega and capital accumulation projects, has selectively picked certain poles functioning as the superimposing global-national-local obligatory passage point. Consequently, notably after 1997-1998 crisis, JMR has been characterised by the spatial divisions of labour where global service circuits have increasingly concentrated in the central business district (CBD) and, meanwhile, global manufacturing has dispersed towards the smaller cities in the outskirts. Notwithstanding the enactment of regional autonomy in the early 2000s, national state has still played a major role in shaping global places within the local administrative boundaries.

How Similar Are the Environmental and Income Kuznets Curves? Evidence from China

Jianming Miao, Shiqiang Hu

Henan University, China, alexjmiao@hotmail.com

Abstract

Inequality has always been a hot issue around the world. Since the reform and opening up, the the fast economic growth in China has caused significant inequality. This develop mode, which is a meaningful experience, has gained more and more attention. Beginning from the analysis of relationship between economic development and income inequality using Kuznets curve, many researches have moved on to other aspects caused by economic development, such as disparities in environment and health. Although some of these researches have reached significant conclusions, few of them has been analyzing the intrinsic relationship between the environmental and income Kuznets curves. This paper brings Chinese empirical evidence to fill this vacancy. First, by using cross-sectional data of China at city level in 2013, this paper estimates the income and the environmental Kuznets curves for China respectively. We select some indicators to measure income and environment such as income ratio between urban and suburban areas, per capita dispensable income, and indexes of industrial water pollution, SO₂ and smoke. Second, we compare their similarities and analyze the interconnections, such as whether these two curves overlap with one another, or which one represents a higher level than the other. Last, we further investigate the reasons behind such outcome.

Key words:

Kuznets Curve; Income; Environmental Pollution; Inequality; China

Industrial Sickness and Its Impact on Economy and Labour Force of West Bengal with Case Study of Haora District

Roy S., Dr. Sumana Roy

Lecturer, Department of Geography, Vidyasagar College, Kolkata, West Bengal, India, umanaroy10@yahoo.com

Abstract

Industrial sickness is a commercial term but it can reflect the socio-economic composition of any region. After independence West Bengal was considered as an industrially front running state of India. Among the districts of this State Haora district has great contribution to the industrial economy of this State. The process of industrialization in West Bengal was started during the colonial period but with the march of time this state has lost its industrial glamour and many well running large scale units have become sick units. This study concentrates on the status of different scales of industries from micro and small to medium and large scale units as well a chronology of industrial sickness. A large number of labours are involved in these units and they have become affected after the closure of these units. This type of ailment can alter the occupational structure of any region. Many policies and acts are available in print and electronic media but in reality Board of Industrial and Financial Reconstruction has failed to revive these units and is unable to render benefit to this huge labour force. Thus quick revival of these sick units may provide some economic space to the entrepreneurs in future and new blood circulation in the industrial economy may be possible.

Key words:

sick units; labour force; industrialization; different scales of industries; economic space

Innovation Cooperative Network of Industry, Education and Academy: A Case Study of Zhongguancun Hi-Tech Park

Lyu lachang, HuangRu

College of Resource Environment and Tourism, Capital Normal University, 10048; center of Beijing innovation and development, 10048, lachanglu@163.com

Abstract

High Tech Park has been a major engine of China's innovation and development. Zhongguancun national innovation demonstration zone is the flag of Chinese Hi-Tech Park with comprehensive strength, forefront industry and the fastest developing speed. It has been known that innovation cooperation network of industry, education and academy in Zhongguancun Hi-Tech Park (ICNIEA) play a vital role in its development. Though literature has emphasized the importance of cooperation of industry, education and academy in the development of the park, these questions, such as how is the network of cooperation evolution, and what is the characteristic and spatial pattern of this networks, are still unsolved. This paper, we examine the evolution process of cooperation of networks of industry, education and academy and spatial pattern based on granted patents by employing the method of the social network analysis and spatial analysis. Based on the quantitative analysis of the node of expanding network transition, we divide the evolution of the cooperative networks as five phases and reveal the network characteristics of each phase. We find, firstly, the actors in the ICNIEA have much increased, reaching the maximum in 2013 and accounting for 66.89% of the total number of 6 years of the innovation actors; Secondly, the sectors, such as science_education_culture_health, Industry and construction industry, have been an important cooperative sectors, and the way of cooperation are between universities and enterprises, and after 2002, are between Scientific Research Institute - enterprises, thirdly, the spatial cooperative trend spread from the near to the far, first in Beijing, Tianjin and Hebei province, gradually to the Ring Bohai area, and then east area of China and along the Beijing Guangzhou railway to the Pearl River Delta region. We also discuss the policy implications.

Key words:

Interrelations between Value Chains and the Use of Information and Communication Technologies (ICT) in Small-Scale Agriculture: A Producer Perspective

Dannenberg, P., Krone, M.

Institute of Geography – University of Cologne, Cologne, Germany; p.dannenberg@uni-koeln.de

Abstract

Integration into Global Value Chains (GVC) has been emphasized by many authors as an opportunity for economic growth, particularly within the Global South. Nevertheless, insufficient access to markets restricts opportunities. Advances in information and communication technologies (ICT) have expanded the possibility to communicate information and knowledge across geographical distances and to shorten the link between producers and buyers.

By using the example of different Kenyan and Tanzanian fresh fruit and vegetable value chains this paper assesses to what extent small-scale farmers are able to integrate themselves within these value chains through using ICT and how different conditions affect ICT usage amongst small-scale farmers. Based on a mixed methods research design this study analyses different forms of value chain integration, their distinctive coordination types, different activities within the chain and the relational proximity between producers and buyers. The results indicate different effects on financial transactions, coordination between producers and buyers and on the access to different types of information and knowledge, to establish and maintain linkages to different buyers in order to access commercial markets.

With this differentiated perspective this paper contributes to enhancing the general debate on ICT for development and addresses some current contradictions regarding the effects of ICT in the Global South.

Knowledge Spillover Effects of Regional Innovation Networks in China from the Perspective of Multi Scale: A Case Study of Biotechnology

Tao Wang, Xiaoyan Huang

School of Geography Science, Nanjing Normal University, 1 Wenyuan Road, Nanjing 210023, China,

wangtao@njnu.edu.cn

Abstract

With the coming of knowledge economic era, knowledge has become the main source of regional competitive advantages by replacing the traditional production factors. The paper selects the biotechnology article written by Chinese scholars from 2000 to 2013 and their citing articles in Web of Science as the database and explores the research from the three aspects. First, it studies the different evolutions of topology and spatial structure in eastern, central and western areas in China at three spatial scales. Second, it studies the characteristics of knowledge spillover in the network. Third, it builds the knowledge spillover model by using knowledge production function, in order to know how the network structural elements affect the level of knowledge spillover. The results are followed: Firstly, the difference of knowledge stock in eastern, central and western areas is huge and the gap is expanding. Secondly, the innovation networks differ on three levels during the process of knowledge spillover. At the international level, the evolution of the network size and density of three regions have the same trend, but large differences in quantitative value. The main receivers are developed countries such as USA, Japan and Germany, and the USA has always been the biggest recipient. During the process, geographical proximity played a positive role. At the domestic level, the three network follows a power-law distribution, but their heterogeneities are different, the strongest in the eastern and the weakest in the central. The spillover in the eastern almost accounted for 70%. At the district level, the three network structure showed a dense development. After 2008, the number of nodes are close to saturation, but the times of spillovers are still increasing. The core cities in the eastern are stable and the structure is mature, however in the central and western, the core cities change a lot and the network are unstable. Thirdly, the companies have a low participation and poor motivation during the process. Fourthly, different structural elements have different effects on the level of knowledge spillover. Network size and degree centrality take positive correlations to the level of knowledge spillover, but the effect of network density depends on the different area. There is a negative correlation in the western due to the lack of communication infrastructure.

Key words:

biotechnology; knowledge spillover; innovation network; multi scale

Revisiting the Role of Institution in the Evolutionary Economic Geography: State Spatial Selectivity Strategy in the Indonesian Spatial Planning System

Dorodjatoen A

The University of Western Australia, Perth, Western Australia, Australia, agung.dorodjatoen@research.uwa.edu.au

Abstract

There is a longstanding recognition in economic geography that institutions play a critical role in shaping regional development. One of the most significant recent contributions is through the work on Evolutionary Economic Geography (EEG). This perspective aims to understanding how economies unfold over space and time, and gives detailed attention to the role of institutions in shaping economic growth. The research presented in this paper uses EEG as a framework, to explore the evolution of regional development policy in Indonesia during the democratic transitional period, 1998-2013. It argues that place-based policy initiatives embedded in the spatial planning system played a significant role in attempts to address the geography of the uneven development in the country. The national government employed a spatially selective strategy that aimed to foster the development of economic clusters to promote growth. The paper reviews these policies and offers some preliminary insights into their success. The findings not only contribute to empirical research aligned to EEG, but also offer novel insights by drawing on a developing country as the case study.

Rural-To-Urban Migration and Skill Upgrading: A Comparative Study between Suzhou and Taizhou in China

Huasheng Zhu¹, Fan Xu¹, Maojun Wang²

¹ Beijing Normal University, Beijing, China, zhuhs@bnu.edu.cn

² Capital Normal University, Beijing, China

Abstract

Rural-to-urban migrants have become the main body of industrial labors in China. Their human skill upgrading or human capital accumulation after migration not only means more individual benefits for migrant workers, such as more opportunities of getting a new job and more income, and of accelerating the process of social integration into the cities, but importantly also means satisfying the urgent demands for high-quality workers as a result of industrial upgrading and economic transformation. Extant relevant literature mainly focuses on the determinants affecting the skill upgrading and the mechanism from the individual, firm and institutional perspective, but cares little for territorial and organizational context, and the regional differences of workers' skill upgrading especially between advanced cities in the coastal area of China. This paper originates from the speculation whether or not there are differences concerning migrant workers' skill upgrading between a grass-rooted locality and a foreign-dominating one. If yes, whether and how do territorial factors play a role into the process? The questions are explored based on the questionnaire surveys in Suzhou, Jiangsu province and Taizhou, Zhejiang province in the summer of 2014 and 2015.

Key words:

rural-to-urban migration; skill upgrading; human capital; agglomeration

Spatial Features of Sale for the Online Retailers and Its Influencing Factors: A Case Study of M-Y Store in Tmall

Jin W F, Zhou C S

School of Geography and Planning, Sun Yat-sen University, Guangzhou, 510275, P. R. China, 452382347@qq.com

Abstract

The traditional commercial geography believe the survival and development of retailers need a threshold of demand, and its selling space should not beyond a certain scope. However, the sale model of traditional retailers and the shopping manner of consumers have been changed by the information and communication technologies. This huge change has a great impact on the traditional theory of commercial geography. It is against such a background that this paper examines the M-Y store in Tmall as a case study to compares its sale spatial features and influencing factors in 2014 with the traditional theory of commercial geography. The study shows that the sales amount in counties exist significantly the spatial agglomeration phenomenon. The sales volume doesn't follow the distance decay law. The relationship between the price of commodity and the distance of sales displays a significant fluctuation change. The sale distance of high price commodity maybe not longer than the low price. In the studied geographical space, the relationship among the income curve, cost curve and profit curve don't abide by the traditional theory. Income curve is always upper the cost curve. Therefore, there are not a threshold of demand and a maximum range of sales. The intensity of influence factors for the spatial disparity of sales are, per capita disposable income of urban residents, number of Internet domain names, the female population scale, distance, number of the postal service sites, in that order. The spatial action of these factors appears heterogeneity.

spatial features; influencing factors; online retailers; commercial geography

Study of Regional Division of non-agricultural industries and the Coupling Degree with Urbanization: A Case Study of Three Big Geographical Area in Shanxi Province

ZHAO Xinxin

Northwest university, Xi'an 710127, China, 765072109@qq.com

Abstract

The non-agricultural industry support is necessary for the healthy development of urbanization, under the background of new urbanization in our country was deepened, the development of the regional industry effective impact on regional development more and more strong. Based on the three geographical areas in Shanxi province as the research object, the regional division of non-agricultural industry and the coupling degree with Urbanization as the breakthrough point, based on the fifth census, six data, the methods of regional specialization index and spatial coupling analysis, the three major regional non-agricultural industry division and the coupling degree of non-agricultural industry with urbanization is analyzed. Research shows that: the non-agricultural industry have a certain centripetal specialization degree and Xi'an as the center outward descending; Non-agricultural degree of specialization and level of urbanization showed some positive correlation.

Key words:

Temporal Evolution of Cultural Industries Diffused Capacity in Xi'an City

XUE Dongqian, ZHAO Shaomin, MA Beibei, DUAN Zhiyong

College of Tourism and Environment, Shaanxi Normal University, Xi'an 710062, China

Abstract

Obtaining data point of Xi'an cultural industry enterprises in 1997, 1999, 2002, 2005, 2007, 2009 and 2012 by Yellow Pages, authoritative search engine, statistics, and field research. The basic spatial unit are 51 offices (town) in the main city street within ring expressway, Using same sector analysis and diffusion index model of cultural industries and other methods, Researching the quantitative of diffused capacity of the cultural industry and exploring the momentum factor of cultural industry diffusion. Research shows: ①The dominated diffusion directions of cultural industries are SW and NWW from 1997 to 2012. ②In a certain space, spatial diffusion capacity of cultural industries enhanced to stabilized state after saturated state. ③The extremely vulnerable grade of spatial diffused capacity of cultural industries was distributed in NE, NW direction, they are near ring expressway and away from the city center, The street number of this grade are rapid decline in the study period. ④The strong ability grade streets of spatial diffused capacity of cultural industries were mainly distributed in 4 km circular area at the core of the Bell Tower, The spatial diffusion center of cultural industries in Xi'an Basically was formed. ⑤The major factor affecting spatial diffusion ability of cultural industries are Market factors, policy factors, related industries and natural resources.

Key words:

Territorial Dynamics and Drivers of Innovation in Turkish Regions

Yavan, Nuri

Ankara University, Department of Geography, Ankara, Turkey, nuri.yavan@ankara.edu.tr

Abstract

Innovation has become one of most important driving force of global economy. As innovation activity is spatially concentrated and thus has an obviously geographic dimension, more than two decades economic geographers examined the territorial dynamics, location and determinants of innovation at local, regional and national level. In this context, this paper analyses the geography of innovation in Turkey using a variety of indicators such as patent grants and utility models. Based on a data sets derived from Turkish Patent Institute and TurkStat, this paper presents the recent space-time patterns and determinants of regional innovative activities during the 2000s. The study reveals that innovative activities in Turkey has been concentrated in metropolitan areas such as İstanbul, Ankara and İzmir and as well as neighboring metropolitan areas. It also finds that innovative efforts has been increasing in new industrial cities like Konya and Kayseri represented the last wave of industrialization in Turkey. In addition, this paper also shows that the location of innovation is fundamentally driven by agglomeration forces, industrial specialization, FDI and various infrastructure availability and quality. The paper contributes to the geography of innovation literature by providing some empirical evidence for understanding the territorial patterns of innovation.

innovation; patent; concentration; spatial distribution; regional development; economic geography; Turkey

The Comparative Analysis about Economic Developing Features of Inland Key Urban Agglomerations of “One Belt One Road”

Chen Ting, Chen Zhongnuan, Huang Yuxing

School of Geography Science, South China Normal University, Guangzhou 510631, China, 2539249215@qq.com

Abstract

According to the panel data analysis results, the economic development influence factors of Guanzhong-Tianshui and Chang Zhu Tan were divided into three parts: common, dominant and others. Then, in order to enrich the theoretical thinking about the characteristics and the differentiation about economic development under the background about "One Belt and One Road", writers tried to use VAR, IRF and VD to analyze and compare the action intensity and features of each factor. The result showed: Firstly, the degree of market development of Guanzhong-Tianshui was weaker than Chang Zhu Tan. And the regional economic momentum could be stronger when the market conditions improved. Secondly, the transport level of Chang Zhu Tan had gotten ahead of its current needs, and limited the development. With the economic environment and conditions improved, the limitation would vanish. Thirdly, science and technology promoted Guanzhong-Tianshui economic growth permanently. So, this urban cluster, maybe, could be built as the regional creative economic center. Finally, as the core power of Chang Zhu Tan, the secondary industry couldn't promote this region developing fast and permanent unfortunately. And, this industry was not suit for the development strategy about ecological cities. Therefore, the industry structure needed to be restructured.

economic developing features; quantitative economy; inland urban agglomeration; One Belt and One Road; comparative analyze

The Dynamics of Petrochemical Enterprises Decline (I): Big Petrochemical Enterprises

Hou L C^{1,2}, Lin Z S^{1,*}, Guan W H¹, Liu H Y¹, Qi X Z¹

¹ College of Geographical Science, Nanjing Normal University, Nanjing 210023, China;

² College of History Geography and Tourism, Shangrao Normal College, Shangrao Jiangxi 334000, China

Abstract

A nonlinear dynamic model of the competition by international petrochemical enterprises as a result of petroleum shortage has been set up. The model shows the internal binding relationship among the number of big petrochemical enterprises that go decline, the petroleum shortage ratio (D) and the petroleum occupancy ratio of the biggest enterprise (q). The results show that if $D > q$ in the international petroleum resource market, the following rules and characteristics exist in the evolution of petrochemical enterprises: (1) the biggest enterprise in the petrochemical system will inevitably go decline. (2) After an incident of petroleum shortage, the surviving petrochemical enterprises will go through three stages. A petrochemical enterprise will continually develop and grow stronger in the petroleum competition, only if it seizes the D and q in the petroleum resource market, understands the rules and characteristics in the petroleum economical system and positions itself correctly.

decline; dynamic mechanism; mathematical model; Petrochemical enterprise

The East Asian Variety of Territorial Planning: Theorising Integration of Economic Planning and Territorial Planning based on S. Korean and Chinese Experiences

Sonn, J.W.

Bartlett School of Planning, University College London, London, United Kingdom j.sonn@ucl.ac.uk

Abstract

Bringing back the earlier tradition from development theories in the 1960s and the 1970s, this paper attempts to piece back together theories of economic growth and spatial planning within a late industrialization context. This paper argues that an understanding of spatial dimensions is important because economic planning for late industrialization is required to simultaneously be spatial planning. This paper use Lefebvre's insight on space as a means of production and explain how the developmental state in East Asia integrates economic planning and spatial planning and reconfigures the national territory as a more efficient means of production. The integration of two types of planning was necessary because due to the productivity gap between advanced economies and late industrialisers and due to the globally integrated and saturated market, the state had to fully appropriate agglomeration economy. The spatial planning that the developmental state conducted (e.g., industrial estate development, new town development and national territorial planning) had some apparent similarity with enterprise zone development, new town development and Keynesian regional policies in the advanced economies. The formers were significantly more intensive in the sense that the developmental state took them as national agenda and used diverse means (e.g., tax exemption, informal negotiation and political loans, among others) to an extreme degree. But more importantly, while spatial policies in the advanced economy are usually responses to correct problems caused by economic changes, spatial policies under the developmental states were themselves economic policies whose aims were industrial upgrading and economic growth.

Key words:

developmental state; national territorial planning; regional policy; getting the price wrong; East Asia

The Mechanism of Cross-boundary Product Evolution in China: An empirical analysis based on export product of prefecture-level cities

LI Yunxiong^{1,2}, REN Yonghuan^{1,2}, HE Canfei²

¹ College of urban planning and design, Peking University, Shenzhen, Guangdong 518055, China ;

² College of urban and environmental science, Peking University, Beijing 100871, China

Abstract

New product promotes the sustainable growth of the local economy. Evolutionary economic geographers believe that the emergence of new products is based on local original products, and related industries. However they have only concentrated on a local perspective, omitting the truth of factor mobility and space opening. This paper discusses whether the evolutionary process can also cross regional boundary and administrative boundaries. Based on the current evolutionary theories, this research studies the cross-boundary evolution progress under the background of Chinese transforming economy. we analyze the development of new products in Chinese prefecture-level cities during the two periods——2002-2006 and 2007-2011. The results show that the cross-boundary evolution product do exist among neighboring cities. Related industry foundation is precondition for this cross-boundary evolution. However the administrative limitation between provinces is a significant barrier due to the Chinese decentralization process. Besides, subject of cross-boundary evolution has change from collective owned firms to foreign direct investment firms during 2002-2011 due to industry upgrading.

Key words:

Cross-boundary evolution; Export similarity; Knowledge diffusion; Proximity; Decentralization

The Progress of Real Estate Transactions by Fukushima Refugees and Land Price Changes after the Great East-Japan Earthquake

Kawamura,S

Department of Regional sciences, Faculty of letters, Hokkaido University, Sapporo, 0600810, Japan. skawamura@qit.ne.jp

Abstract

The Great East-Japan Earthquake and the accident at the Fukushima nuclear power stations significantly damaged public trust in the safety of nuclear power. The earthquake and tsunami thus caused not only physical damage and radioactive contamination, but also psychological and social damage to residents.

This study focuses on changes in land prices and the buying and selling of real estate after the Great East-Japan Earthquake, and clarifies the progress of real estate transactions by Fukushima refugees and changes in land prices.

The results of the study show that in Miyagi Prefecture and Iwate Prefecture, land prices are rising in the inner cities of Sendai region and the coastal region of the stricken area. On the other hand, with the exception of the residential area of Iwaki city, land prices in Fukushima Prefecture are generally falling.

This study finds that real estate transactions and land prices changed after the earthquake in Fukushima Prefecture, but that while the amount of buying and selling increased along with demand, land prices did not increase almost at all. This differed from the land price fluctuations in Miyagi and Iwate Prefectures.

There is a possibility that the high levels of radiation in Fukushima Prefecture will prevent many evacuees from returning for a long time. This study suggests that these evacuees' social and psychological anxiety about their new potential homes is preventing an increase in land prices in a part of areas where buying is on the rise.

Key words:

land price; real estate transactions; radioactive contamination; Fukushima refugees; The Great East-Japan Earthquake

The Rural Floating Population'S Impact and Relocation in A Changing Climate

Abstract

We consider the change in carbon emissions induced by labor that must migrate to accommodate the interindustry shifts across regions, some of which may be the basis of further urbanization. Such urbanization results from mass rural to urban migration. Naturally, insofar as at least household consumption is concerned, carbon emissions necessarily follow population changes. As workers migrate from an undeveloped rural region to an affluent urban region, they change their consumption pattern—most particularly the amount of energy they use. The change in carbon emissions can be estimated as the product of the new floating population and the appropriate gap (depending on whether the region is the origin or destination for the floating householder) in the carbon emissions per household between a rural household and its transformed urban equivalent. Note the implication here is that much population shifts out of primary industries, which are largely rural. This necessarily promotes GDP, but raises carbon emissions embodied in the products and services, as well as via directly in household consumption. Due to the population shifts, we estimate households will directly reduce their production of carbon by 36,600 tons. This, however, is offset indirect rise of 970,000 tons carbon from and average consumption change, so as to the increase of 933.4 thousand tons in total, accounting for 0.2% of the total carbon emissions. So after the trade-off of carbon emissions, the total carbon emissions increase by around 1.95%.²

Key words:

input-output analysis; floating population; carbon emissions

² When workers migrate from region r (say, e.g., Heilongjiang) to region s (say, e.g., Shanghai), they assume consumption patterns of households in region s (Shanghai). The change in carbon they emit from energy use is the difference between resident carbon emissions per capita in Shanghai versus that in Heilongjiang $({}^s C_f / {}^s PE) - ({}^r C_f / {}^r PE)$. It also changes the emissions of carbon *indirectly* through their consumption of other goods as their income rises as well as from the change in their household consumption bundle in moving from Heilongjiang to Shanghai $({}^s F / {}^s PE) - ({}^r F / {}^r PE)$. We define the set of migrating workers from Heilongjiang to Shanghai as $({}^r PE)$, and the direct $({}^r DE)$ and indirect effect $({}^r IE)$ of migration on carbon emissions respectively are ${}^r DE = ({}^s C_f / {}^s PE - {}^r C_f / {}^r PE) {}^r PE$ and ${}^r IE = {}^r \tilde{I}_c (I - {}^r A) ({}^s F / {}^s PE - {}^r F / {}^r PE) {}^r PE$

Transition Pathways in Conventional Food Systems: Geographies of Crisis

Prof. Christine Tamásy, Dr. Oliver Klein

University of Vechta, Germany, oliver.klein@uni-vechta.de

Abstract

In the 21st century, the conventional food sector is more than ever positioned in a field of conflict between various forces. Driven by processes of intensification, concentration, specialization and globalization, the conventional production of food is increasingly regarded as 'unsustainable', especially by critical NGOs and consumer groups. The reasons are many and refer, for example, to ecological damages, land-use conflicts, animal welfare issues, and impacts on climate change.

Against this background, the creation of alternative pathways towards more sustainable food systems is claimed. Such a transition depends to a high degree on the acceptance for change by participating actors and the existence of change agents whose attitudes are strongly influenced by perceptions of technological and economic feasibility with respect to sustainability innovations. However, possible conflicts between the contribution of innovations to sustainable development and their acceptance are not very well researched until now.

Our contribution aims at addressing these issues by taking three steps: first, we outline a number of key challenges which must be overcome in order to transform conventional food systems. Second, we describe some appropriate concepts dealing with socio-economic transitions and sustainability in the context of food production. Third, we give concrete insights from two interdisciplinary research projects dealing with innovation potentials which could have significant effects for more sustainability in conventional agrifood production networks.

Key words:

Food systems; transition pathways; sustainability

An Resilience Exploration Between Regional Economy and Ecological Resilience-:

Taking Beijing-Tianjin-Hebei Urban Agglomeration as the Case

Minhang Yuan, Minhang Yuan, Yingzi Lin

HUAZHONG UNIVERSITY OF SCIENCE AND TECHNOLOGY, China, Chong Peng, pengchong@hust.edu.cn

Abstract

In the current serious contradiction between ecological protection and urban and rural construction, under the condition of resilience concept is particularly important in the process of regional development, the research of urbanization resilient and the relationship between the ecological resilience and urbanization resilience, explore its influence relations is imminent. Current research shows that the resilience area is divided into economic resilient, engineering resilient, social resilient and ecological resilient. economic resilient which will be as a representative of the ability of urbanization resilience. based on the beijing-tianjin hebei urban agglomeration as the research object, first of all, determine the impact of economic resilience and ecological resilience, second, respectively and the ecological evaluation of beijing-tianjin-hebei urban agglomeration economy resilience, finally, to explore the correlation between economic and ecological resilience. Through the above the construction of the evaluation process to determine the influence of the economic and ecological resilience to promote urbanization resilience and harmony development of the ecological resilience.

Division of Housing Price Monitoring System Based on Price's Spatial Segregation: A Case Study in Chongqing Metropolis Core Area

Yang Ren-Hao, Yang Qing-Yuan, Yin Wen, Chen Yi-Duo

Southwest University, Chongqing, 400715, P. R. China, swuyrh@126.com

Abstract

As a fundamental work for monitoring housing price, it is very important to divided the monitoring and statistics areas of housing price. Many factors affect the spatial distribution of housing price, which can be used to divided monitoring and statistics areas of housing price according to their spatial marginal effect. Selecting nine urban areas of Chongqing as the study area ,this paper analyzes housing price data of Chongqing metropolis core area in 2013-2014 using hedonic model to get the influencing factors of housing price and calculates the contribution degree of housing hedonic price via geographical weighted regression (GWR), and then divides monitoring and statistics areas using Voronoi space division technology. The results indicate that 1) there are five main factors that affect the housing price spatial segregation, business supporting, education supporting, medical supporting, traffic condition and convenient distance, and traffic condition effect hard; 2) According the housing price spatial segregation, Chongqing metropolis core area formed by 4 metropolitan plates can be divided into 88 monitoring and statistics areas which share homogenizing internal effects. Among them, Nanan-Banan plate is divided into 6 areas; three north plate (Beibei-Yubei-Jiangbei plate) is divided into 46 areas; Yuzhong plate is divided into 4 areas; Shapingba-Jiulongpo-Dadukou plate is divided into 32 areas. Diverse regulation measures are put forward for all kinds of housing price areas of the 4 unbalanced development primary plates to guide the meticulous monitoring and statistics of estate market price.

housing price; spatial segregation; area division; price monitoring and statistics; Chongqing metropolis core area

Firm Heterogeneity and Industrial Agglomeration in Metropolitan Region: Evidence from Beijing-Tianjin-Hebei

Junzhu Zhao

Central University of Finance and Economics, Beijing, 100081, P. R. China, zjzcufe@163.com

Abstract

Using the unique and detailed firm-level data based on the Annual Survey of Industrial Firms in China during 2001-2009, we apply the footloose capital model with heterogeneous firms to construct a discrete choice model, and verify the 'selection effect' and 'sorting effect' of firm heterogeneity on location choice. The interaction of firm heterogeneity, labor heterogeneity and spatial heterogeneity on industrial agglomeration in Beijing-Tianjin-Hebei metropolitan region is significant. In addition, our empirical results are consistent with the predictions of the theoretical model. They show that the firm scale, regional integration and enterprise productivity are closely related to industrial agglomeration.

Key words:

firm heterogeneity; discrete choice model; location choice; industrial agglomeration; Beijing-Tianjin-Hebei

Resource, Location and Economic Development: a Case Study of Resource Curse Effect in Northeast China

HUANG Yue, FANG Yangang, LIU Jisheng, LI Qiuyu,

Northeast Normal University, Changchun, 130024, P. R. China, huangy612@nenu.edu.cn

Abstract

Resource curse theory points out the negative correlation between resource abundance and economic development. However, former research has rarely considered the factor of location in the resource curse effect analysis. Northeast China, with many resource-based cities, is the old industrial base and under the increasing downward pressure of economic development in recent years. Taking the location factor into account, this paper analyzes the relationship between resource abundance and economic development by using the fixed-effect regression model and the data of 33 cities in Northeast China from 1998 to 2013. The results reveal that the resource curse effect still holds in Northeast China when the location factor is taken into account. In the control variables, manufacturing level, fixed assets investment and education level promote the economic development; however, foreign capital investment impedes the economic development, which means foreign capital investment has not been effectively and rationally utilized in Northeast China. From the viewpoint of location factors, both distance from provincial capital city and distance from nearest port city are negatively correlated with economic development, and yet the significance level of the former factor is much higher than the latter one. In other words, the distance from provincial capital city has an important impact on economic development.

Key words:

resource curse effect; economic development; location; Northeast China

Spatial Characteristics and Forming Mechanisms of Retail Businesses in Changchun, China

HAO Feilong, WANG Shijun

School of Geographical Sciences, Northeast Normal University, Changchun, 130024, P. R. China, haofl587@nenu.edu.cn

Abstract

The rationalization of spatial retailing distribution has an important effect on urban economic development, circulating resource allocation, and resident consumption demand satisfaction. Based on 2013 survey data for large-scale commercial sites in the central district of Changchun, this paper provides a detailed discussion of the spatial characteristics and formation mechanisms of retail businesses using spatial density analysis, nearest neighbor distance, and location entropy analysis. The results show that spatial distribution of retail outlets in Changchun is made up of coexisting areas of concentration in the core area and diffusion in the peripheral areas. The results also show that a spatial pattern of multi-center clustering and a spatial development trend from northeast to southwest among retail sites characterize the overall spatial distribution of retail outlets in Changchun. Different retail formats show different spatial distribution features, and the expansion of emerging formats such as chain supermarkets towards the city periphery has become a trend. Furthermore, different blocks of the retail industry show quite different characteristics: the mature districts generally have high integrated service capacity, while the function pattern of developing districts features a more single-focus approach. Overall, a combination of factors working together with a cross-cutting mechanism influenced the spatial evolution process of retail businesses, including the evolution of retail formats and their characteristic feature selection mechanisms, residents' consumption structure and behavioral factors, the promotion of agglomeration, the government's macroeconomic control policy, and planning factors.

Key words:

commercial site; retail format; spatial characteristic; forming mechanism; Changchun

Study on Economic Convergence of Main Countries along the Silk Road Economic Belt

Jingjing Cao, Jinhe Zhang, Jinkun Sun, Min Chen

Nanjing University, Nanjing, 210023, P. R. China, 2634787551@qq.com

Abstract

Convergence of economic growth is the core study of economic growth. There are significant differences in each level of growth economies in time and space dimensions, convergence of long-term trends can reflect the level of output per worker between different economies. China is the sponsor and advocates of the "Silk Road Economic Belt", further rose it to a national strategy. Analyzed the differences between the level of economic growth trends of China and neighboring economies will play a significant role in promoting the implementation of the national strategy and international cooperation. This paper studies economic convergences between China and core countries (China and Five Central Asian Countries) of "Silk Road Economic Belt" during 2005-2015, verify the existence and the mechanism of convergence, with some evaluation and forward-looking social effects, provide the basis for the strategic implementation of policy "Silk Road Economic Belt".

Key words:

Silk Road Economic Belt; economic convergence; international cooperation

The Relationship between Road Centrality and Spatial Distribution of Retail Stores in Guangzhou, China

Chen X X, Lin G, Liang Y T

School of Geography and Planning, Sun Yat-sen University, Guangzhou, 510275, P. R. China, chenxxdreamer@163.com

Abstract

Many researches have confirmed that transport accessibility can affect the location pattern of commercial activities. However, it has rarely examined the relationship between distribution of various types of retail stores and road network in a centrality perspective in megacity scale. This paper focuses on the problem that whether different types of stores favor different centrality indices based on the multiple centrality assessment (MCA) model composed of closeness, betweenness and straightness. Based on the location information of retail stores on Guangzhou navigation map, we investigate statistical and spatial distribution of three road centrality indices and various retail stores in Guangzhou, a megacity with a long history of commerce in China, using GIS-based methods such as the nearest neighbor index, the centrophobic method, the kernel density estimation (KDE) and band collection statistics as well as correlation and regression analysis by SPSS. Results show that the spatial distribution of retail stores is closely associated with road centrality. Specialty stores favor road centrality most, followed by shopping malls, convenience stores, textile and clothing stores, supermarkets, grocery stores and building-material stores. More specifically, different types of stores are affected by the specific centrality index. These findings indicate that road centrality has significant influences on the location of retail stores and various properties of road centrality capture the location pattern of retail stores in Guangzhou. We hope this study can provide some valuable references for researches on urban economic space and commercial planning through the analysis of big data by GIS and statistical methods.

Key words:

road centrality; retail stores; spatial distribution; big data; the multiple centrality assessment (MCA) model

Banking Sector in Siberia and its Influence on Regional Development

Sysoeva O.V.

The Irkutsk Scientific Center SB RAS, Irkutsk, Russia, st-olya@mail.ru

Abstract

Siberia (Siberian Federal District – SFD) is regarded as a part of Asian Russia, which covers one third of the area of Russia and is populated by over 19 million people (13%). The GRP of the district is 10% of the whole country. The investment in fixed capital is also 10%. Despite the high indicators there are apparent features of economic peripherality in the area including the banking sector.

The structure of the Siberian banking system is considered. The differentiation in the level of provision by bank offices coverage in SFD is demonstrated. The characteristics of bank unit location are formulated. The bank credit share in the investment in the regions is analysed. Thus the role of the banking system as a source of investment is revealed. There are some spatial features of the investments related to implementation of big state projects.

Special attention is paid to the activity of local banks. Their development reflects the process of capital accumulation in the region. The authorized capital of Siberian local banks is small. There are great difficulties for the development of small and medium business. The role of local banks is defined taking into account resource component of the region economy. Therefore, lending to small regional firms is a prerogative for local banks. The relationship among such banks as part of ‘financial chains’ and regional economy is shown. In conclusion the paper proposes to increase access to lending by introducing special regulatory and legislative support for small local banks.

Key words:

banking sector; fingeo; regional banks; spatial features; Siberia.

Determinants of Financial Inclusion: A Global Perspective

Bermeo, Elizabeth

School of Geographical Sciences, University of Bristol, Bristol, United Kingdom, mb14134@bristol.ac.uk

Abstract

Financial inclusion—defined here as the widespread use of formal financial services— has been identified as a key driver of people's economic well-being. Yet the determinants of financial inclusion have received little attention from quantitative researchers and have not been extensively studied from an individual perspective. Using multilevel models fitted to data from the Global Financial Inclusion Survey (Global Findex) for 147 countries and over 152, 000 individuals, this paper aims to fill this gap by analysing the personal and contextual characteristics determining individuals' use of financial services across countries.

This paper seeks to explain why some people are more prone to financial exclusion than others. In particular, I am interested in analyzing how characteristics of the countries where individuals reside influence their probability of using financial services, and whether policies to advance financial inclusion are especially effective among the most commonly excluded groups: the poor, the less educated and women. In contrast to many of the cross-country studies on the topic, which portray financial inclusion as either a consequence of economic development or access to financial services, I highlight the institutional and policy dynamics that are important in explaining the large variations in financial inclusion levels across countries.

Key words:

financial Inclusion; financial access; multilevel modeling; Findex microdata

Financial Centre Development: New Data and Scenarios for Asia-Pacific

Wójcik, D, Knight, E, O'Neill, P, Pažitka, V

School of Geography and the Environment, Oxford University, Oxford, dariusz.wojcik@spc.ox.ac.uk

Abstract

Globalisation and technology continue to fuel worldwide competition among cities for the status of an international financial centre. This study introduces novel data on revenues earned from international finance in 2000-14 by city, and investigates their determinants. It shows that IFCs develop in cities that are leading domestic financial centres, with large, deep, flexible and open labour markets and a large and internationalised non-financial sector, in countries with strong rule of law and contract enforcement. Stock market size and prices, corporate and finance-specific taxation, English as the official language, legal family of origin, and the GMT zone do not seem to matter. In the second part of the paper we draw lessons from this analysis to evaluate various scenarios of financial centre development in the Asia-Pacific region.

Key words:

financial centres; Asia-Pacific; China; globalisation; competition, networks

Financial Potential of Natural Resources for Regional Development

Pylypiv V. V., Bystryakov I.K.

University of the State Fiscal Service of Ukraine, Kyiv obl., Irpin, Ukraine, vpylypiv@gmail.com

Abstract

Current difficult situation in public financial sector of low-income East European non-EU states (such as Ukraine) limits the possibilities for the regional development financing. Under such conditions sustainable development of territories needs attracting not only extremely limited and insufficient financial resources of public sector but also of wider financial space.

The fruitful direction of the situation improvement is seen in formation of modern institutional support that creates conditions for the local resources transformation into the territorial capital. In other words, territorial resources capitalization mechanisms are considered as a possible way of sustainable development and territorial dynamics stimulating.

Natural resources are considered as the main unengaged source of regional sustainable development that is still not involved in financial turnover and undercapitalized in the states with underdeveloped financial infrastructure. Process of natural resources capitalization require an adequate institutional framework in which natural resources could receive an adequate assessment and be easily transformed into financial form.

The concept of natural resources capitalization relates to the idea of territorial capital mobilization for the purpose of sustainable regional economic development. However natural resources are not expected to be used in the direct way (as a factor of production) but as reproducible assets able to generate new financial flows in the regions. Key issues include the specification of natural resources ownership, assessment of natural wealth, financial infrastructure modernization.

The paper explores some opportunities of regional sustainable economic development financing focusing on unleashing of territorial natural resources financial potential.

Key words:

territorial capital; natural resources; capitalization; regional sustainable development.

From Global Financial Networks to Financial Chains: Some Preliminary Thoughts

Sokol M

Trinity College Dublin, Dublin, Ireland, sokolm@tcd.ie

Abstract

Against the backdrop of continuing financialisation, efforts have been made to integrate the conceptualisation of finance with mainstream economic geography frameworks. Perhaps most significantly, the concept of the Global Financial Network has been recently proposed, in strong recognition that geographies of globalising economies cannot be fully understood without understanding finance and its geographies. This paper argues that while the concept of the Global Financial Network is a step in the right direction, there are alternative and complementary ways in which the role of finance in economic geographies can be conceptualised. One such possibility is a concept of Financial Chains. This paper makes the case for the Financial Chains concept, while tentatively outlining its key features and spelling out its implications for economic geography research.

Key words:

financialisation; finance; economic geography; Global Financial Network; Financial Chains

Global Financial Crisis and Hotel Chains Financialization in Spain: Towards New Accumulation Frontiers?

Yrigoy, I

Independent Researcher, Palma, Spain, ismael.yrigoy@gmail.com

Abstract

The paper argues that Spanish hotel corporations are increasingly becoming financialized. From a theoretical point of view, it is claimed that the current dynamics of financialized capital circulation through hotel chains represents at the same time a process by which liquid capitals get *spatially fixed*, whereas for hotel chains financialization represent one of its foremost strategies of creating *liquidity* beyond the traditional hotel overnight stays.

From an empirical point of view, it is argued that hotel corporations financialization takes place in four interrelated spheres (i) the built environment (hotel buildings property becoming controlled by financial funds), (ii) actors (emergence of new actors such as hotel-oriented REITs) (iii) hotel management (new forms of management due to the emergence of financial actors within hotel chains) (iv) profit extraction (hotel corporations increasingly relying on financial profitability).

The paper is structured in the following parts. The first item explores how the new dynamics of hotel chain financialization 'fits' within the Marxian scheme of expanded reproduction. The second part outlines how the financial crisis and particularly the restructuring of the Spanish banking system have forced hotel chains to become further 'financialized'. The third part focuses on the emergence of financialization as a response to hotel chains crisis in the abovementioned spheres, arguing that financialization of hotel chains need of an increased treatment of land and property as financial 'assets'. The conclusion of the paper deals with the uneven spatialization of hotel chains' financialization.

Key words

financialization; hotel chains; global financial crisis; global property; REIT.

High Frequency Traders Challenge Hong Kong and Singapore as Financial Centers

Meyer, D. R., Guernsey, G.

Olin Business School, Washington University in St. Louis, St. Louis, Missouri USA 63130, dmeyer24@wustl.edu

Abstract

Hong Kong and Singapore, arguably, are the two greatest financial centers in Asia. Their exchanges, the Hong Kong Exchanges and the Singapore Exchange, comprise signature features of their financial institutions. Global commercial and investment banks, fund management companies, and hedge funds both trade on these exchanges and house large local offices in their cities. High frequency trading (HFT), which is part of the wider trend towards algorithmic trading, is becoming increasingly important on global exchanges. Consequently, exchanges that are receptive to HFT enhance their competitiveness in attracting trading, which is essential to the profitability of exchanges. The exchanges, the regulators, and the local political economic actors in Hong Kong and Singapore, however, remain conflicted in their approach to HFT in contrast to other Asian financial centers such as Tokyo, Mumbai, and Sydney, which aim to attract high frequency trading. Even as Hong Kong's and Singapore's exchanges vacillate over their approach to HFT, the exchanges are enhancing their technological infrastructure and connectivity to other global exchanges, all of which supports HFT. Financial firms in Hong Kong and Singapore, therefore, have access to other Asian and global exchanges for their high frequency trading. These trends demonstrate that technological change in trading has the potential to partially undermine both cities as leading global financial centers.

Key words:

financial centers; high frequency trading; Hong Kong Exchanges; Singapore Exchange

How Big is Chinese's Real Estate Bubble and Why Hasn't It Yet Burst: A Comparative Study between China and World Major Financial Crises 1980-2014

Simon X.B. Zhao

Department of Geography and International Centre for China Development Studies, the University of Hong Kong, China,

sxzhao@hku.hk

Abstract

This paper represents an international, comparative, empirical study of the relationship between financial crises and real estate development – with a focus on Japan, Hong Kong, the U.S. and China. We look at the way nine variables related to real estate and financial sector development change during a crisis. We then discuss the ways real estate crises develop into financial crises (considering that most recent financial crises actually trace their origins to real estate bubbles). We summarise the similarities and differences in major crises around the world from 1980 to 2013, demonstrating the linkages between real estate bubbles and financial crises. We also look at China's current economic situation, and identify potential threats to country's economic development by comparing its current situation with other countries' historical experiences. We further explore the deep-seated underlying Chinese systemic causes and characteristics that explain why China's economic bubble has yet to burst. Historical heights in nine variables in particular, used to predict economic bubbles, foretell an upcoming burst in China's bubble economy. Our findings suggest that a financial crisis often emerges from a weak financial system which is too closely linked to the country's real estate sector. These linkages allow real estate crises to mushroom into financial crises. In turn, these financial crises balloon into macroeconomic crises. China's current situation is extremely alarming, though the country shows remarkable resilience to crisis. The government seems to possess the tools and capacity to avoid a hard landing. We particularly draw parallels between modern-day China and the pre-asset bubble period in Japan. These two experiences resemble each other in many ways – and such resemblance should sound a clear warning to China's policymakers.

How China's Financial Reforms May Shape its Growth and Development

Winston Mok

Private Investor, HongKong SAR, China, wnmok@yahoo.com

Abstract

China's state dominated banking system has impeded efficient economic growth through misallocation of capital. Good private companies were starved of capital while SOEs received ready and cheap credit for wasteful projects. In the aftermath of the RMB 4 trillion stimulus package, ensuing over-capacities highlighted the unsustainability of investment driven growth. China's leadership recently reoriented its economic policy from Keynesian to Schumpeterian. Partly in support of the new strategy, a range of financial reforms are taking place. Thus, as much as financial reforms drive growth, growth strategy shapes financial reforms.

In the multi-faceted transitional economy of China, its financial system is deeply embedded in its unique political economy. Any discussions of financial reforms can only be understood in the context of China's overall economic evolution. Importantly, China's capitalism is different from either the Anglo-Saxon liberal or the East Asian varieties. Thus, financial reforms can be effective – only if they go beyond narrow financial sector reforms – but extend to a broader set of institutional reforms.

Placing China's financial system in its historical and international context, the paper highlights some of its key problems. To address these problems, Beijing is embarking on a range of financial related reforms, including institutional reforms, fiscal reforms and financial sector reforms. The paper will explore how some of these reforms may shape the future economic map of China. It argues that, in a liberalized financial market, the strong regions may get stronger – resulting in more uneven development.

Key words:

Financial reform, Economic growth; China

Listing Companies and Transformation to Smart Manufacturing in Traditional Industrial Clusters of China: Rethinking The Dynamics of 'Jinjiang Model'

Yue Ding, Huasheng Zhu

School of Geography, Beijing Normal University, Beijing ,100875, P. R. China, dingyue678@hotmail.com

Abstract

Attracting foreign investment and then participating in global value chain division is a way for developing countries to integrate into the global economy. However, some studies have shown that this development model likely makes developing countries be locked in the low end of the value chain, and be "captured". From the perspective of global production network (GPN), this paper takes Jinjiang, a county-level city in Fujian province, as the study area to explore how local leading firms move up to a higher position in the value chain and promote local cluster upgrade. The authors conducted questionnaire surveys and semi-structured interviews with local leading firms, associated enterprises, government departments, and industry associations during April-June 2015. Preliminary finding shows that local leading firms have turned to build up their own brands to de-embed into global production networks (GPNs), and to go public to re-embed into GPNs. Those companies initiate innovation strategies to contribute to the ongoing transformation from mass production to smart manufacturing.

Key words:

Industrial clusters; GPN; industrial upgrading; listing companies; Jinjiang

Mapping Chinese Inter-city Cooperation Networks: A Study Based on Advanced Producer Service Firms in Initial Public Offerings

Wenkai Bi, Fenghua Pan

School of Geography, Beijing Normal University, Beijing, 100875, P.R. China, bwkrose@163.com

Abstract

Corporate networks, in particular, the intra-firm networks of advanced producer service (APS) have been widely used to measure urban networks in existing studies. Recently, the inter-firm relationships have been found to be increasingly important to describe urban linkages. This study provides an alternative strategy to build up inter-city networks based on inter-firm collaboration linkages during the process of initial public offering (IPO), a typical high-end financing practice, in which APS firms—including securities, law firms and accounting firms—cooperate with each other for firms aiming to get publicly listed. It maps the overall pattern of Chinese urban networks based on the inter-firm collaboration linkages. City-Dyad analysis is used to identify the most connected city pairs. In addition, it applies the social network analysis (SNA) to explore the urban system in China. The results show that Beijing, Shenzhen and Shanghai have attained strategically dominant positions within Chinese urban networks; Beijing-Shenzhen has become the most influential city-dyad with regards to urban linkages measured by APS collaboration relationships in the country. Particularly, Beijing holds an overwhelmingly dominant position over other cities than expected, while Shanghai is found to be less important than what was found in previous studies. The collaboration linkages between APS firms prove to be an effective way to explore the urban networks in China.

Key words:

advanced producer service; collaboration linkages; initial public offering; urban network; China

Regional Banking Market Structure and Its Determinants in China

Peng Baoyu, Wei Xueyan, Xie Guizhen

College of Environment and Planning, Henan University, Kaifeng 475000, P. R. China, pbyu@henu.edu.cn

Abstract

This paper is concerned with the spatial characteristics of Chinese banking market structure. Along with the market-oriented financial reform, China's banking concentration kept falling and regional banking market structure was showing significant differentiation. Based on Herfindahl-Hirschman Index(HHI) and ArcGIS spatial analysis methods, the paper empirically analysed the changes of regional banking structure in Chinese 31 provincial administrative regions in 2005-2014, as measured by bank assets, branches and employees. The results indicated HHI of banking structure in many provinces was falling, and the disparity of regional banking structure was enlarging. Different type of Banks had a quite different spatial distribution. Then the paper made an empirical study on the determinants of regional banking market structure by employing a panel data ranged from 2005 to 2014. Based on the above results and optimal financial structure theory, the authors finally put forward some proposals for different regions.

Key words:

regional banking market structure; banking market concentration ratio; determinants; optimal financial structure theory

Regulation of Local Government Debt in Case of Ukraine

Shevchenko O.V.

The National Institute for Strategic Studies, Kiev, 01030, Ukraine, olvalshev@mail.ru

Abstract

Ukraine experiences authority decentralization and enlargement of local communities now. Decentralization is accompanied by budget and fiscal decentralization. At the present moment, there are 159 joint communities which have more responsibilities (in practice) and more finance resources (in theory). On one hand, fiscal decentralization leads to the increase of financial efficiency of local communities, but it is true only for stable and strong communities. On the other hand, poor communities after their integration did not become more reach in financial and resource terms. Due to the Ukrainian laws, the central government has no responsibilities as to the local debts, thus, it constitutes the problem for local authority and citizens which have no possibilities to find resources for debt covering. The local authority can act in some ways to prevent the appearance and rising of local debts and to stabilize the local finance system. Firstly, it can use the outsourcing system for some services execution in big investment projects (in road construction, waste handling, and water supplying). Secondly, it can propose particular guarantees for investors of local communities, i.e. reduced amortization rate, lower tax rates, some privileges during the distribution of land for construction. And thirdly, it can optimize expenditures of local budgets according to the responsibilities and real financial resources. More attention should be paid for external borrowings – municipal loans, because these instruments in Ukraine are not widespread now. More authority means more obligations and thus, the ability of local bodies to operate finance influences the effectiveness of decentralization.

Key words:

local community; decentralization; local government debt

Relationship Between Effective and Comprehensive Financial Reporting with Good Governance and Financing Urban Infrastructure in Indian Context

tyagi, Nishank

Delhi, India, nishank.chartered@gmail.com

Abstract

The rapid urbanization in the country leads to urban mess in terms of the requirement of urban infrastructure and urban services against the demands of urban population. The urban infrastructure is grossly inadequate to meet the demand of the existing urban population and therefore, there is an urgent need for up-gradation and development of urban infrastructure and urban services.

Public disclosure laws have put more responsibilities on the urban bodies to become more accountable for management and use of public money which in turn able to make urban local bodies self-reliant and responsive. The preparation and presentation of financials for the stakeholders needs to be done in more comprehensive and simple manner so that any stakeholder may able to assess the position of their local body and compare it with other local bodies.

The paper is to assess the relationship between the quality of financial reporting and disclosures made by the local bodies for the stakeholders and more particularly, for the general public so as to review whether the financial statements are being able to bring any transparency in its affairs and to contribute for 'Good Governance'. In turn, how much good governance can contribute by bringing more money for the new urban infrastructure and urban services? The effective and comprehensive financial reporting by the local bodies will strengthen the good governance and would support them in generating more avenues and sources of funds for financing their urban development programs.

Key words:

Good Governance; Financial Reporting; Disclosures; Financing Urban Infrastructure

The Geography of Startup City in China: The Importance of Financial Supports

Bofei Yang, Fenghua Pan

School of Geography, Beijing Normal University, 100875, P. R. China, yangbofei327@126.com

Abstract

It has been widely observed that financial support is key to entrepreneurships in existing studies. The last decade has witnessed a tremendous growth of startups as well as the financial markets in China. Despite that the “mass entrepreneurship and innovation” has become a national agenda in recent years in China, few studies have investigated how financial development is related to entrepreneurships across cities in such a transitional economy. Drawing on a unique dataset of over 5000 publicly listed firms in the National Equities Exchange and Quotations in China, this study investigates the geography of startup cities and the role of finance in promoting startups across Chinese cities. It is found that there exists significant geographical concentration of startups and Beijing, Shanghai and Shenzhen are the most important startup cities in the country. Regression results show that better financial supports are significantly related to the number of startups of a city. In particular, the venture capital financing the better access to stock market financing are found to have positive effects on the growth and success of startups. There is strong evidence that more successful divestments of venture capital firms through initial public offerings, and particularly in Growth Enterprise Market, can significantly promote the entrepreneurships of a city.

Key words:

startups; entrepreneurship; venture capital; stock market; geography

The Making of Air Rights Market: Muddling Toward the Financialisation of Urban Space

Hung-Ying Chen

Durham University, hung-ying.chen@dur.ac.uk

Abstract

This paper sets an exploratory goal to assemble a variety of air rights-based urban policies that reflect the spatial processes of financialization and providing a topographical mapping of the 'air rights' sources, channels, and platform in the case of Taipei metropolitan area, Taiwan. The main inquiry of this paper is how do financial rationality and power intertwine within spatial practices. To simply put, it asks why the air rights are assembled? And by whom? Albeit diverse issues ranging from urban resilience, sustainability, to fiscal austerity are developing the action plans respectively, a shared motto is to formulate air rights-based instruments as the key to success risk management strategies. This paper casts doubt on such equation. It unbundles the equation through two parts: The first part explains the 'whys' through identifying the linkages between causes and strategies of risk management, and its spatial interfaces in Taipei and beyond through mapping the glocal resonances of these practices. The perspective of 'assembling air rights' attempts to juxtapose 'air rights' policies in the urban Taipei. It helps us spatializing financialization that underlies in the urban landscapes and urban dwellers' everyday experiences. The second part features on the derivation of spatial-financial instruments and the transforming process of trading platforms of air rights. Both entries help us to depict the variegated processes of capital de-territorialisation through the spatial embodiment of financialization. In this chapter, I argue that the assemblage of air rights calls into question the everyday politics of urban dwellers. The utilization of air rights does not only reflect upon the restructuring of the urban landscape but also, display state-promoted 'air rights based urban policy' as new forms of capital accumulation regimes.

Key word:

austerity; air rights; floor area bonus; liquidity; financialisation

The New Financial Technologies and The Recent Bancarization of Brazilian Population

Fabio Betioli Contel

University of São Paulo/Brazil, Department of Geography, fbcontel@gmail.com

Abstract

Since the 1990s various types of informational technical systems started to be used by Brazilian banks to the provision of financial services, such as ATMs, internet banking and mobile banking. These new technical systems brought more capillarity to banks action in the national space, and allowed a significant bancarization of the Brazilian population. The banking system that was more "analog" and presential, became more automatized and remotely assisted, through the intensive use of information techniques. According to the data of the Brazilian Federation of Banks (FEBRABAN, 2015), it is possible to identify the decrease of importance of the "traditional" channels of providing banking services (mainly bank branches), compared with contemporary/digital channels. In the period identified by the survey (2010-2014), the variation of the use of bank branches was negative (-2%), as well as the use of call-centers (-1%). The use of ATMs increased by 5%, the banking correspondents also grew by 6%, while the use of Points-of-sales (POS) increased by 14% and use of mobile banking, 17%. The most striking change was the use of internet banking, which grew 209% in the period. This new banking topology is one of the most important factors related to the increasing number of Brazilian population that have, at least, a bank account or/and a bank card.

The Production of a Legal-financial 'Nexus Space' in Chinese Financial Centres

Jones, A

City University London, London, UK, andrew.jones@city.ac.uk

Abstract

This paper brings together existing work within two substantial bodies of work within economic geography concerned respectively with the geographies of finance, and the role of advanced business service industries in emerging economies. In recent years, there has been a growing emphasis in research on finance and legal services on the importance of understanding the nature of economic practices within and between firms, as well as the entanglement of these practices between industry sectors. Similarly, research on professional service firms has increasingly questioned the validity of viewing specific business service activities in isolation. This paper develops these arguments by presenting research into the entwinement of the finance and legal service industries involved in foreign investment into China. Drawing on research into financial and legal service firms in leading Chinese financial centres, it argues that because of the specific nature of the jurisdictional and regulatory spaces that exist, these industries are well understood as a professional service nexus that exists across specific physical, economic, organizational and social spaces. It goes on to contend that this 'nexus' space sets the frame by which foreign investment in China occurs with legal-financial actors being key intermediaries and gatekeepers in relation to the nature of foreign economic activity in the Chinese economy.

The Spatial Agglomeration of Entrepreneurial Hedge Fund Firms in Hong Kong, Singapore and Beyond

James Lenzer Jr

University of Hong Kong, HongKong SAR, China, jim.lenzer@gmail.com

Abstract

International financial center (IFC) development is a hot topic in today's global arena at the political level and within academic circles as they can have a significant impact on global, national, regional and local economies. A review of the extant literature on this topic reveals that very little scholarly attention has been directed towards the agglomeration patterns that persist in IFCs, especially in regard to the physical location of different type of financial firms based on their commercial activities, ownership structure, size, origin and so forth. In addition, despite the advances in Geographical Information Systems (GIS) over recent decades, it has been minimally used as a methodological framework to investigate IFC phenomena.

This research specifically investigates the agglomeration patterns of entrepreneurial hedge fund firms (EHF) in Asia's leading IFCs, Hong Kong and Singapore, by incorporating descriptive spatial analysis and a GIS platform that utilizes nearest neighbor analysis and point density analysis. It also touches on preliminary findings on similar research undertaken using the same framework in regard to IFCs located in Europe and North America. The results suggest that EHF firms agglomerate in IFCs with the most intense clustering occurring within close proximity to the nucleus of the main financial district with secondary patterns emerging near its vicinity and along its perimeter. Conceptually, the empirical findings yield an IFC spatial agglomeration prototype to potentially explain the overall spatial patterns and their spatial linkages to large institutions, which can serve as a spearhead for future research on IFC development.

Urban Planning in China: Land as A Leverage for Debt and Growth

Thierry Theurillat, Hongyu Zhan, Jim Lenzer, Simon Zhao

Post-doctoral fellow & visiting research associate, LATTs, Paris-Est University, thierry.theurillat@unine.ch

Abstract

This article develops a more comprehensive framework of China's land driven-growth model that emphasizes the land revenues as a main incentive for urbanization and capital accumulation in China. Based on a strand of literature that highlighted the cost of urbanization carried by local governments and the necessity to get into debt via the use of local government financing vehicles, this article shows that from the start the land model is based on debt. In this, land is mortgaged to finance collective-purposes' projects and urban infrastructures which are the condition to the commodification of urban land. Three main mechanisms have been used to finance and produce urban infrastructure, involving three types of LGIV such as land development centers, state-owned companies and other private real estate companies in the case of a «contractor model». The local governments' debt through LGIV have been related with mainly the banking system, but also with the stock exchange (issuance of corporate bonds by SOEs) and increasingly with the less regulated non-banking system (some would say shadow banking), such as trust and fund finance organized at a national scale and such as various credit companies at a local scale. The banking and non-banking systems are however closely related since banks (branches of the 4 large state-owned banks and also more local/regional banks) function as «intermediaries or brokers» for LGIV to get loans from trusts or funds.

China; local government investment vehicle; urban infrastructures; land-driven model

Urban Rent and Urban Value: A Territorial Approach

Olivier Crevoisier and Delphine Guex

Professor of territorial economy, University of Neuchâtel Olivier.crevoisier@unine.ch

Abstract

Work, production and workers were the core of the industrial society: spatially, the workplaces governed the place of housing of the worker and his family as well as most of their lifestyle. The spatial division of labor induced a mobility of goods, and the mobility of people is usually restricted to the mobility of workers. In such society, territorial value depends on the local capacity to produce competitive products. The productivity in the export sector determines local incomes as well as the price of local rents.

The postindustrial society is characterized by the more and more important role of consumers and by the immaterial and symbolic stakes in the processes of value creation. In spatial terms, information and knowledge have become more mobile. We witness a de-coupling between the place and time of work on the one hand and the place and time of consumption on the other hand because of the increased mobility of customers: the place of work and the place where incomes are spent are dissociated.

In this paper, we suggest a territorial approach to economic value. The value is the result of two dimensions: a transactional dimension (mobility issue) and a spatial dimension (static issue). Actors are getting in touch with other actors through transactions, and through the getting in touch with other places. Places become stages and the various kinds of customers interact with those stages through transactions whether by moving to that place or by consuming products related to that place.

Key words:

value construction; urban development; rent; endogenous development

Where are Services Provided? Comparing the Financial and the Cultural Service

Networks of the Pearl River Delta

Xu Zhang

Department of Regional Planning and Management, Wuhan University of Technology, Wuhan, China, 430070,

x.zhang86@hotmail.com

Abstract

While financial and cultural service activities have both attracted increasing attention in urban studies, little work has been conducted to explore the geography of their service provision from a comparative perspective. This paper fills the gap by providing a first analysis of the financial and cultural service networks of the Pearl River Delta (PRD) region in China. Drawing on the method of the World City Network Analysis, the paper compares the location patterns and the inter-urban networks of firms from two financial (banking and insurance) and two culture-related (advertising and legal services) service sectors within and beyond the PRD. The finding demonstrates the distinct service geographies and networks created by firms from these two sectors, as well as the diverse location strategies adopted by firms with local, national and foreign origins. Information from in-depth interviews reveals that the differences between sectors and firms not only reflect their development histories and client orientations in the PRD, but also are shaped by China's unique regulatory environment and complex state-market relations.

financial services; cultural services; urban network; world cities; Pearl River Delta

Why do Domestic and Foreign Venture Capital Firms Have Different Spatial and Network Configurations in China: A Comparison Study

Wenkai Bi, Fenghua Pan

School of Geography, Beijing Normal University, Beijing, 100875, P.R. China, bwkrose@163.com

Abstract

Corporate networks, in particular, the intra-firm networks of advanced producer service (APS) have been widely used to measure urban networks in existing studies. Recently, the inter-firm relationships have been found to be increasingly important to describe urban linkages. This study provides an alternative strategy to build up inter-city networks based on inter-firm collaboration linkages during the process of initial public offering (IPO), a typical high-end financing practice, in which APS firms—including securities, law firms and accounting firms—cooperate with each other for firms aiming to get publicly listed. It maps the overall pattern of Chinese urban networks based on the inter-firm collaboration linkages. City-Dyad analysis is used to identify the most connected city pairs. In addition, it applies the social network analysis (SNA) to explore the urban system in China. The results show that Beijing, Shenzhen and Shanghai have attained strategically dominant positions within Chinese urban networks; Beijing-Shenzhen has become the most influential city-dyad with regards to urban linkages measured by APS collaboration relationships in the country. Particularly, Beijing holds an overwhelmingly dominant position over other cities than expected, while Shanghai is found to be less important than what was found in previous studies. The collaboration linkages between APS firms prove to be an effective way to explore the urban networks in China.

Key words:

advanced producer service; collaboration linkages; initial public offering; urban network; China

Agglomeration of Economic Activities in the Ecuadorian Amazon: Development vs. Pollution

Grefa J.¹, Yáñez D.¹, Tuci C.², Simón-Baile D.¹, Tierra A.¹

¹ Universidad de las Fuerzas Armadas "ESPE" – Departamento de Ciencias de la Tierra y la Construcción -Carrera de Ingeniería Geográfica y del Medio Ambiente, Quito, Ecuador, jlgrefa@espe.edu.ec

² Secretaría de ciencia y tecnología Ecuador SENESYCT

Abstract

In the Ecuadorian Amazon Region (RAE), the main economic activities that make it a strategic territory for the local and national economy are: agriculture, petroleum, mining, and wood exploitation that together compose the 70% of the national PIB. The region has a rich biodiversity and great potential for eco and bio technology. The objective of the present work was to assess and understand the potentiality and the possible scenarios of the RAE in terms of its economic system. For that, the classical central place theory was applied across a spatial and temporal analysis using GIS. The *Christaller and Lösch's* model was chosen, because the RAE is an isotropic space, perfect for the cartographic representation of the economy in the region. The study showed an urban area dependent from, agriculture and exploitation system, with dispersed population and a simple mobility system. Moreover, RAE shows a trend to concentration of the economic forces in its six province capitals; in particular, the development of the tertiary sector exhibited a clear agglomeration in urban centers in contrast with a dysfunctional distribution of the population. The influence of the new non-isotropic characteristics, for the geographical opening of RAE, allows the fine causes and future effects of a bad urban distribution related to its economic potential development. For these reasons, the reprogramming of roles and functions of RAE's urban system is key to a new vision for sustainable development of its economic system, its spatial distribution and its influence in the organization of the territory.

Key words:

economic development; economic; agglomeration; isotropic space; amazon region.

Green Bonds Implementation in India

Gandhi Shubham, Chauhan G.S.,

Student, MBA (Finance), K.J. Somaiya Institute of Management Studies and Research, Mumbai, India,

Shubhamgandhi14@gmail.com

Educational Officer, Central Region, University Grants Commission, Bhopal

Abstract

This paper aims to examine the potential of green bond implementation in India. It researched the green bond origination, history, definition and categories. India is now re-engineering the financial system by integrating sustainability, social responsibility and environmental factors. Outdoor air pollution in India has significant adverse impact on residents' health and the country's economic development. The main source of outdoor air pollution in India is from burning of coal. And to reduce the coal burning, there are three main solutions: increase renewable energy use, improve energy efficiency and enhance clean production. Case studies from the Yes Bank and CLP Wind farms on green bond issuance and their proceed use show evidential facts that green bonds could help air pollution mitigation by providing financial resources for energy efficiency and for leveraging more capital flow into the environmental area. Green bond implementation could potentially contribute two positives: a) green bonds could help solve the financial resource shortage for mitigating the air pollution problem, b) they can add to the environmental finance products' diversities. This paper finally explores the potential and the challenges of green bond issuance in India based on a key question: can green bonds help air pollution mitigation? By studying the green bond product (concept, feature, proceed use) and bond market, and analyzing the financial need for air pollution mitigation in India, we can conclude a positive answer to the question proposed. The paper applied literature review, case study and interview methods to pursue a conclusion.

Key words:

Green bond; Air pollution; Sustainable finance; Mitigation; Policy reforms

Spatial Pattern, Evolution and Formation Mechanism of Financial Inclusion in the Process of Urbanization: A Case Study of Guangdong.

Zhang GJ

School of Public Policy and Management, Guangdong University of Finance and Economics, Guangzhou ,510320, P.R. China, guojunz66@163.com

Abstract

Financial inclusion is conducive to promoting the rapid development of urbanization to meet the needs of financial services. However, the nature of the capital, despising the poor and currying favor with the rich, makes the spatial pattern of China's financial inclusion appear significant differences in the process of urbanization. This paper takes Guangdong province, China's first economic province with first-mover advantages disappearing, as a case study. from three dimensions of penetration, usage and effectiveness of financial services, we construct a comprehensive evaluation index system of provincial financial inclusion, measure the intercity financial inclusion from 2002 to 2014. Analyze the spatial pattern and its evolution of financial inclusion by integrating the ArcGIS spatial analysis mode. The research showed that:(1) While the disparity of intercity financial inclusion was low, and relatively stable, the financial inclusion was far higher in the Zhujiang River Delta than the surrounding areas; (2) The intercity financial inclusion showed significant spatial correlation and spatial gathering characteristics, with obvious spatial disparity between the Zhujiang River Delta and the surrounding areas and basically stable evolutionary pattern. (3) The evolution pattern of financial inclusion disparity was affected by many interacting factors such as the strategy of the financial provider, the objective demand of the real economy development, the guidance of government economic behavior, social culture and institutions etc.This article argues, to improve the financial inclusion, what is important is to speed up the regional economic development, reinforce governmental regulation, to develop micro-finance, and to cultivate good institutional and cultural environment.

Key words:

Adaptation Process and Migration of Korean in Guangdong, China

JEON Jiyoung, LIU Yungang.

School of Geography and Planning, Sun Yat-Sen University, Guangzhou, 510275, China,

jjiyoung0321@hotmail.com

Abstract

The development of transportation and communication made the whole world a globalization and many people leave hometowns and move to another countries to look for work, for studying abroad, for international marriage and so on. In other words, meaning of a border on a map seems to have blurred. Korean national residing abroad increases year by year, in particular according to the Ministry of Foreign Affairs in Republic of Korea in 2015, there are about 7,185,000 Korean people live in abroad, of which about 2,586,000 live in China. The purpose of this study is to clarify the process of the adaptation and migration of Korean national residing abroad in China by analyzing the economy activities of Korean and their community activities for living-based. The study area is Guangdong, the provincial capital Guangzhou and economic hub Shenzhen are among the most populous and important cities in China, also the number of Koreans living in Guangdong is growing. It's especially so in prosperous cities and special economic zones such as Zhuhai and Shenzhen, near Hong Kong. In addition, it has been 24 years since Korea established diplomatic ties with China. The earlier stage, Korean expatriates emigrated to China for their job, and the next stage was some Korean expatriates started their own business, self-employed Korean and Korean students studying in China. At present, there are many different regional variations on Korean national residing abroad in China, in particular most of these Korean have worked that clothing business in Guangzhou and electronics business in Shenzhen. In conclusion, adaptation processes and migration of Korean are highly diversified in Guangdong, and their economy activities and community activities relates to the regional economy in China.

Analysis the Influence Factors of Location Selection of Chinese Private Enterprises Direct Investment in the United States: Based on State Level

CHEN Ying, MA Bin

College of Tourism and Environment, Shaanxi Normal University, Xi'an 710062, P. R. China, chenying@snnu.edu.cn

Abstract

The United State of America has been the most important country that accept Chinese Outward Direct Investment since 2003 .China's private enterprises have been the main strength in this trend, accounted for 60% of the proportion and continuous growth in 10 years. However, research on their space distribution and the influence factors of location choice based on stated level is rare. In this paper, the spatial distribution characteristics of China's private enterprises direct investment in the United States (from 2003 to 2013years) are quantitatively analyzed by using EXCEL and Arc GIS. The results illustrate that the spatial framework that Chinese private enterprises investment in the U.S.A presents one point (Great Lakes regions) and two belts (the Pacific coast and the Atlantic coast) structure. The motivation of Chinese private enterprises direct investment in the U.S.A have a clear market –oriented .The influence of location choice factors are studied by applying method of grey correlation and the conclusion is: state GDP, China's import volume of trade as well as the number of patents in a state have the greatest impacts on state location selection of Chinese private enterprises direct investment in United States of America.

Bridging Company Locations – Transmigrants in Multinational Companies

Müller, Philip

University of Osnabrück, Institute of Geography, Seminarstr. 19 a/b, 49074 Osnabrück, Germany. philip.mueller@uni-osnabrueck.de

Abstract

Since the 1980's research on highly-skilled international migration gained importance, as economic globalization increases. The literature on transnationalism indicates that migration isn't a single, unidirectional phenomena, but builds – on the basis of increased mobility – transnational spaces between countries of origin and destination. Until now research in the field of economic geography has been mainly focused on emigrant entrepreneurs and their ethnic networks, which operate as boundary spanner, circulating product and market knowledge across national borders. Even though some studies show the value of migrant's personal abilities (intercultural competences, multilingualism) and social networks (intra-firm, extra-firm) at the firm level, their role in multinational companies are poorly investigated. The presentation will set out first a conceptual framework of transmigrants in Multinational Companies, which combines migration theory with approaches of economic geography. Second the framework will be illustrated with findings of empirical fieldwork in German affiliates in the automobile sector in Turkey. Based on qualitative interviews the study demonstrates the relevance of transmigrants in reproducing and transferring knowledge across space as well as in managing conflicts between headquarters and subsidiaries.

Key words:

transnational migration; multinational enterprise; knowledge transfer

High and Low Tide of Foreign Direct Investment in the Retail Sector: The Case of Turkey

Inka Gersch¹, Martin Franz²

¹University of Osnabrück, Institute of Geography, Osnabrück, Germany, inka.gersch@uni-osnabrueck.de

²University of Osnabrück, Institute of Geography, Osnabrück, Germany

Abstract

To categorize the global expansion of Transnational Corporations (TNC) in the food retail sector the picture of waves is often used. However, this simplified metaphor obscures that there are many cases in which TNCs withdraw from the target countries after some years of unsuccessful attempts to reach leadership in the respective market. The case study on the development of the Turkish grocery retail sector will be used to show how not only the expansion of TNCs in an emerging economy can influence the domestic agri-food networks but also their withdrawal can result in new dynamics. The article gives deeper insights into the current market developments in of Turkey: TNCs are incrementally leaving the Turkish market and rapidly growing domestic retail companies are buying the Turkish subsidiaries of the TNCs. The domestic supermarket chains seem to have successfully adapted the TNCs` processes but adjusted them to local habits and conditions on the distribution and the supply site. Local embeddedness seems to be the crucial advantages in the strongly consolidating market environment after customers and suppliers have grown up to the requirements of modern retail.

Key words:

retail sector, foreign direct investment

The Growth of Korean Transnational Corporations and the Role of Expatriates in Vietnam

Koo, Y

Seoul National University, Seoul, Korea, yangmi@snu.ac.kr

Abstract

This study aims to explore the role of expatriates and immigrants in the development of Korean transnational corporations in Vietnam. After the normalization of the diplomatic relations between Korea and Vietnam in 1992, Korea's investment to Vietnam have increased drastically as the connection between them progressed positively. At the beginning of the 2000s, the investment to Vietnam from global transnational corporations has augmented. Many Korean firms also invested in Vietnam, which included not only TNCs but also small and medium-sized enterprises. Early expatriates and immigrants of those firms have played important roles in the formation of formal and informal networks for business activities. These individual actors have been intermediates of different culture and institutional settings between the home and host country while communicating with their corporate headquarters on a daily basis. Their knowledge and network has been important especially in the communist and bureaucratic community of Vietnam. This study will focus on expatriation as channels of information, mediators of knowledge transfer and business pioneers.

Key words:

foreign direct investment; knowledge transfer; Korean transnational corporations; expatriates; immigrants; Vietnam

Abstract

The rescaling of territories is evolving at a pace faster than ever, accelerated by globalisation and processes of regional integration and/or reconfiguration. While some of the geographical scales gain momentum (such as the global, the regional or the local ones), others seem to go into the background (such as the national one losing the forefront). European Union countries of Central and Eastern Europe are a good place for observing these changes, as they are encouraged - and sometimes forced by circumstances - to burn stages in rescaling territories and foster good governance at the appropriate levels. Taking these into consideration our study presents an overview of the challenges the concerned countries are facing in building good governance at local levels. Special attention is paid to the Romanian case, on issues such as the role of local financial autonomy, new forms of horizontal cooperation at local level and the challenges facing public-private partnership. Furthermore, the role of European financial instruments and that of the national programmes and development plans are being presented and discussed.

Key words:

Local governance; post-socialist countries; public-private partnership; financial autonomy; local cooperation; European financial instruments

Labor Force Participation in Mongolia: Cohort Analysis

Byambasuren Lkhagvadorj

University of the Humanities, Mongolia, Byambasuren_lkh@humanities.mn

Abstract

This study is to find the effect of the birth year of workers on the Mongolian working force, using the data from Work force survey of 2002 to 2012. To do so, I have split the sample into groups regarding the date of birth and cohort.

As social welfare schemes and monetary payments are present in Mongolia, the study looks at its effect on labor force participation. To do so people who have received payment is considered from 9 work force surveys and a variable of the amount of monetary payment is introduced and a probit model is estimated using the Maximum Likelihood¹ approach.

From the cohort analysis the young generation tend to be less active confirming the effect of birth year. The probit model shows that monetary payments or welfare payments have a negative effect on labor force participation.

Key words:

Labor force participation, labor supply, cohort, social welfare, monetary payment

Population Migration and Its Social-Economic Impact of China in Future Climate Change

Yi Sun, Zheng Wang

Chinese Academy of Sciences, China, sunyi@casipm.ac.cn

Abstract

In this paper, the Potential Agriculture Production index is introduced to estimate the scale of population migration caused by climate change by analyzing the change of Potential Agriculture Production index. We found that, for the changes of Potential Agriculture Production caused by climate change, circum-Bohai-Sea region, mature industrialized region and the industrializing region as the main regions of emigrating population will face a severe labor shortage. In addition, this paper also constructs a multi-regional CGE model, and analyzes the impacts caused by the change of population distribution pattern on regional economy, regional gap and the residents' welfare. The results show that the economic growth rate of the population immigrating regions has been accelerated; correspondingly, the economic growth rate of the emigrating population region has been reduced, and the greater the population migration scale, the greater the impact on the economy; population migration expands the inner-regional gap, and narrows the inter-regional gap, however the overall regional gap is somewhat reduced.

Key words:

Climate Change; Population Migration; Potential Agricultural Productivity; Regional Gap; Household Welfare

The Theoretical and Applied Research on Location Decisions on Direct Foreign Investment in West China from the Perspective of Industrial Development

Ji Yahui, Ji Xuan, Cao Xiguang

College of Economics, Northwest Normal University, jiyahui_lzk@163.com

Abstract

Since 1990s, the study on direct foreign investment by developing countries has been attracting more and more attention internationally. China's direct foreign investment after China's financial crisis is particularly of interest to many scholars. With China's economic growth and "Belt and Road" strategy proposed, domestic scholars begin to direct their attention to West China's direct foreign investment. Based on relevant theories of direct foreign investment, this research makes an empirical investigation into the current situation and motives of the direct foreign investment by western regions, and analyzes the factors affecting the location decisions on direct foreign investment, aiming to provide from the perspective of industrial development the decision-making basis for direct foreign investment in West China

Chronology of Paleo Climatic Changes in Caspian Sea Region of Last 150 Ka Based on New OSL-Dating

Kurbanov R.^{2,1}, Yanina T.², Svitoch A.A.², Tkach N.^{1,2}, Sychev N.^{1,2}

Institute of Geography, Russian Academy of Science, 199017, Russia, Moscow, roger.kurbanov@gmail.com

Abstract

Chronology of the Late Pleistocene events of the Caspian Sea is one of the most interesting problems of stratigraphy and paleogeography of this large region. With no consensus view on age limits of number of transgressive and regressive stages of the Caspian Sea, rate of sea level change and its impact on the ancient society, the application of modern techniques allow to create a new reliable chronology for Caspian Late Quaternary.

The reference region for stratigraphy and paleogeography of the Caspian Sea is Lower Volga, with series of sections one of which, Srednyaya Akhtuba was chosen for dating of samples of marine and continental loess-soil deposits.

The study based on the method of optically stimulated luminescence using standard Riso OSL-reader accomplished at The Nordic Luminescence Dating Lab. Samples from the middle of the alluvial sands of Akhtuba stage corresponds to MIS-3 (first estimate - 37-40 thousand years), while the age of loess sediments in the bottom of the sequences, selected between the two upper soil horizons 1 and 2, corresponds to 81- 92 thousand years (MIS 5b-c).

The first estimates of the absolute age of Early Khvalynian deposits confirmed a series of radiocarbon dates, which had previously been highly controversial because of their large spread - from 25 to 10 thousand years (Arslanov, 2015). These age-assessment provide a basis for a significant "rejuvenation" of Early Khvalynian transgression of the Caspian Sea, the maximum stage of which, according to new data should take place at the end of the Late Pleistocene.

Early Warning Assessment of Ecological Security in the Three Gorges Reservoir Area

Dongjie GUAN

Chongqing Jiaotong University, Chongqing, 400074, P. R. China, guandongjie_2000@163.com

Abstract

According to the characteristics of Three Gorges reservoir ecosystem in Chongqing of China, the system dynamics models of economy, population, and environmental subsystems were established. Then, main parameters and their mutual feedback relationships were determined; meanwhile, historical value and simulation value were compared to verify this model. Moreover, 3 scenarios containing sustainable development, resource exhaustion and natural state were designed to simulate and determine the thresholds for the indices of ecological security; then, these thresholds were applied into the assessment indices of ecological security for obtaining the comprehensive score of ecological security of Three Gorges reservoir in Chongqing. The results demonstrate that the ecological security in the reservoir area has been emerging an increasing trend, but still in a relatively sensitive period.

Effect of Clear-Cutting On CO₂ and H₂O Exchange between Land Surface and the Atmosphere: Experimental and Modeling Study

Olchev A.V., Mukhartova J.V., Molchanov A.G., Levashova N.T., Avilov V.K., Mamkin V.V., Kurbatova J.A.
A.N. Severtsov Institute of Ecology and Evolution of RAS, Moscow, Russian Federation, aoltche@gmail.com

Abstract

The main goal of the study is to describe the possible impact of clear-cutting on H₂O and CO₂, as key greenhouse gases, between a land surface and the atmosphere. This is experimental and modeling study that integrates intensive field campaigns to derive the spatial and temporal variability of H₂O and CO₂ fluxes, and development and application of local scale process-based turbulent transfer models to quantify atmospheric fluxes.

To describe the difference in the H₂O and CO₂ exchange between anthropogenically changed and undisturbed forest the eddy covariance measurements was applied. To describe the spatial heterogeneity of soil respiration within the clear-cut area and surrounding forest the chamber method was used. During the field measurements it was shown the large variability of soil CO₂ emission within the clear-cut area and its strong dependence on environmental parameters. It was found that the plots with various damage degrees of the upper soil horizon, and non-damaged soil covered with a litter and felling remains are characterized by different respiration rates and different dependences on environmental factors.

To assess the influence of clear cuttings on turbulent transfer of H₂O and CO₂ between land surface and the atmosphere the numerical experiments using the developed two- and three-dimensional transfer models were conducted. Modeling results showed that a clear-cutting leads to strong disturbance of vertical and horizontal exchange within the clear-cut area and surrounding forest.

The study was supported by grant of the Russian Science Foundation (14-14-00956).

Evaluation of Heavy Metal Pollution in Surface Sediments of the Red River in Vietnam

Nguyen Thi Thu Hien^{1,2}, Zhang Weiguo¹

¹State Key Laboratory of Estuarine and Coastal Research, East China Normal University, ²Institute of Geography, Vietnam Academy of Science and Technology, Hanoi, Vietnam

Correspondence to: Zhang Weiguo, wgzhang@sklec.ecnu.edu.cn

Abstract

Heavy metals are non-degradable in the environment and most of them have toxic effects on living organism. The content of heavy metal is an important index to evaluate the quality of river. In this study, fifty surface sediment samples were obtained from the river bank along the main channel from upstream down to the coast and subaqueous delta of the Red River in Vietnam. Two groups of heavy metals (Cr, V, Cu, Cd, Pb, Ni and Zn) can be distinguished in the Red River sediments. (1) Cr and V show strong correlations with particle size, Al, Fe, Mn and TOC, indicating the enrichments of these metals in the fine fraction with abundant Fe/Mn oxides, clay minerals and organic carbon. It suggests that particle size is one of the major factors influencing heavy metal concentrations, and these metals are derived primarily from natural sources such as weathering processes. (2) Cu, Cd, Pb, Ni and Zn do not show significant correlations with particle size. They show no obvious trends along the river. At some sites in the upstream, they show extreme high values. It suggests that these heavy metals are most probable influenced by anthropogenic input. According to the enrichment factor (EF), it is found that heavy metals pollution is present in the Red River sediments from upstream down to river mouth. Heavy metal pollution is most serious in the upstream. Here, Cd, Cu and Pb are the dominant pollutants, with their values reaching a moderate to high degree of pollution.

heavy metal pollution, river sediment, the Red River

Heavy Metal Pollution of History Cultural Layers in Kaifeng City, Henan Province, China

Chen YF, Ma JH, Gu L, Liu DX Institute of Natural Resources and Environment, Henan University, Kaifeng, 475004, P. R. China;

Collaborative Innovation Center on Yellow River Civilization of Henan Province, Kaifeng, 475001, P. R. China, mjh@henu.edu.cn

Abstract

Several dynasty palaces in Kaifeng city were buried underground by flood sediments of the Yellow River, forming the unique spectacle of “city overlapping city”. Different dynasty grounds meaning different cultural layers had various heavy metal concentrations and pollution degrees. In view of this, four 25-long drill cores in Kaifeng city (ZK_{sz} , ZK_{yz} , ZK_{ml} and ZK_{jm}) with a division of 861 samples in total were obtained. The buried cultural layers including the Warring States (WS), Songjin (SJ), Early Ming (EM), Mid Ming (MM), Late Ming (LM) and Qing Dynasty (QD) of ZK_{sz} , ZK_{yz} and ZK_{jm} , as well as WS, Mid Song, Late Song, Jin, Yuan Dynasty, EM, MM and LM of ZK_{ml} , were selected from the flood sediments. Then their heavy metal pollution degrees were assessed using pollution load index (*PLI*). Because of the location near the political, economic and cultural centers in different dynasties with more anthropogenic activities, the heavy metal pollution degrees of ZK_{sz} and ZK_{yz} were generally more serious than ZK_{ml} and ZK_{jm} . ZK_{sz} and ZK_{yz} had the same average *PLI* value of 1.5, indicating light pollution. The cultural layers of ZK_{ml} were not polluted except MM layer, while average *PLI* value of ZK_{jm} was 1.21 of light pollution. The WS, SJ, EM, MM, and QD layers were lightly polluted, with their respective average *PLI* values of 1.21, 1.84, 1.38, 1.27, 0.98 and 1.15, while LM layer was not polluted due to flood of Yellow River.

Historical Trends of Anthropogenic Metals in Eastern Tibetan Plateau as Reconstructed From Alpine Lake Sediments over the Last Century

Haijian Bing, Yanhong Wu, Jun Zhou, Rui Li, Jipeng Wang

The Key Laboratory of Mountain Surface Processes and Ecological Regulation, Institute of Mountain Hazards and Environment, Chinese Academy of Sciences, Chengdu, 610041, P.R. China, yhwu@imde.ac.cn

Abstract

Reconstructing trace metal historical trends are essential for better understanding anthropogenic impact on remote alpine ecosystems. We present results from an alpine lake sediment from the Eastern Tibetan Plateau to decipher the accumulation history of cadmium (Cd), lead (Pb) and zinc (Zn) over last century, from the preindustrial to the modern period. Cadmium, Pb and Zn in the sediment of Caohaizi Lake clearly suffered from atmospheric deposition, and the mining and smelting were regarded as the main anthropogenic sources. Since the mid-1990s, over 80% of trace metals were quantified from anthropogenic emissions. The temporal trends of anthropogenic metal fluxes showed that the contamination history of Pb was earlier than that of Cd and Zn, which was in agreement with the regional Pb emission history, but lagged behind the Pb decline in Europe and North America. The fluxes of anthropogenic Cd and Zn were relatively constant until the 1980s, increased sharply between the 1980s and the mid-1990s, and then kept the high values. The anthropogenic fluxes of Pb showed a marked rise around 1950, and increased sharply in the 1980s. In the mid-1990s, this flux reached the peak, and then decreased gradually. The Pb deposition flux at present in comparison with other lake records in the areas of Tibetan Plateau further demonstrated that trace metals in the Caihaozi Lake region were probably from Southwest China and South Asia. Economic development in these regions still puts pressure on the remote alpine ecosystems, and thus the impact of trace metals merits more attention.

Fang.Gu@biologie.uni-goettingen.de

² Earth Science and Resources Department, China University of Geoscience (Beijing), 100083 China

Abstract

Marine sediment cores GeoB2107-3 and GeoB6211-1 located in the South Atlantic Ocean off coastal of southern Brazil has been studied by dinoflagellate cysts and pollen to reconstruct the sea-surface currents circulation of the South Atlantic Ocean and the vegetation evolution during the last glacial and Holocene period. The aim is to understand the interactions between ocean changes and climate dynamics on the continent, and to discover how changes in the marine parameters such as seasurface currents, sea-surface temperature influence the local and global climate. Living organicwalled dinoflagellates and vegetation are very sensitive and greatly influenced by the environment change, so they are good indicators to reconstruct the physical water conditions and past vegetation changes.

The results show that during glacial times, grassland was dominant vegetation on the South American continent, indicating cold and dry climate, and dinoflagellate cysts data indicate that the Malvinas Current had a markedly stronger influence during the same period, particular during the last glacial maximum period. During Holocene period, the expansion of trees and tree ferns indicate humid and warm climate condition and together shows the increase of the sea-surface temperature in the South Atlantic Ocean. The similar climate background indicates that changes in the South Atlantic Ocean had a strong influence on the vegetation dynamics in South American continent during last glacial and Holocene times.

Late Quaternary History of Manyh Depression and Its Role in Evolution of Caspian and Black Sea.

Kurbanov R., Yanina T., Tkach N., Sychev N., Garova E.

Institute of Geography, Russian Academy of Science, 199017, Russia, Moscow, roger.kurbanov@gmail.com

Abstract

Manyh strait, that connected Caspian and Black Sea in Pleistocene, is unique paleogeographic event. Manyh depression (that was the place of strait's occurrence) extends sublatitudinally from western coast of Caspian Sea to north-eastern part of Azov Sea. Pleistocene of Manyh strait have important stratigraphic and paleogeographic significance in Ponto-Caspian history, because only here can be found direct relationship of Caspian and Black sea deposits. It is basement for correlation of deposits and events and creation of unified stratigraphic scheme of region. It is accumulated great amount of books and articles about this region.

Complex geomorphological and paleogeographical field work were carried out in central part of depression with mapping of territory and drilling (8 boreholes, max. depth 12 m) and 2 cores (depth of each appx. 45 m).

First results allowed to reconstruct preliminary scheme of paleogeographic events in the central part of the Manyh depression in the Late Pleistocene. The beginning of Late Pleistocene (MIS 5e) was characterized by deep penetration of ingressive bay of Karangat interglacial transgression of the Black Sea into the Manyh depression. Its water was quite high (at least 18-20 ‰) salinity that allow the existence of huge amount of Black Sea shells' complex. Transition to a glacial era (MIS 5d-a) led to the gradual retreat of Karangat bay from Manyh depression to the Black Sea basin.

Preliminary results show complex geological history of Manyh depression in Late Pleistocene. Research was supported by Russian Scientific Foundation, project 14-17-00705.

Mid- And Late-Holocene Vegetation History, Climate and Human Impact in the Forest-Steppe Ecotone of European Russia

Novenko E.Yu.

M.V. Lomonosov Moscow State University, Faculty of Geography, Moscow, Russia, e-mail: lenanov@mail.ru

Abstract

Appropriate management of contemporary environments requires knowledge of their long-term history. We use palaeoecological data to explore how contemporary forest-steppe environments have been shaped by climate change and human impacts through the Holocene using the western Mid-Russian Upland as a case-study. Our paper presents new reconstructions of Mid- and Late Holocene climate, vegetation dynamics and local environmental change based on pollen, plant macrofossil and testate amoeba records from a site at Selikhovo (Mid-Russian Upland, Russia). Eutrophic fen vegetation dominated by *Phragmites australis* developed around 6800 cal yr BP and has been resilient to episodes of local burning and variable input of mineral material through the Holocene. New and previously-published data show that the boundary between broadleaf forest and steppe occupied a similar position to present during the period 7000–4800 cal yr BP, despite a warmer and drier climate, but shifted to the south following climate cooling and an increase in precipitation from 4800–2500 cal yr BP. A subsequent decline in woodland cover was caused by both climate change and human impacts, with human activity becoming increasingly significant over the last two millennia. Prior to major human disturbance (about 1700 cal yr BP) the landscape was dominated by mixed broadleaf-pine forests with some spruce covering about 60% of the study area. Our results emphasize the variability of steppe-forest habitats over long time periods and the need to consider human impacts and climate change when setting targets for habitat conservation.

The study was supported by RFBR, project №14-05-00550-a

Multiproxy Survey of Landscape Change Following Early Settlement at KÚÐÁ, Northeastern Iceland

Natasha ROY, Najat BHIRY, James WOOLLETT, Guillaume HAEMMERLI, Véronique FORBES and Reinhard PIENITZ

Centre d'études nordiques and Département de géographie, Université Laval, Québec, Canada,
natasha.roy.1@ulaval.ca)

Abstract

As part of the research program of the *Archaeology of Settlement and Abandonment of Svalbard project*, a series of peat core and monoliths were collected from localities of an abandoned farm sites in the Svalbarðstunga region of northeastern of Iceland. Although the climate is considered the main factor of environmental changes in the North Atlantic islands over the last millennium, in Iceland, it seems that humans have caused the opening of landscape due to over-use of wood resources. But to what extent, the Norse were able to benefit from their environment to adapt to climate change? To answer this question, a multi-proxy paleoecological study (pollen, diatoms and macrofossil) was jointly undertaken the excavation of an ancient farmhouse, Kúðá, located in Svalbarðstunga. According to our data, ecological changes take place well before human occupation. In fact, Birch woodlands had virtually disappeared from inland areas by 5910 cal yr BP at Kúðá. By the time of the initial Norse settlement of the region, *Betula* sp. was scarce and appears to have taken the form of shrubs and isolated trees. The initial settlement of Kúðá appears to have occurred at circa AD 960, as indicated by the occurrence of charcoal, ecofacts and synanthropic insects in off-sites contexts. This result implies a relatively early and rapid spread of Norse colonisation to the inland zones of northeastern Iceland. Human settlement and the expansion of sheep grazing during and following the MWP promoted the spread of sedge species and facilitated the introduction of new plants.

Key words:

paleoecology; northeastern Iceland; climate changes; environmental changes; human impact.

Obtaining an Improved Chronology for the Kostenki Palaeolithic Sites (Russia).Sychev N.V.^{1,4}, Murray A.S.², Thomson K.J.³, Kurbanov R.N.⁴, Tkach N.T.^{1,4}¹ Moscow State University, Moscow, 119991, Russia Federation, nikita.sychev@gmail.com² Aarhus University, Aarhus, 8000, Denmark³ Technical University of Denmark, Kongens Lyngby, 2800, Denmark⁴ Institute of Geography, Russian Academy of Science, Moscow, 119017, Russian Federation**Abstract**

The Kostenki group of palaeolithic sites are unique on the East European Plain, both in terms of density and variety. We have undertaken an extremely detailed study of geological features. A combination of different geochronological methods have been used to make reliable chronology for these reconstructions. A large number of radiocarbon ages are available, based on charcoal or bone derived from the deepest cultural horizon. Unfortunately, recent studies have shown that dating, based on these materials can underestimate the age by up to 70% (Higman, 2011). Ages were also obtained by tephrochronology (Giaccioni, 2006) of an ash-rich horizon present in this section (41-38.5 ka). In addition, palaeomagnetic studies indicated the presence of the Lashamp excursion (40 ka). Unfortunately, investigation into the usefulness of infra-red luminescence signals from feldspar showed that this signal is unstable. Because of inconsistencies, which are often between data from various geochronological methods, during field work in 2015 a series of samples was collected for quartz for Optically Stimulated Luminescence dating. We obtained 7 dates, using sand-sized quartz and a SAR protocol in the section Kostenki-14, supporting the suggestion that the ages obtained by radiocarbon for the cultural horizon underestimate the real age. Elsewhere in the section, age inversion and other analyses of properties and characteristics of the material indicate a likely slope deposit genesis. We have begun to use single grain quartz dating; the first results are expected in the near future, which will help to advance a reliable geochronology for the Kostenki complex.

Optical and Radiocarbon Dating Of Wulanmulun Site in Ordos and Its Implications

ZHANG J.-F.¹, HOU Y.-M.², HUANG W.-W.², YANG Z.-M.³, ZHOU L.-P.¹

¹ College of Urban and Environmental Sciences, Peking University, Beijing 100871, China, jfzhang@pku.edu.cn

² Key Laboratory of Vertebrate Evolution and Human Origins of CAS, Institute of Vertebrate Paleontology and Paleoanthropology, CAS, Beijing 100044, China

³ Ordos Antiquity and Archaeology Institute, Ordos 017010, China

Abstract

Now radiocarbon and luminescence techniques are most widely used dating tools for Paleolithic sites. Especially for the luminescence (including thermoluminescence (TL) and optically stimulated luminescence (OSL) dating method, its application in determining the sites >40 ka (close to or beyond the upper limit of the radiocarbon method) or without organic material has been increased significantly. Recently, we have used the two methods to date the Wulanmulun site in Ordos, China. Here we compare the dating results of the ages obtained from the two methods and assess their reliability. The radiocarbon ages (33-41 cal. ka BP) obtained for the cultural deposits from the site by the conventional ABA method are much less than the OSL dates (50-65 ka), but the radiocarbon ages obtained from the new ABOX method are in agreement with the OSL dates. This implies that radiocarbon ages obtained from the conventional ABA method are much underestimated. The implication of the radiocarbon age underestimation of old charcoal samples from the site is that the radiocarbon age of such old charcoal samples from some archaeological sites in China may need to be re-evaluated or re-dated. Combined with pollen and fauna data, the paleoenvironment of the site during occupation is reconstructed.

Wulanmulun Paleolithic site; Radiocarbon dating; Luminescence dating; Paleoenvironment

Paleo-Fire History Revealed By Charcoal Records in Daxing'an Mountain of China

Xu Xin; Li Yiyin

College of Urban and Environmental Sciences, Peking University, Beijing, 100871, P. R. China, lyy@urban.pku.edu.cn

Abstract

Charcoal records from two high resolution peat profiles in Daxing'an Mountain revealed the paleo-fire history over the past 1700 years. CharAnalysis is used to identify the fire events and to calculate mean fire frequency (MFF) and fire return intervals (FRI). Results showed that these two sites have different fire trends. 12 fire events were identified in TQ peat profile over the past 1700 years with 81 years of mean FRIs, and MFF was 3.5 fire events per 500 years. Three periods of high frequent fire were 1250~1650 year BP, 900~1000 year BP and 50~150 year BP, respectively. 12 fire events were identified in PG peat profile over the past 1300 years with 87 years of mean FRIs, and MFF was 4.3 fire events per 500 years. Four periods of high frequently fire were 1150~1250 year BP, 850~950 year BP, 450~750 year BP and 50~150 year BP, respectively. Fire activity not only responded to regional climate changes, but also presented local characteristics. The different results of two sites may relate to biomass burning, geomorphic conditions and human impacts.

³Key Laboratory for Environmental and Urban Sciences, School of Urban Planning & Design, Peking University, Shenzhen 518055, Guangdong, China

Abstract

In over thousand years of development history of the Taihu Lake Basin, the water resources systems play a core role in human-nature relationship. The construction and maintenance of water resources systems embody human beings' adaptation to the brooky area and development of the resources. By comparing the natural environment changes in the Taihu Lake Basin with the layout and use of water resources systems, this paper concludes the changing characteristics and the inherent law of human-nature relationship. The results show that:

1. Artificial water resources systems have inner instability and interacts with outer destructive factors. The water resources systems mostly have negative impact on natural environment.
2. Mature water resources systems contribute much in the beginning of the construction. But they gradually become the technology lock-in of social development, which brings hindrance to the reform of economic structure.
3. Through research on Contend with each other of hydrology and water resources systems and deep understanding of the human-nature relationship, this paper reevaluates the advantages and disadvantages of grand water resources engineering systems.

Key words:

Take Climate, Land-Use and Social Economy into Estimation of Carbon Budget

Li T, Li J, Qin K, Yang X, Liu J

Tourism and environmental college of Shaanxi Normal University, Shaanxi, 710000, P.R.China, lijing@snnu.edu.cn

Abstract

Global climate change is increasingly recognized as major threat to ecological balance. Mapping and valuing ecosystem services by considering natural and social factors synthetically is an inevitable trend of ecosystem services research. This paper set up 24 scenarios comprised of land-use, climate change, population growth and carbon emission. Then we quantified carbon sequestration (aboveground and underground) under varies climate and land-use scenarios by using the model of Carnegie-Ames-Stanford Approach and carbon cycling, and quantified carbon emission caused by human activities through spatiality of population density. We also assessed the economic value of carbon deficits and profits under different carbon price and discount rate scenarios by using Net Present Value. Our results show that the whole Guanzhong-Tianshui economic region shows a significant carbon deficit: carbon source range from 5.66×10^9 t to 1.84×10^{10} t while carbon emission caused by human activities range from 0.51×10^8 t to 0.64×10^8 t. The value of carbon deficits range from 2.02×10^9 RMB to 1.12×10^{10} RMB. Deforestation, urban sprawl, population explosion and excessive carbon consumption are the main challenges to the balance of carbon source and sink. Carbon price and discount rate can be effective tool to control excess carbon consumption. The result of this study provides a reference for harmonious and sustainable development of study area.

A study of the Chong Zhen Drought event from pollen records in the western suburbs of Kaifeng city, China

Liu DX, Ma JH, Gu L, Chen YF

Institute of Natural Resources and Environment, Henan University, Kaifeng, 475004, P. R. China;

Collaborative Innovation Center on Yellow River Civilization of Henan Province, Kaifeng, 475001, P. R. China,

mjh@henu.edu.cn

Abstract

A 9-m long core was obtained from the western suburbs of Kaifeng City. Detailed pollen analysis, along with AMS¹⁴C dating, grain size and historical documents revealed an extreme drought event in the Late Ming Dynasty in North China. Sediments below the surface of 0-1.8 m interval of the core are the Yellow River warping layer in the mid-20th century and the recent accumulation layer. In the years AD 1642-1644 and AD 1841, the Yellow River flood sediments deposited below the surface of 4-7.8 m interval and 1.8-4 m interval respectively. It turns out that the 5-7.8 m interval's palynological assemblage proved the Chongzhen Drought event. During the time when the 6.7-7.8 m interval was deposited, the percentage of arboreal pollen dramatically decreased, while Chenopodiaceae pollen increased remarkably, drought indicator species such as *Nitraria* and *Ephedra* pollen also appeared. The percentage of arboreal pollen increased, however, particularly that of *Pinus* pollen when the 5-6.7 m interval was deposited. Probably because decrease of vegetation coverage and increase of precipitation variability in the middle reaches of the Yellow River during the drought, which led to more pollen of the topsoil into the Yellow River and transport with water. Large arboreal pollen were carried by the flood to the downstream due to suspension ability and deposited in the water slowly or nearly stagnation. In addition, the surface of the Yellow River flooding sedimentary would also accept local pollen, regional pollen and extra-regional pollen, especially *Pinus* pollen under the influence of the wind.

About the Quality of Cultivated Land Spatial Distribution Features and Application

Results

Chenxin Deng, Dingguo Ma

Jiangxi Normal University, Nanchang, 330022, P. R. China, dgm7799@163.com

Abstract

Cultivated land is an important agricultural resource, and its quality fit and unfit quality directly concerns the development of the national economy. Scientific and reasonable cultivated land protection partition into the key of quality assurance. In this paper, it cultivated land quality, available land and the economic index of spatial variable, the local spatial autocorrelation analysis combined with moran scatterplot chart, and determined by global autocorrelation index weights matrix partial correlation analysis, to explore it cultivated land use spatial agglomeration level and output level rule, and it the cultivated land protection partition scheme is put forward.

Research shows that: it there was a spatial distribution rule of cultivated land quality index, index and the natural spatial correlation between the use of such as, economy, etc. HH, LL region take the form of "group", no obvious concentration, LH, HL area, scattered. Cultivated land protection partition scheme based on partial autocorrelation results, give full consideration to the natural conditions of cultivated land, using conditions and economic conditions. Join the concept of "space" at the same time, expand the partition basis, more scientific and precise, provide reference for it the cultivated land protection.

Analysis and Countermeasures of the Change of Atmospheric Environmental Quality in Urban Area of Chongqing City

Wang Pengfei

South West University, China, 978026120@qq.com

Abstract

In order to get the variation trend of annual seasons of atmospheric environmental quality in Chongqing, this article analyses by using the environmental monitoring data of five function areas provided by environmental protection agency of Chongqing from 2007 to 2014. According to partial materials of environmental protection bureau in Chongqing from 2007 to 2014, we analyse the trend of atmospheric pollution, the differences of geography, the corresponding changing of all kinds of air quality indexes over time. We can draw the conclusions that summer is the best season considering to air quality in Chongqing. Quite the opposite, the most heavily polluted season of a year is winter. There are a peak and a valley in a year. Though the analysis of meteorological conditions of Chongqing, it can be found the correlations between air environment quality and meteorological conditions like temperature, precipitation, sunlight. So, it can provide environmental evidences for the development of five function areas in Chongqing.

Dating Method of Young Oxbow Lake Sediments Based on the Analysis of the ^{210}Pb and Environmental Events: Example from Oxbow Lakes in Jingjiang Section of the Yangtze River.

WANG Feng¹, JIA Tiefei²

1. State Key Laboratory of Estuarine and Coastal Research, East China Normal University, Shanghai, 200062, China;

2. Department of Geography, Shanghai Normal University, Shanghai 200234, China

Abstract

High-resolution and highly precise dating methods for recent lake sediments (last 50-100 years) are essential for quantitative paleoclimate research. Three oxbow lakes, i.e. Tiane'zhou (TE core, 85cm), Zhongzhouzi (ZZ-2 core, 89cm) and Chiba (CB-1 core, 91cm) in Jingjiang section of the Yangtze River were selected for understanding the dating method of young oxbow lake sediments. Dating of the ^{210}Pb and characteristics of the grain size and frequency dependent susceptibility were analyzed. After combining local chronicles with environmental events, such as river/lake transformation events and flood events, which indicated by sediment characteristics, a new dating method with three steps was recommended: (i) According to the $^{210}\text{Pb}_{\text{ex}}$ specific activity changes, the average deposition rate was calculated by constant initial concentration(CIC), and the date range of the sediments was determined. The results in the cores of TE, ZZ-2 and CB-1 are 0.88cm/a, 1.26cm/a and 1.49cm/a. (ii) According to the average deposition rate and the diagnostic characteristics of the grain size and frequency dependent susceptibility, the possible sediment depth of the river/lake transformation event layer was found. Then deposition rate was checked by segments. The average deposition rate of layer B (lake sediments) and layer A (fluvial sediments) were obtained respectively before and after river/lake transformation events. In TE core the average deposition rate of layer B is 0.63cm/a and layer A is 1.07cm/a. In ZZ-2 core the average deposition rate of layer B is 0.89cm/a and layer A is 1.85cm/a. (iii) Cross-validation with historical flood events of known age. According to the flood events, age model was checked again. Eventually, the chronology sequence was established. Although this method is lack of absolute age of the experimental data, the result from the double check of environmental events is closer to real ages of oxbow lake sediments, and the method improved the accuracy of using the ^{210}Pb chronology analysis on short time scale in lake sediments.

Flood Damage Deduction Method and its Application on the Yellow River Alluvial Strata of the Kaifeng City

Lei GU

Institute of Nature Resource and Environment, Henan University, China, hedagulei1981@henu.edu.cn

Abstract

With too much of silt, the inundation of the Yellow River buried Kaifeng city in several dynasties, forming the unique spectacle “city overlap city”. The extent of damage created by the Yellow River flood to Kaifeng city is closely related with the flood intensity. In order to deduct the relationship between the Yellow River and the decline of Kaifeng city in turn, it is vital to propose the deduction method for flood risk index of alluvial strata. Three drill cores (ZK_{sz} 、 ZK_{yz} 、 ZK_{ml}) were selected in urban area of Kaifeng City and 1 controlled core (ZK_{jm}) in the suburbs, and each core depth is 25 m. On the basis of sediments grain size analysis and sedimentary cycle division, extracted 4 indicators, which induced the information of the flood intensity from the sedimentary strata, to describe the flood risk index of the Yellow River quantitatively. They are the ratio of sand and clay ($RSASH$), deposition thickness(H), corresponded grain-size value (Φ) of the intersection point of bedload line and saltation line and the slopes of the saltation line(S) in the grain size probability cumulative curve. Before the total flood risk index(FI) calculation, we carried on the standardization of the data range and assigned weight index to the indicators. On the basis of “Mean \pm Standard Deviation”, the FI were divided into 4 grades, which are weak ($FI < 0.199$), moderate ($0.29 \leq FI < 0.363$), strong ($0.363 \leq FI < 0.528$) and very strong ($0.528 \leq FI$). Combined with the historical documents, deduced the relationship between the Yellow River and the decline of Kaifeng city in turn.

Formation Age and Stratigraphical Cycles in the Pearl River Delta during the Quaternary

Fu Shuqing, Li Pingri

Guangdong Open Laboratory of Geospatial Information Technology and Application, Guangzhou Institute of Geography, Guangzhou, 510070, P. R. China, fsq519@163.com

Abstract

According to the common knowledge, only Late Pleistocene sediments, deposited since about 40 ka B.P., can be found in the Quaternary System of the Pearl River Delta (PRD) plain. And one or two weathering layers, which indicating depositional discontinuity and large-scale sea-level change, were sandwiched in the Late Pleistocene series. There is no relatively continuous stratum since the Mid-Pleistocene has been reported in the PRD plain, except a few ages of 130~550 ka B.P. dated by thermoluminescence (TL) or Optically Stimulated Luminescence (OSL) techniques. In recent study to a boring-core section from the west PRD plain, six red or brown weathering layers were found for the first time, showing at least six times paleoenvironmental change cycles. Through the preliminary age dating and correlation with other records from coastal areas of Southern China, the formation of this sediment profile may date back to the early stage of Late Pleistocene or even Mid-Pleistocene. It should be the first profile found so far in the PRD plain with the most stratigraphic cycles and the longest time span. As further study is performing and if the result is confirmed, it will create a milestone for both the PRD plain's formation history and the frequency of regressive and transgressive during Quaternary in PRD.

Formation and Environmental Significance of Late Quaternary Calcareous Root Tubes in the Deserts of the Alashan Plateau, Northwest China

Zhuolun Li*, Nai'ang Wang, Hongyi Cheng, Kai Ning, Liqiang Zhao

College of Earth and Environmental Sciences, Center for Climatic Change and Hydrologic Cycle in Arid Region, Lanzhou University, Lanzhou 730000, China, lizhuolunlzl@163.com

Abstract

Calcareous root tubes are widely distributed across the Badain Jaran Desert and the Tengger Desert of the Alashan Plateau in northwest China. However, the reliability of their ^{14}C dating results and their environmental significance remain unclear. In this study, the conventional ^{14}C ages of 31 calcareous root tube samples and one aquatic mollusk shell sample, which were all collected from the Badain Jaran Desert and the Tengger Desert, were measured. The results reveal that nine of the 14 calcareous root tube samples from the Badain Jaran Desert were from Marine Isotope Stage (MIS) 3, while two samples were from MIS 2; the other three samples were dated to the mid-Holocene, one of which is consistent with the aquatic mollusk shell sample collected from the shoreline of Zhunzhahanjilin Lake in the Badain Jaran Desert. Moreover, the 17 calcareous root tube samples from the Tengger Desert were all dated to the mid- and late-Holocene, most of which were from the mid-Holocene. The results demonstrate that calcareous root tubes can be used as ^{14}C dating materials and that the accuracy of their ^{14}C dating depends on the time scale. The dating results were reliable at the millennial scale. However, the reliability of the ages from MIS 3a is lower than that of the Holocene ages, though the ages were reliable in tens of thousands years. Based on the statistical analysis, the overwhelming majority of calcareous root tubes collected from the deserts of the Alashan Plateau were formed during MIS 3a and the mid-Holocene. The concentrated emergence of calcareous root tubes in phases implies that they were formed during periods of relatively humid environments in desert areas, arid regions. Moreover, the results indicate that the effectivity of the moisture level probably affects the formation of calcareous root tubes, and the presence of calcareous root tubes indicates the occurrence of periods of relatively humid environments in the study area.

Hydrological Reconstruction of Holocene Palaeofloods and Historical Floods in the Longmen Gorge of the Yihe River

HU Guiming, HUANG Chunchang, ZHOU Yali, PANG Jiangli, ZHA Xiaochun, GUO Yongqiang, ZHANG Yuzhu, ZHAO Xueru

College of Tourism and Environmental Sciences, Shaanxi Normal University, Xi'an 710062, China, 1017211611@qq.com

Abstract

In this study, palaeoflood hydrological and sedimentary investigations were carried out in the Yiluohe River basin. Typical loess- soil stratigraphy of the Holocene period was identified at the Longmenxia (LMX) site in the Yihe River basin. Based on the analysis of sedimentary characteristics, magnetic susceptibility and particle-size distribution, the five flood slackwater deposits were identified and interbedded into the loess- soil stratigraphy. By the stratigraphic correlation and the optically stimulated luminescence method (OSL), the four episodes of flooding events occurred at 3100-3000 a BP, 1800-1700 a BP, 770-610 a BP and 420-340 a BP, respectively, namely at the end of the mid-Holocene Climatic Optimum and the beginning of the late Holocene, the dynasties of Eastern Han to Western Jin, Song-Yuan and the Ming- Qing, respectively. These flooding events might include the AD223 and 1761 flooding events and they well corresponded to the phase of the Holocene monsoonal shift, climatic abrupt change and climatic decline. The flooding peak stages were estimated with the elevations and the depositional depths of the SWD. According to the flood peak stages and hydraulic parameters, the peak discharges were reconstructed at 14100-15800 m³/s with the slope-area method. The reconstructed peak discharges of the flooding events are much more than those of the gauged modern floods at the Longmenxia gauge station in the middle reach of the Yihe.

Interaction between the human and the environment of the Jaydar Dam Lake (southwest Iran)

Mojtaba yamani, Siyamack sharafi

Professor of Geomorphology, faculty of geography, university of Tehran, Iran, myamani@ut.ac.ir

PhD of geomorphology and researcher at Iranian academic center for education, culture and research, Lorestan uin, Iran, sharafi.s64@gmail.com

Abstract

The occurrence of Seymareh landslides, has caused the Kashkan River to be blocked and as a result Jaydar Dam Lake was formed. This blocking, as a result of the landslide, has changed the path of the Kashkan River, and thus it has caused the lake to sustain for a long period of time. Thermo luminescence dating of the lake sediments shows that the Seymareh landslides in 5000 ± 85000 years ago, has caused the formation of the Jaydar Lake in this time zone and the lake has been also evacuated about 700 ± 5000 years ago. Therefore, the dam lake has been existence for about 80,000 years. Moreover, the current research indicates that the settlement patterns of archaeological sites of the Epipaleolithic to Islamic period in connection with the formation of the lake. Due to the long-term sustainability of the lake (85000 to 5000 years ago), Archaeological sites in the Epipaleolithic to the early Iron Age formed in the lake area, and changes in the heights of the sites locations indicate the fluctuations in the lake water level. Furthermore, the results show that during the Neolithic period the lake's water level was in its highest level. In the early historical period, the lake has been completely discharged, and then drying the sediment has led to a proper living conditions for people in the area.

Labrador Current Fluctuation during the Last Glacial Cycle

Longjiang Mao, Piper David, Saint-Ange Francky, Andrews John, Marshall Nicole

Nanjing University of Information Sciences & Technology, China, mlj1214@nuist.edu.cn

Abstract

Records from cores 2011031-059 and 2011031-062 (hereafter 59 and 62) have been used to reconstruct changes in the strength of the Labrador Current in northern Flemish Pass during the last glacial cycle. Grain size proxies for current speed, planktonic foramiferal $\delta^{18}\text{O}$, X-ray diffraction analysis for dolomite and calcite, and abundance of ice-rafted detritus (IRD) have been determined. An age model back to MIS 5e is based on recognition of eleven Heinrich events from total dolomite and calcite, confirmed by O-isotope stratigraphy and radiocarbon dates. A straight-line relationship between sortable silt mean size ($\overline{\text{SS}}$) and percent of sortable silt (SS %) and non-relationship between $\overline{\text{SS}}$ and IRD ($>500\ \mu\text{m}$) indicate well-sorted sediments in cores 59 and 62, which can be used to reconstruct the paleocurrent intensity. Intensified current velocity occurs in MIS 5c, 5a, 3 and 1, so that warmer periods show faster currents, probably through the Irminger Current component of the North Atlantic sub-polar gyre. Low values of $\delta^{18}\text{O}$, SS% and $\overline{\text{SS}}$ correspond to most H events, suggesting a slowdown in the Labrador Current, followed by a rapid return to strong circulation. In some cases current strength recovery lagged slightly after the H events. Correlation with deep-water current strength records in the Iceland Basin show a broad correlation on a multimillennial scale with Labrador Current variations. As our study is on a shallow sediment drift formed by the Labrador Current, one of the surface currents of the North Atlantic sub-polar gyre, it provides new evidence for a tight connection between surface current strength fluctuation and the strength of the deep thermohaline circulation.

Landscape Conditions of Nature Use in Ancient Taman

Nizovtsev V.A.¹, Erman N.M.²

¹ Lomonosov Moscow State University, Moscow, 119991, Russian Federation, nizov2118@yandex.ru

² S.I. Vavilov Institute for the History of Science and Technology of the Russian Academy of Sciences, Moscow, Russian Federation

Abstract

The landscape structure of the Taman Peninsula is dominated by seaside hilly-ridge type of terrain - with adherent mud volcanoes, as well as all the settlements of the peninsula. In ancient times, the peninsula was an archipelago of islands occupied by residential lands, steppe and in part forest landscape complexes. Economic development has affected virtually the entire territory of the islands - all the land suitable for cultivation in this period have been delimited. The lands free from cultivation were overgrown with bushes slopes of high coasts, steep slopes of ridges and peaks of mud volcanoes. An extensive network of ravines served as pastures and hunting grounds. Perhaps this was the first experience in Russia of the landscape contour agriculture. Detailed landscape and historical studies in the vicinity of the village Sennoy (the region of ancient cities Phanagoria and Kepoi) have let establish the dependence of the development of the settlement structure of the ancient time on the local landscape conditions. Cities, villages and farm lands were naturally incorporated into the landscape structure, which allowed to engage in complex economy that provided for own needs in the required amount of food supply. The most developed were the landscape complexes of low sloped plains and valleys of synclinal origin, elongated in the latitudinal direction. They are characterized by the presence of fertile black soils, the proximity of springs and groundwater outlets or allowing artificial reservoirs, as well as protection from adverse weather effects. These were the valleys in ancient times that were the most populated and cultivated. (The work is performed under project №14-05-00618 of the Russian Foundation for Basic Research)

Abstract

Yangtze River, the world's third largest river, derived from the glacier melt water of Tanggula Mountains on the Qinghai-Tibet Plateau and input into the East China Sea. The water volume of Yangtze River is influenced greatly by the climate dynamics. Two cores NT01 and CZ1-1, located oppositely of the Yangtze River alluvial plain, under the influence of the north subtropical, warm temperate monsoon climate and influenced frequently by the East China Sea. Due to the special regional location and tectonic characteristics, the study area is very sensitive to the climate change, grain size and pollen analysis were applied to the sediment samples of the two cores. From the grain size and pollen analysis, the past deposition mode and past vegetation can be inferred. The results also show that during the MIS-5 and the late MIS-3 phases of deep sea oxygen isotope records, transgression events happened frequently in the study area.

Reconstucting Wetland Dynamics in Northeastern Iceland in Response to Climatic Change and Human Impacts over the Last 1000 Years

Isabelle Cyr-Parent, Najat Bhiry, Reinhard Pienitz, James Woollett

University Laval and Centre northern studies, icyrparent@gmail.com

Abstract

The Svalbarð farm was established in the 10th century and is located in the Svalbarð Valley, which formed on the Pistilfjörður shelf in northeastern Iceland. It is the main farm in the valley and is still active in the present day. Over the last 1000 years, several secondary farms were also established in the valley that had direct and indirect relationships with the Svalbarð farm and were then abandoned. Most of these farms were abandoned at different times, but the reasons for their abandonment remain unclear. Since the 1990s, archaeological studies have been conducted in this valley, but little paleo-environmental research has been done.

The aim of this project is to reconstruct the paleo-environmental conditions of Svalbarð Valley in response to recent climate change and human activity. Specific objective were 1) to date the established peatlands in Svalbarð Valley and reconstruct their temporal evolution; 2) to document lake evolution in the vicinity of a satellite farm; 3) to estimate the impacts of known climatic periods (Little Ice Age and Medieval Climate Optimum) on the evolution of peatlands and lakes; and 4) to identify anthropogenic signatures present in lacustrine sediments. The following hypothesis was tested: the wetlands located on the northeastern part of the island were affected by climate and anthropogenic activities more than other coastal regions of Iceland because of their location.

Analyses of peat and lacustrine sediment (including plant macrofossils, diatoms and geochemistry) were used to document the environmental changes that occurred over the last 1000 years.

Key words:

Paleo-environment; climate changes; human impacts; plant macrofossils; diatoms; geochemistry; Iceland

Starch Granule Evidence for Broad-spectrum subsistence economy in Neolithic south Yangtze River Basin, China

Abstract

The Dawangling archaeological site is an important Neolithic age site located on the south bank of the Yangtze River. One stone knife and one stone muller were excavated from the Neolithic age layer and examined through starch residue analysis to reconstruct the subsistence economy pattern. More than 165 starch granules and a few bordered pits of tracheid were retrieved from the residues of these stone tools and were identified as *Coix* spp., food legumes, *Quercus* spp., lotus root, a type of underground storage organs, *Palmae*, and other unidentified plant residues. Ancient starch granule evidence indicates that the Neolithic-age society in the Dawangling site developed a broad-spectrum subsistence economy that included not only cereals, beans, and oak but also some plants that required much water and warm weather, such as lotus root and *Palmae*. The results of the present work offer direct evidence to confirm the existence of a Broad-spectrum subsistence economy system in Yangtze River Basin.

Studies of Landscapes-zonal Features of the Formation of Anthropogenic Landscape Genesis in Russia

Nizovtsev V.A.

Lomonosov Moscow State University, Moscow, 119991, Russian Federation, nizov2118@yandex.ru

Abstract

The economic human activity as a factor of differentiation and development of landscapes on the territory of Russia began to appear together with the development of the producing type of economy since the Aeneolithic-Bronze Age in the southern steppe regions and since the Bronze Age in the forest areas. The first natural and anthropogenic landscapes, comprising from 4 to 7 natural and economic systems, formed in the early Bronze Age in the steppe foothills of the North Caucasus. Their economy was based on a combination of hoe agriculture and house cattle breeding in valley and near-valley landscapes. On the landscape-zonal basis maps were drawn showing the spread of basic material cultures of the initial stages of formation of the producing economy of the forest, forest-steppe and steppe zones of Russia. Landscape-zonal features of the periodization of the process of the initial economic development, nature use and anthropogenic landscape genesis of these zones for the entire territory of Russia were determined. For key areas paleo-reconstruction of landscape features of the living conditions of settlers in different material cultures and retro- reconstruction of natural and economic systems of the initial stages of anthropogenic landscape genesis were made. This allowed to reveal differences in intra-landscape structure of the main zonal types of forest, forest steppe and steppe landscapes, as well as the associated features of formation of the settlement structure and the formation of the producing economy. Detailed studies in the Central Russia have also shown that the most effective economic relations developed on the landscape borders.(The work is performed under project №14-05-00618 of the Russian Foundation for Basic Research)

Abstract

A significant number of submarine canyons and gullies was mapped on the continental shelf and uppermost slope of Rhodes Island (SE Aegean, Greece) using multibeam echo-sounder and side-scan sonar. The major canyons are located in Faliraki, Afantou, Kolympia, Tsampika, Archangelos, Kalathos/Vlichia, Gennadi, Lachania, Plymmiri, to the northwest of Cape Prassonisi, Cape Karavolas, Kremasti and to the northwest of City of Rhodes. The heads of these canyons were found in a variety of water depths ranging from a few meters in the vicinity of shoreline to tens of meters on the outer shelf or upper slope. With the exception of the Karavolas and Cape Prassonisi single – channel canyons, the other display a dendritic pattern. The one third of the shelf-incising canyons that is not associated with rivers, the blind (headless) canyons that are confined below shelf-break, and the upper-slope gullies have been probably generated by down-slope erosive mass flows. In some cases, extended “rippled scour depressions” (RSDs) are in immediate vicinity or directly connected with heads of canyons and outer-shelf gullies, constituting a geomorphological continuum; this implies that RSDs may be directly associated with in canyons and gullies generation. RSDs have been identified at water depths of 5 m to 70 m, and consist of coarse sediments sorted in ripple marks or sandwaves with a relatively long wavelength (0.5-1 m).

Key words:

Submarine canyons; rippled scour depressions; continental shelf; Rhodes Island; Aegean Sea

The Sequence Stratigraphy and Sedimentary Evolution of the Late Quaternary in the Lingdingyang Estuary, South China

shicuicui1985@163.com

Abstract

The sedimentary characteristics, chronostratigraphy, paleobiological strata and geochemistry of the Pearl River estuary in South China were analyzed based on 22 bore holes. The results showed that the formation could be divided into two sections by the spotted clay layer which was the marker of erosion. These two sections correspond to the two transgressions since the Late Pleistocene. From bottom to top, the Late Pleistocene sedimentary sequences were made up of fluvial facies, flood plain facies and paleo-estuary facies, while the Holocene sequences were described as littoral facies, estuary facies, and delta facies. And six stages of evolution within two layers of transgressions can be divided since the Late Pleistocene: (1) The estuary presented all land areas during 65-32 ka BP; (2) When the first transgression event occurred during 32-22 ka BP, sea level began to show an upward trend, a paleo-estuary formed; (3) The top general of transgressive layer was exposed and suffered weathering, forming a unique "piebald" clay; (4) During 12-8.5 ka BP, the second transgression event led to a sharp rise in sea level, the sea-land interaction sedimentation formed; (5) The basic outline of the present estuary was formed when the second transgression reached maximum at about 6 ka BP. At this period, the global low-temperature event occurred at about 5.3 cal. ka BP was recognized through the rich sedimentary record of ancient climate information; (6) After 5 ka BP, the evolution of estuary is no longer a simple natural process, but rather a common remodeling process accomplished by nature and humans.

Abstract

The main goal of the study is to describe the influence of spatial vegetation and relief heterogeneity on turbulent CO₂ fluxes between land surface and the atmosphere using a process-based two-dimensional turbulent exchange model. As a key area for this modeling study the hilly territory situated at the southern boundary of broadleaf forest community of European Russia (Tula region) was selected. The vegetation cover in the region is mainly represented by mosaic of agricultural areas, grasslands, mires and groves that makes adequate determining the local and regional CO₂ fluxes using experimental approaches very difficult.

Applied two-dimensional model is based on solution of the Navier–Stokes and continuity equations using the *one-and-a-half order* closure scheme in the appropriate coordinate system taking into account the shape of the surface. The vegetation is modeled as a continuous permeable medium resisting an air flow. For description of plant canopy photosynthesis and respiration an aggregated approach based on model of Ball et al (1987) in Leuning modification (1990, 1995), the Beer-Lambert equation for the description of solar radiation penetration within a plant canopy (Monsi, Saeki 1953), and also an algorithm describing the response of stomatal conductance of leaves to incoming photosynthetically active radiation is used.

To quantify the possible effect of relief and vegetation heterogeneity on CO₂ fluxes several transects crossing the study area were chosen. For each transect the CO₂ fluxes were calculated for actual vegetation structure and for scenario assuming total deforestation.

The modeling results showed a significant impact of both relief and vegetation heterogeneity on CO₂ fluxes. (This study was supported by the Russian Science Foundation (Grant 14-14-00956).)

Climate Change and Geo-Diversification in Agriculture: A Spatial Empirical Study

Dr. Paramjit Singh

Associate Professor, Department of Geography, Meerut College, Meerut, Uttar Pradesh,
India, singh_param1975@yahoo.co.in

Abstract

This is a fact that climatic change may be considered as one of the important phenomenon not only at national level but also at global level which affects environmental challenges with implication of various factors such as agricultural production, irrigation, drinking water supply, education, health, urbanization, etc. The overriding complexity of the problem is attributed to its deeper global ramifications on a vast range of issues impacting the very survival of life on earth. There are varieties of perceptions regarding the exact size and consequences of climate change. It is stated that risks emanating from climate change are indeed profound, which call for urgent mitigation. Thus, there is an imperative need to take urgent and strong measures in the interest of calibrating and appropriate response to meet the emerging challenges of climate change.

Though climate change poses a variety of challenges, this proposed study would specifically focus on the issues viz: agriculture climate change, crop diversification, cropping pattern, production in agriculture etc. which have immense relevance from the perspective of developing countries like India.

In this paper, an attempt will be made to examine main characteristics of geo-diversification in agriculture and its related factors like production and productivity in agriculture, cropping pattern, use of seed and fertilizers, and sources of irrigation etc. in western Uttar Pradesh of India. Further, it will be sought to study the impact of climatic change on agriculture sector and to analyse problems, difficulties, hurdles related to climatic change and diversification in agriculture.

Dynamic of Fractional Vegetation Coverage of Cold Temperature Zone in Greater Khingan Mountains

LI XD, ZHANG HY

Northeast Normal University, Jilin, 130026, P.R. China, lixd414@nenu.edu.cn

Abstract

In the process of future climate change, the increase of temperature in high latitude region is largely greater than the increase in low latitude region. Boreal forest (Taiga forest) widely distribute in northern Greater Khingan Mountain, where is unique cold temperature zone in China. At continental scale, this region is the southernmost cold temperature forest of eastern Eurasia. The forest of Greater Khingan Mountain is very sensitive for climatic changes which can be as an indicator or indirect proofs on biology or ecology. Fractional Vegetation coverage (FVC) characterize the dense degree of vegetation and the size of the area for photosynthesis. The index get different response to climate change according to the different temporal and spatial scales. This study setups a mechanism of spectrum response for typical forest vegetation in cold temperature zone of China with using the field investigation and measuring; Integration of high spatial resolution Landsat Thematic Mapper (TM) images and high temporal resolution Moderate Resolution Imaging Spectroradiometer (MODIS) images, combined with Multi-source and multi-model, quantitatively inverse FVC, at sub-pixel scale. The results show that the linear mixture model (LMM) used TM images provide higher classification accuracy than dimidiate pixel model based on MODIS images. Utilize the FVC result obtained by LMM to correct the values of NDVI_{soil} and NDVI_{veg} obtained by dimidiate pixel model. This method can obviously increase the accuracy of the results obtained from dimidiate pixel model, which can make this method more feasible and recommended in practice. Special emphasis has hence been put on the evaluation of potentials and advantages when coupling Landsat TM and MODIS images to inverse long temporal series. Based on the resulting maps, the spatio-temporal patterns of vegetation cover changes according to climate change are explained.

Effects of Climate Changes on Net Ecosystem Exchange of CO₂ and Evapotranspiration of a Tropical Rain and Temperate Spruce Forest Ecosystems

Olchev A.

A.N. Severtsov Institute of Ecology and Evolution of RAS, Moscow, Russian Federation, aoltche@gmail.com

Abstract

The possible changes of Net Ecosystem Exchange (NEE) of CO₂, Gross Primary Production (GPP) and evapotranspiration (E) of tropical rain and temperate spruce forests due to projected future climate change are estimated using a process-based model, climate and vegetation change scenarios. For modeling experiments two representative forest ecosystems were selected: the tropical rain forest situated in Indonesia close to equator, and temperate spruce forest situated in European Russia at the southern boundary of the boreal forest zone. For model projections several scenarios assuming future changes of climate conditions, species composition, plant biomass and nutrient supply were applied. Available climate change scenarios for the 21st century assume a double increase of CO₂ concentration in the atmosphere, an increase of the air temperature and precipitation and, at the same time, a decrease of incoming solar radiation and water vapor deficit. Scenarios of vegetation change assume possible increase due to global warming of the fraction of deciduous trees species in the boreal forest community and corresponding reduction of spruce tree proportion.

Results of modeling experiments show that under sufficient nutrient supply the climate changes can lead to increase of GPP and NEE, and as well as to small E decrease. Reduction of nutrient supply can result in decrease of GPP and E. In particular the decrease of nutrient supply of about 20% can completely offset the possible GPP increase due to projected increases of temperature and CO₂ concentration in the air. (The study was supported by grant of the Russian Science Foundation (14-14-00956).)

Possible Link of Net Primary Productivity with Climate Change at Multiple Temporal Scale Based on EMD Method---A Case Study of Carst Area in West Guangxi, China

Huiyu Liu, Mingyang Zhang, Zhenshan Lin

Key Laboratory of Virtual Geographic Environment (Nanjing Normal University), Ministry of Education, Nanjing, 210023, China

State Key Laboratory Cultivation Base of Geographical Environment Evolution (Jiangsu Province), Nanjing, 210023, China

Jiangsu Center for Collaborative Innovation in Geographical Information Resource Development and Application, Nanjing, 210023, China

Abstract

Net primary productivity is known as an important index for evaluating the carbon cycling of ecosystem, which is affected by climate change. Previous studies focused on the effects of the mean state of climate on NPP, and few focused on the effects of climate variability. In this paper, as a case study of Carst area in West Guangxi, the effects of the mean climate change and change variability on NPP were studied based on EMD method. The results showed that: 1) Monthly changes of NPP show positive correlation with monthly changes of temperature and precipitation. However, the anomalies of NPP have no significant relation with the Anomalies of temperature and precipitation. 2) with EMD method, monthly mean NPP anomalies can be completely decomposed into three significant quasi-period oscillations on various time scales including 1-, 2.7-, 5-year time scales as well as a trend. Moreover, 1-year time scale oscillation is the most significant. 3) at 1-year time scale, no significant relation exists between anomalies of NPP and climate anomalies; at 2.7-year time scale, a significant relation exist between NPP anomalies and temperature anomalies; at 5-year time scale, a significant relation exist between NPP anomalies and precipitation anomalies.

Response of Key Species *Abies Fargesii* to Climate Change from Different Elevations at Timberline of Qinling Mountains

QIN Jin¹, BAI Hongying¹, ZHOU Qi², WANG Jun¹, LI Shuheng¹, GAN Zhuoting², BAO Guang²

1. College of urban and environment science, Northwest University, Xi'an 710127, China, jearkeens@stumail.nwu.edu.cn.

2. College of geography and environment science, Baoji University of arts and sciences, Baoji 721000, China.

Abstract

The impact of climate change on vegetation in Qinling mountainous area has already been authenticated by numerous investigations, nevertheless, as the major ridge of Qinling Mountains as well as national natural conservation reserve, the ecology response of Niubeiliang sub-alpine vegetation to climate change has not yet gained enough public attention. In this study, in accordance with the method of dendrochronology, response analysis was carried out and multiple linear regression model was established respectively, so as to contrast *Abies fargesii* 's response pattern to climate change from different elevations. The results have showed that, with the rise of the elevation, the sensitivity of tree growth to climate factors are higher than that of the low elevation, however, the consistency of the series and the amount of the climate information showed the tendency of first decreased and then increased. In general, the arboreal radial growth is more sensitive to temperature than to precipitation, tree-ring width indices' correlation coefficients with temperature is increasing with the rise of elevation; Whereas, the chronology of high elevation presents a significant positive correlation with the air temperature of August in current year, while the chronology of middle elevation presents a significant positive correlation with the average precipitation from March to April in current year. The variation trend of contrast significantly factors revealed that climate change could promote growth season of *Abies fargesii* in advance, but growth dynamic of trees varies at different elevations. The results above showed that at the timberline of the study area, *Abies fargesii* growth from different altitudes may had different response mechanisms to global change.

Simulating the Impacts of Changes in Climate and Land Use on Runoff and Sediment in the Yanhe River Watershed

Chen D, Li J

Tourism and environmental college of Shaanxi Normal University, Shaanxi, 710000, P. R. China, lijing@snnu.edu.cn

Abstract

Natural ecosystems provide human society with crucial products and services. Humans are enhancing the production of some services at the expense of others continuously with rapid increase of population and overexploitation of natural resources. The YanHe river watershed is one of the most serious soil erosion part of the Loess Plateau and policies of ecological protection such as Grain for Green have been carried out for more than 10 years. It is necessary to estimate water yield and soil conservation in this area, as well as analyzing the trends of runoff and sediment under varies climate and land-use scenarios. In our study, climate dataset of 2 periods, Recent (2020-2040) and Later (2040-2060), were simulated by NCC/GU-WG version2.0 (or BCC/RCG-WG version 2.0). Land-use maps under open development, constrained development and protect development scenarios of YanHe River watershed in 2050 were simulated by using Land Change Modeler. Runoff and sediment under varies climate and land-use scenarios, which can be used to evaluate ecosystem services, were quantified by using SWAT model afterwards. Our research can provide a scientific basis for related decision makers in soil and water erosion control, and coordinate ecological protection and economic development as well.

Spatiotemporal Change in Vegetation Cover Trend and Their Auto-Correlation Analysis in Ordos During 2000-2015year

Wendurina, B Yuhai, Yinshan,

Geography department of Inner Mongolia Normal University, Hohhot, 010022, China, 1476281529@qq.com

Abstract

Based on the MODIS NDVI data from 2000 to 2015 year of Ordos city and the FVC data obtained by using dichotomy. This paper studied the characteristics of vegetation changing trend and its spatial variation clustering distribution through the linear regression trend analysis and spatial auto-correlation analysis. The result indicated that the growing season vegetation cover shows an increasing trend among 16 years in Ordos on the whole, and the vegetation dynamics differed from different vegetation types. Also there are differences in space. Spatial auto-correlation analysis showed that the change process of vegetation cover has a strong positive correlation on study area and obvious clustering phenomenon. The spatial auto-correlation analysis further verifies the result of trend analysis, indicating that the vegetation of Ordos has been partially restored and ecological restoration work has produced benefits. Finally, here on talking shallowly about driving factors.

fractional vegetation cover; spatial auto-correlation; spatial distribution characteristics; Ordos

Spatiotemporal Characteristics of Climate Change and the Ecological Responses in Hubei, China

Hongji Zhu, Aiwen Lin

School of Resource and Environmental Science, Wuhan University, Wuhan, Hubei Province, 430079, P. R. China,

zhuhongji@whu.edu.cn

Abstract

To investigate the spatiotemporal characteristics of climate change in Hubei, Central China, measurements of air temperature and precipitation from 35 meteorological stations and multiple model simulation/prediction results from CMIP5 during 1962-2011 are analyzed. The results suggest a significantly increasing trend for air temperature and an overall stable trend for precipitation in the past 50 years. To examine the ecological responses to the climate changes in this region, annual gross primary productivity (GPP) and net primary productivity (NPP) from the MODIS products during 2000-2010 and leaf area index (LAI) from the AVHRR BU LAI products during 1981-2011 are also analyzed. It is discovered that both GPP/NPP and LAI have increased over the recent decades. Furthermore, the correlation analyses between climatic parameters (i.e., air temperature and precipitation) and ecological indicators (i.e., GPP, NPP and LAI) are conducted by a linear model. The analytical results demonstrate that the air temperature has a significant positive correlation with LAI and GPP; precipitation is positively correlated with NPP. Thus, it is concluded that the air temperature exerts a stronger effect on the ecosystem than precipitation in Hubei province over the past decades.

Status of Biomass Energy Resource in Assam

Author A : Borah Jnanashree , Deptt of Geography, Arya Vidyapeeth College, Assam, India, jnanashree@rediffmail.com, Author B : Darshana Sarmah, Research Scholar, Deptt of Geography, Gauhati University, Author C : Dr. Madhushree Das, Deptt of Geography, Gauhati University

Abstract

Biomass has a very high potential as a renewable energy resource because of its reliability and availability everywhere around the globe, and occupies a significant status in the world's energy consumption. Estimates have indicated that 15-50% of the world's primary energy use could come from biomass by the year 2050. Like in most developing countries, the energy consumption in Assam, a constituent state of the north eastern part of India, is primarily for subsistence needs, and characterized by the pre-dominance of biomass fuels. Assessment of available bio-resources is helpful in revealing its status and helps in planning sustained supply to meet the energy demand.

Against this backdrop, an explorative analysis is been attempted with the objectives of estimating the availability of forest biomass and agricultural biomass for energy use in Assam, India. The study is based on secondary data procured from satellite database. For this purpose, National remote sensing data has been used. Other secondary data includes Census of India, statistical handbook, published energy literature etc. The study has been made with regard to agro-climatic zones of Assam where a significant variation in biomass energy resource has been revealed. The status of biomass regarding its energy use in terms of efficiency in respective zones are thereby examined in which all the zones are found to be deficient depicting an alarming situation in the present bio energy resource scenario in Assam.

Biomass energy, agro climatic zone

Study of Drought and Vegetation Response Using the Standardized Precipitation Index and Vegetation Health Index on Central China

Ling Z, Aiwen L, Zhenzhen Z, Qian Y, Yunlin P

School of Resource and Environment Science, Wuhan University, Wuhan, Hubei Province 430079, P. R. China,
cheryl_zou@wh.edu.cn

Abstract

Drought is one of the most serious natural disasters in Central China. Drought events and vegetation response to drought are investigated by Standardized Precipitation Index (SPI) and Vegetation Health Index (VHI) in Hubei province. Precipitation data during 1980-2013 and remote sensing data during 2000-2013 are used in this study. Standardized Precipitation Index is calculated to reveal meteorological drought and analysis drought characteristics. The Vegetation Health Index are applied to study how different vegetation types response to drought. Results show that: a drier climate is observed in Hubei province in recent years as long-term decrease of SPI are observed for all time scales. There are about 48%-53% months of SPI less than 0 for all time scales during 1980-2013, and about 0.25%-1.96% months of SPI less than -1.5 during 1980-2013. A severe drought is observed in Hubei during 2010-2011, when all different timescale SPI less than -1.5 and VHI experiences significant variation: regional mean VHI is 63.38 in June 2010, 52.83 in September 2010, less than 30 in November 2010 and recover to 61.78 in June 2011. Comparing the variation of monthly mean SPI and VHI during 2010-2011, we find that all vegetation are significantly influenced by 3-month and 6-month scales meteorological drought. Best temporal consistency is detected between VHI and 6-month SPI, the correlation coefficient are 0.71, 0.67 and 0.62 for cropland, grassland and forest, respectively. Therefore, a drier climate is observed in Hubei province and 6-month scale's SPI closely link to the health of vegetation, especially crop and grass.

The Guiana Shield Rainforests – Overlooked Guardians of South American Climate.

Bovolo CI, Wagner T, Parkin G, Hein D, Pereira R.

School of Geography, Durham University, Durham UK, Isabella.bovolo@durham.ac.uk

Abstract

Tropical forests are global climate regulators through their interaction with hydrological and biogeochemical cycles and impacts on planetary energetics. Driven by current deforestation trends, many studies have researched the South American and global impacts of Amazon deforestation; however, none have considered the role of the largely intact Guiana Shield (GS) forests north of the Amazon as part of this system. We use regional climate model simulations to show that small scale deforestation in the GS leads to significant multi-scale impacts across South America through vegetation-land-atmosphere interactions that disrupt the initial phases of flow of two major ‘atmospheric rivers’ across the continent: the Caribbean Low-Level Jet to the north; and the atmospheric river taking moisture-rich air from the equatorial Atlantic Ocean over the GS into Amazonia and then south to La Plata Basin (LPB) via the South American Low Level Jet (SALLJ). Our simulations deforestation demonstrate local precipitation and runoff increases in low elevation, down-wind forests, with mean annual temperatures increases of up to 2.2°C in savannahs. Regionally, wetting occurs in northern South America (Apr-Sep) and western Amazon (Oct-Mar) with temperature increases of up to 2°C in the central/eastern Amazon and an increase in the number of dry months. Highly diverse spatial responses occur in LPB due to a reduction of moisture transfer by the SALLJ. Such multi-scale changes would impact biodiversity and ecosystem services, including agriculture in LPB. Our simulations demonstrate a direct link between small-scale land cover change in the GS and hydro-climatic impacts 1000km west and 4000km south.

The Use of Remote Sensing Data for Studying the Dynamics and Monitoring Climate Condition of Mountain Ecosystem (Armenia)

Muradyan V,

The Center for Ecological-Noosphere Studies National Academy of Sciences of RA, Yerevan, Armenia,

muradyan.asx@gmail.com

Abstract

Seasonal characteristics of ecosystems are closely related to characteristics of the annual cycle of weather patterns, therefore changes in plant phenological events may signal important year-to-year variations of climatic condition or even global environmental changes. Monitoring ecosystems that are sensitive to climate change can improve our understanding of the relationships between climate and ecosystem dynamics. Recent advances in remote sensing technology have expanded opportunities to characterize the seasonal and inter-annual dynamics of ecosystems. However, research into the relationship between vegetation phenology and climate variability has not been fully investigated. The objective of this paper was to examine relationships between Normalized Difference Vegetation Index (NDVI), The Vegetation Condition Index (VCI) and climatic data in mountain ecosystem.

The VGT sensor, on board SPOT satellites, has provided daily coverage of the entire Earth since 1998. Ten-day (decade) NDVI synthesis images (NDVIS10) are available from VGT sensor globally. The study has shown that the NDVI values of vegetation varied over years. Analyzing the dynamics of mean NDVI values obtained for the study area for 21 decade periods between 1998 and 2014 indicates that NDVI has increased. The mean NDVI, temperature, and precipitation for the study area were plotted along a fifteen-year time series. The NDVI was correlated with temperature and precipitation: temperature showed higher correlation (positive) with NDVI compared to precipitation (negative). However, the relationships were increased when previous time periods were considered. In particular, high correlation is established between temperature, and precipitation of 2-3 decades' periods and mean NDVI values determined for 4-18 decades periods.

Remote sensing data, NDVI, VCI, dynamics and monitoring, climate, mountain ecosystem.

Variations in Vegetation Activities and Its Cause in Key Ecological Function Zones in China

DU Jiaqiang, SHU Jianmin, HE Ping, FANG Shifeng, LIU Weiling, SHI Huading

State Key Laboratory of Environmental Criteria and Risk Assessment, Chinese Research Academy of Environmental Sciences, Beijing, 100012, P. R. China, dujq@craes.org.cn

Abstract

As a critical component of national ecological barrier, key ecological function zones (KEFZ) are one of the hot-spot areas for ecological protection and restoration. Continued long-term monitoring of vegetation activity in KEFZ has implications for national ecological security. With GIMMS NDVI3g (1982-2013) dataset, the spatiotemporal patterns of change in vegetation growth were detected and their linkage with climate changes and human activity were analyzed in KEFZ over fifteen progressive periods starting in 1982. As a whole, a statistically significant trend of growing season, spring, and autumn NDVI in KEFZ was observed during all or most periods. Non-significant decreases of NDVI for growing season and seasonal seasons were found in 7 KEFZ during few periods, and obvious increases in all others KEFZ during fifteen periods. Vegetation growth in KEFZ was mainly regulated by thermal factor, and the dominant climatic drivers of vegetation activity varied across different regions and seasons. The influence of temperature was stronger on vegetation activity in spring and autumn for those KEFZ located in high latitude and high altitude, while the precipitation was the main control factor for those in the arid and semi-arid region. The impacts of human activity on NDVI were not been ignored, the significant decrease of NDVI in Sanjiang Plain may be related to the rapid land use change from wetland into farmland. The performance appraisal of ecosystem conservation and improvement should be considered from the point of view of history, fully considering the background, and strive to make scientific and reasonable quantitative evaluation.

NDVI; spatio-temporal changes; climate impact; human activity; key ecological function zones

Vegetation and Climatic Changes Reconstructed from a 3.3 Ma Sporopollen Record of the PL02 Borehole in the Yinchuan Basin

Xinling Li, Mingjian Wei, Yanyan Tian, Xiaolei Li

College of Resource, Environment and Tourism, The Capital Normal University, China, Beijing, 100048,

Weimj@cnu.edu.cn

Abstract

Understanding the climatic changes of the Asian arid and semi-arid region from the late Pliocene into the Quaternary is necessary in global change research in paleo-environment. However, it has been hindered by the lack of continuous, high-resolution records. A sediment core of the PL02 borehole from the Yinchuan Basin in the northwest China provides a sporopollen record from the transition zone of arid and semi-arid climates, spanning the past 3.3 million years. Comparisons reveal a close correspondence between the PL02 records and LR04 benthic stack. Spectral analysis of the A (*Artimisia*) / C (*Chenopodiaceae*) ratio shows periods of about 100-kyr and 41-kyr, which may correspond to Milankovitch periods, reflecting eccentricity and obliquity cycles, respectively. Besides, spectral analysis of the percentage of *Picea* and *Abies* shows extra period of about 600-kyr. The results of filter analysis verify temporal changes in periodicity. The fluctuation of A/C is consistent with frequency-dependent susceptibility may represents local climate as well as the changes of percentage of *Picea* and *Abies* is agree with low-frequency mass magnetic susceptibility may indicates the climate of the source area. Our results show that the local area is mostly influenced by global climatic changes, but the source area may affected by both the climatic changes and Tibetan Plateau uplift.

Analysing Spatiotemporal Variation of Net Primary Productivity in the Part of Coastal West Bengal, India

Sannigrahi Srikanta, Paul Saikat, Sen Somnath

Department of Architecture and Regional Planning, Indian Institute of Technology Kharagpur, India
srikanta.arp@iitkgp.ac.in

Abstract

In order to assess the quality of different ecosystem components, reliable primary productivity measurement is essential to quantify the energy, carbon balance and soil productivity. Net Primary Productivity (NPP) is the dry organic matter produced by green plant after absorbing CO₂ from atmosphere and releasing O₂ to the atmosphere by the mechanism of photosynthesis. It has been established that to produce 1g of dry organic matter (NPP) by photosynthesis, plants sequester 1.47g to 1.63g of carbon from atmosphere (1g of dry Carbon is similar to 3.27g of CO₂) and 1.22g of oxygen is added to the atmosphere. Research objective of this paper is to find out spatiotemporal variation of NPP in the highly productive mangrove ecosystem zone in West Bengal coast. The outcome of this study reveals that there is a declining trend of both average NPP and Maximum NPP values during the study period (2000 to 2013). The Average NPP has decreased from a level of 514 gC/m²/year in 2000 to 383 gC/m²/year in 2013 and the Maximum NPP has also decreased from 1586 gC/m²/year in 2000 to 1392 gC/m²/year in 2013 respectively. The above mentioned changes is not homogeneous in terms of spatiotemporal variation, as in the northern part of the study area, NPP has increased with time whereas in the rest of the region, NPP has decreased. The decreasing trend of NPP in the study period can be mainly accounted due to conversion of forest land to bare and urban land in the study region.

Abstract

The interactions between vegetation and atmosphere play an important role in both agriculture and economy. As global mean CO₂ concentration has reached 400 ppm, it is urgent to better understand the relation between CO₂ and vegetation. In this study, we aim to assess the effect of CO₂ and climate on vegetation competition. With the ORCHIDEE model, we performed five simulations with different CO₂ levels and climatic forcings in Last Glacial Maximum and Late Holocene. The result shows a significant global increase of tree proportions as CO₂ rises. Partial correlation analysis illustrates the spatial pattern of sensitivity of forest proportion to different climatic drivers. Forests proportions have strong positive correlation with mean annual precipitation (MAP) globally, while both short wave radiation and air temperature indicate positive impact on tree proportions in high latitudes, negative impact in low latitudes. Based on 90th quantile nonlinear regression analysis, we found the MAP for potential full woody cover in African savannas reduces with elevated CO₂. However, areas of broadleaf and needleleaf change separately in Northern Hemisphere in response to increased CO₂. Different transpiration change of broadleaf and needleleaf are mainly responsible for their different competitiveness. We also propose that improvements of this model are required to regulate the optimum temperature for each vegetation type under different CO₂. Understanding how vegetation responds to elevated CO₂ and climate change are essential for the prediction and management of future vegetation distribution.

Inferring the Patterns of Water Level Fluctuations and the Corresponding Influence on the Distribution of Wetland Vegetation in Poyang Lake, China

Xue Dai, Rongrong Wan, Guishan Yang

Key Laboratory of Watershed Geographic Sciences, Nanjing Institute of Geography and Limnology, Chinese Academy of Sciences, Nanjing 210008, China, E-mail: rrwan@126.com

Abstract

The influence of water-level fluctuations (WLF) on vegetation distribution and the structuring of wetland environments is of growing interest as hydrological regimes has been profoundly modified by human actions and the increasing threat from climate change. In order to develop a scientifically defensible and empirically testable relationship between WLF alteration and the corresponding ecological responses at the regional scale, including both the linear continuum responses and the discontinuous threshold responses, correlation analyses, curve-fitting methods and Classification and Regression Tree (CART) model were used to quantify the relationships between WLF alteration indicators and the distribution of spring Sedge belts (surface area) in Poyang Lake wetland. Those ecologically meaningful WLF indicators, including seasonal, dekadal and antecedent multi-diurnal WLF, were considered which have been proved to have different impacts with different magnitudes and complexity to the distribution changes of spring sedge belts. The results showed that: (1) Areas of spring sedge belts have significant continuum responses to the antecedent 30-day WLF, which were apparently reflected by the antecedent water-level index (AWI) day 30, the average water level over a 30-day period before observation. So it could suggest that sedge belts exposed to rapid fluctuated water regime in nearly 30 days would adjust distribution to adapt the new environment. (2) Areas of spring sedge belts have discontinuous threshold responses to both the antecedent 20-day WLF and the WLF of the last retreating season, which were apparently reflected by the AWI day 20 and the water level amplitude of the last retreating season, respectively. So it could suggest that the situations that continuous exorbitant water level lasting up to 20 days during spring or extremely high water amplitude occurred during the last retreating season could trigger catastrophic changes in the distribution of spring sedge belts. This study is among the first to show both the linear continuum responses and the discontinuous threshold responses of typical wetland vegetation to WLF patterns of lake at multi-temporal scales. Results of this study linked ecological responses to WLF patterns quantitatively, which will be helpful for water resource managers to make informed

decisions about how to regulate these conservancy water projects and conserve the degenerating wetland ecosystems.

Abstract

[Objective] To identify the complex relationship between the hydrological and the growth of typical wetland plants, and then reveal the growth regularity of the wetland plants which depend on water level change. [Method] Based on the images in different months by remote sensing interpretation, the paper analyzed wetland vegetation zone area and its spatial distribution under different water level conditions. [Result] Poyang Lake wetland hydrology has a remarkable characteristic of monthly period, there are significant differences among flood frequency within different elevation vegetation zone, flooding duration and period, thus controls the significant band features of wetland vegetation distribution. [Conclusion] The research results can provide scientific references for the protection and utilization of wetlands resource in Poyang Lake area.

Abstract

In the past few decades, agricultural ecosystem in the North China Plain (NCP) has experienced a complex set of climate changes. In the NCP, atmospheric CO₂ concentration and heat resources significantly increased, while precipitation decreased obviously, and climatic zone has been moved northward obviously. Although climate changes impact on crop yield has received attention, their combined effects and relative contributions are still not well understood. In this paper, by using the crop growth model (CERES–Wheat), and setting four simulation scenarios based on the meteorological data from 1961 to 2010, we examined the responses of crop yield to individual environmental stress and multiple environment changes in the NCP at a fifty-year scale. The results show that temperature increase has a positive impact on wheat yield in all sites. The crop production increased by 13.9 - 51.2%/10a under rain-fed condition, whereas by 12.9% - 40.1% /10a in the irrigated condition. To the contrary, the influence of solar radiation decrease on crops is negative, and the adverse effect under rain-fed condition is smaller than in the irrigated condition. The impact of long-term precipitation's fluctuation is small on wheat production.

Spatial-Temporal Analysis of Vegetation Change Trends and Its Driving Factors in China from 1998 To 2013

Yuanheng Sun

Peking University, Beijing, 100871, P. R. China, sunyh0411@126.com

Abstract

As an essential part in terrestrial ecosystem, vegetation links many environmental elements and balances the circulation and exchange of substance and energy. The spatial distribution and dynamics of vegetation not only reflect its response to climate change and anthropogenic activities, but also influence carbon-nitrogen cycle and social development of human beings, thus attract much research attention in recent years. In this study, we combined datasets of satellite-derived Normalized Difference Vegetation Index(NDVI), nighttime light and ground-site based meteorological data to analyze spatial-temporal patterns of variation in vegetation growth in China from 1998 to 2013 and the relationship between them. Theil-Sen median slope was adopted to estimate linear trends of NDVI and nighttime light in pixel scale for 16 years, in order to explore their temporal variation. Meteorological data, such as temperature and precipitation, were aggregated by growing season and processed with the similar method for each site. Results show that at regional scale spatial heterogeneity of NDVI trends appears clearly. Significant positive trends of NDVI was detected in Loess Plateau and Hengduan Mountains, whereas NDVI in the Middle Part of Inner Mongolia Plateau and Eastern China (i.e. Shandong and Jiangsu Province) decreased. Temperature increased slightly nationwide and precipitation varied from region to region, which all illustrated their little correlation with the trend of NDVI change. However, a strong negative correlation was observed between the change of NDVI and nighttime light in most area of China, which demonstrated human activities may be the main driving factor in vegetation change there.

Abstract

During the global warming, the duration of drought is increasing and the impact on forest ecosystems could be further intensified. But whether will planted forests and natural forests respond to drought differently remains controversial. In this research, the non-parametric Wilcoxon test was used to compare the growth state of forests in short-term drought (2001-2008) and prolong drought (2009-2014), which based on the best time scale of SPEI that obtained by the correlation between MODIS EVI and meteorological drought index SPEI. The results showed that (1) the relationship between the June of EVI of all forests and the 5 months scale of SPEI (SPEI_5) was most close; (2) The growth state of two forests was similar in the short-term drought years, but natural forests were affected more by prolong drought than planted forests. The duration of droughts will increase continuously in the future, given that we suggest more attention should be paid to natural forests.

The Spatial-Temporal Variations Characteristics Research of Weihe River Basin Based on GIS and RS

Zhou Xi

College of Earth Science and Resource, Changan University, Xi'an, Shaanxi 710064, China

Abstract

Based on MODIS-NDVI remote sensing images in 2000 and 2010 of Weihe River Basin, using the Erdas to maximize the data, classifying the NDVI image by the ArcGIS raster calculator, and combining with sub-basin zoning map, county administrative zoning map, landscape and 30m resolution DEM data to make processing and statistical analysis. The results show that 2000~2010 Weihe River Basin vegetation coverage overall in a growth state. Vegetation coverage of each sub-basin, Baojixia to Xianyang Basin > Xianyang to Tongguan Basin > Baojixia basin above > Jinghe River basin above Slips. Different counties vegetation coverage, the low degree of urbanization were better than the higher. Elevation less than 1000m and more than 2500m of the vegetation coverage is higher than the area between 1000~2500m.

Abstract

It is now widely accepted that broomcorn millet and foxtail millet were initially domesticated in northern China along the Yellow river valleys during the early Neolithic period and spread into vast geographic areas including western China, southwestern China, Southeast Asia and even India. However, whether the southward spread of millet agriculture resulted from migration of human (demic diffusion) or through acculturation (cultural diffusion) is still elusive. Here we reported mitochondrial DNA (mtDNA) haplogroups (M9a1b, M9a1a1c1b and A14) and Y chromosome haplogroup (O3a3c) that distributed restrictively in populations from northern and southwestern China. Phylogeographic analysis indicated that these haplogroups originated in northern China at ~12-8 kya and went through demographic expansion at ~7.5 kya, probably promoted by expansion of agriculture in northern China. Significantly, the dispersal routes of these haplogroups are exactly concordant with the southward spread of millet as suggested by archaeological evidences, indicating a codispersal of millet agriculture and millet farmers. Considering that these haplogroups only account for 6.5% of the populations residing along this southward migration route, we speculated that the initial millet farmers had assimilated indigenous genetic components during their southward expansion.

Abstract

The history of prehistoric human occupation on the Tibetan Plateau, the highest area of the world, has been increasingly concerned and studied in recent years. However, when human firstly inhabited the high Plateau, is still open to debate, due to the competing deductions based on different research works. Previous archaeological studies suggest human might have occasionally central Tibetan Plateau around 20,000 years ago, and surely inhabited in northeast Tibetan Plateau since 14,700 years ago. In this work, we systematically dating the charcoals, bones and sediments from the cultural layers of Yushuiping Paleolithic site by radiocarbon and OSL dating methods, which locates at middle Nujiang River valley, southeast margin area of the Tibetan Plateau, with elevation of 2510 m asl. Our dating results, and plenty of lithic artifacts and animal bones from cultural layers in Yushuiping site, indicate that human occupied the site around 39,000-31,000 years ago, suggesting human had inhabited the low-mid altitude areas of the Tibetan Plateau far earlier than previous estimation. The comparison dates in this work with reliable dates from other Paleolithic in the Tibetan Plateau and its surrounding areas, further support our hypothesis that foragers might have migrated to the Tibetan Plateau during MIS III from its southeastern neighboring areas.

Abstract

As a type of the periglacial landform, the formation time of sand wedges are usually represent the period of dry and cold, can substantially write down the ancient temperature. So, the sand wedges are good notepads on the reconstruction of the paleoenvironment. One sand wedge was found, about 1.5 m height and 0.5 m width, in the east lakeshore of Linggo Co which a lake is located in the Qiangtang Plateau (QP) which lies in on the west Tanggula Mountains in the central Tibetan Plateau (TP). Three optically stimulated luminescence (OSL) samples were collected from this sand wedge (SW) section, from the top, the middle, and the bottom of the SW. In addition, one OSL sample was collected from the sand layer which overlies on the sand wedge, about 30cm depth. OSL measurements also were used to make sure the ages. We obtained ages of 0.4 ± 0.0 , 1.5 ± 0.2 , 1.4 ± 0.1 and 6.5 ± 0.5 ka for one sand layer and three sand wedge samples from top to the bottom of the section, respectively. The age results from sand layer sample indicate that the sediments have been deposited at $\sim 0.4 \pm 0.0$ ka, corresponding to the Little Ice Age (LIA). The three ages from the SW section illustrate that the sand wedge had been formed at about 1.5 and 6.5 ka ago, which indicate the sand wedge had shaped at two different stages, during late and middle Holocene. During the sand wedge forming, Lake Level is lower than the bottom of the sand wedge section, belonging to cold- dry period.

Abstract

The relationship between human adaptation and their ecological environment has been debated for nearly a century. The existent research on this discussion are concentrated in Africa, and the main problems are the paucity of *in-situ* archaeological sites and continuous environment records. Here we show quantitative reconstruction of the woody plant content at hominin habitat, based on organic stable carbon isotopic analysis of surface soil and paleosol samples from 5 *in-situ* loess preserved Paleolithic sites in the South Luohe River region, central China. Our results show that, during the Pleistocene, in spite the existed large area of grass dominated landscape of northern China, hominins persistently living in a mosaic of grass and woody plant environment in central China. Grass cover in the South Luohe River region expended/extracted in corresponding to the glacial-interglacial oscillations and global climatic trending. In these ecological scenarios, hominins preferred the patches of woody plant in their early phases, whereas they adapted to the open environment as C4 grass increased to a maximum at late mid- Pleistocene.

Abstract

Current study indicates that Northeastern Tibetan Plateau (NETP) is one of the first widely occupied places by prehistory people on the Tibetan Plateau, which makes NETP very important to understand the human history on the plateau and human adaptation to high elevation environment. Hence, 151 site, a paleo- to Epi-Paleolithic site in the Qinghai Lake basin on NETP, is chosen to excavate. Thousands pieces of animal bones, hundreds pieces of stone artifacts and several possible hearths were unearthed and obtained. Carefully redating of the site shows that it was first occupied shortly around 15 ka BP, then reoccupied from 9000-6000 a BP more intensely. Preliminary study of the site suggest that the first appearance of human in Qinghai Lake basin is closely related to the amelioration of the Last Deglaciation and the prevalence of microlithic technology in North China, which may enlighten the study of early human migration on to whole plateau.

Abstract

By changing the structure and processes of ecosystems, land use and land cover change (LUCC) affects the provisioning capability of ecosystem services (ES). LUCC in Tibetan Plateau (TP) and its influence on ES are hot topics. Firstly, we estimated the cropland, forestland and grassland area of TP at provincial level for 1900s, 1930s, 1950s, 1980s and 2000. Then the spatially explicit reconstruction models of LUCC were designed based on in-depth analysis of TP land use history. Subsequently, the provincial area datasets were transformed into spatial datasets with 1 km resolution based on the above-mentioned models. Finally, using InVEST model, we assessed the changes of water supply services (WSS) and sediment retention services (SRS) under the influences of LUCC. The results show that the dramatic change tendency for 1950s-1980s was the most obvious characteristic of LUCC in TP over the past one hundred years, which resulted from the intensified human deforestation and over-grazing activities. The cropland expanded obvious in the Yellow River-Huangshui River Valley and the valley of Brahmaputra River and its two tributaries. The spatial extent of forestland shrunked significantly in the southeast of TP and grassland degraded obviously in northwest of TP. Owing to the degradation of forestland and grassland, WSS value decreased for 1900s-1980s and slightly increased for 1980s-2000. In terms of SRS, most regions of TP stay in a low erosion level. Decreasing tendency for 1900s-1980s and slightly increasing tendency for 1980s-2000 were found because of cropland expansion and forestland degradation.

Life in the Cold: What Do We Know about the Bioclimatology of the Tibetan Plateau and The Himalayas During the Late Quaternary?

Georg Miehe, Lars Opgenoorth, Joachim Schmidt, Jürgen Böhner, Jianquan Liu

miehe@staff.uni-marburg.de

Abstract

The paleo-climate scenarios of the Tibetan Plateau or the Himalayas diverge depending on the proxies used: ice shield, desert or persistence of life in the high altitude grasslands or forests.

A new approach relies on endemic plants and animals: their current vertical and horizontal envelopes provide temperature and humidity thresholds to be used cross-checking phylogeographical results of range extensions and allow for a re-interpretation of the paleo-climate state of the art: Temperatures and humidity during the LGM allowed the endurance of plants, herbivores and hunters in the Tibetan highlands.

Abstract

Archeological research has been trying to provide evidence relevant to understanding both the timing of and processes responsible for human colonization of the Qinghai-Tibetan Plateau (QTP). According to the previous study, the prehistoric human occupation of the Qinghai Lake dated back to ~15-4.2 ka. Hearths are one of the most extensive, important and typical prehistoric humanity activity evidence on QTP. However there are a number of hearths lacking charcoal material because of the wind and water erosion. Fortunately, most of these hearths can be dated by luminescence dating on the remnant sediments around the hearth. In this study, 18 optically stimulated luminescence (OSL) samples from 14 hearths in Yandongtai site (YDT) and Bronze Wire site (BW) in the northeast of Qinghai Lake area were systematically dated. The OSL ages range from 6.8 ± 0.7 ka to 14.4 ± 1.2 ka. There is a good agreement between OSL dating results and charcoal ages during the late glacier period, which indicates OSL method has great potential in dating hearth on QTP. Combined with the previous dating results from other hearths, the age of hearths concentrate in 11-13 ka BP, i.e. the Younger Dryas (YD) chronozone. The increased number of hearths indicates reinforced colonization in the Qinghai Lake area during YD cold event, implying that the cold climate during YD event was not severe enough to hinder the inhabitation of prehistoric humanity in this elevation of 3.2 km.

djzhang@lzu.edu.cn

Abstract

Human history of the Tibetan Plateau and human adaptation to the high altitude environment is hotly debated in the past decade among archaeological, anthropological, genetic, and even past climate change studies. Based on previous studies on the Tibetan Plateau and our own archaeological studies in northeastern Tibetan Plateau (NETP), we propose that human migrated to the Tibetan Plateau from the last Deglacial period to late Holocene mainly from North China via Yellow River valley and its tributary valleys in NETP. This migration is constituted of four stages (Upper Paleolithic, Epi-Paleolithic, Neolithic and Bronze Age) when human adapted to the high altitude environment and climate change with different strategies and techniques. Particularly, the prevail of microlithic technology in North China provoked hunter-gatherers' first visit to the NETP in relatively ameliorated last Deglacial period, and the quick development of millet farming and subsequent mixed barley-wheat farming and sheep herding facilitated farmers and herders permanently settled down on NETP, even above 3000 masl, during mid- and late Holocene.

Abstract

ECH₂O EC-5 soil moisture sensor can effectively monitor the soil moisture content, and it can reveal the soil moisture dynamic change under different rainfall events. However the ECH₂O EC-5 sensors' monitoring data about soil moisture content is also influenced by soil particle size composition, surface vegetation types, temperature and other factors to deviation. This paper discusses the property of the EC-5 soil moisture sensor's measuring data of soil water content, and the soil sample are taken from the field observation sites in the Qiangtang plateau, western Tibetan Plateau of China. The results show that all samples have good imitative effects, according to the fitted line, the measured data which had already been corrected could efficiently reflect the practical soil moisture content in the next place, according to the further calibration between the soil temperature data and the humidity data, the accuracy of data could be improved a lot, especially in the low temperature time quantum at night.

Abstract

Yak domestication represents an important episode in the early human occupation of the high-altitude Qinghai-Tibet Plateau (QTP). The precise timing of domestication is debated and little is known about the underlying genetic changes that occurred during the process. Here we investigate genome variation of wild and domestic yaks. We detect signals of selection in 209 genes of domestic yaks, several of which relate to behaviour and tameness. We date yak domestication to 7,300 years before present (yr BP), most likely by nomadic people, and an estimated sixfold increase in yak population size by 3,600 yr BP. These dates coincide with two early human population expansions on the QTP during the early-Neolithic and the late-Holocene, respectively. Our findings add to an understanding of yak domestication and its importance in the early human occupation of the QTP.

The Last Deglaciation History in the Mid-Latitude Westerlies Dominated Tibetan Plateau

ZENG X Z, XU L B, HE Z C, XIE J M, FANG X, SHU J G, YAN C Y, ZHAO K L

Department of Geography, South China Normal University, Guangzhou, 510631, P. R. China,

2014021189@m.scnu.edu.cn

Abstract

A knowledge of the timing of glacial activities relative to climate change, CO₂, and changes in insolation is of significance to understand the forcing mechanisms of glacial fluctuations during the last deglaciation. A compilation of 233 cosmogenic ¹⁰Be exposure ages of 60 moraines from main mountain ranges, including the Kunlun, Tianshan, Pamir and Karakorum Mountains, constrains the last deglaciation history of mid-latitude westerlies dominated Tibetan Plateau, climatically dominated by the mid-latitude westerlies. After reducing underproof samples by stratigraphic characteristic analysis and statistic strategy, two main deglaciation intervals are identified. One lies around 21 ka, in discrepancy with the saying that the timing of LGM retreat of mountain glaciers in Tibet occurred several thousand years later due to the influences of monsoon, while consistent with interhemispheric deglaciation, indicating the regional signal of onset of the termination of the global Last Glacial Maximum (LGM), which is considered primary triggered by rising boreal insolation. Another distinguished deglaciation happened at about 17.5 ka, synchronous with Heinrich event stage 1 (HS1), a distinct cold interval suggested by ice-core and ocean sediment archives. Seasonality (extreme cold winters and moderate summers) amplified by the North Atlantic ocean and conveyed by westerlies are likely a significant component for driving the glacial retreat at this cold spell, moreover, convincing evidence of local seasonal signals are provided by model simulations and surrounding lacustrine studies. However, when considering triggers for glacial recession, the contribution of continuous rising insolation and increasing concentration of atmosphere CO₂ can not be denied.

The New Evidence of Human Activities at an Altitude of 4000 Meters Area of Qinghai-Tibet Plateau

Hou Guangliang

Key Laboratory of Qinghai-Tibet Plateau Environment and Resource, MOE, Qinghai Normal University, Xining 810008, P.

R. China, hgl20@163.com

Abstract

Human activities during the early stage in Tibetan Plateau are crucial to improve the knowledge about how human beings react and respond to extreme environmental conditions, especially those in the area with elevation >4000 m asl, which is considered as the key of the migration and diffusion of human from plain to hinterland. Ash layer dated as 11290 ± 69 cal.yr BP and stoneworks such as micro-blade and fine flake mainly occurring at ca.11.2 cal kyr BP were found in the archaeological site XDW1, which can be considered as the first evidence to show the human activities above 4000 m asl in Tibetan Plateau. This study indicates that human beings have migrated to hinterland in the Early Holocene, and evaluated the spacial and temporary population diffusion patterns in northeastern Tibetan Plateau: 1) human occupying the marginal regions with 3000-4000 m asl in northeastern Tibetan Plateau, such as Lak Qinghai basin and Gonghe basin during the Last Deglaciation; 2) expansion to the regions above 4000 m asl during the Early Holocene; 3) further diffusion toward hinterland with higher elevation during the Holocene Climatic Optimum. The three stages of human migration and diffusion in Tibetan Plateau are closely related to the improving climate conditions from the Last Deglaciation until the Holocene Climatic Optimum.

Early Holocene; Qinghai-Tibet Plateau; Human activity

Cosmogenic Radionuclide Exposure Dating Constrained on Glacial Fluctuations on Xuebaoding from 12 Ka B.P., Northeast of Tibetan Plateau

Liu Beibei, Liu Gengnian, Cui Zhijiu

Peking University, Beijing, 100871, China, bb_liu_innu@163.com

Abstract

The Xuebaoding, of which the main peak is 5588 m, located at the northeast of Tibetan Plateau. It developed glacial moraine and cirque as well as other glacial landforms around the peak, but ice expansion remained constricted to valleys. We sample sites from the north and south slope based on field investigation and satellite image. Combine with ^{10}Be exposure dating we identify that the onset of glaciation is about 12 ka B.P. The glacier advance during Younger Dryas cold interval is poorly defined due to lack of a large number of dates (11919 ± 2063 ka and 12748 ± 1897 ka) support and needs to be tested in future studies. Nevertheless, a set of dates (~ 7295 to 10940 ka) for glacier boulder confirm there exist early Holocene glacier advance, minor advances during mid Holocene glacier (5940 ± 608 ka) and the little Ice Age (~ 1311 to 1899 ka). This work provides new insights into the reason induced the glaciation. It is that the glacier development is more consistent with the climate change than the tectonic uplift. Considering the average uplift rate of Minshan Block is 1.5 mm/a , it can uplift at most 15 m since 10ka. However, this height is not enough to control the glacier development.

Abstract

Plant microfossil analyses of ancient human teeth have shed light on the diet of prehistoric humans. The approach is especially useful in areas with acidic soils, like Yunnan, which are unfavorable for the preservation of plant macrofossils. In this study, we report analyses of starch grains and phytoliths preserved in the dental calculus of adult humans preserved in tombs and the results of radiocarbon dating at the prehistoric Shilinggang site in Yunnan province, southwest China. As a result, we show that Bronze Age settlers in Nujiang area ate a wide range of plants, including various underground storage organs (tubers, roots, bulbs, and rhizomes), rice, millet, palms and acorns at about 2500 cal yr BP. What's more, a wide variety of plant food founded here suggest that the human adopted a broad-spectrum strategy although when crop cultivation developed in some extent in northwest Yunnan Province during late prehistoric times.

Prehistoric Human Dispersal to the Tibetan Plateau and Adaptation to the High Altitude Environment

Fahu Chen, Dongju Zhang, Guanghui Dong

MOE Key Laboratory of Western China's Environmental System, Lanzhou University, Lanzhou China, 730000,

djzhang@lzu.edu.cn

Abstract

Human history of the Tibetan Plateau and human adaptation to the high altitude environment is hotly debated in the past decade among archaeological, anthropological, genetic, and even past climate change studies. Based on previous studies on the Tibetan Plateau and our own archaeological studies in northeastern Tibetan Plateau (NETP), we propose that human migrated to the Tibetan Plateau from the last Deglacial period to late Holocene mainly from North China via Yellow River valley and its tributary valleys in NETP. This migration is constituted of four stages (Upper Paleolithic, Epi-Paleolithic, Neolithic and Bronze Age) when human adapted to the high altitude environment and climate change with different strategies and techniques. Particularly, the prevail of microlithic technology in North China provoked hunter-gatherers' first visit to the NETP in relatively ameliorated last Deglacial period, and the quick development of millet farming and subsequent mixed barley-wheat farming and sheep herding facilitated farmers and herders permanently settled down on NETP, even above 3000 masl, during mid- and late Holocene.

Tibetan Plateau; Prehistoric human adaptation

Spatial Distribution and Agglomeration Characteristics of Prehistoric Settlement around Songshan Mountain

Yan Lijie, Lu Peng

Geographical Institute of Henan Academy of Sciences, Zhengzhou, 450052, China; 403018471@qq.com

Abstract

Spatial distribution and agglomeration characteristics of prehistoric settlement around Songshan Mountain were studied and compared by using GIS point pattern analysis method combining the kernel density (Kernel), standard deviation ellipse, Ripley's K (R) function. The prehistoric period included four stages, i.e. Pei Ligang, Yangshao, Longshan, Xia and Shang. The results of the study show that: the settlement sites of the four periods were aggregated. Settlement site distribution was gradually decentralized from Pei Ligang to Yangshao and Longshan. The distribution of settlement sites tended to focus from Longshan to Xia and Shang Dynasties. The spatial distribution pattern of settlement sites from Peiligang to Yangshao changed from Northwest-southeast to northeast-southwest direction. The spatial distribution pattern of settlement sites from Yangshao to Longshan and Xia and Shang changed from Northeast-southwest to Northwest - Southeast direction. The characteristics of prehistoric settlements distribution density spatial variation were expanding from Pei Ligang to Xia and Shang Dynasties. The settlement distribution of the period of Peiligang was the most dispersed with multi core. The Yangshao period, settlement density ratio compared to the period of PeiLigang, had greatly increased with three typical centers, settlement density in Longshan period slightly increased. Settlement nuclear density in Xia and Shang Dynasties was the largest in the four periods.

Study on Academician Shi Yafeng's Academic Thought

Sun J J, Zhao K L

South China Normal University, Guangzhou, 510631, jinjinsun@m.scnu.edu.cn

Abstract

Shi Yafeng, academician of Chinese Academy of Sciences, is an outstanding geologist, and glaciologist, known as the "father" of Chinese glaciology. He was engaged in Chinese glacier and geographical environment research, and led numbers of research projects, which played an significant role in their research fields. He is not only a pioneer in Chinese glaciology, but also laid an important foundation for the study of permafrost, mudslide and hydrological in drought zone. Professor Shi made a great contributions to the development of geography in China, such as, guided the research of geographical environment in the west of China, developed a generation of innovative geography researchers. This paper based on Professor Shi's works and contributions, combined with scientific and social environment to discuss his academic thought's formation process and academic spirit. Shi's academic thought is influenced by the social and family environment, education and his own characteristics.

The Exposure Dating and Formation Mechanism of Hummocky Moraines in Bodui Valley, Southeast Tibet Plateau

Zhao K L, Sun J J

South China Normal University, Guangzhou, 510631, P. R. China, katherine@m.scnu.edu.cn

Abstract

A large amount of hummocky moraines were produced after the Last Glacial Maximum in Bodui valley, southeast Tibetan plateau. This study processes a cosmogenic Be-10 surface exposure dating to the hummocky moraines in Linqiong, Xumu, Yuren, Dana these four hummocky regions. With the analysis of the exposure ages, spreading, geometry and directions of the hummocky moraine in Bodui valley. We indicate that the hummocky moraines in Bodui valley were primarily produced by the supraglacial debris. The forming of hummocky moraines are immediately after the forming of the lateral and end moraines. The scatter of the ages among the lateral and end moraine with the hummocky moraines, are caused by a long lasting instability condition on the dead ice. As a consequence it lengthens the period of ice decay. Our study demonstrated that the hummocky moraines in Bodui Valley were forming at 17.6~14.9 ka BP, and the totally melt of the dead ice in Bodui Valley were at 2.7~1.6 ka BP.

Archaeobotanical Study of Ancient Food and Cereal Remains Alongside the Silk Road of Xinjiang, China

Hongen JIANG

Department of Archaeology and Anthropology, University of Chinese Academy of Sciences, Beijing, China, 100049

Abstract

Starch grain, phytolith and cereal bran fragments were analyzed in order to identify the food remains including cakes, dumplings, as well as porridge unearthed at the Astana and Yingpan Cemeteries in Xinjiang, China. The results suggest that the cakes were made from *Triticum aestivum* while the dumplings were made from *Triticum aestivum*, along with *Setaria italica*. The ingredients of the porridge remain emanated from *Panicum miliaceum*. Moreover, direct macrobotanical evidence of the utilization of six cereal crops, such as *Triticum aestivum*, *Hordeum vulgare* var. *coeleste*, *Panicum miliaceum*, *Setaria italica*, *Cannabis sativa*, and *Oryza sativa* in the Xinjiang during the Jin and Tang dynasties (about 3rd to 9th centuries) is also presented. All of these cereal crops not only provided food for the survival of the indigenous people, but also spiced up their daily life.

Institute of Natural Resources and Environment, Henan University, Kaifeng, 475004, P. R. China;

Collaborative Innovation Center on Yellow River Civilization of Henan Province, Kaifeng, 475001, P. R. China,

mjh@henu.edu.cn

Abstract

Twenty-nine surface dust samples were collected from driving-schools in a city of Henan. Concentrations of Cu、Zn、Pb、Cd、Cr、Ni and Co in dust samples were measured by inductively coupled plasma mass-spectrometry, while Hg and As were analyzed using atomic fluorescence spectrometry. The pollution of heavy metal in surface dusts was assessed by pollution load index, and the health risks exposed to heavy metals in dust, which are carried out in three different scenarios (working for 10a, 20a and 30a in driving-school), were estimated using the health risk assessment model developed by US EPA. The results show that concentrations of the most heavy metals in dusts are higher than their background values except Co and Ni. Average *PLI* of nine metals in dusts is 2.38 with moderately pollution. And the accumulations of Zn, Cd and Pb in dusts are the most serious with heavy pollution. Pb is the major non-cancer risk factor, and non-cancer risks of metals are lower than their thresholds ($HI > 1$) except samples J20 and J26; As is the major carcinogen risk factor, and carcinogen risks of metals are lower than their thresholds ($> 1 \times 10^{-1}$) in four different scenarios except sample J20 in scenes of 2 and 3. The concentrations and health risks of heavy metals in dusts are not significantly related to the operation time and densities of coach car densities in driving schools, but closely related to the surroundings around driving-schools and the previous land use status.

Heavy metal; pollution assessment; health risk assessment; surface dust; driving-school

Climate Change, Social Rise and fall in China over the Past Two Millennia

Yin J, Fang X Q, Su Y

School of Geography, Beijing Normal University, Beijing, P.R. China, 100875, yinjun@mail.bnu.edu.cn

Abstract

The relation between climate change and historical rhythms has long been discussed; however, this type of study still faces the lack of high-resolution data concerning long-term socio-economic processes. In this study, we collected 3378 items of direct and proffered evidence from 25 Chinese history books. We used semantic analysis to reconstruct a quantitative series of the social rise and fall of the past 2000 years with a 10-year resolution to express the phase transition of the social rise and fall of the dynasties in China. Our reconstruction demonstrates that social vicissitudes have obvious cyclical feature in multiple time scales. Next, the association of social rise and fall with climate change was analyzed. The results indicate that social rise mostly occurred in the centennial-scale warm periods, whereas social decline mostly occurred in the centennial-scale cold periods. Temperature displayed more significant effects on the social fluctuation within the long term, while precipitation displayed more significant effects on the social fluctuation within the short term. Under warm-wet conditions, the social rise was over 57%; under cold-dry conditions, the social decline was over 66%. Thus, social crisis, social unrest and dynastic collapse in China usually appeared during the centennial-scale climatic cooling phases.

climate change; social rise and fall; past two millennia; China

Climate Events in Transforming the Urbanscape of Athens during 500 BC - 1200 AD

Yang, L.; Weinelt, M.

Graduate School Human Development in Landscape, Christian-Albrecht-Universität zu Kiel, Leibnizstr. 3, 24118 Kiel, Germany, lyang@gshdl.uni-kiel.de

Abstract

Abrupt paleoclimate changes in a long period (millennium scale) have received wide attention among natural and social scientists, also because of today's rapid climate changes and their extensive impacts on our society. In the eastern Mediterranean area, coherent patterns and synchronous events in history suggest obvious link between urban development and climate forcing. The city of Athens as the origin of ancient Greek civilization experienced many periods of prosperity and decadence. Though the transitions were mostly dominated by wars and power changes between empires, severe climate events and natural disasters may also considerably drove the process of Athens' development. Among many natural disasters, earthquake, tsunami, flood and wildfire were the main forces that stressed the development of Athens. To recover from and respond to the disasters, the city had taken some strategies and measures which either changed the ever existed city patterns or guided its further development to specific directions. The possibility that these transitions may have been response/resilience strategies triggered by abrupt climate events has so far hardly been explored.

With extensive literature review, existing archaeological records and paleoclimate reconstruction modelling results, this study analyses the climate variations in large scale, environment changes in mesoscale and the local natural disasters in Athens and its surrounding areas over the period 500 BC - 1200 AD. The study treats a number of important climate events in the area and urban transitions of the city, of which the integration of all these elements and insights from recent analysis throw some new light on understanding the forcing-transition process. The preliminary results indicate a weak link of climate forcing and urban transition over the whole city, but several links are recognized at specific blocks of Athens. Along with the population growth and land sprawl, more areas and more sections of the city were becoming susceptible to climate events and increased consideration of disasters in their development. The findings have significance for our in-depth understanding of the ancient city construction and development, as well as for the future urban development in facing of global climate change.

Climate change; natural disasters; urban transition; pre-industry; Athens

Climate Push or Climate Pull? Human Migration under Climate Change in Ancient China

Pei Q

The Hong Kong Institute of Education, Hong Kong SAR, P. R. China, peiqing618@gmail.com

Abstract

Unique agricultural practices engender regional variations in cultural customs, variations which pave the way for diverse regional migration patterns at discrete geographic levels. In the present study, we base on fine-grained historic migration records, together with statistical analysis, to explore the relationship between land carrying capacity and migration in China at the sub-national level over the past two millennia. Our results quantitatively demonstrate that in the pastoral region, climate change has a major role in triggering migration. The study further has quantitatively verified the causal pathway “climate change → nomadic migration → conflicts between pastoralists and agriculturalist” in China over past two thousand year. In the rice region, migration is more influenced by population pressure. The wheat region, located between the pastoral and the rice regions, displays the combined patterns of the two regions. Our findings also reveal the importance of regional cultural and geographic context in shaping migration patterns in various agro-ecological zones in ancient China. Based on our results, the application of a “Push–Pull Model” in interpreting historic Chinese migration is revisited with quantitative evidence. This study provides timely empirical proof of a “nature–human” interaction founded on diverse cultural traditions over an extended period which other scientists and policymakers can use as reference in initiating actions that can prevent agriculturalist–pastoralist conflicts.

Abstract

The migration of the Intertropical Convergence Zone (ITCZ) in eastern Africa was resulted in different intensity of summer monsoon, which had largely shaped the basin-wide environmental setting through runoff and hydrodynamics. A sediment core FA-1 taken from Faiyum Lake of the lower Nile River provided a record of the Holocene climatic changes and altered hydraulics of the lake. Quartz roundness, angular or rounded shape, is applied to this study to distinguish the sources of sediment. The angular quartz indicated riverine source of sediment, mostly contributed by river flooding of the lower Nile when ITCZ moved northward during the Early and Middle Holocene. The rounded quartz, an indicator for airborne sediment source from the Sahara Desert, implied an arid climate setting when ITCZ shifted to south. On this base, our quartz evidence indicated a wet climate prevailing in the lower Nile during the Early to Middle Holocene, when ITZC moved northward. The lower Nile, including Faiyum Lake was in severe drought owing to the southward shift of ITCZ after ca. 5000 years ago. Furthermore, our quartz evidence revealed two important time periods at ca. 3700-3300 cal yr BP and 2250-2100 cal yr BP, when Faiyum Lake was connected to the Nile River by artificial channels, a hydro-engineering made by the ancient Egyptian.

Abstract

Contemporary research produces divergent views of urbanism and its environmental consequences. One view proposes that because of their dense populations, cities come with an “urban penalty”. The other view is that densely settled cities provide an “urban advantage” because they are environmentally efficient with positive feedbacks from social interactions that generate more economic value than proportionate growth in resource consumption. There are few archaeological studies about the relationship of cities and their environments in China. Dongzhao site is appropriate for this research. It was an important settlement in Zhongyuan area from late Neolithic to Bronze age. Since the excavation beginning in 2012, three early cities dated from Xinzhai, Erlitou culture to Eastern Zhou period have been found within 100 km², as well as many storage pits, artificial reservoirs, wells, canals and big building remains. A geoarchaeological survey around the site has been conducted to study the geomorphic evolution, human-environment interaction, and the relationship between the ancient cities and local stream network. Applying soil micromorphology, particle size distribution, OSL dating, pollen analysis, basic geochemistry and GIS, this paper presents the results of the geoarchaeological investigation and the reconstruction of site formation processes in relation to the hydrologic processes and water management. Exploring the relationship between early cities and environmental conditions at ancient Zhengzhou area provides archaeological evidence to test the “urban advantage” and “urban penalty” models, which helps us refine our concepts of urban sustainability.

Interpretation of Low-Carbon Tourism Value and Reconstructing the Developing Model

Yong MA, Yang YANG, Na LI, Yun Tong

Tourism Development Institute, Hubei University, Wuhan, China, mytcn@126.com

Abstract

As the new way to upgrade tourism industry, the practices of low-carbon tourism are challenged by many factors. Most of the existing low-carbon resorts are still in the transition to a low-carbon destination--"gray" stage, which is not conducive to the sustainable development of scenic spots. In the first place, the article analyzes the connotation of low-carbon tourism, and then extract the four core values that is functional value, symbolic value, experience value and social value, from the perspective of production and tourism consumption. After that, according to the highlighting extent of low-carbon tourism, the paper divides the model into the original ecological developing model and sub-ecological developing model, what's more, basing the comparison of the two developing models, the paper build low-carbon tourism development model called "driving force - state - response - potential" model on the basis of DSRP reconstruction framework, which promotes the low-carbon area by the "passive, controlled" original mode to the "active, attack type" sub-ecological upgrading model. As a result, we can realize the low-carbon tourism value overflowing to promote low-carbon build tourist destination.

low carbon tourism; the value of developing model; reconstruction

Modeling the Spread of Agriculture to the Tibetan Plateau

Jade d'Alpoim Guedes

Washington State University, United States, jade.dalpoimguedes@wsu.edu

Abstract

The need to construct locally and historically contingent models of food resources was a central concern of “New Archaeology”. However, data and computational limitations meant that archaeologists were unable to go beyond describing coarse patterns of effective temperature, rainfall and net primary production on a global scale. Advances in ecology and computational modeling mean that archaeologists have at their disposition new computational tools and big data that allows us to build frames of reference with a higher level of spatial and temporal precision. This paper describes the creation of ecological niche models for predicting the constraints placed on ancient agriculturalists as they moved crops outside of their homelands of domestication. This paper describes the application of a 5000-year model of changing crop niches on the Tibetan Plateau and describe how the use of this models has elucidated the reasons underlying a major transition in subsistence regimes during the second millennium cal. BC.

Abstract

Two 4000 yr palynologic records from mountainous peatland of Tianmu and Daiyun mountains, southeast China, are assessed to investigate changes in terrestrial vegetation in response to the late Holocene monsoon climate variability and possible human impact. The two palynologic records show almost synchronous changes. Though the monsoon climate became cool and dry in the late Holocene as a whole, during about 4000-1200 cal. yr, trees and shrubs were dominant with vegetation type of evergreen broad-leaf forest. From about 1200cal.yrBP to present, trees and shrubs declined dramatically in accordance with expanding of *Pinus*, upland herbs (dominant by *Poaceae*, *Artemisia*, *Composite* etc.) and ferns. During the Medieval Warm Period, the warm temperature might lead to drier mountainous climate, but the human activities should be the most important impact. According to the history archives, with the population growth, war destroy and economic development, more and more frequent human activities, like clearing land for potatoes, pick tea-leaves and over-cutting forests for marketing, exacerbated virgin forests decline. In recent years, percentage of forest cover grows notably, which may caused by establishing natural reserves for revegetation.

Navigable Rivers Facilitated the Spread of Plague in Pre-Industrial Europe

Pak Hong Yue, Harry Fung Lee

The University of Hong Kong, China, ricciyue@hku.hk

Abstract

Infectious diseases have become a rising challenge to mankind in a globalizing world. Yet, little is known about the transmission of infectious diseases across different spatial domains in history. In this study, we based on the spatio-temporal information of 5559 plague (*Yersinia pestis*) outbreaks in Europe and its neighboring regions in AD1357–1760 to statistically examine the connection between navigable rivers and the spread of plague. Our results showed that 95.5% of plague happened within 10km proximity of navigable rivers. Besides, the count of plague outbreak was positively correlated with width of river and negatively correlated with distance between river and city. This association remained robust in different regression model specifications. An increase of 100m in width of river and a shortening of 1km distance between river and city resulted in 9 and 0.96 more plague outbreaks, respectively in our study period. We concluded that trade and transportation brought by river was an important medium for the spread of plague in pre-industrial Europe.

Perceived Changes in Climatic Attributes and Impacts on the Gaddis (Transhumance) in Chamba, Middle Himalaya

Himanshu Mishra and B.W. Pandey

Department of Geography, University of Delhi, himanshumishra136@gmail.com

Abstract

Gaddi community whose subsistence livelihoods directly depend upon the utilization of natural resources are vulnerable and fragile to the impacts of climate change, and can yet be unaware of actual and possible change. Changes in rainfall, temperature and seasonality could undermine traditional systems built in Gaddis experience. In one such system in the middle Himalaya, some herders practice vertical transhumance whereby they ascend in stages to high-altitude pasturelands for summer and similarly descend in winter. Several climate change models have predicted increasing temperature in the Himalaya but there is no significant information on whether or not Gaddis are aware of any changes in climate. In this study, rainfall and temperature data for the surrounding stations were collected and analyzed, 100 transhumance practitioner and herders were interviewed and 4 focus group discussions were conducted in Chamba district of Himachal Pradesh. Perceptions of herders communicated with the trends of climatic attributes but with some exceptions. The majority of Gaddis reported early onset of summer and rapid melting and receding of snow, early availability of grasses, early maturing of crops, vegetation and the appearance of new grass and plant species in the pasturelands. They also reported decreasing status of water availability and the appearance of new livestock diseases. Findings suggest that the perceptions and indigenous knowledge of Gaddis towards changes in crucial climatic attributes and other bio-physical indicators are useful in understanding of climate change in hostile and remote mountainous region of middle Himalaya.

Pollen Evidence to Interpret the Vicissitudes of Rice Farming History of the Hemudu Site on the Ningshao Coast, Eastern China

Liu Y, Sun QL, Fan DD, Lai XH, Finlayson BL, Chen ZY

State Key Laboratory of Marine Geology, Tongji University, Shanghai 200092, China, yliu@tongji.edu.cn

Abstract

A 3.12-m sediment core named HMD was retrieved at the west margin of the famous Hemudu Neolithic site to decode the rice farming process and its connection to the environment change at the site since mid-Holocene. Pollen-spore results showed a large amount of dinoflagellate and Chenopodiaceae with foraminifera and rootlets appeared in the basal brownish clayey silt dated at >6500 cal yr BP, indicating a supra-tidal flat deposition. Aquatic herbs peaked as dinoflagellate declined at ca.6500-6200 cal yr BP, indicating a desalinized setting that would have favored human occupation and rice farming by clearing and firing. This then followed by a significant increase of Pinus and fern spores, indicating the enhanced freshwater inflow and continuing desalination until ca. 5500 cal yr BP. High freshwater inflow from the adjacent hills might have weakened rice farming at the site as both Poaceae (>40 μm) and charcoal decreased during this time period. Intensive rice farming returned at ca.5500-5200 cal yr BP, accompanying a climate amelioration. From 5200 cal yr BP, fern spores and freshwater algae peaked as charcoal decreased, suggesting wetland expansion due to increasing inflow that made the site less favorable for human occupation, but rice farming would remain at adjacent sites.

Prehistoric Human-Environment Interaction in Hexi Corridor, Northwest China

Guanghui Dong, Fahu Chen

MOE Key Laboratory of Western China's Environmental System, College of Earth & Environmental Sciences, Lanzhou University, Lanzhou, Gansu Province, 730000, China, ghdong@lzu.edu.cn

Abstract

The process and impact of prehistoric food globalization has been increasingly concerned in recent years. The Hexi Corridor of Northwest China was an important area for cultural exchange between west and east parts of the Eurasia since prehistoric times. Here we present new dataset of archaeobotanic, zooarchaeological and bone isotopic analysis, and radiocarbon dating from late Neolithic and Bronze sites in Hexi Corridor, combined with paleoclimatic researches, we discuss human-environment interaction during prehistoric period in the area. Our results revealed the chronology of Neolithic and Bronze cultures, the accurate timing of the introduction of millet crops domesticated in north China, and wheat and barley domesticated in west Asia, the transition of subsistence strategies, the impact of climate change on culture evolution, and human metal-smelting activities on environment during late prehistoric period in Hexi Corridor. These works provide valuable insights to understand the process and regulations of human-land evolution in key region of the ancient Silk Road, during the period of increasing prehistoric cultural exchange among different parts of the Eurasia.

Sky, Spate, and Soil: Agricultural Intensification and Environmental Evolution in the Central Plain, China

Zhen Qin

Washington University in St. Louis, St. Louis, Missouri, 63130, USA, qinzhen@wustl.edu

Abstract

Although a wide variety of new understandings concerning agricultural origins have been gained in the past few decades, there is a huge intellectual gap between the extensive agriculture soon after the earliest domestication and intensive agriculture practiced by early states. Why did early farmers continuously invest various resources to intensify food production? How did environmental factors function behind the progress of agricultural intensification? Questions concerning the relationship between agricultural intensification and environment have been attracting but also puzzling researchers for a long time.

Deeper understanding of these questions may be gained through research at Sanyangzhuang in the Central Plain, China. Sanyangzhuang is a rural settlement in present Henan Province in central China. Many agriculture features, such as ridge-and-furrow fields, have been recovered in three strata (dated to the late Neolithic, the late Bronze Age, and the early Iron Age respectively). Additionally, a complete history of the Yellow River floods has been recorded in the stratum around Sanyangzhuang site. All these features enable our further exploration of interactions between agricultural intensification and environmental evolution.

By use of data from Sanyangzhuang site, this paper will mainly focus on two dynamic environmental factors in this region: The East Asia Monsoon determined paleoclimate and the alluvial process of the Yellow River (notably, alternate periods of stability and inundation from flooding). By integrating these two lines of evidence, the local paleoenvironment will be reconstructed and environment-induced risk management will be investigated as one of the potential driving forces of agricultural intensification.

Key words:

⁴ Department of Asian Studies, Hebrew University, Jerusalem 91905, Israel

Abstract

The Taoshan archaeological site located in northeastern China was found in 2011, and excavated in 2013 and 2014. The archaeological deposits interpreted as aeolian in origin was divided into four layers (designed as Layers 4–1, from bottom to top), and a lot of stone artifacts and pottery fragments were excavated. The chronology of the site was constructed using optically stimulated luminescence technique (OSL) on sediments and radiocarbon technique on charcoal fragments. Its paleoenvironment was reconstructed from multiple paleoclimate proxies (including grain size, magnetic susceptibility, total organic content and pollen). The dating results showed that the OSL technique is of great utility for such archaeological deposits, and the three cultural layers were dated to 16.5–13.4 ka for Layer 4, 13.4–8.7 ka for Layer 3, and 8.7–5.6 ka for Layer 2, respectively. The climate proxies indicate that the local climate is cold and dry for the period of 16.5–13.4 ka, warm and wet for the period of 13.4–8.7 ka and warm and dry for the period of 8.7–5.6 ka. The Taoshan site sheds an interesting light on basic processes which took place during the very late Pleistocene and early Holocene, such as the human colonization of this region and the 'Neolithization' process. Results of this research also reflect about the effects of changing climatic conditions on human adaptation and the development of social and cultural mechanisms.

Taoshan site; Paleoenvironment; Paleolithic–Neolithic transition; Human–environment interaction; Northeastern China

Was Population Collapse Caused by Overpopulation in Late Imperial China?

Lee, HF

Department of Geography, The University of Hong Kong, Hong Kong, SAR, harrylee@hku.hk

Abstract

There is a continuing debate over whether the series of population checks in late imperial China were caused by overpopulation or not. The debate may be rooted in the absence of quantitative estimates of population pressure. In the present study, fine-grained historical socioeconomic and population datasets together with statistical methods were utilized to estimate quantitatively the population pressure in China in the period 1730–1910. The possible paths through which population pressure was translated into demographic catastrophes were also examined. Statistical results show that (1) the frequency of various population checks was positively correlated with subsistence pressure, (2) food strain and its associated demographic catastrophes were driven by the synergistic work of climate-induced agricultural shrinkage and population growth, and (3) the synthesis significantly determined population growth dynamics across China at various geographic levels. To conclude, overpopulation in late imperial China is not a myth, and the series of population checks and eventually population collapse were caused by subsistence pressure during the period. When examining historical Chinese demography, the adverse effect of climatic forcing on human carrying capacity should be considered.

Human Impact on Landscapes and Land Use History of the Meshchera Lowlands (European Russia) - Reconstructions by Palaeoecological and Historical Data

Matasov V.M., Novenko E.Yu.

M.V. Lomonosov Moscow State University, Faculty of Geography, Moscow, Russia, e-mail: lenanov@mail.ru

Abstract

The analysis of land use history of the Meshchera Lowlands since the Neolithic has been realized on three key areas, located in the north of Ryazan region in different natural conditions. The first area is located at the lowest part of the Meshchera Lowlands, with many lakes, wetlands and poor sandy soils. The second one is situated at the junction of low, largely swamped area, with poor sandy soils and better drained territory, with loamy soils. The third study region includes elevated eroded karst plateau with loess fertile soils and a part of the Oka River valley with sandy terraces and meadows on floodplains. The archeological and paleobotanical data (Middle and Late Holocene), maps of the General Land Survey (XVIII century), Atlas of Mende maps (XIX century), satellite imagery Corona (XX century) and modern satellite images (XXI century) were used to reconstruct long-term anthropogenic influences on landscapes.

The obtained results show that the first key region was characterized by early human settlements on shores of lakes (Neolithic-early Bronze Age), the lowest percent of arable land and a relatively low population density. The second area was populated later, the share of arable land was permanently low, and the population was concentrated along the main road. The forestry dominated in land use structure. The third area, so called "Kasimov Opolie", was intensively used by human since the Neolithic up to now. The territory is marked by highest population density and share of arable land.

The study was supported by RFBR, project №14-05-00568-a

Impact of Holocene Environmental Change on the Ancient Cultures of Chaohu Lake Basin, East China: A Geoarchaeological Perspective

Li WU, Xinyuan WANG, Lin LU, Huafu JIAO

College of Territorial Resources and Tourism, Anhui Normal University, Wuhu, 241002, P. R. China, jedi-wuli@163.com

Abstract

Based on the temporal-spatial distribution features of ancient settlement sites from the middle and late Neolithic Age to the Han dynasty in the Chaohu Lake Basin of Anhui Province, East China, using the methods of GIS combined with the reconstructed paleoenvironment by the records of lake sediment since Holocene, the transmutation of ancient settlements with response to environmental changes in this area has been discussed. Studies show that the main feature of transmutation of ancient settlements from the middle and late Neolithic Age to the Han Dynasty was that the distribution of settlements in this area changed from high altitudes to low ones and kept approaching the Chaohu Lake with the passage of time. These could be a response to climate change from warm-moist to a relatively warm-dry condition during the middle Holocene, leading to the lake level fluctuations. The large area of exposed land provided enough space for human activities. These indicate that the above changes in geomorphologic evolution and hydrology influenced by climate conditions affected the transmutation of ancient settlements greatly. The distribution pattern of settlement sites was that the number of sites in the west was more than in the east. This pattern may be related to the geomorphologic conditions such as frequent channel shifting of the Yangtze River as well as flood disasters during the Holocene optimum. Therefore, climate change was the inducement of transmutation of ancient settlements in the Chaohu Lake Basin, which exerted great influence on the distribution, expansion and development of settlements.

Chaohu Lake Basin; Holocene environmental change; ancient culture

Pre-historical Clustered Geo-disasters Recorded at the Neolithic Ruins: A Reflection of the Early Human-environment Interactions over the Northeastern Tibetan Plateau

Yongqiang Guo & Chun Chang Huang

Department of Geography, Shaanxi Normal University, Xi'an, Shaanxi 710119, P.R. China, cchuang@snnu.edu.cn (C.C. Huang)

Abstract

Pre-historical clustered geo-disasters were investigated by multidisciplinary approach at the Neolithic Ruins over the northeastern Tibetan Plateau. The palaeo-earthquakes recorded by loess fissures and palaeo-mudflow recorded by red clay were first found in the Machangyuan Ruins along the Huangshui River valley. The pre-historical clustered geo-disasters were dated to 4.8 ka BP by OSL dating, ^{14}C , and the archaeological record. Based on the geological landscape of the Machangyuan Ruins, palaeo-earthquake events are associated with the major active faults (e.g., Lajishan faults) and local faults (Bazhougou fault). The source of the catastrophic mudflows was traced upslope to the gully heads behind the ruins, where the enormous scars left by mass wasting on the hillsides behind the ruins are clearly visible. A great number of pre-historical settlements such as Majiayao Culture (6.4–4.2 ka BP) were distributed at the foot of the northeast Tibetan Plateau. The distribution suggests that the region have been impacted by human activities during the past 6000 years. Prehistoric land use including farming actives, cooking, heating and making pottery related to deforestation produce erosion power at the heads of gullies in the loess landscape. The Mid-late Holocene climate change (~5.0 ka) was identified by this palaeo-mud flow marker in combination with other palaeoclimate archives. Human and climatic impact on the environment as derived from landscape evolution and earth surface process. The mudflows layers overlay the palaeoground around the Neolithic Ruins suggests that pre-historical clustered geo-disasters were partly created by early-human themselves.

Thermo Luminescence Dating of Seymareh Dam Lake Terraces According to the Archaeological Site Patterns Located in the Southwestern of Iran

Mojtaba yamani, Siyamack sharafi

Professor of Geomorphology, faculty of geography, university of Tehran, Iran, myamani@ut.ac.ir

PhD of geomorphology and researcher at Iranian academic center for education, culture and research, Lorestan uin, Iran, sharafi.s64@gmail.com

Abstract

Seymareh landslides, as the world's largest landslide, has blocked the Seymareh River and formed a dam lake. Field studies along with laboratory experiments led to detect a four staged landslides and also to detect the formation of a quadruple lakes. Using thermo luminescence dating of the lake sediments, the occurrence of the landslide and the formation of the primary Seymareh lakes are estimated to occur about 85,000 years ago and it has been discharged 17,600 years ago. Second Lake with an area equal to 145 square kilometers was formed 16500 years ago and discharged 14,500 years ago, third lakes with an area of 67 square kilometers was formed 10500 years ago and discharged 10300 years ago, and the fourth lake with an area of 47 square kilometers was formed and discharged 10100 and 9967 years ago, respectively. Furthermore, this research indicates the relation between settlement patterns of the archaeological sites from Paleolithic to Islamic period with the formation of lakes. The results show that the main reason of the absence of the Paleolithic sites is that they may have been destroyed by the Seymareh landslide and then buried under thick layers of lake sediments. The oldest known sites (Epipaleolithic period) have settled after the formation and discharge of the first lake and on the surface of the rocky bed in the margins of the lake. From the Neolithic to Islamic period, the sites have been formed after discharge of the lakes and on the surface of lake sediments.

Commercial Assistance for ‘Aging in Comfort’: Slices of Reality - City of Kolkata, India

Basu Anindya

Assistant Professor, Women’s Christian College, University of Calcutta, Kolkata, India, basu_anindya2004@yahoo.com

Abstract

Aging of population can be viewed as an end product of demographic transition which is common in developed nations where governmental or insurance-driven medical aid is common. But in Indian scenario, the senior citizens who account for about 8.5 percent of total population have no or very little official social security and state-sponsored geriatric care system to fall back upon and the legal framework supporting their needs is also very frail. The traditional joint-family system of Indian society has given way to nuclear ones giving little significance to the elderly. Particularly, the modern ‘Bong’ i.e. the representatives of the Bengali community of Kolkata to pursue their dreams of academic and professional excellence have been forced to shift base mostly overseas leaving their vulnerable, aging parents behind. Through the study it surfaced that given the increasing longevity, high population growth and the present societal scenario the budding commercial geriatric care industry, largely unorganized involving home-health segment has carved a niche in the City of Joy with agencies like Portea, Tribeca Care, Health Care at Home, Deep Probeen Porisheba by means of their interesting packages and sound business models. Several professional care-giver centres, old-age homes are also in the picture. With chronic ailments, reduced strength, agility and decline in sensory capacity and cognition the lonely senior citizens have to dabble with the harsh, mundane daily chores of life. Elderly care involves periodical monitoring of physical and psychological well-being encompassing emotional support, security needs and counselling involving male and female care-givers as required. From the interactions with the commercial care-giving agency representatives and their clientele it surfaced that though apparently these commercial solutions to deal with aging and related insecurities seem to be effective and satisfactory there are certain drawbacks like steep charges, lack of professionalism, dearth of trained staff which needs to be addressed. Especially the ones having weak financial standing and the ones who do not have any near relatives to act as the liaison between them and the service providers are seen as burden and they find it impossible to avail these services.

Key words:

geriatric care; Bong; home-health; senior citizen; care-givers; old-age homes

Inter-Embodied Infant Agency/Subjectivity and The Everyday Technologies of Infant Feeding

Louise Holt

Louise Holt, Loughborough University, UK. L.holt@lboro.ac.uk

Abstract

This paper argues the need to explore the role of the inter-embodied agency/subjectivity (Lupton, 2013) of infants with their carers and a range of human and non-human others in the adoption and use of everyday technologies. The paper focuses upon the material geographies of infant feeding. Alongside reproductive technologies, everyday, mundane technologies can be used to optimise feeding and nutrition. Since food becomes matter, the food provided to infants becomes the material corporeality of infants' bodies. The accounts of parent infant feeding practices from a qualitative study of the geographies of infant feeding in the UK are drawn upon to explore the ways parents/carers use a range of everyday technologies to support their 'healthy' feeding choices: from the Internet to specific 'healthier' infant formulas, to vitamin supplements, blenders and feeding apps. However, the accounts also identify that infants are themselves agents in feeding processes who influence the extent to which these 'healthy' infant feeding technologies can be used to promote what parents consider to be healthy feeding practices. The agency of infants can only be understood as inter-embodied with their parents/carers and a range of human and non-human 'others': including food and technologies. The paper considers how new technologies are enabling to parents and yet act as a mechanism for the governmentality of young children and their parents. The potential implications for new smart cities is also explored.

Key words:

technology; cities; babies and food

Negotiating Gender, Migration and Everyday Multiculturalism: Transnational Healthcare Workers in Singapore's Nursing Homes

HUANG Shirlena, YEOH Brenda S.A.

Department of Geography, National University of Singapore, Singapore, Singapore, geoslena@nus.edu.sg

Abstract

Growing numbers of transnational care workers crossing borders within Asia contribute to the social and cultural diversity of their affluent but ageing neighbouring societies. This paper examines healthcare workers from Burma, China, India, the Philippines, and other less well-off countries in Asia employed in the nursing homes of multicultural Singapore, where structural modes of inclusion insert these transnational workers into the lower segments of the urban service sector. These workers are subject to inferior status ascriptions based on gender (the devaluation of care work as women's work), ethnicity/culture (the undervaluation of work done by migrant workers from the South) and legal status (as temporary work permit holders with negligible hope of permanent residency or citizenship). Adding to their challenging situation is the physically and emotionally demanding nature of their jobs, as well as their need to communicate across cultural and linguistic divides, both with one another and with their culturally diverse patients. Together, these factors create circumstances that are potentially ripe for misunderstandings, resentment and even discord across the local-migrant divide, as well as among the various migrant groups. The paper adopts a feminist perspective of care which emphasizes both love and labour and the relationality of human beings, to first, understand how migrant healthcare workers negotiate the subordination and stereotypes they face in their everyday culturally-diverse working environments and second, raise ethical and policy questions relating to migration, care labour and citizenship.

Key words:

Gender; migration; multicultural; transnational healthcare work; feminist perspective; Singapore

Teachers' Care Work: Balancing Pregnancy and Modesty in the Ultra-Orthodox Jewish School

Orna Blumen, Elka Freedland

Faculty of Social Welfare and Health Sciences, University of Haifa, Mount Carmel, 3498838 Israel

ornab@research.haifa.ac.il

Abstract

In the ultra-orthodox Jewish community pregnancy undermines modesty – a prime, gendered value. This study asks how pregnant teachers care for the modesty of young girls in the presence of this challenge. For ultra-orthodox women modesty is the only means that can equalize them with men religiously. Thus modesty is vital for girls' socialization and teaching and cultivating it in female pupils is essential for the care work of teachers. The body and its appearance are central to feminine modesty which primarily aims to protect men from erotic temptations. Whereas females' social body oppresses sexual connotations, pregnant bodies are indicative of a woman's sexual activity and a challenge to the imperative of modesty.

The social meaning of pregnancy is a growing interest in current socio-cultural research and only few have noted that beside women, pregnancy is experienced also by others, mostly partners and passersby. This study locates pregnancy outside the family privacy, in the workplace. More precisely, it situates pregnancy in ultra-orthodox, elementary and junior high- schools for girls, recognizing the girls/pupils as partners who too live through parallel, distinct experiences.

In-depth interviews with 24 ultra-orthodox pregnant teachers, divulge their struggle to maintain the code of modesty, how they manage their pregnancy in the classroom, the reactions expressed by their female pupils and how they tackle the approaching separation their maternal leave entails.

Key words:

teachers; care work; pregnancy; ultra-orthodox Jewish; modesty; school-girls; qualitative methods

'Womenomics', Care Workers, and Feminism in Japan

Janiec, M.

School of Geosciences, University of South Florida, Tampa, the United States; mjaniec@mail.usf.edu

Abstract

In order to promote economic growth, Japan's government is seeking to create surplus labor by moving women out of the household economy and into the capitalist marketplace. Recently, the ruling party proposed reforms seemingly aimed at easing the burdens that women face at home caring for children and seniors. Labeled as 'Womenomics' in popular discourse, these reforms are celebrated for providing opportunities for women to work outside the home. As a part of the implementation process, the government is proposing to increase the number of migrants seeking certification as care workers under the Trainee and Technical Internship Program.

Based on interviews conducted with NGOs, labor unions, and politicians, this study seeks to critically examine national debates on care. Groups opposed to the reforms question the lack of participation of Japanese men in homemaking and providing care. Further, they argue that the reforms do not advance the rights of all women, but rather, exclusively promote only the rights of Japanese women at the expense of migrant women. Overall, this study seeks to set these debates within a broader context of neo-liberalization processes in Japan that require surplus labor to maintain economic growth.

Key words:

aging population; Asia; childcare; homemaking; surplus labor

Formation of entertainment districts around the U.S. military bases after the war in Okinawa: the politics of gendered space

Yoshida, Y

Nara Women's University, Nara, Japan, yoko@cc.nara-wu.ac.jp

Abstract

Generally, entertainment districts are found in close proximity military bases. In Okinawa prefecture, there are some entertainment districts that emerged around the U.S. military bases here. A part of these districts played the role of a red-light district until Okinawa's return to Japan in 1972. On the one hand, USCAR (United States Civil Administration of Ryukyu Islands) did not officially permit prostitution in Okinawa's entertainment districts; on the other hand, USCAR contributed to prostitution through the adoption of an A-sign system which gave business licenses to certain shops (so-called A-sign shops); these involved strict hygienic regulations for restaurants, including cabarets, dance halls, and so on. However, when American soldiers contracted a sexual disease, A-sign shops and the entertainment district were specified as off-limit zones. It can be said that the A-sign shops and the entertainment districts, as well as the local economy in Okinawa, were unstable under the U.S. occupation. In my presentation, I select Kin-cho in Okinawa, where the U.S. military base (Camp Hansen) is located, to uncover how the power relations, which were reflected in the entertainment district, supported Kin-cho's local economy. Moreover, my challenge is to explain the spatial politics that appeared in this district as a space for prostitution in which gender, sexuality, ethnicity, class, and so on were reflected.

postwar; U. S. military bases; entertainment district; local economy; power relations; gender; spatial politics; Okinawa Japan

Gender Issues in Haryana

Jaglan Rajeshwari

Kurukshetra University, Kurukshetra, India, rajeshwariku@gmail.com

Abstract

There are commonalities in the challenges faced by women all around world. The difference arises due to varied circumstances in which they live. Their struggle for equality becomes more challenging if they live in with strong patriarchal norms, when they have limited opportunities and choices in decision making, and when their age of marriage is low, or when they are overworked; or when their educational levels are low, or they live in society where there is strong son preference and there is violence against them. The existence of any of these pose serious challenge in women development, and if any of these exist in combination, then challenges for women reach a level of great discomfort and gender issues calls for greater attention.

In this context, the present paper raises certain gender issues in the state of Haryana, India. Haryana is situated in north-western part of India, a small state in terms of area and having 2 percent of India's population. It may however, be noted that this state is one of the economically developed states of India with highest per capita income and also as granary (bread basket) of country. Paradoxically, the level of economic development does not get reflected in parameters of women and child population. Within this framework, five major gender issues have been discussed with the help of primary and secondary data vis-à-vis their rights and cultural codes enforced in this part of country, i.e. Haryana.

Key words:

Patriarchy; gender issues

Gendered Rights in the Countryside: Educated Women in Rural Communities in Spain

Garcia-Ramon, M.D., Baylina, M., Villarino, M.

Department of Geography, Universitat Autònoma de Barcelona, Bellaterra, 08193. Spain,

mariadolors.garcia.ramon@uab.es

Abstract

Until very recently educated women in rural Spain who wanted to develop their own professional project did not have the options of staying in the rural milieu due to gendered social norms and traditions. But globalization processes that create new relations between many places around the world have allowed that some women decide to stay at the countryside and develop their own life projects. This is a relatively new phenomenon taking into account the steady process of female migration from rural areas to the cities that has taken place in Spain for many past decades. Taking as starting point their life experience we try to set out how these women perceive their rights in these new ruralities in relation to their life project, lifestyle, etc. Through in-depth interviews in two contrasting regions (Catalonia and Galicia) we attempt to study women's critical perceptions of ruralities and of themselves as rural women. These narratives frequently transgress other discourses and meanings attributed to rural space and, therefore might constitute a significant document about daily life, agency and gendered rights, since it may become a mirror for younger female generations.

Gendering the financing regional development in South America: The case of Red de Articulacion Feminista Marco Sur

Vaz, Marcelle. Profit Pachioni, Alena

University of Brasilia, Brasilia, Brazil, marcellevaz@gmail.com

Abstract

Gender mainstreaming and regional development have been discussed internationally since the 1980s, particularly since the Conference of Nairobi (1985) and Beijing (1995). In this context, the debates have highlighted the persistent funding gap for gender equality in the development agenda. The aim of this paper is to offer a panorama regarding the action of a transnational South American feminist network (Articulacion Feminista Marcosur – AFM) and the dilemmas for the construction of a regional fund for the development of the equality of women. The challenges and possibilities faced by AFM are related to the institutionalization of the levels of participation of feminist organisations in international organizations and the general challenges concerning resource allocation and investment for gender equality. In the broader context of the recognition of the social society organisations as strategic actors of development not only the changes in the field of international aid but also shifting state – society relations, influenced by the market globalization in the 1990s and the penetration of economic liberalization, implied reforms and triggered a reduction of the role of the central governments and transferred more responsibility to private sector and non-profit organizations, must be emphasized. Hence, regional development includes diverse processes involving different forms of collective action within local-national and international dimensions marked by the various political arenas involved. Given the complex dynamics of transnational feminist networks and their interaction between the different actors of development, the relevance of this paper is in its contribution to analyse financing for gender equality in the South American context with a special focus on regional development.

Geographical Environment, Gender Political Participation of Leaders in Panchayat Raj Programme in Maharashtra, India

Dr. Bhole A. S.

Department of Geography, M. J. College, Jalgaon, Affiliated to North Maharashtra University, Jalgaon, Maharashtra, (India), arunbhole12@rediffmail.com

Abstract

In the constitution of India there are equal rights for male and females living in India. In 2nd October 1959 at Nagaur in Rajasthan the first panchayat raj programme was started by Prime Minister of India. Regional variations in geographical environment play vital role in gender political participation in panchayat raj programme in India. In this study investigator has studied the role of geographical environment on gender political participation in Jalgaon District of Maharashtra state in India. Active participation in political organization as candidates, voting process campaign, election duty, party meeting. Spatio temporal variations of gender political participation in rural, urban and tribal environment has studied. In this research paper primary and secondary data has intensively used. In this research paper statistical methods, computer software are the tools. Gender political participation in the study region is increasing.

Political participation; Panchayat Raj; Gender; Environment

Health Status of Adolescent and Young Tribal Females and Its Effect on Education

Dr. Debjani Roy, Head

Department of Geography, Nirmala College, Ranchi-834002, Jharkhand, India, debjaniroy696@gmail.com

Abstract

There is a Chinese saying “If you wish to plan for a year sow seeds, if you wish to plan for a decade plant trees but if you wish to plan for a lifetime educate people”

India is going through one of the most significant demographic transitions that have ever taken place. Nearly 30% of its total population of 1.23 billion is under the age of 18 and nearly half under the age of 24. Tribals constitute the second largest social group in India. Health and education are necessary to achieve the full potential of the nation’s human capital. A developing country like India has already entered into the fourth stage of demographic transition by addressing these two issues with great seriousness. Tribals have for long been marginalized and inspite of consistent efforts by the Government their health and educational status needs a lot to be desired. Adolescent and young tribal females are malnourished, wasted and stunted. This has a direct effect on their education. This paper is an attempt to study these two important correlates of human development amongst the tribal population of Jharkhand. The study is based in urban areas where gender bias and societal apathy prevent tribal females from achieving what is rightfully theirs. The study tries to address the larger issue of how poor health and low level of education can impede a country’s progress and suggests ways of mitigating the same.

Keywords:

Tribals; malnourished; educational status; human development

Living on the Edge: Crisis in the Tea Industry and Consequent Maternal Health Risk among the Tea Plantation Workers of India

Kerketta S

Nistarini College, Purulia, India, saraswati.kerketta@gmail.com

Abstract

This paper intends to study the reproductive health scenario through the narratives of women tea plantation workers in India. Tea industry is one of the oldest organized sector industries in India and has very high concentration of female workforce. Maternal health forms an integral part of reproductive health of women. Pregnancy and childbirth is a period of elevated risk for the life of a woman. Utilization of skilled intranatal care services depends upon availability and accessibility of the health care services. There are various legal provisions safeguard the interests of women workers. Plantation Labour Act of 1951 compels tea estates to provide health care services to the workers. After initiation of globalization process, Indian tea industry is facing unprecedented crisis which has its bearing on the health care services provided to the women workers. Plantation workers are the lowest paid workers in any industry in the world. They rely on additional benefits from plantation which including medical facilities. These have been effective means of enslavement of laborers by the owners. Economic determinants restricts these women to use poor quality of health care services provided by the plantations. Besides socio-cultural factors are crucial in determining the utilization of intranatal care services among women laborers.

The results reveal that in the study in Darjeeling hills and Dooars Region incidents of premature delivery, underweight births and miscarriage are common among the women workers. Besides utilization of intranatal care services is substantially low which is closely associated with spatial and socio-cultural inaccessibility of these workers.

Key words:

tea plantation; women workers; intranatal care; socio-cultural factors; spatial inaccessibility; crisis in tea industry.

Regional Pattern and Contemporary Challenges to Education of Tribal Girls in

Jharkhand

Baraik, VIJAY Kumar

Discipline of Geography, School of Sciences, Indira Gandhi National Open University, New Delhi-110068, India,
vijaybaraik@ignou.ac.in

Abstract

Jharkhand is a region of vast physical and cultural diversity with wide regional disparity. The region possesses full of contradiction with coexistence of glaring paradoxical situations. Education, an important means of empowerment and progress of the weaker sections and among best indicators of development is yet to reach the tribals effectively. The educational level among tribal girls is in general low added by a wide disparity across the state and various communities. There are high drop-out rates as well lead by various reasons including outmigration of girls to major cities as bread winners by becoming domestic workers, which has been of a major gender concern in recent times. Overall, the challenges to education among girls pose challenge to the development of the society as these are supposed to be the first teachers of children. In this background, this paper maps the regional pattern of education among tribal girls in the backdrop of various regions of Jharkhand. The paper also highlights the contemporary challenges to education among tribal girls in Jharkhand focusing outmigration also. The study is based on the secondary data obtained by various government sources and supplemented by the field work based report on the subject. It will be a base for addressing some of the above issues related to education for corrective measures for future.

Key words:

Spatiotemporal Analysis of Female Billionaires Geography in China Since 2003

WANG Dongfang^{1,2}, HUANG Jie³

¹ University of Chinese Academy of Sciences, Beijing, China, 100101, wangdongfang15@mailsucas.ac.cn

² Institute of Urban Environment, Chinese Academy of Sciences, Xiamen, China, 361021,

³ Institute of Geographic Sciences and Natural Resources Research, Chinese Academy of Sciences, Beijing, China, 100101

Abstract

With China's rapid economy growth since 1978, female billionaires which stand for the gendered rights of owing higher economic status have become a unique group. And the spatiotemporal pattern of female billionaires in China could reflect the characteristics of the change of gendered geography on female economic rights. *Forbes rich list of China* was initiated in 2003 and ranks the billionaires who own the highest economic status. Mainly based on the top 100 people of *Forbes rich list of China* since 2003, the key features of women including *number, industry type, age, family backgrounds* and *enterprise location* are analyzed to summarize spatiotemporal distribution features of the female billionaires using GIS tools and discuss the key factors influencing the geography change. The results showed that: (1) with the rate of 175%, the number of female billionaires increased from 3 in 2003 to 17 in 2015 which is still small compared with the number of male billionaires. (2) Since 2003, Chinese female billionaires showed a younger trend and the main industry type is real estate. (3) The geographic distribution of female billionaires are uneven which relates to China's uneven economic pattern. Almost above 90% of female billionaires are in *Beijing, Guangdong* and *Hong Kong* while none of them are in the central and west provinces of China. (4) Family background and cultural factors greatly impact on the geography of female billionaires. The study will be helpful for the central government and local authorities to make effective strategies on the fair rights of Chinese women development.

The Dynamics of Gender-Differentiated Assets in the Wake of Natural Disasters in Indonesia

Pangaribowo, E. H.

Department of Environmental Geography, Faculty of Geography, Gadjah Mada University, Indonesia, evithahp@ugm.ac.id

Abstract

Asset holdings are seen as means of coping with various circumstances, particularly the bad ones. Within the households, husbands and wives both accumulate and own assets individually or collectively and they use these assets differently. Using Indonesia, one of the most susceptible countries to climate change and disaster prone, this study investigates the dynamics of assets owned by the household head, his spouse, or collectively by both of them in response to natural disasters. The asset dynamics, particularly those of female household members are important as emphasized by a growing amount of literature on the role and contribution of female's asset in promoting household welfare. This study takes advantage of a longitudinal and nationally representative data set; the Indonesian Family Life Survey (IFLS) to rigorously explore the impacts of natural disasters on the dynamic of gender-differentiated assets in the household. The findings show that asset ownership was male dominant for every category except for jewelry. The gap of asset shares between men and women in the household was almost 2:1, which clearly indicates male dominance in asset holding. Controlling for socio-economic variables such as education, household size, and income, experiencing one of natural disasters (flood, landslide, earthquake and volcanic eruption) affects the jointly asset holdings. Flood and earthquake reduce female's liquid asset holdings, particularly livestock and jewelry. Selling these assets is considered as part of planned mechanism for coping with crises. This finding embraces the importance to female's asset holding to facilitate households recovering from the natural disasters.

Key words:

Gender; asset; natural disasters; Indonesia

The Population change in Women Friendly City

Yeji Lee

Ph.D candidate, Seoul National University, Seoul, 151742, Korea, yl348@snu.ac.kr

Abstract

The woman's right has improved more than any other time. Starting from the right to vote, now women begin to fill the higher level position and have been competed others to show good performance. The role of women in society is different from the past while the role as minority and duty as mother stay same. This is a long time conflict. Many try to solve this problem and this applies to urban planning lately in Korea that named as "Women Friendly City." Currently there are 56 areas practicing Women Friendly City; 31 cities and 25 districts. Many innovative policies, funds, and designs have implemented to make women's living more convenient. Focusing on reproduction and motherhood discipline, the research conducts how effective these implementations have been. Using the 31 cities, the birth rate, the increase of population, the age distribution ratio of women, and the environment of raising children including number of day care, low crime rate, solid education opportunities, and affordable residential price are analyzed between before and after the declaration of Women Friendly City. Since the idea and policy have been introduced only seven years, there are not many significant differences found. The number of recipient and the type of service have increased gradually and it attracts women live the specific city. It needs to work on more, but can be very tiny step to solve population problem in shrinking city, high unemployment rate, discrimination due being a mother, late marriage, and low birth rate.

Key words:

Women friendly city; birth rate; population

Violation of Human Rights of Women in India

Sahab Deen

Jawaharlal Nehru University, New Delhi-110067, India, sahabjnu@gmail.com

Abstract

In India, women's spheres of life are innate in the hierarchal social structure. Indian society is a highly patriarchal and caste-based in which realms of women are extremely gendered i.e. place, right and freedom. Women, in India bear the burden of gender, caste and class. Being women, they suffer from many forms of violation of human rights, including sexual oppression, violence and socio-economic disempowerment. The violation of human rights of women has increased rapidly (NCBR, 2012). The key objective of the paper is to study the violation of human rights women in India. The paper is a quantitative work based on secondary data extracted from NCBR 2000-2014. An index has been constructed for mapping the violation of human rights of women to examine the levels, patterns and linkages among socio-cultural dynamics among the social groups. Firstly, it discusses the evolution of social attitudes towards women in academic literature. Secondly, it analyzes the status of violation of women's human rights across the Indian states. The literatures indicate that the women have been treated as slaves in view of their unfair position to men. This subjugation of women is underscored and justified in well-known sanctity of religious texts. The current status of women reveals that they are continued to be discriminated and face violation of their human rights. The magnitude of women's human rights violation varies among the social groups and regions. Thus, the patriarchal socio-cultural practices are still prevails in the society which are encouraging the violation of women's human rights.

Customary Right of Women to Inherit Property: A Study of Mirzapur District Uttar Pradesh in India

Dr. Sher Singh

Ram Lalit Singh Post Graduate College Kailahat, Chunar, Mirzapur, Uttar Pradesh-231305, India,

shersinghacademic@gmail.com

Abstract

In India, women's location of life-course is inherent in the hierarchical social order. Indian society is a highly patriarchal and caste-based hierarchical society in which domains of women are highly gendered i.e. place, rights and freedom. The gendered domains are the most crucial for women to inherit property in her father's as well as in-laws' family. Thus, the main objective of the research paper is to analyze the socio-cultural right to inherit property for women and try to find out the causes of demoralizing the right to inherit property for women in Indian society. The research paper is based on quantitative and qualitative work of primary data; total 50 samples have been interviewed from different locations in the villages of district Mirzapur, Uttar Pradesh, India. There are two major section of the present research study. First section explains the socio-cultural customs in the available literature which underscores to secondary status of women and discourage the customary right to inherit property in their father's family and in-laws' family. Second section has tried to explore the present social and economic factors engrained in the psyche of the society in the form of customary laws which debar women's right of succeed to property in their respective families. Findings of the study reveals that there are existence of several social and cultural customary laws entrenched in the psyche of the highly patriarchal Indian society which are playing a major role to depressing the women's right to inherit property in their respective families in India.

Socio-Culture Right to Education and Consequences on Women Empowerment: A Review of Indian Historical Discourse

Dr. Mahendra Pratap Singh, Dr. Sher Singh

Ram Lalit Singh Post Graduate College Kailahat,

Chunar, Mirzapur, Uttar Pradesh-231305, India, mahendrasinghmirzapur@gmail.com

Abstract

A subordinate attitude towards women in India goes to long historical course of time. Women have been treated as slaves in view of their unfair position to men. This subordination of women is underscored in a well-known verse in Manusmriti: "In childhood a female must be subject to her father, in youth to her husband, when her lord is dead to her sons; a woman must never be independent" (The Laws of Manu (Trans.G.Buhler, 1964). This leads to impoverishment of women in terms of education and self-development. Thus, the main objectives of the research paper are i) to analyze the social attitude for educating women and its consequences, ii) to explore the causes of sluggish progress in women's education in India. The research paper is based on available historical literature along with supplemented by qualitative primary data collected from different locations of Mirzapur district of Uttar Pradesh, India. Firstly, the paper has discussed the social attributes towards women education available in different historical, religious and social laws books. Second section has tried to explore the socio-economic factors engrained in the psyche of Indian society which devaluates women education. The analysis of the study reveals that during the decades since independent, there is very slow progress in educational development of women at National level as well as regional. Moreover, there are several socio-economic and cultural practices prevailing in the patriarchal Indian society which creates obstacles to educational development of women despite the fact that government provisions to promote women empowerment.

Women's Empowerment among Youth and their Human Rights

Dalia Galal elAbady

Central Agency for Public Mobilization and Statistics), Cairo, Egypt and dalialabady@yahoo.com

Abstract

Women face much discrimination against evaluating their rights. The research problem can be crystallized in three questions: what is empowerment, why we want to influence the extent of women's domestic empowerment as a concept for evaluating their rights, how we can measure it and judge according to their rights. Take in consideration that young women represent the future generation, and the back bone of any development in the society. The study aims to empower the Egyptian young women (18-29) and to investigate what are the young women's human rights as well as they represent the future generation in Egypt. More specifically, the study meets the following objectives: Identifying the empowerment level they achieved (18-29) compared by the age (30+) and to explore various levels and types of empowerment measures in the household level, related to their rights. Identifying the recent differentials of Young women empowerment aged (18-29) compared by the women (aged 30+) in the context of their rights through some demographic and socio economic indicators. Identify factors determining women's empowerment and their rights regarding education, employment, place of residence, wealth status and circumcision. The study uses raw data mainly from (EDHS,2014) The study is based on both a descriptive analysis technique is employed to assess the levels, and differentials to reach the objectives of the study. An index has been used to measure the level of empowerment through SPSS and an analytical procedure of Geographic Information System or GIS data to represent results on maps.

Key words:

Women's empowerment index; differentials; determinants of women empowerment; GIS analysis.

An Analysis of Gendered Urban Insecurities and Implications for The Sustainable Development Goals

Peake, L and de Souza, K.

York University, Toronto, Ontario, Canada, M3J 1P3, lpeake@yorku.ca

Abstract

In the current era of neo-liberal development, framed in the global south by high levels of movement into urban areas and the new development efforts of the Sustainable Development Goals (SDGs), there is a paradoxical occurrence. On the one hand, there are increased efforts to lift people out of poverty and, on the other, increasing levels of insecurity in urban places. Insecurities are deeply gendered and defined here as having five dimensions: (i) social insecurity: one's place in the city, according to racialised ethnic hierarchies; (ii) economic insecurity: the condition of not having a stable income or other resources to support a standard of living now and in the foreseeable future; (iii) physical insecurity: condoned norms of (often unchallenged) practices of gender-based violence against women and girls; ((iv) emotional insecurity: a sense of vulnerability or instability, underpinned by a lack of hope; and (v) environmental insecurity: the ability to cope with environmental risks or changes (including climate change) and access to resources, including food and water. These insecurities are explored in relation to the ways in which women use and give meaning to urban space, with analysis focusing on the insights these findings provide for the SDGs relating to gender equality and empowerment and inclusive and sustainable cities.

Cities; urbanization; gender; women; Sustainable Development Goals

Landscapes of Women's Fear in Tehran

Baniasad, A, Mohammadzademiraki, T

Department of Geography, Shahid Beheshti University, Tehran, Iran, alibaniasad@hotmail.com

Abstract

In an urbanized world, women are playing a crucial role in the development of cities more than ever. Gender equality is a factor that shows the extent to which they can actually take part in such a process. City managers and planners are seeking to create urban spaces for all citizens in order to improve their quality of life. Fear of crime is a concept affecting women's interaction with public spaces, hindering their equal access to city; hence lowering their living standards. Tehran, the capital of Iran, is experiencing rapid urban growth and women's place in its constantly changing built environment is a matter of concern. By conducting a series of quantitative (survey questionnaire) and qualitative (face to face interview and diary recording) researches from a specified sample group of female university students and reviewing city policies, we have tried to overcome ambiguities around fear of crime and its related concepts to address how fear of crime shapes the everyday lives of women in the city. It appears that the state's ideological system of government along with women's perceptions of crime, generate fear of crime which in turn restricts women's ability to move freely in public spaces and prevents their access to their full rights in the city.

Key words:

fear of crime; urban space; spaces of fear; gender

Negotiating Neoliberal Urbanism in Ibadan, Nigeria

Adeniyi Ogunyankin, Grace

Carleton University, Ottawa, Canada, Grace.Ogunyankin@carleton.ca

Abstract

In the past five years there has been an intense focus on making Ibadan, Nigeria a world-class city. While the plans are aesthetically pleasing to many residents, there have also been resistances to the exclusionary nature of the urban projects taking place. This presentation will focus on women's gendered urban insecurities, particularly economic, social and environmental, which are currently exacerbated by neoliberal urban projects. Women's analyses of their gendered urban insecurities reveal the ways in which they negotiate religion, culture and colonial legacies in their daily lives. Their analyses also highlight their awareness of patriarchal impositions, which facilitate their exclusions from decision-making processes. I argue that contrary to survivalist accounts about African women, the Ibadan women in my research often frame their issues within a positive and negative rights discourse and do not view themselves as victims but rather subjects with entitlements. Women's rights discourse enables them to call into question the government's limited and gendered approaches to women's issues that often tend to shy away from feminist politics of gender and socio-economic equalities in attempts to label such social transformation projects as "un-African". However, rather than overtly agitate against patriarchy, women use cultural understandings of their gendered roles to strategically make rights claims to the neoliberal city and envision a more just city.

Key words:

Neoliberal urbanism; gendered urban insecurities; Ibadan; decision-making process

Women's Economic Insecurities and Strategies in Iran

Azam Khatam

Research Affiliate, the City Institute York University, Toronto Canada. azkhatam@yorku.ca

Abstract

Iran has one of the lowest rates of women's participation in the formal labor market in the Middle East. According to the official census, this rate has not changed much since 1966. Two decades of authoritarian modernization before the 1979 revolution did not change the overall rate of women's participation in the labor market in cities: the increased number of middle class women in public employees and social services like education and health was accompanied by a decline of working class women active in the handcrafts and traditional textile industry. Conservative efforts to marginalize women in the public spaces and social life in the post Islamic revolution forced secular female experts to seek early retirement, or shift to family businesses. The women policy of the Islamic Republic remained contradictory as significant efforts to improve women's education and health in the last three decades coupled with dramatic backward shifts in women's legal rights and status.

This research examines women's economic (in) securities in terms of access to economic resources, including formal job market, property ownership and participation in the household's important economic decisions. Based on my interviews with women in working and middle class families in three cities in Iran, this paper suggests that women have adopted ownership strategies, in forms of dowry, share of home ownership, personal jewelry and bank deposits to face existing and future economic insecurities which are intensified by legal and political system.

Key words:

Women and labor market; women's economic strategies.

Abstract

A gender perspective on displacement and associated resettlement is less common, since the traditional discourse has categorised the development refugees to be a homogenous undifferentiated people - without gender, age or other defining characteristics except ethnicity. Many studies are being done to analyze the impacts of displacement caused by development projects on the resettled communities. But the differential impacts of displacement on men and women have only been considered very recently. Gender has been missing in the impact assessments of large development projects like dams. This paper, based on an ongoing research work, is an attempt in this direction to analyse some post resettlement impacts of Sardar Sarovar Project on the tribal communities from a gender lens.

The first part of the paper dwells upon the changes in livelihood opportunities and their impacts upon men and women at the new sites. The second part shows how the spatial mobility of both men and women has undergone a change at these resettlement sites. The manuscript ultimately attempts to highlight the transformations in gender roles and gender relations due to displacement and resettlement by providing empirical evidences from resettlement sites. The research has adopted mixed methods in data collection. Data has been collected through household surveys, focus group discussions and in-depth interviews with key informants.

Key words:

Gender Analysis; Displacement; Post Resettlement; Livelihood; Spatial Mobility

Demystifying the Gendered Aspects of Migration and Multiculturalism in South Korea

Jung, H. J.

Seoul National University, Seoul, South Korea, jung0072@sun.ac.kr

Abstract

Feminist approaches to migration have captured complicated dynamics of contemporary international migration, which is gendered, power laden, and intersectional. In spite of their innovative contribution to this field of research, the feminist approaches tend to be clustered around particular types of migrants, namely the third world women migrated to the first world as care givers. This paper provides a case that apparently goes against the feminization of migration, using an example of South Korea, and makes an argument that the impact of feminization is not limited to the “women’ works,” and needs to be considered with other processes including ethnicity and nation. South Korea, which has rapidly turned to a migrant receiving country shows bipolarized patterns: feminization in marriage migration and masculinization in labour migration. The former draws heated spotlight of government-led multiculturalism discourses, while the latter is dealt with economic discourses rarely touched by gendered perspectives. Female workers in the latter group mostly consist of Korean Chinese who are entitled to take over service jobs not allowed to other ethnic groups according to the visa policy for diaspora. This policy accelerated gendered and ethnic division of migrants’ labours producing male young workers salient in industrial pockets, which accounts for almost 90% of males under working permit system. This research criticizes too much “gendered” multiculturalism discourses in South Korea proposing intersectional approaches and argues that apparently masculinized labour migration is not a symptom of de-feminization but a part of feminization, which combines nationalistic discourses into gendered migration.

Key words:

South Korea; feminization of migration; multiculturalism; intersectionality

Does Government of Uganda Emergency Plans and Strategies Taking into Account Different Needs and Social Roles of Women and Men, Before, During and After Forced Displacement?

John Mushomi

Makerere University, jmushomi@gmail.com

Abstract

The influx of internally Displaced Persons in Uganda is still a negative point of contention and the issues of gender in relation to forced displacement continue to be eminent points of challenge due the fact that the analyses of the available refugee plans, strategies and policy have not been given a priority. The paper seeks to investigate a) the gender oriented specific needs of current displaced persons in Uganda by place of origin. b) The resources provided c) The available emergency plans, policies and strategies and how they treat issues of gender. d) The level of involvement of main stake holders in responding to gender issues before, during and after forced displacement. e) The impact of gender specific needs and social roles to displaced populations and to host communities in Uganda are presented.

Drought and The Copying Strategy of Migration Among the Maasai People of Kenya: A Gendered Analysis

Thomas Kibutu

Department of Geography, Kenyatta University, P. O. Box 43844 – 00100, Nairobi, Kenya, nkibutu2@gmail.com

Abstract

The Maasai are well-known pastoralist and their photographs dominate tourist guidebooks about East Africa and its wildlife. They are one of the main selling points of Kenya's tourism industry and their culture is commercialized and exploited the world over. However, this high degree of visibility obscures the fact that over time, they have become increasingly exposed to processes of marginalization and destitution. Historically, this has been a result of socio-economic dynamics during the colonial and post colonial periods that have lead to diminishing range resource base. However, in the recent past, the Maasai way of life has also been increasingly adversely affected by climate change, and more so, increases in the severity of drought. This paper presents the findings of a research on a group of Maasai families who migrated with their livestock to a village in the outskirts of the city of Nairobi (Naserien) to escape the ravages of drought in the nearby rural Kajiado County. The paper shows that their reactions to dislocation appear to be gendered experiences. The majority of the men got employed as either *askari-wa-usiku* (night watchmen) in the nearby middle-class residential estates and business premises or as *ocekut* (herdsmen) or, in some instances, both. The majority of women on the other hand are engaged in the businesses of beadwork and milk. Indeed, women seem to have taken up more of the men's traditional obligations as they now take care of much of the family budget from their engagement with the market. In some sense, the changes that are happening can be viewed as empowering to both men and women. The paper concludes that there are now more complex and layered identities among the Maasai as a result of this migration.

Empirical Analysis on Marginalized Experience and Negotiation Process of Spouses of High-skilled Migrants in Singapore

Cindy Si Yeon Rim

Korean National Commission for UNESCO, Seoul, Korea, syrim@unesco.or.kr

Abstract

In response to the challenges of globalization, an ageing population and a low fertility rate, Singapore government has adopted an aggressively liberal immigration policy to attract high-skilled migrant known as 'foreign talent'. As there is a growing negative sentiment about foreign talent that accuses many of them of only taking advantage of Singapore, its citizens' anti-immigration anxiety is prevalent and only worsening. To mitigate the anxiety, the government has started to take the restrictive policies on the migrants such as strengthening the regulation for qualification of EP visa and PR, which foremost affected the migrants on the margins such as women. This article examines the case of female spouses of high-skilled migrants in Singapore who, in many cases, are as well-educated and skilled as their partners in their home country. Whilst researches on high-skilled migration were mainly focused on male, and researches on female migrant were concentrated on low-skilled workers such as foreign domestic workers, these dependent spouses have not been given sufficient attention in the scholarship despite their importance. Confronting the transition status from independent career women to dependent housewives to their male spouses, these women are trying to negotiate their situation by getting their own job, pursuing further degrees, or actively participating in community work. Host country's recent policy change deeply affected the migrant on the margins and narrowed the employment opportunity for those women and they tried to negotiate the situation by making different decisions accordingly. This article explores the marginalized experience and negotiation process of dependent spouses of high-skilled migrants in Singapore, relying on in-depth interviews and participatory observations.

Home Away from Home: Lived Experiences of Taiwanese Women in Hong Kong

CHIANG, L. H. N.

Department of Geography, Taiwan University, China

Abstract

The 1980-1990s saw a significant wave of emigration of Taiwanese to developed countries where they seek political stability, social security, children's education and better quality of life. By using in-depth interviews of 35 women who are aged 40-75, this study focuses on female migrants who went to Hong Kong to join their husbands, or have married Hong Kongers, and have developed their own businesses successfully. Starting as early as the 1960's, some have made Hong Kong their homes, while encountering various difficulties in adapting to a different kind of Chinese culture at the beginning. Through belonging to various organizations, they have developed female friendship networks over the years, enabling them to relate closely to other Taiwanese in Hong Kong society. Despite successful efforts in planting new roots/becoming Hongkongers over the last few decades, respondents talked about returning (*luo ye gui gen*) to Taiwan. Connections maintained with their Taiwan homeland has enabled them to be aware of developments, and transnational linkages with their parents and relatives in Taiwan have strongly affected their desire to return. This study concludes that frequent contacts with their first homes have triggered their desire to return, while a hospitable environment with a good quality of life in Taiwan have all been part of their intention to leave their host community.

‘Hong Kong is not China!’ Glocal Articulation of ‘China Threat’ Discourses in Hong Kong

Es, M.E.

Department of Geography and Resource Management, Chinese University of Hong Kong, Hong Kong SAR, China,
murates@cuhk.edu.hk

Abstract

Hong Kong is a rather quiescent place to discuss issues regarding cosmopolitanism, difference, and conviviality, despite Hong Kong S.A.R. Government’s reluctant embracing of multiculturalism and attempts to brand Hong Kong as “Asia’s world city” where “East meets West.” Relatively muted public discussions of ethnic difference and multiculturalism generally revolve around the problems faced by local South Asian communities and foreign domestic workers, yet nowadays some of the greatest cultural anxieties of Hong Kongers stem from their city’s conflictual reintegration with mainland China. The tensions between increasingly vocal localist activists and the daily visitors from mainland has reached new heights in the wake of 2014’s Umbrella Movement. This paper investigates the articulation of global discourses of ‘China threat’ to local struggles over belonging by looking at the ways in which negative images of, and narratives about China and the Chinese circulate, get appropriated, and reworked in Hong Kong. To this end, I explore the gendered representation of mainlanders as ‘heartless mothers, greedy gold-diggers’ as well as ‘uncivilized masses’ in various media and online platforms. The paper deploys the concept of ‘narcissism of small differences’ to explain the construction and reproduction of cultural boundaries through everyday encounters between the mainland visitor and the Hong Kongers.

Marriage, Migration and Multiculturalism: Arranged marriages in Britain

Pande, R

School of Geography, Politics and Sociology, Newcastle University, Newcastle upon

Tyne, UK, raksha.pande@newcastle.ac.uk

Abstract

This presentation looks at the practice of arranged marriage among women of Indian, Pakistani and Bangladeshi origin resident in Britain. It examines the conflation of arranged marriages with forced marriages and the assumption that arranged marriages are examples of cultural practices that thwart individual agency. Drawing upon original empirical data, I will argue that in the practice of arranged marriage, some South-Asian women are able to exercise agency while choosing their marriage partner. They adapt traditional arranged marriage practices to navigate their way around strict cultural expectations and to negotiate with their family members the choice of a match that is favourable for them. I provide a corrective account of arranged marriages by challenging the stereotype of the 'oppressed third world women' and their experiences of such marriages. I will do this by employing the idea of post-colonial feminism and by highlighting two long standing issues in feminist debates; the notion of agency and the conception and role of power in the struggle for women's rights. Finally, I will make a case for a post-colonial approach to feminism as one way of reconciling feminism with the politics of multiculturalism.

Arranged marriages; British-Asian; post colonialism; feminism; multiculturalism

Multiculturalism and Gender: Challenges Posed by New Migration and Diversity

Ho, E.L.E

National University of Singapore, Department of Geography, Singapore, elaine.ho@nus.edu.sg

Abstract

This paper examines the multiplication of difference evinced through new migration in Singapore and its intersection with gender difference. Singapore is a site of both 'old' and 'new' migration trends. The arrival of new migrants from the same ancestral homelands as Singaporeans of Indian and Chinese ethnicity has resulted in an increasingly diverse social fabric that defies the multiculturalism model upheld by the Singaporean state for five decades. This multiculturalism model, which seeks to promote racial equality, is premised on categorisations corresponding to the ethnic groups considered 'pioneer' in Singapore. In popular parlance, this is known as the CMIO model (i.e. 'Chinese', 'Indian', 'Malay' and 'Others') and it informs the formulation of a range of policies in Singapore, including housing and education. However, new migrants from China and India trouble the state's compartmentalised approach towards ethnic relations. Despite being co-ethnics with Chinese- or Indian-Singaporeans, they are considered socially inferior by locally born Singaporeans. This paper highlights the gendered aspects of the multiplication of difference manifested in Singapore today by drawing attention to the gender subordination of Indian migrant brides and the derogatory stereotypes attached to Mainland Chinese female migrants in Singapore. In so doing the paper reflects critically on the majority-minority relations paradigm that has characterised multiculturalism debates so far, including within feminist critiques of multiculturalism (e.g. 'minority patriarchy'). It argues that the multiplication of difference through new migration necessitates new approaches towards living in/with diversity.

Skilled P.R. Chinese New (Im)migrants in Singapore: Negotiating Gender Identities with Sense of Belonging in a Multicultural Society

Qi, YT

Department of Geography, National University of Singapore, Singapore 117570, yunting.qi@u.nus.edu

Abstract

Researchers have given much attention to examining the case of transnational migrants negotiating their 'fit' into a culturally different society. In these cases, transnational migrants have to deal with a huge cultural gap with host society, among other related problems. In this paper, I focus on a less examined case, in which migrants share a similar cultural background with the host society. Taking skilled P.R. Chinese (im)migrants in Singapore as an example, I interrogate how they negotiate their sense of belonging to their homeland alongside the development of a new sense of belonging to host society, paying attention to the dimension of gender. Drawing on semi-structured interviews with 12 females and 13 males, as well as 6 participant observation of organized group events involving P.R. Chinese (im)migrants, the research finds that both female and male (im)migrants do not engage with the multicultural environment in Singapore, although female (im)migrants keep a more open-minded attitude towards multiculturalism than males. However, while generally lacking social integration with their hosts, female (im)migrants show a stronger belonging to Singapore, especially to local everyday life, than males. These findings suggest that first, similar cultural background can help to generally strengthen the (im)migrants' sense of belonging to multicultural host society; second, gender can make a difference of sense of belonging due to the gendered geographies of everyday life. By providing the less examined case, the research furthers the knowledge of transnational migrants in a multicultural society from a gendered perspective.

Key words:

gender identity; sense of belonging; multiculturalism; P.R. Chinese new (im)migrants; Singapore

The Multi-ethnic Islamic Society in Guangzhou and The Daily Practice of New Chinese Muslimahs

MAY LI

Yokohama City University, Tokyo, Japan, sevenleaves77@hotmail.com

Abstract

Guangzhou, situated in the southern tip of main land China, has a long history of embracing foreign merchants and migrants including Arabic and Persian Muslims. In the first two decades of the “open door” era, many Chinese Muslims including “Hui” and “Uyghur” came to Guangzhou in chase of business chance. Around the ancient mosques new Islamic society came into form. Since late 1990s, along with China’s economic growth and the improvement of the degree of freedom of religion, more Muslims, both Chinese Muslims from northwest China and Muslims from Middle East, Southeast Asia, Africa and other foreign countries, joined Guangzhou’s Islamic society and made it a highly diversified multi-ethnic place.

The author did a two-week fieldwork in Guangzhou’s Muslim society in the summer of 2015. During the fieldwork, the author met and interviewed Muslims from different areas and countries, including a group of New Chinese Muslimahs who converted to Islam out of marriage with Muslim migrations or other reasons. This study shows how contemporary Muslim Migrations contribute to the diversification of Guangzhou’s Islamic society. Also through a gender perspective these study exams how the New Chinese Muslimahs empower themselves by means of daily practice such as learning Arabic and Islamic knowledge.

Lot: A Poetic Memoire of Girlhood in the Colonial Island Landscapes of Haida Gwaii in Northwestern British Columbia

de Leeuw, Sarah

The University of Northern British Columbia, Northern Medical Program, UBC Faculty of Medicine, Prince George, Canada deleeuws@unbc.ca

Abstract

Haida Gwaii (the Queen Charlotte Islands) holds a unique place in Canada's historic and contemporary colonial imagination. Romantically constructed since late 18th century contact through to late 19th and early 20th century geological and anthropological exploratory expeditions, and arguably into the present day through discourses of eco-tourism and new-age spiritualism, Haida Gwaii (and the Haida First Nations Peoples who have lived on the islands since, in their words, 'time immemorial') have consistently been positioned as a faraway yet accessible, savage yet civil, island geography. Named by surveyor Captain George Dixon in 1787, whose ship was *Queen Charlotte*, the islands were formally renamed from The Queen Charlotte Islands to Haida Gwaii in 2010 as an alternative to the colonial-era name – emblematic of complex and gendered colonial relationships, however, removal of Queen Charlotte erased one of the few references in settler colonial British Columbia to what may have been Britain's only Black monarch, Charlotte of Mecklenburg-Strelitz. This paper, in conversation with a growing series of literatures, popular cultural references and even tourist guides, is a poetic memoir about growing up on Haida Gwaii. The paper (a poem) grapples with the tense and overlapping narrations and presences inherent to the islands and is extracted from a poly-vocal long poem that combines colonial journals, geological surveys, tourist bogs, and ethnographic records with personal memoire-esque reflections about growing up 'white girl' on Haida Gwaii.

Paradise Island for able bodies?

Schmidt di Friedberg M., Malatesta S., Garbo R.

University of Milano-Bicocca, Milano, p.za ateneo nuovo, 1, 20121, ITALY

Abstract

The Maldivian Resort is, “par excellence”, a place created to stress the exoticness and sensuality linked to the tropical island geographical imaginary. The illusion of living an exclusive experience, surrounded by the “perfect tropical setting”, has been based on the selection of suitable places, norms, practices and actors. This “place making” process can be read even as a mechanism of inclusion of the human and natural bodies allowed to “inhabit” this paradise. In fact, beyond the well-known “commodification of places” as principle of production of the tourist sites, this mechanism helps us to reflect on the spatial exclusion of those who, due to economic, cultural and physical status, are not suitable as actors of this “scenario”. By quoting Chris Philo (1992), in this contribution, we read this spatial mechanism by discussing the geographies of “other than” abled-bodied tourists and by analysing both the materiality (in term of accessibility) and the imaginary (in term of inclusion) that define the Maldivian Resort as a place.

Resorting The Island in The Maldives: From The Bali Syndrome to The Kurumba Game

dell'Agnese E., Università di Milano-Bicocca, Milano, Italia

elena.dellagnese@unimib.it

Abstract

The Bali syndrome (Minca 1996) refers to the dynamics of enclavisation of tourism destinations. The spatial delimitation of purified enclaves, in apparent contrast with the tourists craving for Otherness, is usually explained with the desire to provide services of high standards and beautified landscapes, avoiding social and cultural clashes in the same time. In the Maldives, the process of tourism enclavisation has been pushed further. Since the establishment of first resort, Kurumba, in the Seventies, tourism activities have been promoted under the logic of “one island, one resort”. So, tourism islands have been designated as “spaces of exception”, operating in a Time Zone different from the one of the State, and consenting the infringement of all the rules concerning the body (about eating, drinking, wearing swimming suits or having sex outside the marriage), imposed by the State religion. Inside the island-resort, other spaces of difference are delineated; beside the beach, the Spa and the other tourism areas, where the “certified” bodies of the tourists can move without restrictions, there are the areas for the staff and the maintenance, where the tourists cannot enter and the Maldivian rules are still operating. Inside the tourism spaces of the resort, the recent trend of Halal tourism and the need of Arab women of enjoying their privacy, while sunbathing, demand private swimming pools and restricted access. In this way, new spaces of exception are created, like a set of Chinese boxes, which turns the Bali Syndrome in the much more articulated Kurumba game.

The Sexualization of the Coastal Female Body: The Case of Young Women

Solana-Villanueva, N.

Colegio de Postgraduados, Tabasco, México, nsolana@colpos.mx

Abstract

The experience of young women³ in Lagunillas⁴, a coastal community in Tabasco, Mexico, is related to the daily tensions motivated by the sexualization of their bodies. Stereotypes associated to place strengthen this perception, as it naturalizes “girl’s behavior”, showing them as savage and immature women.

There is a series of representations about the teenagers’ sexuality in this coastal area, which impersonate them as uncontrollable bodies. These representations limit their mobility and opportunities. It also motivates adult control mechanisms such as rumors and gossip impacting the prestige of these girls.

One explanation for these representations of gender and sexuality, are associated to the articulation of the categories of race and ethnicity in that area. There is a relationship between the historical construction of sexualization of young girls and the process of miscegenation in the coast. This construction is related to the sexualization of black, indigenous, mestizo and low class women too, which started with Colonial period. The narrative discourse about honor and decency of the privileged impacts the construction of those women not belonging to this class, and have facilitated a type of family organization which favours cohabitation, rather than marriage.

The sexualization of the coastal female body, shows that this stereotypes has been built from the idea of the naturalization of the body. This idea essentializes the mestizo and other racialized human groups, and shows the association to the geographical origin and cultural consumption of the region.

Key words:

gender; geography; interseccionalidad; race; sexuality

³ It refers about women between 15 and 18 years old.

Gender and Geography of Spatial Mobility: The Role of Women's Education and Work

Guin, D

Centre for the Study of Regional Development, Jawaharlal Nehru University, New Delhi, India,
debarshi.guin.1988@gmail.com

Abstract

Women's physical mobility is one of the most important aspects of women's autonomy. In India women are often restricted within the household domain and they are not allowed to go outside alone. This is more a result of patriarchal and patrilocal society where social customs and norms have a firm grip on behavioral pattern of women. However, studies reveal that there is a spatial difference in women's status in India where women in southern India experience higher autonomy than North. The present paper is an attempt to analyse if education and work status of women have any bearing in improving their spatial mobility and whether the impact is similar across regions using National Family Health Survey -3 data. Pearson's Correlation Coefficient and Binary Logistic Regression has been used. The result shows a direct relationship of women's education and work on their physical mobility in terms of their freedom to go: market, to health care and to relative's house. Women having higher level of education and those who work outside home enjoy more freedom of movement than others. Though it has been seen that in case of urban areas, some of the north Indian states like U.P., Rajasthan, and Bihar etc, which are considered to be more restrictive in terms of women's freedom, show higher mobility among women who works outside home than southern states, the overall analysis indicates that the impact of education and occupation is not independent of the socio-cultural setting of India.

women; freedom of movement; education; year of schooling; work

Increasing Female Participation in electioneering Process in Bihar: A Study in their Empowerment (Assembly Election: 2010,2015)

Bharti Prerna

Department of Geography Patna University, Patna, India, bhartiپرنا123@gmail.com

Abstract

It is argued that women need to be empowered in the realm of political decision –making so as to facilitate their real empowerment. The growing participation of women in elections indicates a silent movement of women empowerment. The process of this empowerment is neither abrupt nor have similarities with western countries. There is a growing idea among women in the region that social transformation is much slower than political change so they prefer to play a decisive role in elections. Bihar is economically backward region and male migration to rich state of the federation is a common phenomenon. This factor gives female a responsibility to look after herself and her family in the absence of male members.

The objective of the study as (i) To find out an overall spatial pattern of participation of women in assembly elections held in 2010,2015 in Bihar. (ii) Nature and extent of participation of women in both elections.

The entire study has been conducted using secondary data obtained from election office, and then it is statistically and cartographically treated and represented. The study reveals that the women's participation has precedence over male participation. Although spatial variation in women's participation have been observed in both the assembly elections. It is also observed that women from rural area have more concern about their voting right in comparison with urban women.

Key words:

social transformation; political change; spatial

Reconstruction of Retirees' Masculine Identity in Japanese Suburban Communities: An Examination of Their Life Stories

SEKIMURA O.

Gunma Prefectural Women's University, Tamamura-machi, Japan, sekimura.orie@gmail.com

Abstract

This study examines the transformation process of the masculine identity of male retirees residing in the suburban community of Sakuragaoka, Tama City, Tokyo, who opted for voluntary retirement, by analyzing their life stories. After 1990, it was established that gender is not an essential structure but is shaped by social and cultural differences. Femininity and masculinity are not axiomatic and can be modified. The author used a surveying technique to understand the subjects' identity, culture, and societal background from their life stories and experiences. Their narratives included reflections about their masculine identity, which they took care to maintain especially in their respective offices. From their narratives, we learnt that masculinity is not a monolith but instead is contextually and dynamically constructed. In suburban communities, residents have various roles beyond modern, fixed gender roles. Men who are part of a community need to construct a new masculine identity, which can positively undertake the changes of a flexible gender role. To achieve this, men should share housework and caring with women and restructure their masculine identity to collaborate with women.

Key words:

masculine identity; retirement; life stories; gender; Japanese suburban community

Status of Women in A Border State of Indian Territory: A Case Study of Jammu

District

Anuradha Sharma,

University of Jammu, India, anujammu2012@gmail.com

Abstract

In the course of history, the status of women has changed from time to time depending on socio economic and political structure of society. Women have enjoyed higher status during Vedic age in home and outside in India. They were well educated and had right to study Vedas and participate in all vital decision making processes. Later they lost opportunities. Today women are at disadvantageous position due to the wide gender gap which remained unabridged since centuries. The present study is an attempt to understand the phenomenon associated with gender. There are serious questions related to gender gaps especially in India and particularly in bordering states like Jammu and Kashmir where the political unrest and social convictions make the problem more complex. With no authority or power to live with confidence they have lost they control of their life and choices. Cropping gender issues in society clearly indicate the existing inequality in gender hence the concern calls for response and mature understanding. This study focuses on the components which are necessary to empower women for making choices for their better future and making this world a better place to live. a

Key words:

Status, Vedic age, gender gap, inequality, empower

Where Is the Retirement for Elderly Women in India? An Analysis Based On Census, 2001 And 2011

Subba D and Das B

Jawaharlal Nehru University, New Delhi-110067, India, subba.dipika@gmail.com

Abstract

Later life is a transition from active life to retirement, health to functional impairment, independence to dependence. Work, in India's context is complex. There is a large group of workers whose work does not generate sufficient sustenance for their livelihood. This paper analysed population Census data 2001 and 2011 to address the query pertaining to the work status of elderly women. Our enquiry also extends to understanding economic and non-economic activities of the elderly by gender.

The data is extracted from Economic tables, Census of India 2001 and 2011. Mostly rates and ratios are employed to understand gendered nature of the process over the years. ArcGIS has also been used to understand spatiality of the process of withdrawal/retirement.

An interesting dynamics of main activity of the marginal workers and non-workers has been revealed. It is identified that in Andhra Pradesh and Chhattisgarh relatively more women receive pension in their old age. However, dependency among women remains high even though the pension status of women in these states is better. It suggests that pension is quite insufficient in amount for women. It has also been observed that work participation rate among working age individuals (15-59) and among elderly (60+) varies widely for males but not so for females. Comparison between 2001 and 2011 reveal that pension receivers have increased substantially among women but dependency status did not improve at all. The data suggests irrespective of the source of pension; it is insufficient to relieve women from dependent status.

Key words:

work status; elderly women; retirement; dependent

Women Rights in Marital Life Course

Nagrle, N. S., Moon, M. M.

Jawaharlal Nehru University, New Delhi, India, neelamnagrle25@gmail.com

Abstract

The present paper focuses on subordination of women's rights in marital life. Gender is now understood to be a social status and a set of relationships between women and men. Gendered rights are social construct of the culture imposed on a particular individual/gender especially to women in almost every society. However in many societies women's rights are ignored or suppressed. Gender inequality is built into the organization of marriage and families, work and the economy, politics, religions, the arts and other cultural productions, and the very language we speak. The key objective of the study is to explore the causes of subordination of women in marital life. The paper has adopted analytical and descriptive approach to examine the issues related women's rights in their marital life. It analyzes feminist theories about why women and men are unequal? Further, it explore the causes of violation of women's right in marital life and presents the possible solutions of the problems through merging thoughts from different feminist perspectives. Findings of the research reveals that feminist argument about gender inequality is that it is not an individual matter, but is deeply ingrained in the structure of societies. The group of feminist arguments against biological determinism suggested that gender rights result from cultural practices and social expectations. Being a woman is not natural fact, she is not only product of history but also long history of socialization in order to civilization. Making women and men equal, therefore, necessitates social and not individual solutions.

Does Access to Inheritance Rights Really Matters? Insights from Population Based Study of Elderly Women in Rural India

Tripathi, Niharika

PhD Candidate, International Institute for Population Sciences (IIPS), Mumbai- 400088, India, niharika.t2010@gmail.com

Abstract

Context: Increasing evidences from both developed and developing societies underscores the pervasive phenomena of feminization of ageing process. It suggests that most of the issues related to economic support, provision of health care and social support will be largely challenges of elderly women. However, lack of appropriate data and poor understanding about the issues and concerns of elderly women in resource poor societies hamper sound policy formulations.

Objective: This paper examined socio-demographic variations in the access to property rights and its association with the economic dependence, social status and well-being/life satisfaction among elderly women in rural areas of India.

Data and Method: Using a mixed-method approach, data on about 300 women aged 60 years and above was elicited on range of demographic, socioeconomic and health related characteristics including inheritance/property rights, decision making agency, status within family and community, wellbeing and life satisfaction etc. Cross tabulations, Chi-square test and adjusted logistic regression models were fitted to examine the association between access to inheritance rights and economic, social and wellbeing of elderly women.

Findings and Conclusion: Data indicate that only about one-third of elderly women inherited some property (essentially land or house) from either biological parents or husband. In fact, majority of elderly women inherited property from deceased husband as per prevailing cultural practice in rural societies of northern India. Often, the actual maintenance and rights rested with the children mainly the son of elderly women. However, it emerged that elderly women who accessed inheritance rights had relatively lower economic dependence, better decision making agency and reported improved well-being/life satisfaction than their counterparts. These results re-iterate the call for addressing the economic support for women in general, and elderly women in particular.

Inheritance rights; Older women; Agency; Economic Dependency; Well-being; Rural India.

Educational Attainment and Participation of Women in Rural Occupations: A Case Study of Haryana (India)

Dr. Rajesh Kumari Assistant Prof.

Dept. of Geography, Ch. Dheerpal Govt. College, Badli, Haryana (India), rajpoonia.jnu@gmail.com

Abstract

Women and rural women in particular, play many social and economic roles inside as well as outside the home. In addition to her daily work routine, consisting of, cooking, cleaning, and other domestic chores, rural women are also heavily involved in all aspects of state's agricultural sector. From crop production to livestock rearing, rural women are expected to regularly engage both domestic and commercial aspects of society. Despite such a huge contribution, her role has yet not been recognized. They have been excluded from the various training and rural development programmes which usually involve the menfolk, being offered only programmes related to child health, nutrition and so on. It indicates the invisibility of the majority of women, who act as unpaid workers on the family farm. Care of livestock is a female domain but as dairy work is becoming modernized, women are losing control of both management and economic returns. Training of women in animal husbandry is found to be totally neglected. The level of improved household technology, too, is very unsatisfactory, more especially in backward regions where the majority of women are still working with age-old tools. The paper examines the participation of rural women in home and farm activities with educational attainment in the state of Haryana (India). This paper highlights also impact of educational attainment on women occupation in rural areas. The study is based on data from the B & C Series, Census of Haryana (India), 2011. Above 15 years of the age group is the specific age group for observing the data. The statistical tool of correlation and cartographic technique (GIS, bar & pie diagram) has been used in the study.

Female Exploitation in Bt Cottonseed Cultivation; A case study of North Gujarat, India.

Nishu Kumar

Jawaharlal Nehru University, India, nishu.jnu2006@gmail.com

Abstract

With the advent of modern technology, especially after globalization and market liberalization period, the entire Indian agricultural sector has witnessed several structural changes from production related mechanism to new system of labour arrangement in the agribusiness sector led by Contract farming. Contract farming for Bt Cottonseed has developed and emerged immensely with its own positive as well as negative externalities. Many labourers are trafficked and are held captive by the contractors or rich farmers to assure the uninterrupted supply of labour force. Since most of the work done by manually, an intensive labour force is required more particularly the female children play a crucial role in it. Although in Bt Cotton seed cultivation, labourers constitute the major part of commodity chain process, but they are the weakest beneficiaries from the value chain. They are highly exploited even at the risk of their education, health care, family bonding and other safety guard protection measures in the hazardous work. The work activity creates inter-generational transfer of poverty, misery and bleak future for their socio-economic development. Majority of girl child are forced to leave education and work in the farms. Thus, creating conditions of bondage and slavery like situations.

Thus, there is a strong urge to address the whole question of a changing agrarian production structure under contract farming from a gender perspective, especially issues related with the labourer's nature of participation and working conditions.

Key words:

Globalization; Agri business; Externalities; Contract farming; Commodity Chain; Labour force; Gender; Exploitation; Health; Trafficked; Wages; Poverty; Hazardous work; Bondage.

Gender Equity and Empowerment: Role of Native Women in Conservation and Management of Natural resources in Himalayan regions of India

¹UPRETI Pallavi, ²SINGH Rani, ³JANGWAN Ashutosh

^{1,3}Research scholar, H. N. B. Garhwal University, Uttarakhand, India, pallaviupreti@gmail.com

Post-Doctoral Fellow, UGC New Delhi, India, raniprasadsingh@gmail.com

Abstract

Women are considered integral to conservation and management of natural resources especially in mountain regions. Socio economic dependency of local communities on local natural resources is much higher in mountain ecosystems. This paper tries to contemplate the role of native women folks in natural resource management by highlighting their roles in management of forest, land, water, agriculture, livestock, etc. The paper is based on the findings from the case studies of Mountain villages in Rudrapryag District of Uttarakhand (India). Taking women as primary respondents; empirical work used participatory techniques, focus group discussion, and field observations. Findings suggest that involvement and interaction of women in utilizing ecosystem service in the region is much more than men, in terms fodder-fuel wood collection, agro-forestry activities etc. Yet they face exclusion in terms of economic benefits and social equity. However, both mountains and women have begun to receive more global attention in the last two decades. There is a remarkable convergence of policy objectives between the themes of sustainable development, environmental conservation, and the advancement of women. Therefore, the paper also aims to identify ongoing natural resource management strategies, conservation benefits with women as major stakeholders and how these practices strengthen their socio economic capacities for better livelihood. In order to ensure sustainable use of natural resources the article recommends that policy makers, planners, local government and local communities must realise the predominate role of women in decision making, preserving traditional indigenous knowledge, daily livelihood practices, managing and monitoring economic activities in the region.

Key words:

Gender equity; Mountain ecosystem; Community based natural resource management

Socio-Economic Characteristics of Migrants Rural Households: Feminization in agriculture

Dr. Sarda Prasad

Post Doctoral Fellow, CSRD, Jawaharlal Nehru University, New Delhi-110067, India, sardaprasadk@gmail.com

Abstract

Migration is socio-economic process and it is one of the important demographic factors. At present rural out-migration is major factor that influence rural development. It has both positive and negative impact in rural economy by receiving remittances and loss of productive member from the village. Therefore, this study has been planned with two specific objectives- to study the factors rural out-migration and to examine the impacts of remittances on rural economy and agriculture. Study is based on primary survey that was conducted during May to October 2011 in two districts of Bundelkhand region, Uttar Pradesh. There were 360 households has been selected equally migrant (MH) and non migrant household (NMH). Study reveals that economy of migrant household is better than non-migrant households. MH has leased in and leased out of their land more than NMH. Cropping intensity among MH was higher. MH are more exposed about the health seeking behaviour, new agriculture technology and conscious about the time management. Female participation in home management has increased in the study areas. They are empowered by taking decision in household management and expenditure on household as well as on agriculture.

Key words:

Feminization in agriculture; Rural out-migration; Socio-economic status; remittances

Developing Interlinkages between Geographical Competencies and Value Education: Implications in the Teaching- Learning Scenario

AGNIHOTRI SEEMA

Amity Institute of Education, Amity University, Noida, U.P, India, seema.agnihotri@gmail.com

Abstract

The current century can be easily marked by dichotomies where on the one hand humanity is experiencing dense connectivity through advance technology and on the other feeling isolated and alone at the individual level. Due to all these, our value system is on hold. Many disciplines are addressing these issues according to their expertise and nature but no discipline can help us better than the geography which over the two centuries has tried to understand the intricacies of the physical and human relation through different approaches in a scientific manner. Geographical competencies not only enable us to remove our spatial biases but also curtail down the existence of stereotypes, prejudices and biases, emanating from spatial ignorance. Further, it also holds the key to transform our perception about the resources which under the materialistic outlook seems to be infinite.

With this background, this paper is attempting at the theoretical level with slight empirical evidences to inter relate geography with the value education. The main objective of this paper is to signify the geographical competencies as value laden software to promote the peaceful and harmonious world by minimizing the negativity prevailing while interacting with the spatial environment. In order to vindicate the objective, data was collected from the pre-service teachers to observe their geographical competencies regarding different places of the earth by abiding the norms of standard geographical competencies in mind. The paper concludes by evolving the framework where geographical competencies will be interlinked with the specific values, to be used in the classroom transaction to promote peaceful world.

Keywords:

Geographical competencies; value education; integration of geographical competencies with value education

Enhancing Scientific Literacy with Primary Geography Curriculum in China: An International Perspective

Xiaowei Xuan, Qingna Jin, Mijung Kim, Yushan Duan

School of Geography Science, East China Normal University, Shanghai, 200241, P. R. China, xuanxiaowei.123@163.com

Abstract

In China, geography is a basic subject with the nature of both science and social studies in elementary schools (Grades 1 to 9). This subject plays a key role in developing children's scientific literacy. In China, geography curricula (grades 3 to 6) are separately included in Science and Morality & Society subjects in primary schooling. In this study, authors look into the Chinese primary geography curriculum from the respective of geography as key part of developing scientific literacy. This study includes two parts: 1) it is to develop a framework of scientific literacy suitable for Chinese situations, by reviewing different definitions and interpretations of scientific literacy from an international respective; 2) based on the framework, it is to develop a primary geography curriculum in China in order to strengthen scientific literacy with geography themes in the curriculum. In this study, authors construct a geography curriculum evaluation framework for scientific literacy based on responsive model, by conducting interviews and survey questionnaires with the different groups who are related to primary geography curriculum (e.g. primary geography curriculum standards makers, scientific literacy researchers, geography educators, and primary school students). This research will bridge the gap between geography curriculum and scientific literacy in the current elementary education and provide possible suggestions for the coming primary geography curriculum reforms.

Key words:

Primary geography; scientific literacy; curriculum evaluation

Geography and Music – Enhancing Cultural Approaches to People and Places in Values Education

Meyer, C.

Leibniz University Hanover, Hanover, Germany, meyer@idn.uni-hannover.de

Abstract

In the Anthropocene, humans are the most influential factor behind transformational processes, as demonstrated by the phenomena of industrialization, globalization and climate change. The outer world is a mirror of the inner world and therefore of cultural awareness and values. If we want to ensure that the outer world has a sustainable future, we have to develop the consciousness necessary for achieving sustainability.

Geographical education is predestined to increase cultural awareness and values education. Since music works holistically on humans, it is particularly capable of reaching the inner world. Thus, music can enhance cultural approaches to connect the inner and the outer world. Furthermore, music can make a major contribution to values education beyond cognitive judging, because values arise in personal, affective experiences characterized by self-transcendence. Three interconnected stages of values education can be identified.

- 1 To be touched and deeply moved means having feelings which connect us with people and places. For example, the soundtrack of the documentary HOME evokes such feelings and experiences of self-transcendence.
- 2 Being involved and connected means empathizing with people and understanding their perspectives. For instance, “Beds are burning” advocates the rights of the Aborigines and asks the public to regard their history and cultural beliefs.
- 3 To be confident and committed means being self-aware and acting responsibly. The video “TckTckTck – Time for Climate Justice – Beds are Burning” by way of example seeks to raise public awareness about the impact of climate change and to make this planet a better place.

Key words:

Geography and music; cultural awareness; consciousness; values education

Geography Education in Bangladesh: Emerging Need in National Development

Muhammad Abdur Rahaman

ADAMS, Bangladesh, rana@b-yes.org

Abstract

Bangladesh faces the constant challenges of rampant poverty, high population density, and increasing population rate. Poor people are victim of a lot of problem including anthropogenic and natural disasters, underserved urban development, rural economic backwardness etc. It is one of the poorest country of the developing world, with a low resource base, a very low land-man ratio, and is threatened by both natural hazards and overexploitation. However this resource base is under see threat and environmental planning is necessary to regional and national land use planning, local development plan, local climate adaptation plan, geographical resource base appraisal and utilization planning. Moreover, in order to maintain a modern, scientific and effective education system including environmental education, Bangladesh need more emphasize on geography education. But in every sphere of education, geography education is lying under marginal level. The study aims to illustrate the present scenario of geography education in different level of education in Bangladesh and urgency of improvement of geography education in all level. With this objective, the study was conducted in primary to university educational institutional level with reviewing existing curriculum, sociometric analysis of geography education personnel, KII among education expert. The study reveals that geography is under marginal level and there is a high potentiality of geographic education to ensure national socio-economic and regional development.

Key words:

The Preliminary Study of Assessment about the Geography Practical Ability

Weiguo Zhou, Yushan Duan

East China Normal University School of Geographic Sciences, China, zhouweiguo21@126.com

Abstract

Geography practical ability is one of the key literacy about the secondary geography discipline. Compared with the previous test contents and methods, the assessment of the geography practical ability has some unique features. Based on this subject's literature review and referred to other subjects' assessment methods, this paper proposes the essential requirements of the assessment about the geography practical ability: scientific principle and geographic principle are the basic principles; the assessment is based on the geographic knowledge points, and, the assessment goal is to assess the level of students' geography practical ability; to test the students' language expression and operation ability is the characteristic of this assessment model. Based on above statements, this paper put forwards to make an assessment model by use of the paper and pencil test, question and answer test, operation and practice test to assess the students' geography practical ability.

Key words:

Geography Practical Ability; Assessment; Paper and Pencil Test; Question and Answer Test; Operation and Practice Test

A tracer Study on the Graduates of a Popular Bachelor Academic Program in Tourism

Industry: Geography of Tourism

Mălăescu S

Babeş-Bolyai University, Cluj Napoca, Romania, smalaescu@geografie.ubbcluj.ro

Abstract

Recent reviews report that issues pertaining employment in tourism are still superficially analysed, including not related to wider social, economic or political considerations. This paper aims at addressing these shortcomings, analysing the broader context of the insertion rates in the tourism industry for 1558 graduates of 4 tourism bachelor programs (graduating between 2008 and 2014) from one of the largest university from Romania. We found that Geography of Tourism offered by the Human Geography and Tourism Department proved to be the most popular program (1058 graduates), frequently chosen as a secondary bachelor program (33,6%) after graduating another first Bologna system bachelor program. The percentage of graduates of this program employed in tourism industry was 36,6% measured earliest at 1 year after graduation (in comparison with 35,2% in the case of the Economy of Commerce, Tourism and Services Program and 44,8% for the Business Administration in Hospitality program). 35% of the graduates (21% from the Geography program) declared that more specialised courses have to be included in the curricula and that internship or practical training should be more extensive than they are now. Graduates from other tourism programs reported the need for more extensive Geography training (Geography of Europe, Regional tourism Geography etc.). Furthermore, the study revealed that the National Quality Assurance Agency as well as other educational stakeholders seem to be consistently interconnected and permeable in what concerns feed-forwarding of information from several fields, but possibly under-connected with the most important ones: namely the employment market and the graduates' feedback.

Key words:

Tourism tracer studies; tourism academic programs; Babes-Bolyai University; tourism training

Effects of collaborative learning on student creativity training in Geography

Ahmadi A

Alzahra University, Tehran, Iran, pahmadi@alzahra.ac.ir

Abstract

This study was conducted to evaluate effects of cooperative learning method on Fostering Creativity of SHAHR-e-REY's daughter sophomore is in tenth grade students in Geography lesson. Research way was semi experimental and statistical population were included all SHAHR-e-REY's daughter sophomore is in tenth grade students in humanities field. This study was conducted in the 1391-1392 academic year and using purposeful sampling method selected 27 daughter sophomore is in tenth grade students from REYHANE high school in geography lesson. Data gathering tool in this study was ABEDI's creativity standard test. To analysis obtained data, we have used Descriptive and inferential statistics. Measures which presented in descriptive section indicated that there are differences between student's average scores of creativity test and its sub measures in pre test and post test. We had used Paired- sample T Test (random selection of subjects, existence of a similar group, normalized frequency distribution of scores and Interval scale measures). Results showed that geography education by cooperative method had significant effect on elevating creativity of student (fluidity, development, Initiative, flexibility) in this lesson.

Key words:

Challenging Pupils to Explore Sustainability to Help Them Develop Global

Understanding

Van der Schee, J.A.

Faculty of Behavioral and Movement Sciences, Vrije Universiteit, Amsterdam, The Netherlands, j.a.vander.schee@vu.nl

Abstract

The International Year of Global Understanding (IYGU) aims to raise the awareness of the global embeddedness of everyday life. Bottom-up movements that relate to this aim are welcome. The main fields of action are research, education, and information. The focus is on connecting the local and the global, sustainable ways of living and sustainable actions and technologies for local use.

Students at the VU University in Amsterdam developed teaching materials for secondary geography education about waste, energy and water. The idea was to stimulate secondary pupils' learning about sustainable living. The question is whether these teaching modules are good practices of what the IYGU stands for. In this paper we analyse the choices made by the students that developed the teaching modules as well as the reaction of an expert group of geography teachers that studied the modules and the reaction of some secondary school pupils.

Although the teaching materials seem to offer good input on the road of global understanding, the research results also show that the role of the teacher and group of pupils are vital for a successful module. An international exchange of teaching modules about global understanding can be a way to build a range of good practices. However, the approach will only work if a clear framework is available and if these teaching modules consist of more than texts and assignments. Teaching modules for global understanding should include joint research projects, exchange of story maps, virtual fieldwork and examples of discussions.

Key words:

Geography education; global understanding; sustainability; international co-operation; futures education.

Contribution of Geography Education for Learning to Combat Desertification: Pilot Results of the Desertification Watch Program

Yembuu BATCHULUUN, Gestel URANCHIMEG, Purevsuren ENKHJARGAL, Sandag KHADBAATAR, Tsendsuren MUNKHBADAR

Mongolian State University of Education, Ulaanbaatar, Mongolia, batchuluun@msue.edu.mn

Abstract

This article provides the pilot results of the “Desertification-Watch” program development project which implemented by Geography Department of the Mongolian State University of Education with the UNESCO. “Desertification Watch” is geography education oriented extra learning program which based on the needs assessment baseline survey and includes activity-based booklet, videos and web sites or online learning. These include the need to find convincing expression of geography's contribution to the education for sustainable development of all young people in arid areas and coping with desertification and climate change. “Desertification-Watch” piloting had covered in two Soums (administration unit) where severe affected by desertification in Gobi region of Mongolia, because here, strong vulnerability for climate changes and desertification (including, e.g., the water scarcity, rapid mining industry, overgrazing, loss of traditional and indigenous knowledge because of social changing). Within the framework of the “Desertification Watch” program development had conducted the needs assessment baseline survey which covered the target students, teachers and local communities as well as field research. The project also attempts to respond in new ways to combat desertification and enduring challenges facing community in arid/semiarid areas and also hopes to contribute in development of the Project Based Learning in schools through geography in Mongolia.

Key words:

Project based learning; Climate Change Education; Combat Desertification

Ideas of Sustainable Development in Geography Education in Russia, China and the Ukraine (Middle School)

Khlebosolova O., Tsareva L., Guo F., Munich N., Maslova L., Trunina M., Yakimchik A., Yudochnik N.
The Russian State Geological Prospecting University, Moscow, Russia, o.hlebosolova@mail.ru

Abstract

Geography education has the unique opportunities in shaping pupil's knowledge and skills in sustainable development. To what extent are they used in middle school? This question was the key point of the international program "Future for Geography Education: Ideas of Sustainable Development in Middle School of Russia, China and the Ukraine". Comparison of the main directions and issues of introduction the ideas in geography education became a purpose of this research. It was based on principles, approaches and concepts of the international documents in Education for Sustainable Development, Charter and Declarations by the International Geographical Union Commission on Geographical Education. Research program included the following steps: (1) Description of geography content of standards, programs and textbooks for middle school of the three countries; (2) Questioning of geography teachers and authors of textbooks about implementation of sustainable development in school subject, their needs and suggestions; (3) Comparison of final results and key ways of geography education in the three countries. Results of this research help to understand the unused opportunities, the main directions of teacher education, concept and skills for the school subject that pupils should be able to use by the completion of geography education in middle school.

Key words:

sustainable development; implementation of basic concept in school subject; middle school; geography content of standards; teacher education

Planning to Call Their Own: the Teaching of Urban Flooding in the Light of Paulo

Freire Method

FONSECA, M.N.

University of Porto, Porto, Portugal, murilonoli@gmail.com

Abstract

Reflect on the cities of the past, analyze the cities of the present and think about the cities of the future and the conditions which will enable these populations inserted in them necessarily permeates debates, studies and risk analysis and vulnerability, and especially discussions in schools. In this context it appears that the traditional dictates education has offered students a learning resulting in mechanical memorization act of a set of theories that are taken from textbooks, which, in turn, has the tendency to present the courses content isolated, that is this, there isn't interconnection with the reality of the world. Given this, the present work aims to develop a lesson plan on urban flooding in the face of extreme weather events, from the method developed by Paulo Freire (1996). This issue gains importance as it appears that at the end of the decade more than half the world's population will be living in urban areas. This planning should be carried out with students aged between 15 and 17 years and will cover four classes, three in the classroom and school yard (2 hours each) and a field in class (lasting 5 hours). It is expected that this plan allows students to exercise sensitivity and perception of the relationship of man in and with the world, by exposing the debate about climate change, the urbanization process, and the debate around the concepts risk and vulnerability and presenting the distinction between floods, mudslides and flooding.

Key words:

Floods; Education; Climate Change; Paulo Freire; Planning.

Preferences to Heritage Environment Interpretation of Middle School Students in Honghe Hani Rice Terraces

LIU Zhilin, JIAO Yuanmei, WANG Mei, YAN Xiaojing, DING Yinping

Yunnan Normal University, Kunming, 650500, L. Z. China, 995159288@qq.com

Abstract

It has a very important practical significance for students, who are the future heir and owner of the world heritage, to establish environmental interpretation system meeting their demands to take the heritage education for sustainable development and heritage conservation. This research analyzed the environmental interpretation needs of students at Yuanyang first high school, using methods of questionnaire. The results showed: there was a little difference in the need of interpretative contents, the order with environmental knowledge (4.05), environmental awareness (4.00) and environmental skills (3.95). The median and mode were both 4, which illustrated that students were in need and urgently in need for various interpretation knowledge. In the way of interpretation: narrator (69.2%), audio-visual media (36%) the need to highlight; In the way of joining the environmental activities: mainly personally experience (83.3%), game (63.5%), followed by touch (53.1%), observation (51.2%). In the way of interpretative space: the dispersed explanation (80%) had great advantages; in the interpretative way on the environmental issues: most students chose field study (87.7%); in the activities: student had great interesting in participation local Festival activities (84.3%), activities participating in observing terrace and ditches (81%). In short, high school students were eager to environmental interpretation at heritage, significantly with a way of firsthand experience and field trips. Therefore, the interpretation for high school students had better in participatory.

Key words:

environmental interpretation; world heritage; students' need

Refuting Persistent Misconceptions in Climate Change – a Lesson Study Approach

CHANG Chewhung

National Institute of Education, Nanyang Technological University, Singapore, chewhung.chang@nie.edu.sg

Abstract

Misconceptions in climate change have been well documented among youths in several international studies. This study, which was conducted in Singapore, aimed to correct students' persistent climate change misconceptions by using refutation texts. Adopting a Lesson Study approach, the materials and pedagogical approach used were developed in close collaboration with Geography teachers, taking into consideration the unique characteristics of their classrooms and student profile. The aim of the study was to monitor how children learn through refutation texts and to document how teachers process the experience. A pre-test and delayed post-test comparison showed that there was significant improvement in the students' climate change conceptual understanding. The presentation will also discuss implications on the teaching and learning about climate change.

Key words:

climate change education; refutation text; misconceptions; lesson study, Singapore

The Implementation of an Environmental Management System to Enhance Education for Sustainable Development

Barry Richter, Luiza De Sousa, Alex Kanyimba, Schalk Raath.

School for Natural Sciences and Technology for Education, Faculty of Education Sciences, North-West University, Potchefstroom Campus, Republic of South Africa. barry.richter@nwu.ac.za

Abstract

Rapid population growth combined with the increase in economic growth world-wide, has led to concerns as to whether natural resources on the earth can support future development. These concerns create a challenge for all governments, especially those in developing countries. One way of creating awareness among the youth to protect the environment is the development and implementation of Education for Sustainable Development (ESD). All school subjects as well as schools' management systems need to be taken on board for the implementation of an ESD. The purpose of this quantitative case study is to determine how selected schools in South Africa and Namibia developed their unique Environmental Management System (EMS) within their context to implement the aims/objectives of ESD, after attending a training session on the integration of ESD in school management. A checklist was used to generate data from ten schools (n=10) on the research problem and this data was analyzed by using descriptive statistics. The results of the research showed that with effective support and assistance, schools can develop and implement environmental management systems that support education for sustainable development.

Key words:

Education for Sustainable Development (ESD); environmental management of schools; whole-school approach; effective delivery of ESD; Environmental Management Systems (EMS).

The Vision of Wangari Maathai in Geographical Education: “Taking Root” and “Replenishing the Earth”

Meyer, C.

Leibniz University Hanover, Hanover, Germany, meyer@idn.uni-hannover.de

Abstract

“Taking Root” is the title of a documentary about the vision of Wangari Maathai (1940-2011) who was awarded the 2004 Nobel Peace Prize for her contribution to sustainable development, democracy and peace. Along with the foundation of the Green Belt Movement (GBM) in Kenya, Maathai was convinced that the Kenyan people had to identify the roots of the disempowerment that plagued them and to assume personal responsibility for improving their quality of life. These attitudes are further associated with the four core or spiritual values of GBM outlined in “Replenishing the Earth” (Maathai 2010): 1. Love for the environment; 2. Gratitude and respect for Earth’s resources; 3. Self-empowerment and self-betterment; 4. The spirit of service and volunteerism. “Such values are not unique to the Green Belt Movement. They are universal (...). They define our humanity.” (ibid., 16)

In “Taking Root” Maathai stated: “I’m a child of the soil.” (40:07-40:11) Hence, her vision was far more than only planting trees and protecting Kenya from desertification. She argued that a shift in consciousness and a change in “perspective” is necessary: “We need to reflect more thoughtfully on our responsibilities to the planet and to one another (...).” (ibid., 55)

What do students think about Maathai’s vision, the meaning of “taking root” and the spiritual values? Selected results of two different studies with questionnaires in 10th grade classes of secondary schools in Lower Saxony (2012: 140 students; 2015: 80 students) and some suggestions for geographical education will be presented (Meyer 2016).

Key words:

taking root; values; responsibility; shift in consciousness; change in perspective

Young Children Learning about Evaporation - Conceptual Change in Primary School

Schmeinck, D

University of Cologne, Cologne, 50931, Germany, Daniela.Schmeinck@uni-koeln.de

Abstract

During the last decades a growing interest within the Science and Geography education community has been on children's ideas about scientific concepts. Additionally, results of actual research raise questions about the efficacy of 'conventional teaching strategies'.

The presentation shows the various dimensions of primary school children's concepts as well as on their conceptual responses to special developed teaching sequence on evaporation.

As a result the presentation points out the need for using teaching strategies that explicitly take into account misconceptions children bring to the classes and/or acquire during teaching-learning processes.

Key words:

conceptual change; evaporation; water cycle; education; primary school

Botanical Gardens as Spaces for Discovery: Fieldwork in Geography Teaching

Castrogiovanni, A.C.; Batista, B. N.

Universidade Federal do Rio Grande do Sul, Porto Alegre, Brasil, castroge@ig.com.br

Abstract

Fieldwork represents a vital instrument for understanding our world through direct experience, for gathering data about it, and as a fundamental method for fomenting geographical education. The investigation of the relationship between Geography teaching and public spaces by fieldworks is the issue of this research. Moreover, constructing competencies in Botanical Garden through Geography is possible or not? Thus, we conduct a case study in a Botanical Garden located in Porto Alegre, southern Brazil. Our methodology is based on the Paradigm of Complexity and Qualitative Research. Our first goal is the comprehension of the representations that Botanical Garden brings on Geography teachers. From that, we propose a set of pedagogical activities supported by Geography teaching theories and Critical Pedagogy related to the Genetic Epistemology. Outdoor learning is the basis of the pedagogical activities developed with public High School students. This work indicates the necessity of constructing a reflexive thought in the school oriented to citizenship considering students as subject in changing society processes. Fieldworks allow an approach to reality showing that everything is connected to everything. Exploring student previous knowledge is the major source of meaningful teaching and learning possibilities. Thence, fieldwork represents a challenge element on the subjects pressing them to act on Geographical Space in a competent way.

Key words:

Botanical garden in Porto Alegre; Geography teaching; Complexity; Fieldwork; Competencies.

The Development of Visual-Spatial Abilities in Children (5-10 Years old) through the Preparation, Response & Recovery (PR²) Simulation Game: A Mitigation Strategy In the Face of Increasing Vulnerability to Natural and Anthropic Risks in San Juan, Puerto Rico

Cabiya, M.M., Zorrilla, M.C

The University of Puerto Rico, Recinto de Rio Piedras, San Juan, PR, michellemcabiya@gmail.com

Abstracts

In 1983, American psychologist, Howard Gardner, developed his theory of Multiple Intelligences, which correlates visual-spatial capabilities. This theory suggests that human beings have the capability to recognize and elaborate visual images, distinguish specific traits of objects, create mental images, reason through spatial dimensions and handle & reproduce external & internal images. Most mayor cities around the world have an array of variables associated with natural and anthropological risks that expose their population to high levels of risk & vulnerability. With climate change becoming a mayor threat to the island of Puerto Rico and the increasing crime rates in San Juan, adaptability measures should be taken to assure the survival and recovery of the Puerto Rican population. For this reason, this research project has developed the Preparation, Response & Recovery (PR²) simulation game, an educative experience, targeted at children between the ages of 5-10, that seeks to develop their visual-spatial abilities to effectively respond to high levels of stress caused by immediate natural (Floods, Hurricanes, Earthquakes, Tsunamis etc....) or anthropic (assault, robbery, potential school shootings etc.....) disasters. This game will serve as a mitigation strategy to adequately prepare Puerto Rican children to respond to life-threatening situations through visual-spatial awareness decision-making.

Key Words:

Spatial Abilities; Spatial reasoning; visual-spatial intelligence; spatial games; simulation games

An Interactive-GIS-Tutor and Integrational Framework: a GIS teaching solution for developing countries?

Fleischmann, E.M-L

Cedar College of Education, Kranskop, South-Africa, elfriedaf@cedar.org.za

Abstract

Because of the emerging importance and demand for Geospatial Information Systems (GIS), educational GIS has become significant. Despite the growing interest in GIS, the majority of teachers worldwide still struggle to find suitable ways to introduce GIS practice in their classrooms. Consequently, uncertainty regarding GIS practice integration, have arisen worldwide and also within South Africa.

The South African Department of Basic Education (DBE) has phased GIS into the FET-phase school curriculum from 2008 to 2010 and has re-introduced GIS in the South African Curriculum and Assessment Policy Statement (CAPS). The slow diffusion of GIS practice through the South African education system suggests that GIS educational policy developments in South Africa have outpaced supportive academic research of GIS practice within the South African context. This I-GIS-T project started with a pilot study conducted during 2012 and continued with the rest of the project during 2014. This study focuses on filling this research gap in the academia with the provision of GIS integration guidelines to the DBE by means of an Interactive-GIS-Tutor (I-GIS-T) integration framework.

The research design of this concurrent mixed research study was tailor-made in order to best answer the research questions, with pragmatism as the underpinning philosophy. This study, divided into two parts, includes a national online FET phase teacher survey (Part 1) which investigated current GIS integration barriers and a multiple-case study (Part 2) which evaluated the I-GIS-T and its preliminary framework within seven schools (which include control classes).

Quantitative data was generated through the teachers' survey, attitudinal and knowledge pre- and post-tests as well as questionnaires. Qualitative data collection included open-ended questions in questionnaires, one-on-one teacher interviews, focus group interviews, photographs and observational notes which provided a thick description regarding the viability of the I-GIS-T and its framework within the natural class setting. SPSS® version 22, SPSS® AMOS and ATLAS.ti™ software were utilised with analysis of quantitative and qualitative data.

Findings indicated that key GIS practice barriers, globally as well as in this study, were lack of support, low

teacher TPACK abilities, learner differences and lack of resources, especially in classes with large learner numbers, as found in this study. All the grade 11 Geography teachers and a very large majority of the learners evaluated the I-GIS-T framework to a large extent as workable and viable. Findings further suggest that the I-GIS-T and its framework also surmounted the main GIS practice barriers. GIS attitudinal tests revealed an overall positive shift on attitudinal questions, while knowledge tests also showed a positive shift in most schools. Structural Equation Modelling (SEM) showed that according to the Technology Acceptance Model (TAM), the I-GIS-T application is very likely to be accepted. Future I-GIS-T development would recommend incorporation of a multi-language choice component, more exploratory activities and enhanced sound quality and screen resolution.

The final proposed I-GIS-T integration framework is supported by the TIP model, which made use of Roger's innovation diffusion and TPACK. A learner workbook, I-GIS-T PowerPoint and teacher guide were developed for teachers, supporting flexible GIS integration within their classes.

Key words:

barriers; education; GIS; framework; learning; multimedia design principles; multiple-case study; teaching; Technology Acceptance Model; Technology Integration Model

Assessing the Effectiveness of Digital Learning Tools for Outdoor Learning Processes

Kangur M, Terasmaa J, Arro G, Puusepp L, Malleus E, Tammets P, Kukk A

Tallinn University / Estonian Geographical Society, Tallinn, Estonia, mihkel.kangur@tlu.ee

Abstract

Digital learning tools are more widely used in learning processes but there is lack of studies assessing effectiveness of such tools. The current study is based on digital learning tool Avastusrada (Discovery Trail) (www.avastusrada.ee), prepared by Tallinn University for Estonian Environmental Board in 2015 for centres of environmental education. The application allows to integrate the subjects of natural sciences and humanities through practical activities and inquiry learning and to enhance general competencies. To assess the effectiveness of the Avastusrada it is needed to understand its functioning in the broader context of environmental education and contemporary knowledge about learning processes. Through the learning process it is essential to achieve flexible reflection of environmental topics both individual as well as an abstract level. The studies have shown that this process is time-consuming and during this synthetic concept may occur when student uses complex terms but do not understand their meaning. Using the different set-ups and trail designs (exercises, questions, tasks etc.) and measuring instruments of educational psychology it is possible to control the effectiveness of the digital learning tool for substantive understanding of complex problems and concepts. The results of the current study would give input for designing of more sophisticated e-learning tools.

Key words:

Environmental education; digital learning tool; learning processes

Augmented Reality in Earth Observation Education – An Example with the High Definition Earth Viewing Experiment from the ISS

Rienow A., Graw, V., Heinemann, S., Ortwein, A., Schultz, J., Selg, F. & G. Menz

University of Bonn, Department of Geography, Bonn, Germany, a.rienow@geographie.uni-bonn.de

Abstract

"Man must rise above the Earth – to the top of the atmosphere and beyond – for only thus will he fully understand the world in which he lives". Considering famous quote by the Greek philosopher Socrates, the project 'Columbus Eye – Live-Imagery from the ISS in Schools' aims at the sustainable integration of earth observation in schools. It implements the footage of NASA's High Definition Earth Viewing Experiment (HDEV) at the International Space Station (ISS) for secondary education material published online and free of charge (www.columbuseye.uni-bonn.de). Applications of geographic information build the canvas for explaining physical curricular knowledge. Background information, quizzes, and informative animations encourage pupils to solve geographic problems in order to foster their methodological competences. This contribution presents the shift of didactical paradigms from computer aided e-learning to smartphone supported m-learning. Exemplarily, it will be demonstrated how regular topographic maps are augmented by the HDEV footage and linked with maps of isobars to explain the origins and dynamics of the typhoon Maysak. The tangible dimensions of pens & papers are virtually lifted into the fascinating environment of space and improve everyday teaching reality.

Key words:

High Definition Earth Viewing, Augmented Reality, ISS, Remote Sensing in Schools

Building Students' Spatial Skills through a Sequential Technology- Enabled

Curriculum Design towards Work-Ready Planners

Yan Liu, Derlie Mateo-Babiano, Sebastien Darchen

School of Geography, Planning and Environmental Management, The University of Queensland, Brisbane, 4072, Australia, yan.liu@uq.edu.au

Abstract

Spatial skills, including spatial thinking, spatial planning, spatial modelling, spatial reasoning and visualisation, are key graduate attributes in the fields of geography, planning and other related fields. However, the key challenge students face is the difficulty to spatially design or 'plan for' an environment which may be different from the real environment they live in, or assess the impacts of new development prior to it being developed, or visually communicate a planning output with professionals and the general public. This paper reports a learning design transforming three core but discrete courses in the Bachelor of Regional and Town Planning (B RTP) program at the University of Queensland into a sequential scaffolding of courses through the introduction of a virtual dynamic learning platform in order to develop students' spatial skills. Using ESRI's CityEngine we developed a computer based three-dimensional (3D) model of a living city – Brisbane's inner suburb of West End – for students to visualise, plan, assess and communicate existing and new developments in planning. West End is a rapidly evolving suburb with active urban renewal and redevelopment occurring, making it an excellent case study area for planning students to evaluate new development in relation to planning theory, principles and regulations, or to design and assess their own planning scenarios. The sequential learning design and implementation helps to enhance students' capacities for transition from being students to skilled practitioners, matching the skills requirements by industry and community.

Key words:

spatial skills; technology-enabled curriculum design; 3D city model; work-ready planners

Designing an Inquiry-Based Fieldwork Activity to Investigate the Impacts of Tourism on a World Heritage Site in South Korea

Lee, J. & Oh, S. M.

Ewha Womans University, Seoul, 03760, South Korea, jongwonlee@ewha.ac.kr

Abstract

The focus of the current study is to design inquiry-based fieldwork activity to investigate the impacts of tourism on a World Heritage site (Yangdong Folk Village in South Korea), where students are expected to detect and map land-use changes at the building level and conduct a survey to ask residents and businesses what's changed and what should stay the same in the village. Since it has been argued that mobile devices can support learners by allowing the learners to maintain their attention to the context and by offering appropriate assistance when required, two versions of the fieldwork activity with/without a mobile GIS solution are developed to determine the advantages and disadvantages of incorporating the mobile GIS solution into the fieldwork. Video observation and student work are collected and analyzed using various indicators, including the types of talk, the nature of collaboration among team members, how the students engaged in the fieldwork, and advantages and limitations.

Key words:

Inquiry-based fieldwork; mobile GIS; World Heritage; sustainable development

Geographic Knowledge Representation Based on Digital Resources Integration and Information Technology Fusion

Chen Ping, Tian Zhong, Tang Jianjun, Wu Jinsong, Li Ke, Lichunmei, Ye Huilin

SinoMaps Press, Beijing, 100054, tianzhong@sinomaps.com

Abstract

With the development and application of information technology in educational field, the traditional geography teaching mode is being transformed in China. Many middle schools have an attempt to construct a new geography teaching mode, which is based on systematic digital resources and mature information technology. In order to meet the immediate needs of geography teaching, and to improve the informatization level of geographical education, we have done deep explorations of the representation of geographic knowledge by new techniques, which include new products of digital geographical resources and new teaching mode. These explorations are based on full investigation of geography teaching mode and middle school teachers and students. In this study, a systematic set of digital resources, which matches abundant geographical teaching materials accumulated for 60 years by Sinomaps Press, and a whole-flow intelligent platform are established by advanced digital visual techniques such as virtual reality technology, geographical information technology and augmented reality, through resource integration, data mining and technique innovation.

The integration of resources and the fusion of technology are beneficial to improving the quality of teaching and learning under the support of visualized geographical digital resources, realizing the personalized teaching, improving the pertinence and effectiveness of teaching; and to improving the balance and fairness of the allocation of national educational resources.

Key words:

digital resources integration; information technology fusion; geographical knowledge representation

Geospatial Analysis and Geospatial PDF Visualisation of School Students' Performance

ND Nik Abd Kadir and NA Adnan

Centre of Studies Surveying Science and Geomatics, Faculty of Architecture, Planning and Surveying, University Teknologi MARA, 40450 Shah Alam, Malaysia., nikdahlia@gmail.com, nor_aizam@salam.uitm.edu.my

Abstract

The information of school students' performance is made publicly; however further analysis was not able to be done due to restricted education information dissemination by the government policy. The existing school student's performance data was prepared by the Malaysian Ministry of Education with a geographical information system (GIS) school database format. However, the data are not further studied and not presented in the spatially mapping format. Mapping has emerged as a communication tool and also becomes effective way to publish the digital and statistical data to be more attractive and user friendly. The state of Kelantan is a part of Malaysia was chosen as a study area to perform the analysis of student's school performance in science and mathematics scores of the Sijil Pelajaran Malaysia (Malaysia Education Certificate, MEC) Examination for the year 2014 using the inverse distance weighted (IDW) method of spatial analysis in GIS software. In addition, the second objective of this study is to produce the Geospatial PDF of Education Map for MEC student's performance result in the year 2014. Overall, this study will be able to provide better representation in a spatial view of student examination performance to the Malaysia education management as well as to the public.

International Online Geographical Education with Geospatial Technologies

Osvaldo MUNIZ

Department of Geography, Texas State University, San Marcos, TX, United States, o.muniz@txtstate.edu

Abstract

Online interaction and cooperation in geography education has revealed important results from several international research experiences conducted during the recent decade. However, research on how geospatial technologies (GST) can be utilized remain an uncharted theme.

In this paper, we present the experience of Red-Online ('Red' is the Spanish translation for Network), a research project funded by the Pan American Institute of Geography and History (PAIGH) in 2015. The objective is to measure international online collaboration practiced by high school teachers who are working in several Latin American countries. Teachers do not have international interaction to improve their geographic knowledge and Red-Online allows them to be part of an online network to learn. For this purpose, they use Interactive Digital Maps, Google Earth, ArcGIS Online and Story Maps – Cloud, to study global climate change in the Americas. The results illustrate that interaction and cooperation among teachers during three months of online activities were enhanced with the exposure to GST within Cloud environment. We also discover that collaboration through problem-based learning (PBL) is better performed when GST are available with the application of various tools. Finally, it is necessary to recognize that progressive learning is absolutely required to reach a good level of practice with GST. For that purpose future research should consider mentorship as a critical key for success during online practices.

Key words:

Online geography education; geospatial technologies; global climate change; PBL

Learning Progressions for Geographic Core Literacy in China----A Case Study of “Regional Identify”

LI Ya DUAN Yushan

School of geographic sciences, East China Normal University, China, liyageography@foxmail.com

Abstract

Learning progression is a hot research area in international education. However, there have not been any proper studies on the learning progressions for secondary geography education. This study is a localized learning progression research centered on core literacy which is intend to promote current geography education reform in middle school. Based on systemizing the situation of literacy education from a international view, analyzing the constructing process of core literacy system of geography and literature overview for learning progression in U.S. and in China, a method of learning progressions for geographic core literacy is been constructed Then, there is a case study of learning progression for “regional identify”, including making the hypothesis of Lps for regional identify and constructing the assessment instrument of “regional identify”. According to the framework of this literacy and Rasch model, we design the items and chose a middle school in shanghai to do the pre-test. Then, we use the Winsteps software to analyze the quality of the assessment instrument and point out some suggestions for optimization. This is the first more in-depth exploration of the application of learning progression for geography education in China. The experience and deficiency can be reference for later researchers at home and abroad.

Key words:

core literacy; learning progressions, regional identify, assessment instrument

Learning Spatial Thinking with Web-Based Geospatial Technology: High Spatial Ability Learners Are More Positively Affected

Xi Xiang

East China Normal University, Shanghai, 200241, P. R. China, xxiang@geo.ecnu.edu.cn

Abstract

This study aims to verify the learning effectiveness of using Google Earth (one type of web-based geospatial technology) in geography classroom on the development of spatial thinking, and to investigate the effects of Google Earth based lessons on learners with different spatial abilities. A quasi-experiment design was employed in two Singaporean secondary schools. A total of 122 students (aged 15) participated in this study where they were randomly assigned to either experimental or control groups based on intact classes. The results indicate there was significant difference between the two groups with students made greater improvements in some spatial skill areas completing Google Earth based lessons. Besides, a significant interaction effect was found between the learning approach and learners' spatial ability. Statistical analysis shows a significant difference in spatial thinking of high spatial ability learners in the experimental and control groups, but no significant difference was documented for low spatial ability learners in the two groups. Findings signify students with high spatial ability benefited more from utilizing the web-based geospatial technology in developing spatial thinking as compared to the low spatial ability students. The possible explanation is that high spatial ability learners have enough cognitive capability to extract spatial information from geo-visualizations in Google Earth and then to reconstruct their existing mental model. This study highlights students' learning abilities as a factor that influences the impact of geospatial technologies to promote spatial thinking and could help geography educators to facilitate individualized learning.

Key words:

spatial thinking; web-based geospatial technology; learning ability

Spatial Thinking and Geography Education: The Effect of Digital Atlas Implementation in The Classroom

Miguel González, R. & Buzo, I.

Faculty of Education, University of Zaragoza, Spain, rafaelmg@unizar.es

Abstract

Technological advances have revolutionised lecture halls and classrooms alike facilitating new ways of learning. The cloud can be very easily integrated in daily lessons and research. Active methodology improves spatial and digital competencies. In this context the School Digital Atlas (ADE) is created on the ESRI platform ArcGIS Online. It contributes to motivating students in Geography Sciences and skills, encouraging efficiency in quality open geodata management in order to improve learning results. ADE deals with the current secondary school Geography curriculum. Therefore it is transforming a descriptive character into GIS competencies so as to achieve critical and smart geospatial thinking, which are very necessary elements for the future work of 21st century citizens.

Within such a transformation framework the Digital School Atlas (ADE) emerges. It is an interactive atlas on the ArcGIS Online (AGOL) platform of geospatial ESRI technology. In the end the AGOL platform has been adopted for Atlas implementation based on its easy interaction with ArcGIS Desktop, which is a useful tool for making and improving content and for a final data visualization, so it integrates interactivity and usability.

The ADE is an innovative material for curriculum objectives and a new resource that enhances and expands on the possibilities offered by print atlases for teaching and learning Geography in secondary education. Although scheme and organization may be similar, its digital nature allows great interaction among students as well as a process development of spatial learning by discovery. It also has functions of a GIS, and its layered organization allows students to understand the complexity of the elements involved in the organization of territory (physical, social, economic, political and cultural) resulting from their interaction. All this is made possible through a simple update of information at a very low cost. Wide dissemination of ADE will take place in Spanish secondary schools, with the support of the Spanish and international leaders in geographical education, both cited throughout this work.

Paper will combine theoretical debate in geospatial technologies and spatial thinking education, with research method for implementing ADE in schools as a best-practice experience to obtain results to improve geography education.

Key words:

School Digital Atlas; WebGIS; geodata; Geographical Education; spatial thinking

Technology, Pedagogy and Content: Perceptions of Innovative Geography Teachers as “Early Adopters” of Geospatial Technologies in Secondary Geographical Education

Bowman B, Brett P, Fluck A, Callingham, R

University of Tasmania, Launceston, Tasmania, Australia, bianca.coleman@utas.edu.au

Abstract

While research literature continues to report on a range of significant and persistent challenges which have thus far constrained the wide-spread adoption of geospatial technology (GST) in K-12 geographical education, innovative geography teachers are nonetheless making progress in their endeavours to embed the technology within their teaching practice. These “early adopters” recognise the relevance and utility of GST for teaching geographical concepts and skills and have envisaged a space for GST within the boundaries of current curriculum requirements and their own pedagogical practices. Utilising qualitative data drawn from semi-structured interviews with six innovative Australian secondary geography teachers, we report on the perceptions of these early adopters with respect to the role they envision for GST in geographical education (technology), their beliefs about how GST support and enhance their geography teaching practice (pedagogy) and their use of GST as a reflection of their fundamental philosophies about the nature and value of geography (content). These findings provide the foundation for an on-going research study which aims to examine the intentions and experiences of early GST adopters in Australian schools. By understanding how and why early adopters embed GST in geographical education, recommendations and conclusions can be made as to how teachers and schools can be supported in developing their GST use.

geospatial technologies; geographical education; geography teachers

The Role of Augmented Reality (AR) in New National Curriculum of Geography, Japan

Ida Y, Itoh S, Akimoto H, Ugawa Y, Tsutsumi J and Onishi, K

University of Tsukuba, Tsukuba, Japan ida@human.tsukuba.ac.jp

Abstract

New high school curriculum will be implemented from 2022 in Japan. Currently, geography remains as option-subject in Japanese high schools, which causes a problem that some high school students cannot take geography even if they want. In addition, school geography has not the continuity from elementary to high school in national curriculum. However, geography will become a compulsory-subject by new national high school curriculum. In the new curriculum, the active learning is adopted to all subjects, and the learning of GIS becomes more important in geography of high schools. In this situation, not only geography teachers, history and citizen teachers would be engaged in geography due to the shortage of geography teachers. Therefore, development of simple-operate GIS is an urgent matter. Augmented Reality (AR) is the possible tool in this situation. Given supplementary explanations by AR system, students could realise the contents of geography class more clearly in our example high schools. In this presentation, the role of AR in Japanese high school geography is discussed.

new national curriculum; high school geography; compulsory subject; gis; augmented realty; Japan

Development of Open-Access E-Learning Material for GIS Education

Hiroyuki YAMAUCHI, Takashi OGUCHI

Center for Spatial Information Science, The University of Tokyo, 5-1-5 Kashiwanoha, Kashiwa-shi, Chiba, JAPAN,
h.yamauchi@csis.u-tokyo.ac.jp

Abstract

Many projects related to GIS education have been conducted in Japan. As a result, a basic core curriculum and teaching materials for university lectures were developed. However, materials usable for GIS practice courses in universities have been limited, although education of practice is necessary to provide human resources for future development of GIS. Therefore, we launched a project “Development of Open-access E-learning Material for GIS Education Based on the Existing Core Curriculum and the Body of Knowledge”. The purpose of this project is to develop GIS learning materials for practical classes of university departments and graduate schools.

This paper presents the background and current situation of the project. Materials to be developed by this project support GIS-related 1) indoor use of software, 2) field surveys, and 3) utilization of the internet. Materials to learn the indoor use of GIS software concern basic operations of free GIS software such as QGIS. Materials to learn field survey methods related to GIS include videos showing the operation of equipment such as UAV. Materials for utilizing the internet include the creation and publication of GIS data using WEB GIS.

These learning materials are provided in the form of PowerPoint files and Markdown files with easy-to-understand descriptions. They will be published in the GitHub platform to obtain supports from users particularly to update the learning materials to efficiently deal with a version-up of software. After the materials are improved, they will be open to the public for e-learning of various people including students and civilians.

Key words:

GIS; education; practice; learning material; open access; GitHub

Improving a Summative Assessment in Geography Education Through the Use of a "Tasks Designer" Theoretical Model

Khlebosolova O., Tsareva L., Iurchikova N.

The Russian State Geological Prospecting University, Moscow, Russia, o.hlebosolova@mail.ru

Abstract

According to the Russian State Federal Educational Standard and a new Program, a summative assessment in the 5th – 9th school classes is an important part of controlling geography education results. The purposes of a summative assessment are different: (1) comparison of the actual results and the programs' requirements, (2) analysis of the long-term dynamic trends, (3) analysis of pupils' achievements and difficulties they face, (4) description of an individual educational trajectory, (5) improving of teaching and learning.

These purposes can be achieved by using of so called "tasks designer" theoretical model. This is a table with description of tasks' difficulty each pupil may face, geographical content of every course, task and procedure types. The table includes three elements of a geographical content for the 5th – 9th school classes: (1) theoretical knowledge (geographical approaches, theories, hypotheses and concepts), (2) empirical knowledge (the geographical facts, place names, etc.), (3) methods of geographical research (methods of the geographical description and comparison, the cartographical and statistical methods, the methods of geographical modeling and forecast). The "tasks designer" contains the five levels of difficulty for pupils: (1) knowledge (learning and recall), (2) understanding (explanation and interpretation), (3) application (on a model or in a new situation), (4) generalization and systematization, (5) values and meanings.

The "tasks designer" theoretical model can be used by teachers for creation of their own estimation tools. It includes also the examples of different geographical tasks.

Key words:

geographical education results; summative assessment; pupils' achievements; tasks designer

Mobile Geo-Location Logging and Analysis for Enterprise Customers

Liangmin Hu^{1*}, Yanke Hu², Xiwang Zhang¹

¹College of Environment & Planning of Henan University, Kaifeng, Henan, 475004, China, lmhu@henu.edu.cn

²IBM, San Francisco, CA, 94105, US

Abstract

With the rapid development of mobile and cloud technology, improving and optimizing business mobile apps' customer experience is unprecedented important. Geo-location data is probably the most important and interesting data that vendors or researchers care about when their designed apps are being used. There are many application scenarios involving Geo-Location data. If an organization maintains several apps, and it wants to monitor the geo-location trend of each app's usage, it will be chaotic and redundant to implement geo-location logging module for every individual app. Instead, it's much cleaner to encapsulate geo-location logging component into SDKs, and centralize the reporting portals into the same cloud service. In this paper, we propose an approach of Mobile SDK and Cloud reporting architecture, to enable Mobile apps with Sensor information logging and reporting by inserting one single line of code. We also use Geo-Location Logging as an example and explain how it works on iOS and Android platforms. Our approach can bring several advantages including removing redundant implementation of function modules and bringing more scalability on backend reporting.

Research Progress on Application of Mobile Technology in Geography Teaching

LIU Shi-rui

College of Environment and Planning, Henan University, Kaifeng 475004, Henan, China, liushirui2007@126.com

Abstract

With the rapid development of mobile Internet, mobile technology has penetrated into the field of education, mobile devices are getting more and more popular, its portability, mobility and flexibility can access to data and information fast and convenient. It is imperative to study the application of mobile technology in geography teaching, under the trend of education informationization. Through the literature review in order, the teaching software based on mobile technology is increasing day by day, and from the teaching case with used of mobile technology, proved the technology have a unique advantages and adaptability in geography teaching.

A Brief Overview about Research in Cartography and Children in Brazil

BAUZYS, F., NASCIMENTO, R.

Universidade Federal de Santa Catarina, Florianópolis, Brasil, fernandabauzys@yahoo.com.br

Abstract

This article aims to present a brief overview about scientific production on cartography and children in Brazil. This kind of research comprises the theoretical and methodological process in cartography and maps education. This area of knowledge makes an effort to provide students a different treatment with regard to the cartography teaching, taking into consideration their cognitive development. It's of fundamental importance the adequacy of cartographic products for the public to which it is intended, in order to ensure there is no gap between the maps makers work and their user. The cartography and children research has established itself as a knowledge built in the interfaces between cartography, education and geography. The representative geographical space process used by the teacher in the study of spatial phenomena should be increasingly complex, evolving each year of elementary school, to accompany mental development of the child and therefore also the level of abstraction. In Brazil, Livia Oliveira's thesis habilitation, published in 1978 and entitled "Methodological and Cognitive Study of Map", is considered a pioneering milestone in research in this knowledge area. Since this thesis publication, to the present days, much has been investigated in relation of cartography and children in academia. In our country have been published several studies on this subject. The main national scientific event focused specifically on this theme is the "Colloquium Cartography Children and School", to be held in October 2016 in its ninth edition.

Cartography and children; Brazil; geography; education; research

A Longitudinal Study of Geography Student Teachers' Perceptions of Their Self-Directedness in Learning with the Implementation of Integrated Problem-Based Learning Experiences. A South African Case Study

Golightly, A.

School for Natural Sciences and Technology for Education, Faculty of Education Sciences, North-West University, Potchefstroom, South Africa. Aubrey.golightly@nwu.ac.za

Abstract

Problem-based learning (PBL) is a teaching and learning strategy that could be implemented in teacher education to foster Geography student teachers' self-directed learning skills. In this study an integrated PBL approach was integrated over a three-year period in the Geography modules offered in the Baccalaureus Educationis curriculum. During the ensuing PBL experiences the first- to third-year Geography student teachers had three weeks per module to formulate solutions to the stated problem. In the first- and second-year Geography modules the PBL tutorial sessions were presented in contact sessions, but in the third year the students had to execute the PBL experiences on-line on the university's learning management system. The purpose of this longitudinal mixed method case study was to explore Geography student teachers' (n=45) perception of their self-directedness in learning in integrated problem-based learning experiences over the three-year period. Guglielmino's (1978) Self-Directed Learning Readiness Scale was used as research instrument. Semi-structured interviews with participants (n=8) were employed to gain a deeper understanding of the results of the quantitative data. The results indicated that the students' SDL scores increased in the first year, followed by a decrease in the second year and then a steep increase in the third year of their Geography studies. Female students had slightly higher SDL scores than their male counterparts. Participants indicated that the implementation of PBL experiences developed their SDL skills.

Key words:

Geography education; self-directed learning; integrated problem-based learning; learner-centred instruction

Assessment of Community of Inquiry Principles in Online Problem-based Learning Activities for Geography Education Modules in Blended Learning Classrooms

Van der Westhuizen, C.P.

North West University, Potchefstroom, South Africa, christo.vanderwesthuizen@nwu.ac.za

Abstract

It has long been recognised that meaningful and worthwhile learning is associated with collaborative communities of inquiry (CoI), inevitably being described as the ideal learning environment for higher education. The most prominent model to ensure or measure effective blended learning is the CoI framework developed by Garrison, Anderson and Archer (2000). It is a valid and dependable instrument to measure the quality of the online part of learning by focusing on three important presences, namely, social, cognitive and teaching presences. These principles can, therefore, be used by Geography lecturers to design and evaluate effective online learning environments.

The pedagogical principles of a CoI mould well with problem-based learning (PBL) as a teaching and learning strategy in the Geography classroom. From literature it is evident that PBL can help develop problem solving, critical thinking, self-directed learning, decision-making, reflection, collaborative and interpersonal skills.

This paper reports on the 3rd year Geography student teachers perceptions on the use of PBL as teaching strategy in an online learning environment managed in a learning management system (LMS) in an attempt to establish a sound CoI. Both quantitative and qualitative data were collected and the results indicate that the Geography student teachers held positive views of the online PBL strategy supported by a simple usage of the university's LMS.

Developing Geographical Data Interpretation and Analysis Skills: Drawing from Mathematics and Scientific Inquiry

Kidman, G., Kriewaldt, J., Casinader, N.

Faculty of Education, Monash University, Melbourne, Australia, Gillian.Kidman@Monash.edu

Abstract

It is increasingly important for the geography student to appreciate that the acquisition of skills in statistics and data analysis is as much part of modern geography as work in the field, laboratory or library. In this respect, data analysis aims to link the use of statistical techniques by means of computer software, to the acquisition of geographical-knowledge and the scientific method of inquiry. This paper will describe how one Australian teacher used techniques drawn from mathematics and science inquiry, to develop the data interpretation and analysis skills of her Year 6 (11 years of age) students. Using data from Word Bank eAtlas of Global Development, nominal data relating to life expectancy in years at birth in years was collected. Most teachers would simply compare a small number of countries and discuss the data in terms of health and wealth. However, to develop the data interpretation and analysis skills of the students, an excel spreadsheet was introduced where the countries were grouped according to their geographical locations (base continent). Graphs were created showing the relationship between life expectancy and continent as a scatterplot for the countries. The teacher was able to use scatterplot printouts to have the students identify data outliers and data clusters. From the data clusters, means were approximated, and dispersion around the means were investigated. Further, comparisons of the size of the clusters, and their overlap led to class discussions that provided a foundation of analysis of variance (ANOVA) statistical tests.

Key words:

geographical inquiry; data interpretation; graphical analysis; science inquiry; life expectancy; ICT

Did They Read it? A New Approach to the use of Novels in the Geography Classroom

Joseph Manzo

Concord University, Athens, West Virginia 24712, USA, manzoj@concord.edu

Abstract

Literature has long been used in the geography classroom. A current grant from the Benedum Foundation to the Concord University Geography Department was used to encourage English teachers and geography teachers to share the same students in high schools. The main goal was for teachers to extract environmental processes from novels and explain them to the students. The purpose of this paper is to present a strategy for using novels now that students read less and the essence of many novels can be gleaned from websites that summarize the story, describe the characters, and explain the symbolism found in the work. This paper suggests a test based on obscure, but fair, questions that require students to have read the book in a thorough manner in order to pass it. The test is then followed by a three-page essay that allows students to express their views of the work under consideration. Data collected from student evaluations indicate most students liked the books and most thought they were better prepared to understand the environmental processes extracted from those novels. Most realized, when asked, that the quiz forced them to be more focused readers. Moreover, they believed the quiz led them to earn a better grade on the essay that followed.

Key Words:

Novels; Environment Process; Quiz; Assignment

Discussion on the Necessity and Existing Problems in the Transition from High School to College in Geography Teaching

Xiao-ting GOU Zao-yin YE

Kunming No.1 Middle School , Kunming,650031, P. R. China, 422219939@qq.com

Abstract

The issue on how to bridge the gap of teaching practice at different academic stages has long been regarded an essential part of geography education and research, not only because it plays a significant role in connecting all the components of geography, but also because it helps students form a complete knowledge system of this subject while current emphasis has been placed on how to link secondary school teaching to high school geography pedagogy by researchers, little attention has been paid on the link between high school geography teaching and geography education on the college level. Thus, the necessity of bridging the gap of high school and college geography education is elucidated in this essay, and the current problems of this issue in teaching practice are also explored.

Key words:

necessity and existing problems; geography teaching; high school; college

Experiments of Map Literacy Training for Preparation of the College Entrance Examination of High School Students with Special Talent--Take School-based Research of Geography of Art Class for Example

Xiaoping Huang

Nanning Yucai Experimental Middle School, Nanning, 530023, P. R. China, 1005439537@qq.com

Abstract

This paper, according to latest research achievement of psychological studies on geographical education and theory foundation for Constructivism, multiple intelligence and etc., combining school-based research of geography for liberal arts students of art class under the guidance of geography curriculum standard of our school, from view of first-line geographical teaching of instructional design of geography, specialized training on cultivating map literacy, and etc., explores effective ways and related approach of improving geographical literacy of high school students with art talents.

Key words:

Students with special talent; map literacy; college entrance examination

Pictures and Images of a Slum in Nairobi – The Potential of Hermeneutic Photography for Geographical Education

Eberth, A.

Leibniz University Hanover, Hanover, Germany, eberth@idn.uni-hannover.de

Abstract

The presentation focuses on results of interviews with 19 groups of young people, aged between 15-24. All of them were born and raised in Korogocho, one of Nairobi's informal settlements. Due to their place identification the youth started different bottom-up activities for transforming Korogocho and create better urban conditions. Using hermeneutic photography as research method, the study from 2014/2015 shows how the test groups in Korogocho identify with this place as their home.

In this study the task for the groups was to take three photos of situations or places which were important and meaningful in their everyday life. After they had chosen their motives they communicated their reflections about the meaning they allocated to them. The outcome shows community awareness creating an atmosphere of responsibility and caring for self-empowerment contributing to community development.

Based on the geographical concepts Space and Place as theoretical frame the presentation shows selected pictures and interview sequences of the data analysis and discusses the potential of this research approach for geographical education. How to use pictures in a critical way and with regard to changing perspectives is the leading question for discussing self-reflexive geographies in this context. Furthermore, the results may also contribute to think about different and differentiated images about 'Africa', and life in slums often stigmatised as hardship and poverty in a marginalized place.

Key words:

Youth in Slums (Nairobi); Place identification; Hermeneutic Photography; Pictures in Geographical Education

Practitioner's Perspectives of Using Bring-Your-Own-Device for Fieldwork

France, D, Welsh, K, Mauchline, A., Whalley, W.B. and Park J.R.

University of Chester, Chester, CH1 4BJ, UK, d.france@chester.ac.uk

Abstract

The Bring Your Own Device (BYOD) concept is a growing trend in Higher Education and is the idea that an individual makes use of their personally owned technological device rather than using an institution owned device to perform work or education related tasks. Much of the BYOD research in recent years has focused on the use of devices in classrooms. This study presents the first piece of research into practitioner's perspectives of using BYOD for fieldwork, a method of teaching used in a variety of disciplines including geography, bioscience and archaeology. Research from 6 UK and international fieldtrips from two Higher Education Institutions indicates that practitioners like to use BYOD for fieldwork as the students are more familiar with their own devices and therefore more engaged, it reduces reliance on limited or unavailable university devices and reduces the cost to the department or institution. The research showed that whilst some of the challenges practitioners faced when trying to implement BYOD were similar to that in the classroom e.g. inequality between students, supporting a range of operating devices, concerns such as distraction by their own devices was not such a factor during fieldwork as it is in a classroom. Practitioner's cited a lack of time, lack of knowledge and overcoming student inequality as reasons why they have not implemented BYOD.

Key words:

Fieldwork; Geography Education; Technology-enhanced learning; Practitioner; BYOD

Subject Specific Pedagogy and Subject Didactics: Lessons for Geography Education

Brooks, C

UCL Institute of Education, London, UK, c.brooks@ioe.ac.uk

Abstract

The northern European tradition of subject didactics has remarkable similarities to the Anglo notion of curriculum making. In this paper I explore what messages both approaches have for a subject specific pedagogy in geography education. Underpinning this paper is an understanding that geography education is about promoting deeper geographical understanding (after Bennetts 2005). Geographical pedagogy should be more than exploring geospatial technologies or the learning potential of fieldwork. This paper takes a broader approach, considering pedagogy as both the art and science of teaching, but also an expression of relational and cultural values within the classroom. This raises issues about the relationship between the students (and their cultural experience) and the ways they are taught geography. The question is how can the two approaches of pedagogy and didactics (each with a different perspective on culture and the classroom) bring us to a deeper understanding of geography education. Both traditions have highlighted the value of exploring the relationships between content, teacher and student. However, the didactics approach explores this in a relational way, emphasising how each of the components interact. The curriculum making approach (from the Anglo tradition of pedagogy) sees them as overlapping, emphasising commonalities and points of intersection. The origins of the models also emerge from deductive and inductive reasoning. Whilst these findings have profound implications for geography education researchers, the paper highlights the lessons for geography teachers, and explores an example of how relational pedagogy can lead to deeper geographical thinking and better conceptual understanding.

Key words:

Subject didactics; geographical pedagogy; relational thinking; curriculum making

Teachers' Understanding and Teaching of Geographic Concept in Elementary Geographic Education of Korea

Okkyong Yoon

Cheongju National University of Education, Cheongju, Rep. of Korea, okyoon@cje.ac.kr

Abstract

There are many topics to cover geographic facts and phenomena in geographic education. The concepts and terminologies to describe them have frequently appeared in the text book. Some of these concepts and terms are often constructed through the quantitative measurement in general, e.g. average annual precipitation. In the side of students, it isn't easy to recognize what's the meaning, how to measure and calculate, due to the storage of experiences that the knowledge. In addition, a more serious problem is that teachers are not familiar with these concepts. Surprisingly, teachers suffer from teaching these concepts because they don't major in geography in the elementary geography education. Moreover, students are unlikely to know the concept of measurement.

This research is looking for ways to address concerns how to deal with these concepts in any level in elementary geographic education. It is important to reduce the gap between students and teachers to acquire the concept.

Key words:

geographic concept; elementary geographic education

The Suggestopedic Geography Textbook – a New Generation Textbook

Soultanova, M.

Center for Control and Assessment of the Quality in School Education - Ministry of Education and Science,
Sofia, Bulgaria, m.sultanova@mon.bg

Abstract

As every textbook, the suggestopedic Geography textbook is a tool that supports the educational process. The new in this type of textbook is that it is created according to the principles of the suggestopedic educational method. The approach was based on the power of suggestion in learning, the notion being that positive suggestion would make the learner more receptive and, in turn, stimulate learning. Lozanov holds that a relaxed but focused state is the optimum state for learning. In order to create this relaxed state in the learner and to promote positive suggestion, suggestopedia makes use of music, a comfortable and relaxing environment, and a relationship between the teacher and the student that is akin to the parent-child relationship. Music, in particular, is central to the approach. In this method the textbook has a crucial role, more so than in the traditional educational setting, in two aspects: its required use in the educational process and its increased volume of content compared to a traditional textbook. The suggestopedic textbook is structured in several large informational blocks, that are being read during a (the reading of new material accompanied by classical music in a comfortable and relaxing environment). Therefore, In the suggestopedic textbook there is a unity between geographic information and art. This makes the textbook multilayered and multifunctioned, enriches the discourse of the textbook making it more communicative. Its purpose is, together with the other educational means, trained teacher, suggestopedic boards, games, etc., is to create an environment of interactive learning.

Key words:

suggestopedic educational method; multilayered and multifunctioned; large volume of content; concert sessions

Urban Gardening as a Curriculum Artefact for Students with Asperger Syndrome

MacKeen, D

City of Glasgow College, Glasgow, Scotland, don.mackeen@cityofglasgowcollege.ac.uk

Abstract

This paper addresses the need for students with Asperger syndrome (AS) to gain social understanding in order to learn. Students with AS have difficulties understanding other people's points of view and this can often be a barrier to learning. In this paper I discuss how geographical concepts offer a means to help students with AS understand the world they live in, other people's situations, points of view and how the student can think of and create alternatives. Lefebvre and Harvey's argument for the Right to the City provides a framework for an active citizenship that challenges the dominant message of neoliberalism. By encouraging students to actively engage with a physical place that they have helped create and maintain, geographical concepts can be discussed in a more concrete manner, and the value of abstract concepts can become more obvious and less obtuse. The desire on the part of young people for learning to be "relevant" is more likely with a curriculum artefact that is both productive and compelling and can be part of a "GeoCapabilities" approach that meets the needs of Scotland's Curriculum for Excellence. It is recommended that further study be carried out to assess the value of a GeoCapabilities approach for students with AS.

Key words:

pedagogy, teacher role, curriculum artefact, urban gardening, Curriculum for Excellence, GeoCapabilities

Assessment of Geographical Thinking Quality

Shi Chenxi

The National Education Examinations Authority, China, shicx@mail.neea.edu.cn

Abstract

Geographical subject ability can be roughly divided into geographical thinking ability, field work ability and geographical expression ability. But under the condition of large scale, written examination, the evaluation of geography ability can only focus on the geographical thinking.

Geographical methodology accords geographical thinking fundamental characteristic, such as synthesis, area, space, correlation, criticism, and the pursuits of new conclusions. The geographical thinking, from remembrance to integrated applications, is classified into distinct levels. Every level has distinctive value to evaluate.

The paper introduces how to set situations which close to real life, progressive layers of questions, with the items of the National College Entrance Examination in geography. These items show students' geographic thinking process, evaluate students' geographical thinking quality.

Key words:

Geographical Thinking; Education measurement; The National College Entrance Examination

On the Need for a Complex Thinking in Geography Teacher Training

Castrogiovanni, A.C.; Batista, B. N.

Universidade Federal do Rio Grande do Sul, Porto Alegre, Brasil, castroge@ig.com.br

Abstract

What could be the foundations that support epistemologically the contemporary Geography teacher training? Our current context experiences an educational crisis that is also a part of a civilization crisis. Moreover, both the school and the information society play role in knowledge transmission. In this uncertain scenario, we ask how can scholar Geography become relevant to this young generation students? In face of neoliberalism requirements, which ways can provide a Geographical education that leads to a political subject that can deal with a wide range of differences in a common earth? Once we are teachers, we are committed with the search for all the possible answers to these concerns and we consider that the principles of Edgar Morin's complex thinking may support us in this task. The Morin's principles encourage us to teach Geography as an open system that belongs to a entirety. This entirety can be known only by knowing each one of its parts. According to them, uncertainties and dialogical actions are substantial since opposed ideas don't compose a synthesis but a complementary and antagonistic complex phenomenon. Applying Morin's idea to education means that scholar relationships should be taken as auto-eco-organizational. In other words, the exchanges between teacher and students are essential to engender a both dependent autonomy as well as an authorial and creative way of thinking. Finally, we argue that a questioning education could become a practice that connects separated parts and brings knowledges together by assuming Morin's principles as key-ideas in Geography teacher training.

Key words:

Geography Teaching, Teacher Training, Complex Thinking, Teaching Method

The Research of Geography Field Practice Teaching System at Three Gorges

Xuelian zhao

China University of Geosciences (Wuhan), 430074. P. R. China, zhaoxuelianxj@163.com

Abstract

Teaching practice in the field of physical geography teaching is one of the important parts of the teaching work, the students could have deep understanding of theoretical knowledge obtained from books through the field practice.

It is very important part of the practice for students whose major are natural geography and resources environment, The field geological practice teaching in our university 's practice base at Three Gorges. After analyzing the existing field practice base-- Beidaihe base and Lushan base, We analyze the natural resources of geography at our university 's practice base at Three Gorges. Then, we discuss how to build the Field Practice Teaching System in the Three Gorges and try to build the modules of the practice of teaching content.

The modules of the practice of teaching content mainly cover several aspects: 1. the geologic teaching routes, 2. Tourism Geography and observation of Quaternary landforms teaching routes, 3. resources and environment teaching routes, 4. natural and man-made disasters teaching routes.

Key words:

Geography Field Practice Teaching System; Practice base at Three Gorges

The Teaching Practice on Geographic Education

Santos, M.F.P, Souto, X.M., Neto, I.L.G.

Universidade Federal de Alagoas, Maceió, Brasil, francineilap@gmail.com

Universidad de Valencia, Valencia, Espanha, xmsouto@ono.com

Universidade Federal de Alagoas, Maceió, Brasil, irislisiegn@gmail.com

Abstract

The teaching practice is considered an essential moment in initial docent formation in geography. Thus, the research of how the teaching practice has been discussed, as well as topics related to it in the magazines Cuadernos de Pedagogia and Didáctica de las ciencias experimentales y sociales, is the objective of this work. The analysis we'll do is focused, at first, on to evidence the articles present in the cited journals, which deal with teaching practice in initial docent formation in the interval of ten years, between 2005-2015; and then to investigate which topics related to it are present in those articles; and, lastly, to analyze the existing proposals in those articles for the practice of teaching. We understand that the moment to discuss the teaching practice is appropriate due to the current discussions about this subject in Spain and in Brazil (after the implementation of the latest curriculum reforms in universities). The analysis of articles shows experiments and proposals that aim a better development of teaching practice. Therefore, we consider important an analysis of the contributions displayed in these articles, in order to apply them in teaching practice seeking a significant initial docent formation committed to the aspirations of Geographic Education in contemporaneity.

Key words:

Teaching practice; Initial docent formation; Geographic education

A Comparative Perspective on Intended Geography Curriculum at the Middle Level Schools in India and Pakistan

Geetha,T

Department of Education, University of Delhi, INDIA.t.geetha.k@gmail.com

Abstract

Texts are parts of actual social relations- written in specific time and read in specific circumstances thereby realising concrete social transactions (Bazerman,2006). The interpretive mode of analysis of curricular text(content!) attempts to increase the meaning of the text, wherein the content analysis treats the meaning as unproblematic and directly revealed through text. In this study, the comparative perspective of intended geography curriculum in Pakistan and India has focussed more on the nature of the discipline, specified objectives and content in terms of its sequencing at the middle level of the school and less on the social and political factors. Geography curriculum has been conceptualised at different levels of generality depending upon where structures involves micro or macro elements. Micro elements were directly derived from list of objectives and major ideas; and macro elements (categories of micro elements) from textbook content. The Study analyses (a) the representation of geographical knowledge as specialised or as generic/ integrated, (b) the application of the 'classification' concept propounded by Bernstein to categorise knowledge statements or texts as either strongly or weakly integrated and (c) the treatment of geographical knowledge as propositional or procedural as referred by Schweb(1978). In both the countries, the content of physical geography and human geography was treated as differentiated branches of the discipline. Further analysis has given some implication for the restructuring of geography curriculum as both the countries share the physical continuum and the people (human beings) shared the freedom struggle at certain point of history. This comparison may help the planners to revisit the structure and the content of geography curriculum and thereby help the learners to connect at the human level.

Key Words:

intended geography curriculum; structures; micro or macro elements; classification; propositional or procedural knowledge

Comparative Research on Cambridge International Education (IGCSE) Geography and National Curriculum of Mongolia (in case of Theme Population and Settlement)

Zogsoosuren BAYARMAA

New Era school, Ulaanbaatar, Mongolia, zs.bayarmaa@yahoo.com

Abstract

The aim of this study is to compare the National Curriculum of Mongolia and Cambridge international education's IGCSE level syllabus. The Mongolian government, through its Ministry of Education and Science (MEDS) seeks to address the Education challenges through implementation of an Education Quality Reform project with objective of rapidly improving learning outcomes for all children. According to the Government Action Plan (2012-2016), the Ministry has been initiating and implementing primary and secondary education core curriculum reform through designing, piloting and implementing the curriculum in all schools of Mongolia. MEDS established "New Era" laboratory school to implement the Cambridge international education program in 2010. Methodologically, this is a comparative study quantitative and qualitative approaches. The main data collection tools are the curricula and geography textbooks of the Mongolian and CIE, so that document analysis is the methodological technique to be utilized in this research. The data is analyzed by math statistics. The result of analysis, assessment objectives different from each other and specification grid is non-existent in Mongolian national core curriculum. It is argued in conclusion that comparative research needs to make clear core curriculum objectives released to assessment objective and assessment specification grid.

Key words:

national core curriculum; syllabus; objectives; assessment; specification grid

Curriculum Making in National Settings

Bagoly-Simó, P.

Humboldt-Universität zu Berlin, Berlin, 10099, Germany, peter.bagoly-ssimo@geo.hu-berlin.de

Abstract

The curricula of the individual German federal states have experienced a progressive transition towards a skill-based curriculum. Following the main framework of moderate constructivism, several curricula emphasise generic sets of skills over subject-specific competencies. In light of this development geographical knowledge experienced diverging patterns of change in different national settings. The aim of this paper is to analyze the subject-specific knowledge of geography in international comparison. Content analysis served to map the individual models in the geography curricula of several European and Latin American countries. The main objective was to critically explore the extension of concepts, such as curriculum making, skills, or knowledge inherent to the above mentioned discourse. Therefore, the paper also sets its focus on classroom curricula or curriculum making in terms of lesson planning practice in light of curricular frameworks.

Key words:

Curriculum making; knowledge; international comparison

Initial Teacher Training of Geography: Comparative Study of Models between the Lisbon University, Portugal and the Ceará State University, Fafidam Campus

NASCIMENTO Maria Anezilany Gomes do, ESTEVES Maria Helena

IGOT, University of Lisbon, Portugal, lananascimento@yahoo.com.br

Abstract

The following research aims at analysing in a comparative study the models of initial teacher training in Geography in two universities (University of Lisbon, Portugal and State University of Ceará, Brazil) involved in pedagogical formation. In both countries initial teacher training is undergoing some key changes and it is important to understand which are the recent objectives and contexts of training, to analyse differences between the models of training and learn from each one's specificities. Considering that Geography Education is guided by reports and recommendations issued by international educational organizations such as the UN, UNESCO and International Geographic Union, it is interesting to analyse how different universities incorporate these recommendations both in initial teacher training and in the definition of a model of Geography teacher arising from this training. Since 1996, Brazil is undergoing general curricular reforms with the publication of the New Law of National Education and more specific ones in 2001/2002 with the National Curricular Orientations. Important changes have been introduced in the field of teacher training and a new conception of initial teacher training has resulted. These changes are present in areas such as hours in training and practical activities, In Portugal the adaptation to Bologna Process also implied a recent and new organization in initial teacher training programmes, being now a second cycle formation (conceived as a disciplinary formation both in History and Geography), This model has now been replaced by a single area formation.

Geography; Initial Teacher Training; Portugal; Ceará; Brazil

The Cognitive Demands of the Intended Geography Curriculum in China and Canada: An Analysis Based on Revised Bloom's Taxonomy

Qingna JIN, Mijung KIM, Xiaowei XUAN

University of Alberta, Edmonton, Canada, qingna@ualberta.ca

Abstract

While there has been an increasingly remarkable worldwide convergence in the emphases of geography curricula over the past few decades, the cognitive demands that they make on learners have not been well-researched. Without knowing these intellectual or epistemic requirements when learning geography in school, issues concerning curricular alignment and access to spatial thinking and abstract geographic understanding are likely to occur. To highlight the value of such forms of analyses, we examine the whole intended geography curricula (K-12) from China and Canada (Alberta Province) using revised Bloom's taxonomy as analyzing tool, as well as describe some of their general features for teaching and learning. The results confirm "the phenomenon of curricular similarity", which is proposed by some contemporary curriculum scholars, at the same time, contribute insights into the complexities of the whole geography curricula among two similar yet different educational systems.

Key words:

Geography Curricula in Mongolian Secondary School

Purevsuren ENKHJARGAL¹, Getsel URANCHIMEG¹, Tsedev BAT-ERDENE¹, Sandag KHADBAATAR¹, Avkhinsukh AMGALAN¹

¹Department of Geography, Mongolian National University of Education, enhjargal@msue.edu.mn

Abstract

In the 1990s Mongolia moved into new political system and the change has been a constant theme in all sectors of the society including education. In the education sector structural, organizational, technological and curriculum changes have been ongoing ever since. Among these areas, curriculum renewal is a key factor in education system change. In this regard learning objectives are being redefined, new core curriculum, standards, textbooks and support materials are being developed, and pedagogical methods, assessment systems and learning environment are being improved as well.

In relation to adoption of 12-year general education system, new core curriculum, textbooks, and teaching handouts are being developed. Since the beginning of 2015-2016 academic year, a new curriculum of Geography has been used. Thus, the article focuses on historical changes in curriculum of Geography, comparative studies of old (2012) and new (2015) curriculums (structure, content, continuity, relation, etc) and presents the result of the research. Research methods used are primary source analysis, comparison and induction.

Key words:

curriculum; core curriculum; curriculum history

Positive Effects of In Our Students, Teachers and Administrators after the European Union Comenius Projects İn Kadıköy-İntaş High School

Gülçin Ayhan ERTEK, Ms.Art.¹ ; A.Prof.Dr. T.Ahmet ERTEK²

¹Kadıköy-İntaş Kız Anadolu İ.H. High School, Geography teacher, Kadıköy, İstanbul, TURKIYE. gaertek@gmail.com

²İstanbul University, Letters Faculty, Geography Department, İstanbul, TURKIYE. taertek@istanbul.edu.tr

Abstract

The European Union Education and Youth Programs have entered a new period in 01.01.2007. Since 1 April 2004 “Turkey” participated as “full membership” to Lifelong Learning Programme, until 7 years covering periods. The main objective of the Comenius program, "School Education" in the field is to improve the quality of education through cooperation with European countries and to promote language learning by providing cultural dialogue.

Our school has been an international school projects by 3 units between the years 2006 to 2013, became a model for other schools and influenced them in a positive way in our district. These three projects name's; Society Growing Old? Fun for Future-Lets Love Learning and The European Cultural World in Children's Folk and Fairy Tales. Results of these 3 projects conducted the study with 11 countries. These countries together with the presentation, poster, brochure and catalog promotions were made. Language and cultural unity was made. At the moment, some of our students currently studying in college and the other part are specialized in professional university degree. Some parts of our teachers are still continuing education and some of them were retired. The project aim is to take the best aspects of seeing each other's differences in education and implement our own country. Partner school students and teachers in the EU has made the exchange of information from interaction also, Turkish culture was introduced to them and toured in İstanbul. Students and teachers have gained a lot of cultural point of view. So, 72 people (students, teachers, administrators) have gone abroad.

The aim of the Comenius project expands students' horizons, develop foreign language (English) skills, compare their own culture with new cultures, and for our teachers to be more beneficial to innovation in education for its students. It was an international school for school administrators, education in how the world is progressing as we can see it. Guests witnessed the different cultures by foreign students for the first time made it home for parents and children 1-week parenthood.

As a result, three different EU projects by students, teachers, administrators, parents and our school has been in a great development.

25 Years of the All-Russian Geography Olympiad: Didactical Conclusions

Naumov A.

Lomonosov Moscow State University, Moscow, 119991, Russian Federation, alnaumov61@gmail.com

Abstract

In 2016 The All-Russian Geography Olympiad celebrated its 25th anniversary. This Olympiad story has started ever earlier – in 1950s, when first competitions were organized by the Faculty of Geography at Lomonosov Moscow State University. Nowadays, more than 200 secondary school students from the whole country compete annually for achievements and possibility of free (no exams) admission to the most prestigious Russian universities. They are selected through all-national hierarchical system of competitions, e.g. in 2016 more than 5.500 students have competed on regional level. Long-term experience of managing the Olympiad provides important data for measure level of geographical knowledge of Russian secondary school students, evaluate their interest in the subject in general, and analyze professional career of the winners. Olympiad requires specific methodology and contents of the tests, which are reviewed. Presentation is based on samples of ‘theoretical’ and ‘field’ tasks from recent years tests of The All-Russian Geography Olympiad. Special attention is paid to use of classical heritage and modern achievements of geographical science and techniques in the Olympiad tasks.

Key words:

geographical education in Russia; geography olympiad

Dispositions toward Teaching Spatial Thinking through Geography: A Case of Chinese and Korean Preservice Teachers

Lee Jinhee¹, Jo Injeong¹, Xuan Xiaowei², Zhou Weiguo²

¹Texas State University, San Marcos, USA, j_l281@txstate.edu

²East China Normal University, Shanghai, China

Abstract

This study aimed to examine Chinese and Korean preservice teachers' dispositional characteristics related to implementing aspects of spatial thinking into their future classrooms. "Teaching Spatial Thinking through Geography Disposition Inventory," developed by Jo and Bednarz (2014), was administered to over 1,200 pre-service teachers recruited from various geographic areas of the two countries. The relationships between gender, grade level, geography course experience, and geospatial technologies experience of participants with specific dispositional characteristics under five categories: (1) teaching thinking skills; (2) teaching spatial thinking skills; (3) spatial thinking in geography; (4) explicit teaching of spatial concepts; and (5) adopting spatial representations and geospatial technologies in instruction, were examined. In this presentation, both similarities and differences in dispositional characteristics between Chinese and Korean pre-service teachers will be reported. Implications of the findings and recommendations for preparing teachers to incorporate spatial thinking into classrooms will be discussed in the context of each country's education and teacher preparation systems.

Key words:

Spatial thinking; Teacher education; Preservice teachers; Teacher disposition

Geography as a Basis for Training Specialists of Tourism in Ukraine

Liubitseva O.

Taras Shevchenko National University of Kyiv, Ukraine, loa13@ukr.net

Abstract

High education and training for tourism in Ukraine, in fact, evolved since the country gained its independence. Existent at that time organizational approaches to tourism during Soviet times yet did not require a large number of staff and their special training. The formation of the contemporary system of education and training for tourism was pioneered by the Chair of Regional Geography and Tourism. From then till now the chair and its scholars actively participates development of professional training, research on tourism and practice of tourism industry in the country. Intensification of social developments and changes in the economy influenced the tourism market improvements and its civilized forms. Contemporaneously, high education institutions started to introduce corresponding specialty. The curricula followed the basic branch of the high school: geographic, technical, economic, humanitarian basis. The Ministry for Science and Education licensed over 100 high schools around the country to educate tourism bachelors, among those 23 institutions provide for master degree programmes. Geography, however, maintains its position in tourism managers training. Together with the conventional geographical disciplines, like Recreation Geography, Tourism Geography, Medical Geography and basics of Balneology, it enriches curriculum introducing Regional Tourism Studies, Theory and Practice of Recreation and Tourism Nature Management, Regional Problems of Sustainable Tourism Development. The particular geographical essence refines Methods of Tourism Research.

Key words:

geographical education of specialists in tourism; sustainable tourism

Internationalization of Geography Education with Special Reference to Tertiary Education in India: Issues and Challenges

Singh, RAVI S.

Professor: Dept of Geography, Institute of Science, Banaras Hindu University, Varanasi 221 005 (UP), India,
ravisingh.geog@gmail.com

Abstract

Globalization is taking place all over the world, whether we are for or against it, and India is no exception. It has resulted into unprecedented international flow of people, services and goods. The volume of international movement of students seeking higher education (degrees) from a country other than of their origin attests such a growing trend in the (tertiary) education sector. In the recent past, there has been good amount of discussion on why and how to internationalise (tertiary) education and what role can geography play with this respect (e.g., Shepherd et al. 2000, Haigh 2002, Pandit 2009, Ray and Solem 2009). In the broader perspective, through this process we can aim at intercultural exchange and improvement in competence of our graduates in different fields. In a way, this process may also ensure quality education and training which in turn contribute immensely to the larger process of development. Education and training exports in one hand can generate direct economic value; and, on the other, create positive role as far as international relations and diplomacy (from national perspective) are concerned. India with a large tertiary education system/structure, comprising of the network of both public and private institutions, can vie to take advantage of it. The available statistics however reveal that so far we have not been able to reap this potential benefit. The present paper looks into issues, opportunities and challenges with respect to internationalization of geography education in India.

Geography education; Globalization; Internationalisation; Tertiary education

The Direction of Geography Study in Thailand

Losiri, Chudech

Lecturer and Former Secretary of Geography Association of Thailand, Department of Geography, Faculty of Social Sciences, Srinakharinwirot University, 114 Sukhumvit 23, Bangkok 10110, Thailand. chudechlosiri@gmail.com

Abstract

Geography has been teaching in the bachelor degree curriculum of Thailand for a long time. Initially, this subject was divided into four branches; system geography, regional geography, techniques in geography, and philosophy of geography. However, the content of the subject as well as techniques for spatial data enquiry have been developing in order to analyze and solve geographical problems. As a result, the Geography curriculum in Thailand has been changed dramatically. The Geographic Association of Thailand (GAT) is taking this change into an account; therefore, the GAT conducts a survey to all institutions, who are running the bachelor degree in Geography, across country. An 18-curriculum from eighteen universities is sent back to the GAT. Results from the survey found that the bachelor degree in Geography can be divided into three main curriculums. First is a Bachelor of Arts in Geography and Geography and Geoinformatics. Second is a Bachelor of Science in Geography and Geography and Geoinformatics. Third is a Bachelor of Science in Geoinformatics. The structure of subjects from these curriculums comprise of five main themes; physical geography, human geography, regional geography, map and geographic techniques, and philosophy and integrated geographic knowledges. These themes have been revised from time to time and reflect to the geography curriculum in Thailand.

A Grounded Theory Approach on the Typological Process of How Primary Geography Teachers' Professional Identities Are Formed and Developed

Dong-min Lee

Catholic Kwandong University, Gang-neung City, Republic of Korea, dr.dongminlee@gmail.com

Abstract

Primary teachers are the central agent of geography teaching in primary schools. This means that they are professionals at teaching primary subjects, including primary geography. In other words, "primary teacher" needs to be the primary geography-teaching profession. This requires primary teachers to have a strong primary geography teacher professional identity. However, cultivating a geography teacher professional identity for primary teachers may be more difficult, complex, and complicated than for secondary geography teachers. This is because primary teachers major in primary education, not geography education, and they teach several subjects in primary schools. Some advanced research notes that these problems probably impede primary students' achievements in and satisfaction with primary geography education.

Based on the awareness of such matters, this study attempted to analyze and categorize the processes behind how primary teachers form, develop, and change their professional identities as primary geography teachers. To conduct this typological research, Straussian grounded theory, a qualitative method, was used with approximately twenty-five primary teacher participants. The interim findings of this study imply a rough sketch of the process. The findings and discussions of this study will contribute to a more systematic and sophisticated understanding of primary geography and primary teachers and help to improve primary geography teacher training.

Key words:

primary geography education; primary teacher; professional identity; grounded theory; teacher training

Challenges of Teaching Geography Education in High School: A Case study of Nigeria

Salisu Lawal Halliru

Department of Geography Federal College of Education Kano P.M.B 3045 Kano lhsalisu09@gmail.com

Abstract

Geography which is widely recognized as very essential in making a child to appreciate his environment, and learn how to live peacefully with it, has however, being substituted with social studies for long. The consequences of such shift on the overall teaching and learning of Geography in general and the depth of knowledge of even those that study it remain generally not documented for many years. This paper examined the consequences of this change. This study was conducted during the 2011/2012 academic session in FCE Kano, Kano state and involved 360 students that graduated from senior school between 2003-2011. The result obtained indicates that for Human Geography pass and fail 36% and 64% respectively. For Physical, it was 32% and 68% respectively for pass and fail. For Regional it was 33% and 67% for pass and fail while for Map work only 28% of them passed and 72% failed. It was concluded that the student's depth knowledge was generally weak and most probably reflect relatively shorter period over which they were exposed to the discipline during the last 3 years of secondary school period. Likewise, it's appears that long period of learning social studies have not equipped the student's fundamental thematic Geographical issues. It's recommended that the teaching of Geography in Nigerian schools should be re-introduced back at the very 1st year of primary school education. A model for such re-introduction has been proposed, and is referred to as GEOPYRAMID.

Chinese Pre-service Geography Teachers' Competency on Spatial Thinking

Jiang, L. F¹., Muniz, O. A²., Duan, Y. S¹.

¹East China Normal University, Shanghai, 200241, P. R. China, jianglianfei520@163.com

²Texas State University, San Marcos, Texas, 78666, U.S.A.

Abstract

Spatial thinking is a collection of cognitive skills comprised of knowing spatial concepts, using tools of representation, and reasoning processes (NRC,2006). It is a powerful way of problem solving in our daily lives, at the work place, as well as in science. So spatial thinking should be a systematic and integral part of the normal education system (Bernarz, 2004a). While Geography is the best subject to develop students' spatial thinking skills in view of its subject contents and characteristics. Boehm and Sharma (1994) assert that teachers can not teach what they themselves do not know. The pre-service teachers of today will be charged with the responsibility of teaching geographic concepts in the future. In this paper, we mainly focus on the current situation of pre-service geography teachers' competency on geospatial thinking in China via a case study in East China Normal University. Through The Spatial Thinking Ability Test and sketch maps which are taken by the last year students who prepare to be geography teachers in the future in East China Normal University to get the result. We will analyse this result by t-tests to draw the conclusions and suggestions for Chinese geography pre-service teachers' preparation.

Key words:

Chinese; pre-service teacher; geography; Spatial thinking

Exploring Teachers' Geographical Identities: Why It Matters?

Till, Emma

The University of Winchester, United Kingdom, emma.till@winchester.ac.uk

Abstract

Teachers have multiple identities. Teachers' professional identities are the result of the many different ways in which teachers see themselves including as subject and pedagogical experts. In the UK, non-specialist teachers usually teach geography in primary schools as a discreet subject. It is also the case that in some secondary and high school's geography is taught by individual teachers who do not have a background in the subject. It is therefore likely that the relationship that individual teachers have with the subject will be significant in relation to their practice. This paper outlines the rationale behind empirical research, which focuses on the relationship that a sample of teachers who are enthusiasts for the subject and identified as experts in their classes and their schools has with geography and which examines the *essence* of 'being' a geographer for each individual. It is contended, that understanding the relationships that individual teachers' have with geography, can start to explain some of the influences on these individuals motivation and the way that they teach the subject. With regard to the training of new teachers, it is argued that facilitating opportunities for trainees to explore aspects of their overall professional identity including their *subject-identity*, will lead to an improvement in the teaching of geography and also benefit individuals as practitioners.

Key words:

Geographical identities; subject-identities; teaching; professionals; relationships

Future Teachers' Dispositions toward Teaching with Geospatial Technologies

Jo, Injeong

Texas State University, San Marcos, USA, ijo@txstate.edu

Abstract

Much of the literature on teacher preparation for successful integration of technology into classrooms has focused on enhancing technological, pedagogical, and content knowledge (TPACK), and slow and ineffective technology implementation has often been attributed to a lack thereof. However, studies also have identified a positive relationship between teachers' personal beliefs and dispositions and their classroom integration of the technology. Therefore, effective implementation of innovative technologies in education, like geospatial technologies (GST), will require preparing teachers to develop not only the necessary knowledge and skills for but also positive dispositions toward using them as a tool for teaching. This study examines the effect of a minimal Web-based GIS experience within a semester-long methods course on enhancing preservice teachers' dispositions regarding the use of GST in their future classrooms. Fourteen preservice teachers enrolled in a senior-level methods course, offered in geography department at a large-sized state university in the US, participated in the study. The findings of the study indicate that Web-based GIS activities had a positive impact on participants' beliefs, attitudes, and confidence in GST implementation and teaching spatial thinking in their future classrooms.

Key words:

Web-based GIS; teaching with geospatial technologies; teacher education; teacher preparation; teacher disposition

GeoCapabilities: Teachers as Curriculum Leaders

Solem M

American Association of Geographers, Washington, D.C., 20009, USA, msolem@aag.org

Abstract

The GeoCapabilities project has produced an online teacher training platform that draws on principles of human capability development as an approach to preparing teachers as future curriculum leaders. This paper will present an overview of the motivation, theory, exemplary materials and questions for reflection that compose the four modules in the platform. Collectively, the aims of the modules are:

- Enable critical reflection on the teaching of geography at the level of goals and purposes
- Develop ideas of disciplinary rigor in geography education and to link this effectively with enquiry pedagogies
- Empower in teachers with new understandings of the significance of their role in 'enacting' the curriculum
- Inspire teachers of geography internationally to take responsibility for 'curriculum making' and to learn from each other
- Provide examples of curriculum leadership

The GeoCapabilities project argues that the absence of geographical knowledge in formal education deprives young people of some vital perspectives, ultimately undermining their capabilities as global citizens. One important outcome of the GeoCapabilities project will be the means to communicate effectively (and internationally) how the development of geographical knowledge and understanding in young people contributes to the fully educated person.

The GeoCapabilities platform is designed to provoke and stimulate creative and committed responses from teachers. The platform's four modules are intended to be enjoyed and to be professionally rewarding and motivating, contributing to teachers' lifelong learning as curriculum leaders.

Key words:

Powerful disciplinary knowledge; capabilities; curriculum making; curriculum futures; teacher leadership

Impacts of the Program PIBID in Teacher Training and Geographical Education, in Brazil

NASCIMENTO Maria Anezilany Gomes do

IGOT, University of Lisbon, Portugal, lananascimento@yahoo.com.br

Abstract

This paper presents the impact of a policy to initiation to teaching on teacher training of geography, in Brazil. The Institutional Program of scholarships to Initiation to Teaching (PIBID), started in the mid-2000s, covers currently more than 90,000 students distributed among more than 300 projects developed in 05 regions of Brazil. The main goals of this program are to search the quality of teacher training, the integration of educational institutions, public schools of basic education and post-graduate programs and expand the production and dissemination of knowledge produced from the projects. Through some results with geography projects linked to this program we can list important aspects such as: the connection between theory and practice, respect for regional and local characteristics in the production of knowledge and the relationship between education, research and extension. These conclusions are the result of the PhD thesis developed by this author. The thesis is focused on the relationship between the university and the school in initial teacher training in Brazil and Portugal. The Pibid is one of the empirical and analytical elements of the research. Interviews, fieldwork and surveys are some of the data collection instruments. In addition to improving the initial training of teachers for basic education in Brazil, an important also achieved dimension is the induction to the continuing education of teachers who are in the work environment of professional practice and who have returned to university to reflect their practice.

Key words:

teacher training; Pibid; geographical education; Brazil

Pedagogical Strategies and Practices Collaborative for an Ethical Living

Hindenburgo Francisco Pires¹, Yan Navarro da Fonseca Paixão²

¹Geography Institute, Rio de Janeiro State University, hindenburgo@uerj.br

²Pedro II School of Realengo - Rio de Janeiro

Abstract

In the 21st century, the knowledge obtained through learning methods based on innovations sustainable, and critical pedagogy, tends to favor the development of practices collaborative for an ethical living and new experiences educational communicative.

The aid of technologies for learning and communication; the use of technological interfaces (virtual learning environments, blackboard digital, social networks, blogs, multimedia projector, internet, learning objects); and the implementation of strategies critical pedagogical, based on narratives transmedia, are contributing to that students and young learners have a more active and constructive role for an ethical living, in the discussion and development of new content and didactic materials directed to environmental education.

Educational strategies aimed to promote a better world in didactics of teaching Geography, are producing changes in the school, in the classroom and in new environments of pedagogical mediation.

The objective of this work is to discuss, through the geography teaching, as in small actions, we can contribute with our students, to maintain more sustainable the environment, and promote ethical values within our home, school and room class and also revolutionize the didactics of geography teaching in the current period.

Key words:

Didactics of geography teaching; practices collaborative; teaching strategies; innovations sustainable; ethical living

stoltman@wmich.edu

Abstract

Scholarly organizations are living organisms, and as such, they develop unique attributes that represent their academic and societal relationships and contributions. The International Geographical Union (IGU) Commission on Geography Education (CGE) came into being in 1948, and was officially recognized by the IGU in 1952. At that time, the world's leaders were searching for a means to counter the effects of war and social upheaval, and especially the consequences of conflict for school-aged children. There was agreement among the academic and political leaders that geography provided the means. The Commission became the instrument with which to reach out to the global educational community regarding international understanding between and among people and governments. The accomplishments of the IGU-CGE became evident as it collaborated with Unesco in providing the growing populations of young people globally with the concepts and challenges of international understanding. Curriculum materials, books, resource papers, and workshops for teachers were among the most celebrated activities. The common memories of senior members of the Commission regarding those activities were captured during symposia and conferences well into the 1970s. Much of the early activity of the Commission did not appear in print, so this paper is attentive to those aspects of the Commission's early years that were captured verbally. The record demonstrates the transition from international understanding to a much broader focus on the attributes geography and their contributions to a comprehensive geographic education.

A Research Coordination Network for Transformative Research in Geography

Education

Solem M

American Association of Geographers, Washington, D.C., 20009, USA, msolem@aag.org

Abstract

This poster illustrates the components of a new research coordination network (RCN) for transformative research in geography education. The National Center for Research in Geography Education (NCRGE), co-headquartered at the American Association of Geographers and Texas State University, is serving as the coordinating hub of this RCN.

NCRGE was established in 2013 to build a RCN whose members carry out bold, visionary and innovative research that has significant potential to improve geography education. Through its Transformative Research grant program, NCRGE will strengthen geography education research processes by creating the networks and opportunities for interdisciplinary conversations that ultimately result in sustainable lines of research. The long-term vision is to produce research findings that inform the work of teachers, curriculum developers, professional development providers and organizations supporting geography education.

The NCRGE Transformative Research program supports network-building through 1) research fellowships for interdisciplinary collaboration, 2) travel funds for research meetings and site visits, and 3) contributions of datasets, instruments, literature and other resources to the NCRGE research clearinghouse. Examples of RCN activities supported by this program will be provided.

A Fresh Approach for Freshmen: Exploring an Integrated Method of Teaching the History of Geographical Ideas

Chao Ye

School of Geographic Sciences, East China Normal University, Shanghai, 200241, P. R. China, yeover@163.com

Abstract

It is vital for undergraduates majoring in geography to learn the history of geographical ideas. Although the cultural and educational backgrounds of China and the West are very different, teaching methods such as teaching through texts, student presentations and group learning are common and without borders and so are appropriate for use by most teachers and students even if from different countries and regions. The integrated method is helpful as a way to popularize the history of geographical ideas and improve the standard of teaching and learning. Due to lack of specific classes on geographical history in countries such as China, the authors of this article have explored a more integrated method for the teaching of first-year geography undergraduates and have assessed the effects of this teaching through questionnaires. The students have identified different benefits and the responses to this class have been mixed. A special learning group consisting of one teacher and several undergraduates was involved in the research and have the status of coauthors of the paper through the compilation of the questionnaire, interviewing and analyzing materials from 67 freshmen, in China, majoring in human geography and geographical education. For undergraduates, especially from countries like China, it is well worth the effort of making geographical history both a necessary and an interesting class.

Core Ideas of Geography in Basic Education in China

Zaozao Zeng

Beijing Institute of Education, Beijing 100044, greta9999@163.com

Abstract

Core ideas of geography originate from the geographical thought and the academic tradition, which have value for geographical education in basic education. This paper focuses on core ideas of geography, such as human-environment interaction, space, earth system, etc. in order to build a conceptual system of core ideas, which can provide a method of learning progression for core ideas in geographical teaching, to help teachers to understand values of geography.

Key words:

core ideas of geography; geographical education

Educational Values of Geography in Secondary School

Fengtao Guo, Yushan Duan, Lizhong Yu, Weiguo Zhou, Lizhi Shi

East China Normal University, Shanghai, 20041, P.R. China, fengtao.guo@foxmail.com

Abstract

Recently, geography education in China puts more attention on test score rather than the value of geography. This research focus on what are the educational values of geography and how to promote geography education to be itself. Through literature review, analyzing scholars' viewpoints, comparing six different national geography standards and field survey, this research put forward eight educational values of geography which includes system thinking, sense of man-nature harmonization, view of space-time, sense of place, interdependence, spatial and technological capability, appreciation ability and comprehensive practical ability. Furthermore, regarding the problem of the investigation, there are eight suggestions including remodeling teachers' and students' recognition of geography, examination evaluation of fair use, Increase in geography experiment and fieldwork, developing problem-based geography textbook and teaching resource suitable for Digital Native, etc. In a word, the realization of educational value not only need theoretical study of values of geography, but also a variety of method applied in practice of teaching geography.

Key words:

educational values; geography; secondary school

Geographical Core Competences in the High School of China

Yushan Duan

East China Normal University, Shanghai, 20041, P.R. China, ysduan@126.com

Abstract

Geography in high school of China is one of basic courses connecting with geography in compulsory education, content of which links knowledge social science and natural science.

Geography standard for high school is under revision now. The new geography standards pay more attention to cultivate students' core competences. Consequently, we mainly deal with two question, 1) what is geographical core competence? 2) how to identify and judge students' competence? Geographical core competences for student, developed by learning geography, is essential character and morals and key skills with geographical characteristics. Core competences include sense of man-nature harmonization, holistic thinking, regional recognition and geographic practical skills, which corresponding to three dimensions basic values, basic ideas and methods, basic activity experience. Moreover, in order to identify students' competences, each competence was classified into five performance levels from simple to complex in term of cognizant law of student.

Social Classes and Geography: A Study amongst Brazilian Textbooks

AMORIM, P.

Instituto Federal de Santa Catarina, São José, Brazil. geopaulo@ifsc.edu.br

Abstract

Considered as a Human Science in Brazil's national guidelines for middle school curriculum, Geography has as one of its task the development of the comprehension of societies as results of the agency of different social subjects in time and in space. One of the core concepts historically related to the identification of the role of human groups in history is social class, a theoretical tool developed by, but not only, historical materialism and widely discussed along the XX century. The present work aims to determinate if Geography textbooks dialogue with the concept of social class to achieve this discipline's goal and, in addition, it searches for the ways in witch it shows social classes to students. For this, in addition to reviewing classic texts about social classes and about the history of textbooks in Brazil, were analyzed 12 out of 14 textbooks distributed by Brazilian State to public schools. Their textes were sorted in themes and evaluated according to conceptual levels established with bibliographical review. The result shows that those textbooks have strong points, but still it is possible to improve in order to promote a general and complex understand of social classes' action.

The Geographical Core Competencies Division Research of Senior High School in China

Qian Gong

School of Geographical Sciences, East China Normal University, Shanghai, 200241, P. R. China

Abstract

With the advent of globalization, the information age and the knowledge society, the competition among the countries has converted from the surface level of productivity to deep and talent-centric competition. Making economic development as the core, committed to the promotion of civic competencies, it has become a common theme in development around the world. The students cultivated by Chinese education have shown the incomplete of their competencies development such as the decline of their physical quality, the lack of ability to adapt to the society, the promotion of negative emotion and the lack of practice and innovation ability. The current situation and problems are urgently need the change of education quality concept, setting up the "core competencies of students" as the basic framework of education quality evaluation and curriculum system, to deepen and implement the promotion of "quality education". In order to comply with the world development trend of education and enhance the international competitiveness of Chinese education, the research integrate qualitative and quantitative methods and take a top-down and bottom-up combination comprehensive ideas. The research focus on identifying the structure of geographical core competencies of Chinese secondary school students, selecting the index of geographical core competencies of Chinese secondary school students, defining and dividing the connotation of the index and proposing the ways to implement and promote the geographical Core Competencies related work.

tungfung@cuhk.edu.hk

Abstract

Sustainability has been increasingly introduced in university curricula and programs to enrich and educate students on this concept and its implementation. Parallel to pedagogical work, many universities, as teaching laboratories where concept is put into practice, have also established sustainability related offices to promote the concept of sustainable campus and implement it within the campus. The scope varies among universities but most would focus on energy conservation, waste management, food and water security, ecological conservation, green building design, green procurement and even smart city development. Various standards have been established to benchmark on activities and performance. Consortia are formed to promote and share among institutions on similar development. This paper attempts to trace the development of the concept of sustainable campus, scope of its development and ascertain how it is related to geographical education.

A Dynamic Construction Mechanism of Thematic Symbol under the Aspect of Semiotics

Fei ZHAO, Ming MENG, Lixun DING

School of Resource Environment and Earth Science, Yunnan University, Kunming, 650091, P. R. China, vwobai@163.com

Abstract

The construction of thematic map symbols is a very complex and intellectually demanding process, but thematic symbols can be automatically generated and easily shared on the web using the syntactic structure of semantic symbols. In this paper, the symbol types, inner structure, and design pattern are discussed. A syntactic construction theory based on letter (thematic maps primitive) - word (single thematic symbol) - sentence (combined symbols or complex symbols) structure model is proposed to automate the construction of thematic map symbols. As a result of this research, symbols can be defined using cartographic primitives which are arranged according to syntactic principles. A semiotic model and word-centered construction theory can be integrated into interactive cartography as represented by the technology of Internet. Finally, the concepts and schema of this theory are discussed, and some examples are presented based a web thematic cartographic system to verify its utility.

Assessment of Solar Energy Resources in Ethiopia- Modeling Solar Radiation and GIS-Based Multi-Criteria Analysis

Fikremariam Teshome Tekle

Department of Geography and Environmental Studies, Addis Ababa University, Ethiopia,

fikremariam.teshome@aau.edu.et

Abstract

The sun is the ultimate source of energy for life on earth, and hence the knowledge of solar radiation is essential for hydrological, climatological, biological modeling and utilization of renewable energy resources. Solar radiation can be measured from ground meteorological stations. Installations of instruments that directly measure global solar radiation are quite expensive, and thus spatial density of instruments is low. For instance, in Ethiopia there is only one Pyranometer, which is currently not functional. Unlike rainfall and temperature that can be measured at a few locations and interpolated for other areas within reason, solar radiation cannot be interpolated with any degree of confidence due to its high dependence on topography and surface features. Digital Elevation Models (DEMs) are important to derive these topographic characteristics that affect the amount of incoming solar radiation. Estimation of solar resources in a complex topography and remote areas where ground measurements are not available and/or expensive to measure over large areas from DEM is fast, cost effective and reliable. Ethiopia is located in the tropics and thus highly endowed with an abundance of solar energy. However, exploitation of solar energy is much underutilized and the energy sector is the least developed. The aim of this study is to calculate available solar energy resources and mapping the most suitable sites for large-scale PV installations in Ethiopia. The monthly and annual global solar radiations of Ethiopia were calculated from 30 m resolution ASTER DEM using ArcGIS solar radiation analysis tools. Solar radiation potential of Ethiopia ranges from 0.2 MWh/m²/year in the lowlands (peripheral area) to 2.6 MWh/m²/year in the central highlands. Large portion of Ethiopia receive solar radiation above 1.8 MWh/m²/year. Using GIS-based multi-criteria analysis, about 195 sites mainly in the eastern part of the country or 6000 km² in total, were selected as ideal locations for large-scale PV installations in Ethiopia. The selection process takes various topographic, economic, social and environmental factors into consideration. If selected sites could be exploited properly, they can generate more than 65 GW which is about to 1/6 of electric power of all nuclear power plants in the world assuming 10 percent PV efficiency. Finally, a sensitivity analysis was performed to verify selected sites. It is hoped that this study will promote investments in solar energy and encourage researchers for further studies in Ethiopia.

Diffusion of Verbal Maps for People with Visual Impairments by Volunteer Group in Japan

Tanaka M.

Tokyo Metropolitan University, JSPS Research Fellow, Tokyo, Japan, tanaka-masahiro1@ed.tmu.ac.jp

Abstract

Whereas previous studies of public participation GIS (PPGIS) and volunteered geographic information (VGI) have mainly considered the diffusion of information within a single administrative district, few studies have examined activities across administrative borders. Hence, I examined the process of VGI diffusion from the perspective of “politics of space,” with a focus on PPGIS carried out across administrative borders. The subject of my study is a non-profit organization called *Kotoba-no-Michiannai*, established in Tokyo and managed by people with visual impairments. Collaborating with local residents, they make “verbal maps” that facilitate travelling for people with visual impairments all over Japan. The organization also lobbies administrative authorities to improve road conditions. In the organization’s early days, an area around the Kita ward in Tokyo was a “space of dependence” for the organization because they made maps using analogue techniques. In addition, they created “spaces of engagement” through public relations with local administrative organizations and the mass media. Subsequently, development of web-based mapmaking software through a joint project with a national administrative agency started the spread of “spaces of dependence.” They began to coordinate the development of “spaces of dependence” in other administrative districts every one to three years and to use “spaces of engagement” established in each new location. Through this process, verbal mapping has been spread throughout Japan.

Abstract

Yunnan Province is a region with frequent forest fires due to its dense virgin forest and special climate type. A fire probability model with excellent performance is crucial for forecasting forest fires and formulating emergency plan. There are ten models generated with two modeling methods by previous researchers. In this paper, we applied the spatial autocorrelation method to analyze and evaluate the performance of fire ignition probability models. The results show that: 1) the models generated by geography weight logistic regression method are superior to the ones created by binary logistic regression method; 2) compared with other models, Model 7 is the optimal one analyzed by using the global and local spatial autocorrelation methods. The results are of significance for establishing early warning systems in Yunnan Province.

Explore Spatiotemporal and Demographic Characteristics of Human Mobility via Twitter: A Case Study of Chicago

Guofeng Cao

Department of Geosciences, Texas Tech University, United States, Guofeng.cao@ttu.edu

Abstract

Characterizing human mobility patterns is essential for understanding human behaviors and the interactions with socioeconomic and natural environment, and plays a critical role in public health, urban planning, transportation engineering and related fields. With the widespread of location-aware mobile devices and continuing advancement of Web 2.0 technologies, location-based social media (LBSM) have been gaining widespread popularity in the past few years. With an access to locations of hundreds of million users, profiles and the contents of the social media posts, the LBSM data provided a novel modality of data source for human mobility study. By exploiting the explicit location footprints and mining the latent demographic information implied in the LBSM data, the purpose of this paper is to investigate the spatiotemporal characteristics of human mobility with a particular focus on the impact of demography. To serve this purpose, we first collect geo-tagged Twitter feeds posted in the conterminous United States area, and organize the collection of feeds using the concept of space-time trajectory corresponding to each Twitter user. Commonly human mobility measures, including detected home and activity centers, are derived for each user trajectory. We then select a subset of Twitter users that have detected home locations in the city of Chicago as a case study, and apply name analysis to the names provided in user profiles to learn the implicit demographic information of Twitter users, including race/ethnicity, gender and age. Finally we explore the spatiotemporal distribution and mobility characteristics of Chicago Twitter users, and investigate the demographic impact by comparing the differences across three demographic dimensions (race/ethnicity, gender and age). We found that, although the human mobility measures of different demographic groups generally follow the generic laws (e.g., power law distribution), the demographic information, particular the race/ethnicity group, significantly affects the urban human mobility patterns.

Introduction of Asia-Oceania GEOSS Initiative

Zhou X, Gu XF, Li GQ, Li JH, Liu C

Institute of Remote Sensing and Digital Earth, CAS, Beijing, 100101, P. R. China, zhouxiang@radi.ac.cn

Abstract

In Asia-Oceania region with large population, climate change drastically and natural disasters occur frequently, it features most complex geography ecological environment and unbalanced socioeconomic development. The region specially needs to strengthen earth observation ability and promote various applications under the framework of Group on Earth Observations (GEO) /Global Earth Observation System of Systems (GEOSS). Through establishing Asia-Oceania GEOSS (AO GEOSS) with effective cooperation at national and regional levels, the ability of earth observation and efficiency of information services in Asia-Oceania countries are expected to be improved remarkably.

With support of bilateral and multilateral cooperation, it is necessary to coordinate the observation resources, infrastructure, cooperation base and joint application projects, capacity building and other resources of all the participators in Asia Oceania region. The initiative will persist with its efforts in the following aspects, seamlessly regional observation network with extensive participation, earth observation data and information processing system, comprehensive earth observation data sharing platform, earth observation technical supporting network. It aims to guarantee the connectivity of earth observation information and service coverage in Asia-Oceania region.

The AO GEOSS will cultivate spatial information processing technology and earth observation application of member countries and participating organizations in the field of social and economy development, such as food security, sustainable agriculture, water resources safety, disaster warning, ecological environment and major infrastructure construction. With support of high quality spatial information service, implementation of AO GEOSS will further increase power of Asia-Oceania region to jointly cope with the challenges of sustainable development.

Asia-Oceania; GEOSS; spatial information service; data sharing platform; regional cooperation

Load Balance Strategy for Parallel Geo-Computing among Heterogeneous Parallel Platform

Zhenjie Chen, Manchun Li, Chen Zhou

Department of Geographic Information Science, Nanjing University, Nanjing, Jiangsu Province, 210023, P. R. China,
chenzj@nju.edu.cn

Abstract

With the advent of multi-core clusters and GPUs, heterogeneous parallel platforms have become popular platforms for parallel computing. Because of the complexity of geographic data and algorithms, parallel geo-computing suffers a lot from the load balance. In this paper, we present a strategy to balance workload for parallel geo-computing among heterogeneous parallel platform. Our strategy includes task allocation and redistribution among processes. During task allocation, an adaptable decomposition method is employed to decompose dataset into subsets according to the computing capabilities of available processes. When parallel tasks are performed, the manager process monitors the progress of processes and evaluates whether task redistribution is required. If one process finishes its current task, the manager process finds the process that has the maximum quantity of data to handle. The manager process then examines whether the progress of this process is below the threshold. If it is, then the manager process adjusts parts of its task to the idle process. We implement a parallel algorithm for geographic data conversion using our strategy. The results show that the conversion time of experimental data was reduced from 1362.36 to 165.78 s and that a desirable speedup with the maximal value of 8.23 was achieved.

Key words:

Load balance; task allocation; task redistribution; parallel geo-computing; heterogeneous parallel platforms

Mapping Complex Urban Activity Spaces

Tong D and Li R

School of Geography and Development, Tucson, Arizona, 85721, daoqin@email.arizona.edu

Abstract

Activity space represents an important concept for understanding human activity-travel. The ellipse-based approaches widely used for delineating activity spaces are limited in fully characterizing real-world travel behaviors. To address the issue, this research proposes a new approach to more accurately portray activity spaces of urban travelers by incorporating the full complexity of real-world travel and underlying urban structures. Results of an empirical study are presented based on the 2008 Add-on National Household Travel Survey conducted in Tucson, Arizona. Activity spaces of 1164 sample travelers are delineated and analyzed. Results show the effectiveness of the new approach in more realistically depicting urban activity-travel.

Activity-travel; Activity space; Transportation; GIS

Mapping the Altitudinal Vegetation Belts on the North Slope of Changbai Mountain

ZHANG Hongyan, GUO Dan

School of Geographic Science, Northeast Normal University, CHANGCHUN 130024, China, zhy@nenu.edu.cn

Abstract

Topography is the leading factor that affects mountain vegetation distribution. The control mechanisms of topography on altitudinal belt are critical to understanding altitudinal belt dynamics and future changes. These mechanisms have not been understood quite well enough because of increasing human disturbance, without proper method and low data resolution. In this study, we developed a method to present the relationship between the altitudinal belt and topography based on high spatial resolution remote sensing data and a digital elevation model in north slope in Changbai Mountain with little human disturbance. The results showed that the altitudinal belt pattern has heterogeneous changes in the horizontal direction, controlled by topography. Different types of topography have different vegetation composition. In each elevation range, the vegetation pattern is determined by topography composition and vegetation proportion of various topographic type. At the same time, topography controls the altitudinal belt pattern by affecting environmental factors. In each elevation range, the vegetation pattern is a function that depends on environment factors controlled by topography. Slope affects the altitudinal belt pattern by redistribution of solar radiation and soil moisture. Aspect affects the altitudinal belt pattern by redistribution of soil moisture and snow cover. In alpine zone, the extreme environment cause by slope-aspect combination limit tree distribution. At the Changbai Mountain alpine belt, snow cover is the most common extreme environment.

Remote Sensing based Investigation on the Vegetation Recovery after the “5.12 Wenchuan Earthquake”

Jingzhong Li^{1,2}, Mingming Cao¹, Haijun Qiu¹, Bing Xue²

¹College of Urban and Environmental Science, Northwest University, Xi'an, 710127, P. R. China; zhong_lij@163.com

²Lab for Urban & Environmental Computation, Institute of Applied Ecology, Chinese Academy of Sciences, Shenyang 110016, P. R. China

Abstract

Investigation on the vegetation recovery during post-disaster reconstruction is a critical basis for evaluating the efforts. In this study, 5.12 Wenchuan Earthquake was taken as a case, and both qualitative and quantitative analyses by using MODIS-NDVI time-series data are performed to evaluate the vegetation change as well as figure out the year with the largest vegetation destruction degree before the Earthquake which was determined as a referable baseline for further comparison. Then, proper Landsat data was applied to perform the vegetation recovery rate, by calculating the normalized difference vegetation index (NDVI) and computing the vegetation coverage based on dimidiate pixel model. Herein, the vegetation recovery rate was calculated according to the following equation: $VCRR = (FC_2 - FC_1) / (FC_0 - FC_1)$. The results showed that the response of vegetation coverage to earthquake showed the lag phenomenon; the recovery rate of damaged vegetation was closely related to its distance to surrounding river, elevation, slope, and aspect. This research outcomes may provide a decision basis data for improving vegetation recovery and rebuilding the ecosystem service in post-disaster after earthquake.

Post-disaster reconstruction; MODIS; Landsat; vegetation coverage; vegetation recovery rate

Repeated Structure Detection for 3D Reconstruction of Building Façade from Vehicle-borne LiDAR Data

Chen Yanming, Li Manchun, Cheng Liang, Wang Jiecheng, Yang Kang, Chen Dong

Department of Geographic Information Science, Nanjing University, Nanjing, 210093, China, chenyanming@nju.edu.cn

Abstract

This study proposes a new method for repeated structure detection and the three-dimensional (3D) reconstruction of building façades from vehicle-borne LiDAR data. The method consists of four steps: the unfolding of façade points, the detection of façade structure, the restoration of façade points, and the 3D reconstruction of building façade. Firstly, the building façade is unfolded to improve the automation of structure detection and building reconstruction. Subsequently, the unfolded façade is decomposed into tiles by analyzing the repeated structures. Tiles with strong similarities are matched and merged to restore the imperfect façade points. Based on this data, a 3D building façade can be reconstructed with a complete structure and fine detail. An analysis is conducted to compare the constructed 3D model with the LiDAR points of actual façade. The results of this analysis demonstrate that the proposed method can effectively deal with missing areas caused by occlusion, viewpoint limitation, and uneven point density, as well as realizing the highly complete 3D reconstruction of a building façade.

Key words:

Vehicle-borne LiDAR; Building reconstruction; Façade unfolding; Structure detection; Data restoration

Socio-Geographical Research in the Republic of Kazakhstan Using Geographic Information Technologies

Nyussupova G.N., Kenespayeva L.B., Tazhiyeva D.A.

Al-Farabi Kazakh National University, Almaty, 050040, Kazakhstan, gulnara.nyusupova@kaznu.kz

Abstract

The aim of this research is to analyze regional characteristics of social and demographic processes of the Republic of Kazakhstan on the basis of established geographic database using GI technology. Digital vector map is compiled for 14 regions of Kazakhstan and Astana, Almaty cities. Geodatabase was created using ArcGIS10.2 for the following social and demographic indicators: dynamics of population, natural movement, sex and age composition, life expectancy of population of Kazakhstan in the view of regions taking into account type of locality and gender structure. Series of thematic socio-geographic maps in dynamics for 1990-2015 are compiled on the basis of formed geodatabase of social and demographic indicators of Kazakhstan. Social and demographic situation which is currently formed in Kazakhstan is characterized by high intensity of population reproduction, life expectancy increase and aging population. Assessment of indicators in the view of regions is also made. Analysis of life expectancy of population in the country for period 1991-2015 has shown an increase of this indicator from 67.6 to 71.6 years. Problems of demography, gender equality, problems of lifespan and health status of population are quite relevant for our country. Kazakhstan, being a small nation, should focus more at improving of qualitative and quantitative indicators of social and demographic processes. Creation of information system based on use of GIS technology allowed to make spatial-temporal monitoring of evolving geo-demographic situation of Kazakhstan's regions, provide analytical support at making managerial decisions by authorities to develop measures aimed at regulating of social and demographic processes.

Temporal and Spatial Analysis of Industrial Competitiveness in Anhui Province

Jie ZHU , Zhanqiang CHANG , Mi CHEN,Chao ZHAO,Xiangxing WAN, Wei WANG, Wen YU

College of Resource, Environment & Tourism, Capital Normal University, Beijing 100048, China

Key Lab. of 3D Information Acquisition of Education Ministry of China, Beijing 100048, China

18519196454@163.com

Abstract

Regional industry competition is a momentous aspect of regional economic competitiveness. It is quite vital to investigate industrial competitiveness in both theoretical and practical fields. In this paper, the principle and procedure of principal component analysis (PCA) were respectively introduced in detail. The empirical study and comparative analysis of the regional economic competitiveness from 2003 to 2013 was conducted by setting some economic indicators. At the same time, SPSS software was applied to extract several available parameters which indirectly reflected the enhancement of industrial competitiveness. By analyzing and comparing the economic development of the 16 cities in Anhui Province during 2013, we sought out the primary factors affecting the growth trend, and then calculated the overall score of each city according to comprehensive evaluation model. The results of spatial analysis indicated that the overall score was consistent with each city's economic strength. The analysis in this paper certainly makes sense to provide theoretical reference and practical value for the improvement of overall economic strength and sustainable regional construction.

industrial competitiveness; evaluating indicator; principal component analysis.

A Hybrid Approach to Determine Runoff Directions Based on DEMs

Yuling XIA, Tao WANG, Xiaojuan LI

Capital Normal University, Beijing, 100048, China, taowang50@163.com

Abstract

Determination of water runoff direction based on DEMs is a key part in distributed hydrological modelling. Single direction flow algorithm (D8) and various multi-direction algorithms have been implemented. D8 algorithm tends to generate artificial and parallel drainage lines. Multi-direction algorithms distribute water flows in a divergent way and generate drainage information more naturally. However these algorithms introduce uncertainties in upslope areas where surface runoff paths are prone to be convergent. They also present difficulties to trace deterministic upstream areas for most downslope areas.

In this paper, we propose a hybrid approach to determine flow directions over DEM surface, in which local terrain shape is introduced. First the given depressionless DEM is classified into a shape map according to convexity of local terrain using a template-based detection method. Four types of terrain are extracted including valley, ridge, slope and flat areas. Flat areas are treated using an available algorithm. D8 algorithm is applied in valley and ridge areas. A slope threshold value is then used to classify slope areas, where D8 algorithm is applied to steeper slope areas. And slope areas with smaller slope values are treated by a multiple flow direction algorithm. The threshold value can be determined based on a trial and error process.

The initial results of the new algorithm were compared with those by previous algorithms using two real DEMs. The dispersive effect is apparently suppressed compared to MD8. The occurrence of straight parallel drainage lines is decreased compared to the results of D8 algorithm.

³ Key Laboratory of Virtual Geographic Environment, Ministry of Education, Nanjing Normal University, Nanjing, 210023, P.R. China

Abstract

The hydrologic terrain processing from digital elevation models (DEMs) is one of the important tasks in digital terrain analysis (DTA). The computational process augments the content of digital elevation data by removing spurious pits, determining a structured flow routing, and calculating surfaces of hydrologic information derived from the flow routing. With the increase of scope and resolution of DEMs, the traditional serial algorithms have become increasingly difficult to perform and are often very time-consuming, especially for DEMs of large areas and fine scales. In recent years, parallel computing is able to meet this challenge with the development of computer technology. However, the parallel implementation based on the watershed structure, an efficient strategy to reap the best parallel performance and to break the limitation of computing resources in processing massive grid terrain datasets, is hesitated to apply in DTA research field. This paper develops a subwatershed-based approach to parallelize the hydrologic terrain processing. On the basis of the proposed two-phase parallelizing approach of the subwatershed-decomposition strategy, parallel algorithms are designed to extract the stream network of a watershed and calculate drainage densities based on subwatersheds in a watershed. In the process of parallel computing, the key issues are researched in detail, such as subwatershed merger, load balancing and task allocation, and information transmission between subwatersheds. Experimental results prove that, the parallel algorithms based on the subwatershed-decomposition strategy makes the total execution time greatly decrease; meanwhile, the parallel algorithms are under the condition of granularity control and achieve a good parallel performance.

Augmented Reality and Perception of Analogue and Digital Images and Maps

Werner P.A.

Faculty of Geography and Regional Studies, University of Warsaw, Warsaw, Poland, peter@uw.edu.pl

Abstract

The idea of combining information from a database with information derived directly through the senses is termed augmented reality. Augmented reality (AR) is that organically, in real-time and dynamically overlaying virtual images created by computers and other information on real environment which the observer sees. And when the observer moves in real environment, virtual information changes according to the movement, just like those virtual information truly exists in real world.

AR is used with the mobile devices with GPS and WiFi connections. The user gives the system information to identify the desired destination, and the system then generates sufficient information. The disadvantages reveal themselves when there is no WiFi connection or there is no space in the storage of mobile device to maintain the image of the whole map. Then the traditional ways of recognition of localization must be used, most often with analogue (paper) map or image.

The presentation of coding of some data and metadata on an image or a map (both in digital and analogue form) permits inter alia the inclusion of e.g. paper map or analogue image into the chain of digital devices use. The prototype is subject of a patent application to EPO.

Key words:

augmented reality; data; metadata; coding; map; image

Design and Implementation of Beibu Gulf Scientific Database Sharing Platform and Decision Support System

Baoqing Hu, Kaixian Qin, Yuchu Xie

Key Laboratory of Environment Change and Resources Use in Beibu Gulf (Ministry of Education), Guangxi Teachers Education University, Nanning 530001, China, hbq1230@sina.com.

Abstract

The Beibu Gulf Economic Zone is one of the three key economic zones in China's West Development project. However, with the rapid economic development and climate change in this zone, the contradictions among the population, resources and environment are becoming seriously and prominently. In especially, regional environment and ecological security have been adversely affected under these human activities of the urbanization, industrialization, environmental pollution, population growth. In order to regional economic and eco-environment coordinative development, the idea of sustainable development has become inevitable in this economic zone. Hence it has become increasingly emergently in designing and establishing scientific database sharing platform and decision support system for the integration of regional data resources and economic sustainable development. Scientific data as important resources for the sustainable development of modern science, its sharing platform and decision support system has a strong scientific significance and practical significance to maximize the effectiveness of data resources and provide to local governments in the decision-making services, scientific research in earth science-related fields. Taking natural and social economic data in Beibu gulf as a case, this study will built on business-based distributed database platforms, and provide users with transparent access for structured data access and unstructured data access. Specifically, the platform largely used the current advanced technology RS, Web GIS, metadata technology, and build the database frame, classification and standards. Secondly, the geographic database, remote sensing image, ecological data, monitoring data and the methods of 3S, information transfer, visualization, knowledge sharing technology were applied to build the Beibu gulf scientific data information sharing platform. Meanwhile, the dynamic change of resources-ecology-environment-disaster prevention on Beibu gulf will be real-time monitor. Thus, the platform will achieve the researches of ecological vulnerability assessment, risk assessment of natural disasters, land intensive utilization, urbanization, regional development and optimization in the Beibu gulf economic zone.

Database; Sharing platform; GIS; Ecological environment; Beibu gulf economic zone

Evaluating the Use of SPOT-5 Satellite Imagery in Extracting Small-Sized Archaeological Sites along Palaeochannels in the Chaohu Area, China

Li WU, Xinyuan WANG, Lin LU, Huafu JIAO

College of Territorial Resources and Tourism, Anhui Normal University, Wuhu, 241002, P. R. China, jedi-wuli@163.com

Abstract

Because of the flourishing vegetation and developed agriculture in eastern China, it is difficult to extract information of small-sized archaeological sites from remote sensing images based only on spectral analysis. By selecting the Zhegao region in the Chaohu area, Anhui, as a research area, and utilizing SPOT-5 satellite image, topographical maps, and other data, this study addresses the extraction and identification of information from small-sized archaeological sites based on the knowledge of spatial relations between ground objects, thus providing a rapid and integrated approach for the third national archaeological survey. Initial studies of SPOT-5 satellite imagery have shown evidence of a prominent palaeochannel river system, buried under land cover in the Zhegao region. Digital 1:50000 topographical maps can be highly effective in determining mound-shaped sites and their elevation in this area. These mound-shaped sites include known and unknown small-sized archaeological sites of the Neolithic and Pre-Qin periods. A database of seven known small-sized archaeological sites imported into a GIS environment can be utilized to help understand their relationship with identified palaeochannels. By integrating above multi-source data, three likely archaeological sites were identified from the many mound-shaped sites and tested by field survey. This integrated method strengthens the use of multi-geoinformation technologies in small-sized archaeological surveys of subtropical agricultural areas. The results also suggest that there is a close relationship between these archaeological sites and palaeochannels.

Key words:

palaeochannel; SPOT-5 information extraction; Chaohu area

Information Extraction from Landsat TM Data for Alteration Mineral Mapping and Target Identification in the Gejiu Mining District, China

Shucheng Tan¹, Zhifang Zhao¹, Xiaohu He¹, Xionggang Hu¹, Yanzhu Jin¹,
Pinliang Dong²

¹School of Resources, Environment, and Earth Sciences, Yunnan University, Kunming, China, shchtan@ynu.edu.cn

²Department of Geography, University of North Texas, Denton, TX 76203, USA

Abstract

This paper presents methods and results of information extraction from Landsat Thematic Mapper (TM) images for mineral mapping and target identification in the Gejiu mining district, Yunnan, China. Based on the understanding of the spectral properties of iron-oxides and hydroxyl-bearing minerals, a Feature Oriented Principal Components Selection (FPCS) method was applied to two sets of Landsat TM bands to extract areas with high iron-oxides exposures and hydroxyl-bearing mineral concentrations. The results from Landsat images were compared with existing geological, geophysical, and geochemical data, and validated through field investigation. Finally, a total of nine target areas under three categories were identified as potential areas for mineral exploration.

Overview on Spatial Data Partitioning Method Research in Parallel Computing

Environment

Jin Liangyi, Zhang Yajun, Wang Si

The PLA Information Engineering University, Zhengzhou, 450001, lyking@whu.edu.cn

Abstract

Spatial data partitioning is a main issue on distributed storage and parallel computing. The merits and demerits of a partitioning method will directly affect the storage load of parallel nodes directly, and further affect the overall performance of the parallel computing system. In this paper, we summarized three methods of spatial data partitioning as follows. The first is the traditional data partitioning method, which is from the angle of spatial data attributes and very simple to implement. However, it mostly focuses on the equality of the number of spatial objects on every storage node, not considering the size of the object itself, so there will be a serious problem of data balance. The second is the partitioning method using space filling curve, which especially the Hilbert Curve, has a good aggregation behaviour on spatial objects. The method guarantees space-near between two spatial objects on the storage node, and at the same time it can maintain the storage balance on each storage node properly. On the foundation of this method, researchers proposed some methods based on grid and hierarchical classification with the space filling curve. The third is the spatial clustering partitioning method from the perspective of statistics, which is subjected to clustering criterion, different rules or clustering centre selection, causing a very large uncertainty of the partitioning result. At last, combining with the characteristics, advantages and disadvantages of various methods, we pointed out the research trend of the spatial data partitioning method and the next research direction.

Remote Sensing Data Storage Based Hilbert Curve and Hadoop

Yuan Guobin, Li Xia

School of China University of Geosciences, Wuhan, 476890373@qq.com

Abstract

As the amount of remote sensing data is increasing, how to store these data efficiently has become a hot topic in the field of geospatial. This paper combines Hadoop with Hilbert curve to store data and puts forward the relevant optimization strategy. It optimizes the policy of data's partition by Hilbert curve to improve the efficiency of storage and partitions the Remote Sensing data into n subsets on the order of Hilbert spatial ordering code. Each subset has a substantially balanced amount of data and corresponds to a block of HDFS, then it constructs R index of locality block on the basis of Hilbert curve. This article optimizes for the storage policy of duplicates to save the storage space. It summarizes the number of times of data is accessed in each period, the frequently be accessed data will be stored in multiple copies and the less accessed or mostly no accessed data will be stored in lesser copies than the frequently be accessed data.

Remote sensing data; Hilbert curve; Hadoop

Remote Sensing Monitoring of Surface Subsidence in Longkou Mining Area Based on D-InSAR

KANG Ri-fei, WU Qu-yuan*, LV Jian-shu**, WANG Fei, CAO Wen-tao, CAO Jian-fei

Shandong Normal University, Jinan, 250014, P. R. China, 18366198908@163.com

Abstract

This paper took Longkou mining area of Shandong Province as the research area, selected three scenes ALOS PALSAR data of L band in 2007, the surface subsidence information in study area was obtained by way of “two pass” D-InSAR technology, such as Settlement spatial distribution, ground settlement, settlement area, dynamic subsidence curve and sinking rate contour, analyzed the status of collapse and regularity of surface deformation in two monitoring period of LongKou mining area. The results show that: ①the settlement areas were mainly concentrated in the western and northern areas of the mining area, located in the North soap Village and the village of Xinglong; ②During 2007/7/10 ~ 2007/8/25, cumulative maximum settlement was 22 mm, settlement total area was about 0.21 km², the average sedimentation rate was 0.32 mm d⁻¹, in the vicinity of the North soap village, the mining subsidence profile was the deepest, the deformation of this period was not active; ③Compared with last monitoring period, during 2007/8/25 ~ 2007/10/10, the maximum settlement decreased to 11 mm, settlement total area increased to 1.2 km², the average sedimentation rate was reduced to 0.11 mm d⁻¹, it indicated that the settlement depth decreased, but the settlement range increased, the subsidence deformation tended to be more gentle. This study can provide reference for the construction of the surrounding buildings, roads and other infrastructure construction and farmland reconstruction.

Research on Coupling Coordination Degree between Island Tourism Industry and Ecological Environment Based on Changshan islands

Gao Wei-quan

Liaoning University of International Business and Economics, Dalian Liaoning, 116052, gaoweiquan@126.com

Abstract

Based on the coordinated development theory and the coupling model, this paper analyses the coupling of tourist industry and ecological environment coordinated development level for quantitative research, by using Changshan islands in 2006-2014 statistics. Research shows that: ①Changshan islands tourist industry and ecological system coupling coordination degree in the promotion stage, the development speed is relatively slow; ②Changshan islands tourism industry and the ecological environment of the coupling coordination degree is poorer, coordination degree is low; ③Changshan islands tourism industry system and ecological environment comprehensive evaluation index system of comprehensive evaluation index is phased development. Before 2011, comprehensive evaluation index of the tourism industry is less than the ecological environment evaluation index, ecological environment is the main driving factor for the growth of the tourism industry. 2011 years later, the tourism industry is bigger than the comprehensive evaluation function of the ecological environment evaluation function, the ecological environment become the restriction factor of the tourism industry development.

Research the Personalized Recommendation Model Based on Geographic Information Service Platform

Po Li

Information engineering university, China, 154362092@qq.com

Abstract

Aim at how to provide more personalized service for users in geography information service platform. This paper bases on the global Internet data integration and distribution system as the experiment platform, collecting the site registered user data properties and behaviors data, and to filter the collected data, such as convergence, and associated pretreatment. By analyzing the traditional recommendation algorithm was proposed, and which adopts an improved collaborative filtering algorithm based on the user. And combine the characteristics of the geographic information service platform, this paper adopts an improved collaborative filtering algorithm based on the user. This paper statistics and analysis user's needs which is included in the user-group that is similar to the target user and the history requirements of user goals respectively by using the algorithm. And according to certain rules, this paper compares and analyzes the result of the two finally predicts which are the most likely customers' needs. Experimental results show that compared with the traditional recommendation model, this model can more accurately predict the user's individualized requirements.

Road Network Topology Automatic Change Detection Based on GPS Spatial Temporal Trajectories

Luliang Tang, Chen Jin, Zihan Kan, Xue Yang

State Key Laboratory for Information Engineering in Surveying, Mapping and Remote Sensing, Wuhan University, Wuhan, China, tll@whu.edu.cn

Abstract

The conventional methods of road change detection extract the differences by comparing two road network data before and after the change, which have disadvantages in the data acquisition period, data cost, algorithmic complexity, calculation difficulty and the update period. In this paper, we propose a new road network topology change detection method based on vehicles' GPS spatiotemporal trajectories. In this method, the similarity between the GPS trajectory vector and the regional topological vector is first measured using the vector similarity measurement model. Then we detect the topological changes of the road network by comparing the road changes of the addition, the deletion and the modification. Experimental results showed that the proposed method can not only detect the changes of the addition, the deletion and the modification of road network, but also realize the real-time change detection of urban road network.

Spatial Patterns of Population Change in the 23 Special Wards of Tokyo after the Period of the Bubble Economy

Koizumi, R. and Wakabayashi, Y.

Kanagawa University, Yokohama, 2218686, Japan, rkoizumi@kanagawa-u.ac.jp

Abstract

This study examines the spatial patterns of population change in the 23 Special Wards of Tokyo after the period of the bubble economy in the late 1980s. To this end, we analyze grid square data suitable for time-series analysis between 1985 and 2005. After selecting major indicators representing three dimensions of the social area analysis, we map each indicator and make quantitative comparisons between six zones, classified by distance and direction from the city center. The indicators used in this study are three variables representing family status, three variables representing socioeconomic status, and one variable representing ethnic status. Analysis of the spatial pattern of population change in the 23 Special Wards between 1985 and 2005 reveal that a population recovery has occurred since the latter half of the 1990s in central Tokyo. On the basis of this trend of population change, we examine the spatial pattern of each indicator in the social atlas. Concerning age and household composition, its spatial distribution has gradually shifted from a zonal pattern to a sectoral one. The spatial distribution of socioeconomic status represented by the occupational structure maintained a sectoral pattern characterized by the contrast between the eastern and western parts of Tokyo although this distinction has blurred. In particular, the number of managers and officials has decreased and its distribution shifted to a zonal pattern, which indicates the polarization of white-collar workers. The distribution of non-Japanese shows a zonal pattern in which the highest value appeared in the area surrounding the city center.

Spatial-Temporal Distribution of Net Primary Production and Its Influencing Factors in Guangxi Xijiang River Basin from 2003 to 2012

Yan Yan, Hu Baoqing, Rong Jian

Key Laboratory of Environment Change and Resources Use in Beibu Gulf (Guangxi Teachers Education University),
Ministry of Education, Nanning 530001, yanyan168166@163.com

Abstract

Based on the MODIS-NDVI time series dataset and corresponding ground based information on vegetation, meteorological data, land use data and solar radiation, an improved Carnegie Ames Stanford Approach(CASA) model was applied to simulate net primary production (NPP) in Guangxi Xijiang river basin between 2003 and 2012. Then, the spatio-temporal patterns of NPP were investigated using spatial statistical analysis. The results indicated that: (i) NPP in the east and north regions were generally higher than that in the west and south parts of the study area. From 2003 to 2012, the average annual total NPP in Guangxi Xijiang river basin was $1.06 \times 10^8 \text{ gC} \cdot \text{m}^{-2} \cdot \text{a}^{-1}$, with the average NPP of $523.72 \text{ gC} \cdot \text{m}^{-2} \cdot \text{a}^{-1}$. (ii) The annual NPP in study area fluctuated from year to year but showed an overall decreasing trend ranging from $602.48 \text{ gC} \cdot \text{m}^{-2} \cdot \text{a}^{-1}$ in 2003 to $430.05 \text{ gC} \cdot \text{m}^{-2} \cdot \text{a}^{-1}$ in 2012, with an overall decrease of 28.62%. The areas of extremely significant decrease, significant decrease, decrease, no significant change, increase, significant increase and extremely significant increase for NPP trends accounted for 25.16%, 30.41%, 33.32%, 9.33%, 1.48%, 0.25% and 0.05% of the total area, respectively. (iii) The correlation between NPP and average annual temperature was positively related accounting for more than 47.47%, of which significantly positively related accounting for 2.79% located mainly in north of the study area, such as Baise, Hechi, Guilin, Liuzhou, Wuzhou. The regions that show a negative correlation accounted for less than 1% of the total area. (IV) The regions where the NPP and precipitation had a significance negative correlation were located mainly in the southeast part, central part, west part, accounted for 17% of the total area ($p < 0.01$). The regions that show a negative correlation are widely distributed in Guangxi Xijiang river basin, accounted for 55% of the total area ($0.01 < p < 0.1$). The regions that show a positive correlation accounted for less than 1% of the total area, at the $0.01 < p < 0.1$ level. The correlation between precipitation and NPP was not significant in other places of study area, at the $p > 0.1$ level. (V) Among all vegetation types, evergreen broad-leaf forest, with a NPP of $760 \text{ gC} \cdot \text{m}^{-2} \cdot \text{a}^{-1}$, are the most productive. The mean annual NPP values for evergreen needle-leaf forest, evergreen and deciduous broad-leaf mixed, deciduous forest, shrub, grassland were $685 \text{ gC} \cdot \text{m}^{-2} \cdot \text{a}^{-1}$, $653 \text{ gC} \cdot \text{m}^{-2} \cdot \text{a}^{-1}$, $624 \text{ gC} \cdot \text{m}^{-2} \cdot \text{a}^{-1}$, $514 \text{ gC} \cdot \text{m}^{-2} \cdot \text{a}^{-1}$, $443 \text{ gC} \cdot \text{m}^{-2} \cdot \text{a}^{-1}$, respectively. While the least productive one is planting crop, with the NPP of $414 \text{ gC} \cdot \text{m}^{-2} \cdot \text{a}^{-1}$.

Spatio-temporal Trajectory Fusion and Road Map Generation Based on Cognitive Law

Ren C, Liu Z, Tang L

State Key Laboratory of Information Engineering in Surveying, Mapping and Remote Sensing (LIESMARS), Wuhan University, Wuhan, 430079, P. R. China, imrc@whu.edu.cn

Abstract

With the rapid development of urban transportation and the worsening traffic environment, people urgently need the fine, high-precision and up-to-date road information when travelling. Meanwhile, people themselves are the sensors which detect the fine and real-time road information by generating spatio-temporal trajectories. It is becoming a great opportunity and challenge to collect fine road map from those trajectories. In this paper, a new approach is proposed for trajectories fusion and road map generation from GPS trajectories. It leverages Delaunay Triangulation and its skeletonization, and is based on progressive cognitive levels of space, perception—cognition—symbol. Experiment and evaluation on the GPS spatio-temporal trajectory data collected by taxis in Wuhan city are carried out, and results indicated that the proposed method is practicable, more accurate than existing methods, especially on the road network topology information extracting.

Key words:

Cognition law; trajectory fusion; road map; GPS spatio-temporal trajectory

Study on Urban Spatial Information Integration Platform in Network Environment

SHI Xianlin¹, CHEN Xing²

¹Earth Sciences College, Chengdu University of Technology, Chengdu 610059, Sichuan China, shi_xianlin@126.com

²Tourism and Urban-Rural Planning College, Chengdu University of Technology, Chengdu 610059, Sichuan, China

Abstract

In the process of transformation and upgrading in promoting "digital city" to "smart city", construction of urban spatial information integration platform under the network environment can provide a more comprehensive and in-depth application substrates for the subsequent construction of "digital city" geographical space framework, and provide geographic information resources integration services for the planning, construction, urban management and public services and other areas.

Urban spatial information resources "integration" research is in close combination of application needs according to the current situation of information resources, and it researches and solves the use of a platform to provide users with a variety of map services; to provide users with a variety of ways of positioning by using a benchmark; to provide users with a variety of environmental services by using a set of data.

This paper presents the design and construction of urban spatial information integration platform. The overall framework of urban spatial information integration platform is based on two major security systems which have six levels, including the infrastructure level, data level, service level, interface level, security authentication level and the user application level and two security systems of information resource security system, information resource technology standard and management system. Urban spatial information platform data exchange system as a core component of the urban spatial information integration platform conduct distributed management to data maintenance through the whole sharing platform. To design data sharing service system for urban spatial information platform from the four aspects of metadata sharing services, spatial data sharing services, spatial information application services and spatial data sharing operation management. Urban spatial information resources "integration" technology research is based on the city space information, and it takes the network as the carrier to complete multi-source, multi-temporal spatial data integration and management and to realize the wider and deeper application services of the urban spatial information in the aspects of social public, government office, business management and surveying services, etc.

Key words:

Urban spatial information; Public platform data; Integrative platform; Data-sharing; Data transformation

Temporal and Spatial Distribution of High Efficiency Passengers Based on GPS Trajectory Big Data

Fei Sun, Xia Zhang, Luliang Tang...

State Key Laboratory of Information and Engineering in Surveying, Mapping and Remote Sensing, Wuhan University,
Wuhan 430079, China, 384023846@qq.com

Abstract

The uneven spatial and temporal distribution of taxi passengers not only affects cabdrivers' income-but also has an effect on development and enhance of taxi efficiency. Since taxi is regarded as the supplementation of city public transit, it is important to improve the taxi efficiency. According to many former researches done on taxi driving strategies, the objects always aim to focus on the taxi driver, and researchers merely consider the effects of an empty taxi situation, which may affect the taxi efficiency due to the fuel consumption and time cost. In this paper, in order to improve taxis' profits and efficiency, we used the taxis' GPS big data to optimize the evaluation model of taxi efficiency by taking its empty state into consideration, and proposed the concept of high efficiency passengers for the first time. Then, we defined and quantified the high efficiency passengers, and established a new spatial and temporal analysis method for high efficiency passengers. Finally, we extracted high efficiency passenger source information and its spatial and temporal distribution pattern from taxi driving routs. To further verify this method, we took Wuhan's taxi data asan example, extracted the high efficiency passenger source from different aspects, such as time, space and screening conditions, and found some distribution patterns of the city passengers through comparison and analysis. According to the distribution patterns, the quantity of high efficiency passengers is associated with traffic conditions, and most high efficiency passengers are distributed far from the downtown area. These facts have proved that the studies on temporal and spatial distribution of high efficiency taxi passengers can provide scientific evidence and references for improving cab drivers' income and taxi efficiency.

Key words:

high efficiency passenger source; GPS big data; spatial and temporal distribution; big data

The Common Edges Extraction Algorithm Research of Non-Topology Remote Sensing Image Vector Data

Jin Liangyi, Zhang Yajun, Jiang Nan

The PLA Information Engineering University, Zhengzhou, 450001, lyking@whu.edu.cn

Abstract

Compared with general non-topology vector data, the non-topology remote sensing image vector data have different characteristics. Such as the nodes on the common edge of the adjacent polygons are not completely consistent. But in the traditional depth search matching method, the consistency of the nodes on the common edge of the adjacent polygons is the premises, so it has insurmountable defects when applying traditional method to extract the common edge of non-topology remote sensing image vector data. However, extracting equivalent data from common edges is the foundation of non-topology vector data simplification. In this paper, aimed at the fault of the traditional methods and combined with the characteristics of non-topology remote sensing image vector data, a new algorithm is proposed based on collinear search matching, to extract common edge and non-common edge of polygon, recording the left and right side information of the public side in the process of extracting at the same time, the algorithm of Douglas-Peucker is used to simplify data. Then data can be reconstructed according to the simplified data. The three key points of the algorithm are the judgment of collinear line, the judgment of polygon edge direction and the construction of the common edge extraction rule. Experimental results show that the algorithm proposed in this paper is accurate and efficient to extract common edge and non- common edge of non-topology remote sensing image vector data, and it can effectively eliminates crack when using the Douglas-Peucker algorithm to simplify data.

³Mongolian National University, Ulaanbaatar-23, Bayangol district, 11th Khoroo, School Building 1

Abstract

The aim of this study is to conduct urban mapping and analyze the land use changes of Ulaanbaatar city, Mongolia using very high resolution remote sensing (RS) and geographical information system (GIS) data sets. For the study, the changes that occurred before 1990 are compared with the changes that occurred after 1990 and the socio-economic reasons for the changes are described. For the development of the primary digital database, a large scale topographic map and historical description of the land use elements are used. To generate land use information from the fused RS images, a visual interpretation is applied. Overall, the study demonstrates that during the market economy the central part of the capital city is urbanized very rapidly and became very dense.

Analyzing the Urban Goods and Services Delivery through the Informal Sector - the Street Vendors of the Kathmandu Valley, Nepal

Puspa Sharma

Tribhuvan University, Nepal, pus.geog@gmail.com

Abstract

The street vendors considered as informal traders spreading across the cities of most of the developing countries are the key agency for offering goods or services to the people. They usually operate their business through fixed locations, or moving from place to place in a way that the people get their household needs conveniently. This invisible economic sector is assumed to contribute to the urban development significantly. This paper intends to analyze the street vendors of the Kathmandu Valley cities in terms of their spatial distribution, location attributes, choices of locations, historical accounts, types of goods and services, and social and economic features by using appropriate analytical techniques including the geographic information systems, simple statistics, mappings and others. Spatial planning of the street vendors in the Kathmandu Valley is provided for better delivery of urban goods and services.

Assessment of the Environmental Efficiency (EE) of Urban Industrial Concentration Areas: The Case Study of Beijing

MaochengZhen^{1, 2}, XiaoluGao¹, Haihong Yuan^{1, 3}

¹ Institute of Geographic Sciences and Natural Resources Research, Chinese Academy of Sciences, Beijing 100101, P. R. China, gaoxl@igsnrr.ac.cn

² University of Chinese Academy of Sciences, Beijing 100049

³ Department of Urban Science, Ningbo University, Zhejiang 315211

Abstract

Industrial zones have become the driver of urban and regional economic development and the main carrier of industrial clusters. At the same time, however, as the increment of negative external impact of industrial concentration on urban environments, the healthy and sustainable development of the city is seriously hampered. From the perspective of environmental governance of urban areas, it is particularly difficult to cope with the externalities of industrial concentration in built-up areas because they usually contribute to the economy and there is few policy tools to encourage individual companies to improve their environmental performances or take actions to avoid pollution. Based on analysis of the characteristics of the spatial distribution of pollutant industries, we propose the theoretical model to evaluate the environmental efficiency (EE) of urban industrial areas to solve this problem: (1) the concept and evaluation indices of EE are explored, as well as methods to apply the results as the tool of spatial governance; (2) comprehensive assessment system for EE of the urban industrial areas are established considering the economic contribution, external effect and environmental risk of industries; (3) principle and method for choosing the reasonable spatial unit of EE assessment are clarified. The results are then applied to a typical industrial concentration area in Beijing, to comprehending the space feature of pollutant industries, their economic contribution to the city and impacts on ecological system and residential areas. The rationality of EE assessment system in urban industrial zones is validated and policies to cope with the environmental effects of industrial concentration in this area are proposed.

Key words:

Environmental efficiency; Industrial Zone; Environmental governance; Urban built-up Areas

Delineating Ecological Red Line at Regional Scale in Jiaxing, China

Lu L.Z.¹, Mo Y.M.², Huang Y.L.¹, Gao M.³

1. School of earth sciences, Zhejiang University, Hangzhou, 310027, P.R. China, llz_gis@zju.edu.cn

2. Zhejiang Province Environmental Monitoring Center, Hangzhou, 310012, China, 40459229@qq.com

3. Environmental Protection Agency of Jiaxing City, Pinghu, 314200, China, 280198481@qq.com

Abstract

Ecological red line (ERL) is a new national eco-environment strategy in China. The goals of ERL delineation is to ensure ecological integrity and sustain ecological security. This study proposes a research framework for ERL delineation at a regional scale. It includes the stages of: (1) data collecting and analysing; (2) ecoenvironment importance assessing; (3) ERL delineating; and (4) eco-environment protection goals making. A study case in Jiaxing, China is chosen for demonstration. By incorporation of multiple planning integration, field surveys, remote sensed imagery and applying dominant eco-environment function identification method, the ERL schema of “1 slice, 1 belt, 7 zones, 31 points and 38 corridors” is determined. The results show that the framework for ERL could allow the ERL zones maintaining or achieving the corresponding eco-environment functions.

Ecosystem Services as A Factor for Trajectory Strengthening of Region's Development and Well-Being - Environmental Governance

Marek Degórski, Jerzy Solon

Institute of Geography and Spatial Organization, Polish Academy of Sciences, Warsaw, Poland, m.degorski@twarda.pan.pl

Abstract

Within the field of regions' development and well-being, the environment is becoming increasingly perceived as a factor capable of generating trajectories of development, which can become more compact, and start creating places of their attraction, so called attractors, having their extent, so called pool of attraction, deciding among others about the so-called viscosity of the place. One of the methods of environmental potential valuation, which can influence directions of regions' development, is the provision of ecosystem services. Concept of ecosystem services and landscape has currently become not only widely discussed in the literature, but also more frequently included in the practice. Unfortunately, there are some ambiguities and misunderstandings arisen around the concept, which can be proved by completely different definitions of services, referring either to natural resources and processes, and to the actual material goods acquired from the environment. Aim of this presentation is an attempt to answer some basic questions referring to the essence of ecosystem services in the application context. In the light of past experiences, reasonable and effective use of the concept of ecosystem services in practice plus the comparability of the proposed solutions, require at least three consecutive steps: more precise definition of specific concepts; implementation of proper and standardized measures of services; association of individual measures with practical activities, especially in the field of spatial planning. In the consequence of such an approach, economic valuation is of secondary meaning and results directly from the adopted measures and indicators of supply and demand for ecosystem services.

Ecosystem services; governance; human well-being; region development

Engagement of Forest Protecting Communities to Deal with Climate Change

Ojha Nabaghan

Policy Reforms Expert, IPE Global Pvt Ltd, New Delhi, MSc Student (Distance Learning), Bangor, niversity, UK,
nojhabbsr@gmail.com

Abstract

Increasing biotic pressure, diversion of forest for non-forestry purposes and decreasing space for community's rights in public law making process are some the grave challenges that forestry sector in India encounters today. Such processes, on one hand, have fastened the momentum of forest depletion and on the other hand, squeezed the traditional local rights that forest dwellers, especially tribals, enjoyed since time immemorial. Odisha, a State in eastern part, has the unique distinction of offering rich diversity in forest protection and management practices. Large sections of human mass mostly forming into informal groups have been protecting their local forests as a response to forest loss and economic gains. These groups known as community forest management (CFM) groups have subsequently clubbed themselves at different levels to form federations that could demonstrate a collective force for initiating a rights bargaining process. Unfortunately, in Odisha and also in most parts of India where such informal initiatives have existed, public law making process has refused to officially recognize them as viable resource management institutions. However, there is a visible growth of a vertical social capital that has been experienced as a result of networking of forest protecting villages at the cluster, district and state level. These collective forces have provided a platform for negotiation and interface with policy makers at different levels for changes in policies and practices. These institutions have developed time tested tools to coop with different types of environmental shocks which need to be recognized as a strategy to combat climate change.

Community forest management; climate change; forest protection

Engendered Dependence and Management of Forest Commons of Gahrwal, India

Shiv Narayan Sidh

Government College Gairsain Chamoli, India, shivsidh@gmail.com

Abstract

Does women's participation in management of community forestry make difference in conservation outcomes? Identify gendered, caste-class patterns and seasonality in dependence. Research is based upon 16 weeks of fieldwork, undertaking 160 households from 8 villages covering four agricultural seasons in Chamoli district of Garhwal to capture seasonality in time use (TU). Village communities are highly dependent on forest common hence have high stakes in conservation. However, at micro-level village society is stratified and women do not form homogenous entity. Women's participation in management of "Van Panchayats" has bearing on the environmental outcomes and household food security.

In this study 100% household used village forest commons for the collection of fuel wood and fodder. SC & ST women in entirety depend on the forest commons for fuel wood while 96% women from upper caste are exclusively dependent on it. TU Survey reveals the seasonality in agriculture and gendered patterns of dependence.

Key words:

Community governance; Women, fodder; fuelwood

REVIEW: Environmental Challenges Associated with Development of Socio Economic Activities in East African Countries Comparative Study with China

Sahim Abdalla Juma, PhD, Professor Song Wei

University of Science and Technology of China, Anhui China, sahim@mail.ustc.edu.cn

Abstract

The environment is directly or indirectly affected by socio economic issues, contributing to change either positive or negative in human well-being and in the ability to cope with environmental changes (UNEP 2007). Impacts on socio economic activities are highly dependent on the characteristics of the drivers and their variation between developed and developing regions (UNEP 2007). On this paper, I have studied Chinese policies on environmental issues and its five years economic plan. Furthermore, I have studied what Chinese government have done in relation to socio economic activities and what lessons are available for East African countries. Finally, I have proposed possible solutions for East African countries on Environmental challenges associated with development of socio economic activities with the potential of combining economic and environmental interests in East Africa. My proposed solutions are based on the following sectors; demographic Change, agriculture, buildings, cities, energy, fisheries, forests, manufacturing, tourism, transport, waste and water.

Floods, Social Vulnerability and Environmental Governance in Argentina: Lujan River Basin as a Study Case

Valverde, A; Tancredi, E.

Department of Social Sciences of the National University of Luján, Luján, Argentina Valverde.alejandra.5@gmail.com

Abstract

This writing analyzes the relationship between land management, risk management and public participation, which configures complex scenarios to recurrent floods in the Lujan river basin, (Buenos Aires province, Argentina), especially those occurred between 2012 and 2015

In this scenario, different actors participate actively in discussing and defining key elements regarding land management, giving rise to new ways of environmental governance. Luján city, founded and built in the floodplain of the river, reveals the consideration of flood risks and makes the relationship between water dynamics, topography and relief of the Lujan River basin -which have been shaped naturally by physical processes and, more rapidly, by artificial ones- essential to be understood. The latest floods evidence the inadequate management by state agencies, the lack of urban planning, the decoupling between the production of scientific knowledge and public policies development, as well as solidarity and self-organization in emergency context. The analysis of this study case is approached from vulnerability and uncertainty dimensions. It analyzes, particularly, population responsiveness and the actions of institutions in general, with special focus on the labor of institutions in risk management. It also intends to make a theoretical contribution to local social organizations, which are struggling for the disputed territory in order to find complete solutions to the issues.

Key words:

Social vulnerability; environmental governance; risk management; public participation; floods

Gaps of Ukrainian Environmental Governance (National and Region Level)

Rudenko L., Lisovskyi S., Maruniak Eu.

Institute of Geography of Ukraine NAS, Kyiv, 01030, Ukraine, salisovsky@gmail.com

Abstract

Ukraine is among countries where the impact of poor governance in all field of society's life is noticeable, while social, economic and environmental problems are rising. In the sphere of environmental governance Ukraine has undertaken a number of international commitments, which are still not implemented properly. There is no Strategy and indicators of sustainable development. Situation at the regional level, where provisions on sustainable development are poorly integrated into government activities is even worse. In addition, due to the weak interaction between Ministries responsible for spatial planning and environmental policy, the ecology is hardly taken into account in planning decisions. However, the natural environment is constantly getting worse because of the intensive nature use.

On the base of own long-lasting research, cooperation with public authorities as well as NGO's, co-authors conducted a comprehensive analysis of the environmental governance and implementation of sustainable development principles in Ukraine. In particular, approaches, national driving forces, tools, and legal framework for sustainable development were estimated. Moreover, the gaps of Ukraine's international commitments fulfilment were identified as well as appropriate recommendations in the field of environment protection were developed on the example of global conventions (Convention on Biological Diversity, Framework Convention on Climate Change, Convention to Combat Desertification). Concept of integration of ecological considerations into spatial planning system was developed at the regional level (a case of model region). Best practices and participation of Ukrainian NGOs and scientists in the implementation of environmental policy also will be delivered in the presentation.

Key words:

Governance; sustainable development; Conventions; spatial planning; nature use; indicators

Governance and Management of Natural Resources in Reserves within South Africa: Neoliberal Conservation Vs People Stewardship

Segage, M

Department of Development Planning & Management, University of Limpopo, Polokwane, South Africa,
martina.segage@ul.ac.za

Abstract

Natural resources management in the democratic South Africa has in the late 1980s captivated conservation with a human face largely due to the shift in conservation from fortress approach to community-based management and later, co-management efforts. Such management approach emphasized community involvement embedded by the “people shall govern” narrative. However, in practice, the interface remains scarcely tested. The paper seeks to examine the tensions that exist in the governance and management of natural resources, amidst stark poverty and inequality in South Africa, which continue unabated due to the divisive commercial self-interests of the state and private companies. The entry of commercial interests in resource management has intensified contestations over natural resources. Nature reserves provide a typical example of the manifestation of these contestations. Underwritten by the philosophical motive for inherent valuation of natural resources within reserves, poor people are denied access to natural resources for survival. In practice, nature reserves have served the commercial interests of global business and capital. Consequently, nature reserves in developing countries such as South Africa have circumvented the requirement to serve distributive justice through environmental conservation, notwithstanding pronouncements to the contrary. Given that such nature reserves are established through natural capital in areas inhabited by poor communities, the emphasis on environmental protection tends to exclude these owner-communities from access, thereby creating tensions. The paper concludes that South Africa could avoid such tensions by ceding ownership of natural reserves capital to local communities for intrinsic instrumental socio-economic value.

natural resource management; neoliberal conservation; people stewardship

Governance for Sustainable Transition: Reflection on a Community Recycling

Initiative

Tong, Xin

College of Urban and Environmental Sciences, Peking University, Beijing, 100871, P. R. China, tongxin@urban.pku.edu.cn

Abstract

With a review on the community-based tool developed from common resource management for sustainable development in three perspectives: behavior studies, governance structure evolution, as well as its scale issue, we report our experimental garbage-sorting initiative in Hongfuyuan, a residential community in Changping District of Beijing. We study the behavior of the participating households as response to our garbage sorting promotion from Dec 2013 till now, the impacts of the governance structure among all stakeholders, and the cross-scale interactions among the community action, the urban waste management system and the producer responsibility scheme. In conclusion, we discuss the implications of this research to current urban governance for sustainable transition in China.

Key words:

Governing Delhi's Riverscapes: Conflicts of Interest, Power and Knowledge Asymmetries in Urban Environmental Governance

Dr Alexander Follmann

Institute of Geography, University of Cologne, Germany, email: a.follmann@uni-koeln.de

Abstract

Delhi's riverscapes, referring spatially to the river Yamuna and adjoining areas in the urban limits of the megacity Delhi, represent an ecologically sensitive, yet highly polluted and environmentally degraded environment. For drinking water supply of the megacity, the river's water is completely impounded in the non-monsoon months. Reduced flow and the discharge of untreated sewage from the megacity make the Yamuna in Delhi one of the most polluted rivers in the world. Additionally, urban mega-projects have recently been realized on the river's floodplain resulting in dynamic land-use changes and a wakeup call for environmentalists emphasizing the ecological integrity of the river and the close relationship between the river and the city.

The governance of Delhi's riverscapes is generally characterized by sectoral approaches. A multiplicity of agencies and individuals (state and non-state) is involved in urban environmental policy-making. Based on a discourse analytical approach the paper analyses existing conflicts of interest, power and knowledge asymmetries between state authorities and civil society actors. The paper focuses on the role of local environmental non-governmental organizations (NGOs) in (re)shaping environmental discourses and their influence on environmental regulations and land-use planning, in particular through the courts.

Key words:

land-use change; urban environmental governance; river pollution; megacity; environmental non-governmental organizations; courts; India

How Authoritarian Is China's Low-Carbon Governance? a Local Perspective

Lo, K

Department of Geography, Hong Kong Baptist University, Kowloon Tong, Hong Kong, lokevin@hkbu.edu.hk

Abstract

Authoritarian environmentalism, defined as a policy process dominated by an autonomous state and the pursuing of environmental outcomes by restricting individual liberty, is commonly used to characterize China's low-carbon governance. This paper challenges this prevailing perception with an empirical case study of Changchun in Northeast China. It shows that while China's low-carbon governance appears highly authoritarian, the situation on the ground is much more ambiguous, displaying a mixture of authoritarian and liberal features. While China's top-down and non-participatory policy environment has been crucial in stimulating a low-carbon transition, the failure of the central government to control local actors has created a situation of de facto neoliberal environmentalism, where local governments and energy-intensive enterprises enjoy a high degree of freedom and flexibility to manage their own energy consumption in spite of the overt authoritarian rule. The findings of this research show that viewing China's low-carbon governance as a clear-cut instance of authoritarian environmentalism should be done with circumspection, and that studying the nature of environmental governance as a complex process requires a thorough understanding of not just national policy but also local politics and the ways the two are connected.

Key words:

Authoritarian environmentalism; environmental governance; low-carbon governance; China

Insoluble Intergovernment Political Issue: Gabčíkovo-Nagymaros Dams

Hajdu, Zoltán

Centre for Economic and Regional Studies of Hungarian Academy of Sciences, hajdu@rkk.hu

Abstract

After some decades of planning and political, technical, environmental etc. discussions the GND was started to be built in 1987 across the Danube, between Czechoslovakia and Hungary. In the processes of systemic changes Hungary has changed her point of view, Czechoslovakia was split up into two countries.

In May of 1993 Hungary and Slovakia agreed to take their dispute to the International Court of Justice in The Hague. The Court found that both Hungary and Slovakia had breached their former legal obligations. Because of changing of governments, attitudes of national emotions the dispute was not still resolved.

There are different points of views on necessary technical measures as a whole construction, but a joint proposal is under preparation for identification of mutually acceptable aims in the Danube reach between Szap – Budapest of necessary technical measures. Restricted content can conclude an agreement by the two governments.

Key words:

Land-use Change and Environmental Governance in Rural and Peri-urban Wetlands of East Africa: Findings from Rwanda, Tanzania and Uganda

Greiner, C., Mwaka, I., Treidl, J., Van Soest, M.

Global South Studies Center, University of Cologne, Cologne, Germany, clemens.greiner@uni-koeln.de

Abstract

With year-round water availability, high quality resource base and the potential to harvest several times per year, wetlands are emerging production hotspots in Eastern Africa in the face of increasing climate variability, food insecurity and rapid population growth. Wetlands, however, also provide various important ecosystem services and are highly sensitive to disturbance. Sustainable agricultural usage of wetlands, therefore, can only be achieved if good environmental governance minimizes negative effects on environmental health and human well-being. This paper is based on ethnographic and interdisciplinary research in Rwanda, Tanzania and Uganda. To varying degrees, the wetlands in our research areas have been commercialized for cash crop production, building land and other economic activities (e.g. sand and clay extraction, brick production) and conflicts over access to wetlands have increased. Preliminary findings suggest that conflicting interests, weak institutions and high economic needs tend to threaten sustainable use of these fragile resources. In this context, we focus on the nexus between intensified wetland usage and environmental governance efforts at local, national and international scales and explore its outcome for different groups of wetland users.

Key words:

Wetlands; East Africa; small-scale farming; land-use; governance; institutions; rural areas; peri-urban areas

Participatory Forest Management Strategies for Enhanced Livelihood in Dehradun Valley

Poonam Kumria

Miranda House, University of Delhi., India, poonamkumria@yahoo.co.uk

Abstract

The trees are primary producers and without them it is just impossible to imagine animal life, including man. But these facts have remained as bits of information; as forests in India have been shrinking for several centuries owing to pressure of agriculture, commercial and industrial uses, urbanization, and meeting the energy requirements of the large section of the population especially in rural India. Forest is an important part for livelihoods especially in rural areas of Dehradun valley. Forest is under immense pressure and valley faces significant energy crises. The forest dwellers represent the societies insist on subsisting on their local resources and the state represents the forces of modernisation, which control the resources. Participatory forest management approaches have a long history in Uttarakhand being rooted in traditional local practices. With this contested realm the community participation has been outlined as an important aspect of forest management in India since 1990s. After a decade the assessment of joint forest management became very important as process of forest degradation is still going on in the valley. The remote sensing and GIS techniques have been used to identify the surveyed villages. The ten villages have been surveyed based on their distance from the urban areas and proximity to forest. The dependence on forest increases tremendously as distance from the urban centers increases. The SWOT analysis of participatory approach has been done to underline sustainable forest management in the valley.

Various parameters have been identified to enhance the livelihood of poor and lower caste farmers. The study also reflects the exploitation of poor women who are much more dependent on the forest resource than their male counterpart. With bold steps, community participation and constructive institutional change; a strong foundation can be laid for total forest management leading to sustainable rural development in the valley.

Key Words:

Forest degradation; Participatory forest management; SWOT analysis; Constructive institutional change

Participatory Natural Resource Management in Rural China: Making Indigenous/Community Narratives

Ju-Han Zoe Wang

The University of Sydney, Sydney, Australia, zoe.wang@sydney.edu.au

Abstract

Environmental narratives produce certain environmental knowledge and social orders (Forsyth & Walker, 2008). Environment and development discourses can be categorised into three narrative themes, or motifs, framing human-nature relationships in China's environmentalism: peasant, indigenous and community (Hathaway, 2007). In particular, indigenous and community narratives have emerged and have been adopted by eNGOs in China in the recent years in promoting projects on local communities. This paper aims to analyse the ways various environmental narratives were made through eNGO projects in rural China, and discuss the implications of such narrative-making. Case studies are drawn from a participatory resource management project of a domestic eNGO in Yunnan, where natural resources have been the arena for contest between various actors including NGOs, local communities and the government. The authors argue that neither the indigenous nor the community narrative themes are never fully internalised by the relevant rural communities, although the narratives may be used strategically. The reasons for not internalising the narratives may be because of the incompatibility of Chinese language with the western-oriented concepts, and the lacking of territorial and cultural claims by the rural Chinese communities.

Key words:

Environmental narratives; indigenous; community; participatory resource management; China

Place- Speaking: Attending to the Relational, Material and Governance Messages of Silent Spring

Bartel, R.,

University of New England, Armidale, Australia, rbartel@une.edu.au

Abstract

Silent Spring is often credited as having launched the modern environmental movement. Its major arguments concerned the dangers and risks of indiscriminate chemical use, particularly insecticides and their negative impacts on ecosystem and human health. Rather than revisiting this content of Silent Spring, which has been heavily interrogated previously, and considerably extended by other studies since the book's publication, this paper concerns itself with some of the less well-examined elements of the work, including Rachel Carson's foregrounding of place and non-human agency, and validation of lay knowledges and alternative approaches in both science and policy. Specifically, the lens of legal geography is deployed here to illustrate the import of these contributions, as well as their remarkable prescience. In particular, the significance of relational ontologies, the relevance of materiality, and the value of collaborative governance, areas which have only relatively recently formed the subject of wider scholarship and debate, are all scoped by Carson in Silent Spring. These contributions furthermore hold great promise for better appreciating and addressing contemporary environmental and institutional challenges, including those that currently define the Anthropocene.

Key words:

Silent Spring; legal geography; materiality; place agency; governance; Rachel Carson.

Place- Thinking: the Hidden Geography of Environmental Law

Bartel, R.

University of New England, Armidale, Australia, rbartel@une.edu.au

Abstract

Environmental law and its students stand accused of ignoring space. The degree of reflexivity given to law by jurisdiction, social and political change and case-by-case flexibility is chimeric rather than substantive, serving only to further ensure law's hegemonic attempts to conceal spatiality and to silence non-human voices. This paper will draw on a case study to demonstrate how native vegetation laws and species classifications are open to challenge by vernacular knowledge and plant perspectives. The analysis unsettles the universalist, anthropocentric and essentialist claims made by law, while at the same time offering explanatory power hitherto concealed. An alternative relational-material methodological pathway for the interrogation of environmental law, revealing its hidden tenets and consequences, as well as a potential opportunity for reform, is presented. To transform its vision and impact environmental law must interrogate its universalist, essentialist, anthropocentric and also utilitarian assumptions. Such a transformation involves a finer-grained attendance to geographical conditions, including not only spatial diversity but also temporal dynamism, change and emergence, as well as the incorporation of non-human perspectives and a de-centring of the human. Such lessons of contextualization and deep democratization have relevance for law and policy analysis more generally.

Key words:

methodology; environmental law; materiality; place agency; native vegetation; weeds

Struggle for Resources or Struggle for Territory? Conflicts Regarding Water and Energy in Southern Chile

Höhl, Johanna

Heidelberg Center for Latin America, Santiago de Chile, Chile, johanna.hoehl@googlemail.com

Abstract

The terms *conflicto mapuche* or *problema mapuche* are commonly used in Chile – the media, politics, enterprises and also the indigenous movements themselves talk about a conflict. The parties involved depend from case to case – the mapuche and different stakeholders – such as the State, Chilean society and entrepreneurs. Also in research on the history of the mapuche the terms conflict or problem appear.⁵ Some parts of Chile are even attributed to the „red (and therefore dangerous) zone“. The Chilean state, enterprises and parts of Chilean society pursue certain objectives with this discourse: The mapuche are a threat for national safety and the economic development in Southern Chile. However, the mapuche (re)construct identities and traditions in order to fight for a recognition of the indigenous population in the Chilean constitution and against the neoliberal economic model. Other positions represented by other stakeholders complement this bipolarity in different levels. Hence, what role play the discourses and identities associated to the different scales (local, regional, national) and how do they influence the respective positions (of power)? To what extend are local arguments exploited for national purposes? On the basis of conflicts in the Araucanía region regarding water and energy these questions will be analyzed and discussed, as in these disputes various stakeholders are involved at different levels.

Key words:

Governance; Water; Energy; Indigenous people; Mapuche; Environmental Conflict; Hydroelectricity; Power relations

Study on the Structural Optimization of Land Use Quantity Based on Ecological Land Constraints: A Case Study of Lushui County, Nujiang City

Bao Huashu, Jiang Deming, Li Yimin

College of Resource Environment and Earth Science, Yunnan University, 650091, P. R. China,

Institute of Geography Yunnan Province, 650091, P. R. China, 313783449@qq.com

Abstract

With the development of social economy, the ecological environment problem gradually revealed. How to achieve the purpose about coordinate the relationship between human development and ecological protection by changing the human land use behaviour, this is one of the important topics to be solved at present. Defining the concept and the types of ecological land with the present research results and the need of this paper, which laid the foundation of the ecological land calculating and model building. At the meantime, by introducing the concept of ecology priority and the method of ecological security pattern, the paper analyses the constraints of regional ecological land in the target year of land use planning. Then, an optimization model of land use structure is built based on the ecological land constraints and the objective of maximizing land use economic benefit, and a case study in Lushui was taken.

Key words:

ecology priority; ecological land; ecological security pattern; land use; structural optimization

The Mechanism of Social-Ecological Systems changing in Upper Irrawaddy River Basin

WANG Wenling^{1,2} FENG Yan^{1,2}

¹Asian International Rivers Center at Yunnan University, Kunming 650091, China, wangwl@ynu.edu.cn;

²Key Laboratory of International River and Cross-Border Ecological Security, Kunming 650091, China

Abstract

One of the key issues towards regional sustainability is how to coordinate the nature conservation and economic-social development. The upstream of the Irrawaddy River Dulong river basin is a unique area of Dulong ethnic group living. By using methods of key informant interview, PRA and questionnaire survey, the social-ecological dynamics was analyzed since 1950s. The major results are:

(1) Since 1950s, the settlement fragments changed from the pattern of “big dispersion and small concentration” to the one of “small dispersion and big concentration”. The limited arable and habitable land controlled the settlement distribution; the traditional culture was affecting the choice of settlement location; land ownership limited settlement expansion; grain accessibility and infrastructure construction drove the settlement to become more concentrated and led to a dramatic demographic shift toward fewer but more populous settlements.

(2) The ecosystem provisioning function that has been in place while the slash-and-burn farming replaced by permanent farming, the ecosystem culture function was reduced as well. The policy provided stable drivers to change the farming system. Grain subsidy lowered the demand of the ecosystem food provisioning function, changed the way to use land and market integration and infrastructure construction provided the food security, driving the farmland to produce more economic crops.

(3) The policy only limited the access of the ecosystem without replacement strategy, failed to meet the target and create greater conflicts. The innovation integration of those policies with other compensatory policies drove the system to become more efficient.

Key words:

Social-Ecological Systems; Ecosystem Services; Land Use; Landscape; Scale; Dulong Watershed

Water Resource Management for Pre-Monsoon Paddy Cultivation through Local Self-Government – Case studies from Sundarbans, West Bengal, India

Mridha Tanusree

JRF, UGC, Lady Brabourne College, University of Calcutta, Kolkata, India, sreetithi@yahoo.in

Abstract

Water resource management is extremely essential for successful harvest of pre- monsoon crops in India. By the 73rd (Constitution) Amendment Act 1992 in India, Rural Self-Government has been entrusted to look after the small irrigation including its planning, operating, and maintenance as well as collecting revenue at local level. This study aims at evaluating the performance of rural self-government in planning and development of small irrigation. For this purpose, case studies have been conducted at different islands of Sundarbans area in the state of West Bengal. The studied area is absolutely mono-cropped. It is found that potentiality of sub-canal and surface water sources for irrigation are remained under utilized for different reasons. The study suggests how to upgrade the irrigation facility in this area for pre-monsoon crop cultivation through peoples' participation under the leadership of present Rural Self- Government system.

Key words:

pre monsoon; self-government; small irrigation; Sundarbans

Study on Spatial Pattern Dynamic Evolution and Driving Mechanism of China's Environmental Regulation Efficiency

CHENG YU, REN Jianlan, CHEN Yanbin, XU Chenglong

College of Population Resource and Environment Sciences, Shandong Normal University, Jinan 250014,

China, chengyuwyp@sina.com

Abstract

Environmental issue is the front-burner and focus issue that influence China's economy and society sustainable development. With the destructiveness of environmental pollution's negative externality to production and living becoming bigger, government and general public's environmental awareness enhancing and environmental value concept converting, environmental regulation has been the inevitable choice of regional economy and environment synergetic development, improving the quality of residents and building harmonious society. Mid-term evaluation results of the 12th Five-Year Plan published by National Development and Reform Commission show that the pace of 4 obligatory targets (the proportion of non-fossil energy in primary energy consumption, unit GDP energy consumption, CO₂ emission intensity, NO_x) has lagged behind. Hazy weather and human settlement continuously deteriorate, it illustrates environmental management's result is unsatisfactory. So the performance and driving mechanism of government's environmental investment and management need to reexamine. Environmental regulation efficiency evaluation is a key manner that assesses government's environment governance performance. China's Environmental regulation efficiency is measured by Data Envelopment Analysis, its spatial evolution characteristics are analyzed by variable coefficient, Gini coefficient, spatial autocorrelation and Tobit model, and its influence factor and comprehensive drive mechanism are discriminated. Conclusions are as follows: ①different regions' environmental regulation efficiency fluctuated upward trend in 2000-2012, variable coefficient and Gini coefficient presented the situation of "combined efficiency > scale efficiency > pure technical efficiency"; ②environmental regulation combined efficiency, pure technical efficiency and scale efficiency characteristics of spatial heterogeneity are "east region > northeast region > central region > west region", environmental regulation efficiency's situation of spatial agglomeration is obvious; ③economic development, urbanization, technology input, marketization, globalization had positive correlations with environmental regulation efficiency, industrial structure (the proportion of industrial output in GDP) had positive correlations negative correlation with environmental regulation efficiency. Combining phase characteristics of China's regional

sustainable development, the spatial pattern dynamic evolution's rule and comprehensive drive mechanism of China's environmental regulation efficiency are discussed, environmental regulation's predicament that ecological environment local improvement but overall degradation is solved, environmental regulation efficiency's research framework of spatial evolution's geographical processes and multi-factors driving mechanism are completed, geography's key scientific problems of "process + pattern" and "element + mechanism" are strengthened, this paper can provide decision and reference for regional sustainable development.

The current state of the climate and cryosphere of the Arctic in the AMAP assessment reports

Ananicheva M, Klepikov A

Institute of Geography of RAS, Moscow, Russia, maria_anan@rambler.ru

Abstract

The outcomes of the “Climate change and the cryosphere - Snow, water and permafrost in the Arctic” (SWIPA) project of AMAP, are presented. The SWIPA report gave an up-to-date assessment of the state of the Arctic cryosphere, including the Greenland ice sheet, mountain glaciers, sea and freshwater ice, permafrost and snow cover at the background of climate changes in the first decade of our century.

The results of assessment reports show a rapid change of the Arctic climate. The last five years in the Arctic were the warmest over the entire observations. Glaciers and the Greenland ice sheet melt quicker compared to the previous decade. The sea ice cover area decreased (by 25-30%) recently. The snowcover area decreased by 18% since the mid-1960s. The temperatures in permafrost increased by almost 2°C during the past decades. Changes in the Arctic influence the planetary processes. Melting of the Greenland and glaciers contributes to a more rapid sea level rise than supposed before.

Efficiency of the adaptation strategy can be increased by means of further studies of potential challenges and opportunities, the Arctic Council initiated the project “Adaptation Actions for a Changing Arctic” (AACA) under the AMAP. The AACA will provide valuable information on how these drivers of change may interact. AACA will cover three pilot regions: Barents Region, Baffin Bay and Davis Strait Region, and Bering, Chukchi and Beaufort Region. All three regions will cover both marine and terrestrial areas, and will be forward looking with a focus on 2030 and 2080.

Assembling the Periphery: Moving out of Resource Curse in Chile and New Zealand

Murray W E, Overton J, and Rehner J*

Victoria University of Wellington, New Zealand. Warwick.murray@vuw.ac.nz

Abstract

The concept of Resource Periphery was introduced by Hayter et al (2003) referring to the specific role within globalization of areas relying on commodity exports – especially emphasizing the contestation of space that results. This discussion is linked to the analysis of resource abundance and how this perpetuates uneven development as well as producing conflicts (social, ecological, cultural) concerning the extraction and export of commodities. Work in this area has largely ignored the impact of the scale of analysis and has focused on the national level impacts. This paper reports on work on regional resource peripheries in Chile currently evolving and seeks to apply the resultant findings to the case of New Zealand.

Key words:

Assessing the implementation of the 'Coordinating Urban and Rural Construction Land' policy in China

Pingyang LIU¹, Neil RAVENSCROFT²

¹ Fudan University, Shanghai, P.R.China, 200433, Pingyang.liu@gmail.com

² University of Brighton, Brighton, UK, BN4 2GJ

Abstract

Rapid urbanization in China has led to the increasing scarcity of land suitable and available for construction. Concurrently, rural depopulation has resulted in many vacant properties, including farm houses, farm buildings and warehouses that were once part of large collective farms. In order to address this inefficient resource utilization a national policy of "Coordinating Urban and Rural Construction Land" has been widely implemented since the early 2000s. Since implementation started there have been successful schemes that have resulted in benefits for urban and rural development, while there have also been failures, allegedly caused by both local resistance and corrupt practices. As China continues to face major challenges of this type, it is appropriate to consider what components of such schemes tend to result in beneficial solutions, and how individual communities can best organize themselves to achieve these outcomes. Based on a case study of the earliest pilot program in Chengdu, Sichuan Province, we seek to argue that the top down nature of this policy does not mean that it is best implemented in a top down manner, largely because the government officials responsible are not part of the local collective. Informed by Ostrom's common pool resources theory, we further seek to argue that collective construction land is a typical common pool resource, meaning that bottom up policy implement and effective collective action are crucial to the realization of successful schemes. In particular, the case study indicates that with the empowerment of villagers to participate in the policy process it is possible to achieve a broad consensus on the best approach to addressing the problems, with community interests protected and properly monitoring. We conclude that even in cases where a top down approach appears necessary, policy should be implemented from the bottom up by empowering communities to be able to take strong and collective action.

Key words:

Collective Action; Rural Construction land; Bottom up approach; Community empowering

Communities which are not Included in Local Self-Governance: A Case Study of North Caucasus Republics of Russia

Glezer O.B.

Institute of Geography, Russian Academy of Sciences, Russia, Moscow, yalog@rambler.ru

Abstract

In Russia intension of local self-governance to respond the needs of all citizens is rather nominal. The paper analyzes characteristic deviations with emphasis on North Caucasus republics. While municipalities in Russia were formed top down, existing local communities were not completely considered. Merged rural settlements, urban-type settlements joined to cities or turned into rural ones, and settlements within urban boroughs could not form their own municipalities. Socioeconomic peculiarities of North Caucasus republics which aggravate all-Russia processes are explored. (1) In many rural and small urban municipalities share of personal income tax having small absolute size exceeds 85% of budgetary tax revenues, with almost no other taxes. Such budgets are filled 80–95% with federal and regional transfers, so municipal authorities are not free when managing public affairs. (2) Makhachkala, Nalchik, and Karachaevsk each have incorporated several urban-type settlements. The lack of the independent status contradicts ethnic-rooted identities of these communities. (3) Conflicts of land and ethnic nature emerge in Dagestan in the settlements on the plain dealing with distant-pasture cattle raising. Their inhabitants have no opportunity to influence authorities' decisions where they do live, since they are attributed to mountainous municipalities. The study revealed several relevant types of North Caucasus local communities whose inhabitants have not got access to self-governance in their settlements and loose interest for it. As the solution of this problem, reshaping of territorial model of local governance by development of intercommunal connections and diversification of inner structure of urban boroughs according to their specifics are suggested.

Key words:

local self-governance; urban and rural settlements; community; territorial structure; municipality

Discourse and Ethical Value Chains: New Zealand, Norway and Chile Compared

²University of Bergen, Bergen, Norway

³University College Bergen, Bergen, Norway

Abstract

Resource dependent industries use various discursive techniques in order to justify their activities. These vary across time and space and are contingent on various factors at different geographic scales. In this paper we trace how the salmon industries in Chile and Norway and the dairy sector in New Zealand have altered their legitimising ethical discourse overtime and what this implies in terms of the evolutionary economic geographies of these sectors.

Governance of Electricity Delivery for Cost Recovery in a Democratic South Africa

Professor Johannes Tsheola and Ms Mmakgosi Precilla Maloa

Department of Development Planning and Management, University of Limpopo, South Africa,

johannes.tsheola@ul.ac.za

Abstract

Service Delivery in developing countries such as South Africa has become an endemic challenge in the post-apartheid era. With democratisations, services had to be extended to the formally excluded sectors of the population. However, these sections of the population live in poverty and could not afford the cost of consumption. In the same light, the inability to pay for cost of consumption strained the sustainability of the expansion of services and sustenance of quality delivery. These dilemmas are exacerbated by the fact that the excluded and poor sections of the population are the primary voting constituencies of the ruling political party, African National Congress. The apparent impasse of service delivery and cost recovery in a democratic South Africa questions the appropriateness of the regulatory governance regime. This paper examines the societal implications of the continuances of regulatory governance of electricity delivery in a democratic South Africa.

Key words:

Regulatory Governance; Service Delivery; Electricity; Cost of Consumption; South Africa

Local Governance, Non-Governmental Organizations and Vulnerable Groups. A Multi-Scale Approach in Western Romania.

DRAGAN A.

West University of Timisoara (Romania) / Universite d'Angers (France), alexandru.dragan88@gmail.com

Abstract

After the fall of the Communism, a major challenge was the emergence and the structuring of the civil society. The development of non-governmental organisations (NGO) had a key role in this process. In Romania, we can generally decompose the aim of the NGOs in two main categories: “watchdogs of democracy” and organisations focused on vulnerable groups. Both can have a significant role in local governance. Our paper aims at analysing how NGOs contribute to and involve citizens in the process of local governance, at three different scales. Concerning the large cities, we took the case of Timisoara, university and innovation centre. At medium-sized scale, we focused on Jiu urban Valley, symbol of mining industry, of violent protests and one of Romania’s poorest area. Regarding small towns, we choose Jimbolia, a multi-ethnic town situated at the border with Serbia and Hungary. We addressed 862 surveys to population, 105 to NGOs and 60 interviews to local authorities and NGOs. As results, despite the preoccupation of Romanian NGOs in vulnerable groups, the higher the poverty and the social exclusion are, the less NGOs are present: in Jiu Valley, the NGOs are almost non-existent. In the process of governance, the singularity of public institutions is still visible. This situation blocks the prosperity of the area and sustains the emigration of young population to prosperous cities, especially Timisoara. In the case of Timisoara and Jimbolia, diversity is a keyword in the processes of governance, various ethnic, religious and economic groups becoming actors of local governance.

Key words:

Civil society, local governance, non-governmental organisations, vulnerable groups

Rethinking the Social Capital in Participatory Planning: The Role of Bridging Social Capital for Immigrant group in Collective Decision-making Process

Cho H

University College London the Bartlett School of Planning, London, The UK, hyunji.cho.14@ucl.ac.uk

Abstract

This study explores local governance process of community-led regeneration projects in Seoul, South Korea by examining the contribution of social capital in forming public discourse in the participatory planning. Previous comprehensive government-led developments have been gradually replaced by community-led regeneration projects since the early 2000s in Seoul. However, despite the heterogeneous nature of urban communities, there are challenges within Korean community planning to expand the concept of community to engage different groups.

On the contrary to bonding social capital referring to strong ties within a group, bridging social capital has gained attention as a concept providing the further understanding of relationships between different groups. As researchers started to focus on the dynamics among diverse social members in local communities, the studies on bridging social capital have been expanded to look into the role of social networks for minority groups in building links and providing accessibility to public discourse. Even though open participation is dealt with importantly to achieve consensus including minority viewpoints in recent planning literature, the study of its mechanisms seems to be still limited.

The study focuses on that participatory planning is interwoven with participants' social and cultural contexts. Therefore, it seeks to explore the interplay between local group relations, particularly focusing on the role of bridging social capital for minority groups. The data will be obtained by qualitative methods including in-depth interviews with local communities and the observation on the community meeting, and the document analysis of local policy documents.

Key words: community-led regeneration; community participation; immigrant group; consensus building process; social capital; bridging social capital

Rural governance and Space Production in the City of UMhlathuze, South Africa

Ndimande N

University of Zululand, KwaDlangezwa, South Africa, ndimanden@unizulu.ac.za

Abstract

Rural societies across the world have witnessed a shift from government to governance. In South Africa, rural governance has multiple layers consisting of government, traditional leadership and land institutions, farmers and farmers associations. Governance extends beyond formal institutions and actors to include informal or non-institutional actors. This paper examines how rural governance arrangements, actors and power relations shape and produce rural space in the post 1994 South Africa. South African literature on rural governance has focused on local governments, traditional leadership and land reformation. Little has been done to examine governance beyond formal institutions and traditional leadership. I used Halfracree's three fold model (trial by space) to catechize space production and relationships among formal and informal actors in governance within the City of Umhlathuze. I argue that governance arrangements in rural areas are complex and characterized by disconnected and incongruent relationships and that there is a power shift from the formal actors to informal actors.

Key words:

rural governance; space production; rural space; actors; trial by space

State- Rural Society Relations in the Yellow River Catchment: Voluntary Resettlement, Participatory Governance and Poverty Alleviation

Gomersall, K

The University of Melbourne, Melbourne, Australia, k.gomersall@student.unimelb.edu.au

Abstract

Resettlement policy in China has progressed from forced migration for major infrastructure projects to voluntary programs designed to alleviate poverty and fulfil central government industrialisation and urbanisation objectives. Current Poverty Alleviation Resettlement policy is one such program that makes specific reference to community consensus on decisions such as the decision the move, where to move and how to move. To date, the application of neoliberal governance procedures during resettlement implementation in rural China is under researched. This project aims to shed light on the complexities of applying participatory governance measures, given China's hybrid governance system that incorporates socialist and pre-socialist structures.

Case study research in the Yellow River catchment explores the state-rural society relations that emerged during resettlement implementation. A governmentality methodology has been applied to exploring relations between the state, villager leaders and village communities which are important for determining the efficacy of participatory processes in producing inclusive decision making. Entrepreneurial village leaders that are essentially outsiders act as an arm of the state implementing central government policy. Alternatively, village leaders who are part of the community can resist or negotiate space for resettlement outcomes that better reflect the desires of villagers. The result is the need for a more nuanced approach to participatory governance in which informal governance systems embedded in village social relations are taken into account.

Technology Diffusion of Agricultural Science and Technology Park

LI Tongsheng¹, LUO Yali^{1,2}

¹ College of Urban and Environmental Sciences, Northwest University, Xi'an, 710127, P. R. China, leetang@nwu.edu.cn

² College of Civil Engineering and Architecture, Huai-yin Institute of Technology, Huai-an, 223001, P. R. China, luoyl8502@sohu.com

Abstract

Agricultural Science and Technology Park (ASTP) is the technopole of agricultural development in China, and is a new mode of agricultural innovation diffusion. Based on the comparison on the representative figure, the core thought and methods about different research paradigms of the agricultural technology diffusion in various periods, the study put forward a research framework of ASTP technology diffusion from the perspective of geography. The study showed that the growth process of the agricultural technopole was a process of enhancing the technopole's technology "potential" and the technology "potential difference" between the technopole and its surrounding area. Furthermore, this paper analyzed the internal mechanism of the ASTP technology innovation and diffusion. After analyzing the technology diffusion system elements and characteristics, the paper concluded that the technology diffusion environment may affect the direction, the speed, the way of the technical flow and the effect of technology diffusion. And then it put out the evaluation index system of technology diffusion environment. Following the "basic" paradigm, the paper discussed the spatio-temporal process characteristics, analyzed the influencing factors and mechanism of ASTP innovation diffusion. Finally, it concluded that ASTP innovation diffusion followed the basic rules of "point-axis" diffusion. Following the "adoption" paradigm, the paper analyzed the influencing factors and mechanism of the peasant household's technology adoption; and further researched the difference of the peasant household's behaviour on different technologies under different environment conditions. The studies showed that the technical attributes and the diffusion environment had a significant influence on peasant household's technology adoption behaviour.

Key words:

agricultural science and technology park; agricultural innovation diffusion; spatiotemporal mechanism; peasant household behaviour

The Block 113 dialogue: A Chinese Oil Company's Foray into Participatory

Governance in Peru

Matisoff, A.

University of California, Los Angeles (UCLA), Los Angeles, CA, am2285@g.ucla.edu

Abstract

Corporate social responsibility (CSR) that includes civil society in decision-making about Chinese resource extraction projects challenges China's governance norms. But as Chinese state-owned resource companies go abroad to extract oil and other natural resources, they are investing in countries that favor CSR, rather than regulation, as a means to address environmental and social conflicts that arise. Given that Chinese state-owned companies operating domestically lack participatory governance experience, this case study examines a dialogue initiated by the Peruvian subsidiary of the China National Petroleum Corporation (CNPC) with indigenous peoples federations and environmental NGOs in Peru over conflicting land claims. Drawing on evidence from interviews and field visits conducted in Peru during summer 2012, I argue that despite efforts by the Peruvian government to evade responsibility for disputes that arose, CNPC's CSR efforts ameliorated conflict with civil society. This would seem to suggest that CSR is a viable tool through which Chinese resource companies can mitigate conflict abroad. However, this outcome much depended on the unified, rights-based approach taken by indigenous federations and environmental NGOs. Therefore, this case study ultimately presents CSR as a site of contested governance and questions whether it is an effective tool for Chinese companies to adopt to address conflict abroad if rights-protection mechanisms are absent.

Key words:

Chinese overseas investments; civil society; corporate social responsibility; natural resources

The Case for a Geography of Corruption

Maharaj, Brij

University of KwaZulu-Natal, Durban, South Africa maharajb@ukzn.ac.za

Abstract

An enduring feature of the 21st century is the rise of corruption as an endemic, international problem, permeating both the public and private sectors, in the global north and south. There is clearly a geographical connection, in terms of territorial distribution of incidents of corruption, the consequent entrenchment of socio-spatial inequalities (especially in south countries), and political implications (weak/strong states and the complicity of politicians), and critical scholars have contended that there is a neoliberal connection. However, with a few exceptions, this has been a neglected area of study by geographers. In South Africa this was linked to political correctness, the retreat of critical scholars and consultancy/policy turn. Also, there are methodological problems relating to access to data. There were great expectations that South Africa, the world's youngest democracy, would be different, with its constitutional commitments to equality, transparency, apartheid redress, and improving the lot of the poor and disadvantaged. Twenty-one years into democracy, corruption has become endemic in South Africa. This paper analyses the escalation in corruption in the public sector in South Africa. Key contentions of this paper are: i) this escalation is related to the ambivalence of the ANC government to act decisively against perpetrators, especially as senior party members are implicated; ii) attempts to restrict public access to information; iii) threats to restrict press freedom.

Key words:

Corruption; neoliberalism; socio-spatial inequalities; South Africa

Diplomatic Actions and Consensus Formulation in the Geopolitics of Internet Governance

PIRES, H.F.

Institute of Geography - Rio de Janeiro State University, Rio de Janeiro, Brazil, hindenburgo@uerj.br

Abstract

This research aims to investigate how the models "multistakeholder" and multilateral influence the geopolitics of representation of the agents involved in the geopolitics of global Internet governance (government, civil society and large capitalist corporations). The term stakeholder, heavily used in the documents of the Clinton Administration, was broadcast in 1984 by Edward Freeman, creator of "Stakeholder Theory". This theory has been applied in the US business environment and the corporate governance activities of private and public enterprises in the US. The stakeholders theory Freeman, used strictly for the management of conflicts in the administrative organization of private companies, was developed in order to strengthen the organizational level. The abandonment process of multilateralism bias in global Internet governance has implications in all aspects in the future development of the Internet, given that it covers a wide range of topics not only related to the issue of technological development, but also to political issues concerning the sovereignty, political representation, security, geography, geopolitics, economy, education, citizenship, privacy, freedom of expression, among others. Therefore, the objective of this study is to analyze the emergence of organization of democratic initiatives and representation of the relevant social actors in civil society, in the Internet Governance Forums - (IGF), organized by the UN, and the Social Internet Forum, organized by the Just Net Coalition (JNC).

Key words:

Internet Governance Internet Governance Forum; Social Internet Forum; multistakeholdism and multilateralism

Multiple Subjects and Multi Governance: A Research on Features of Rural Development Experiments in the Perspective of Governance Structure

Rui CHEN

School of Architecture and Urban Planning, Nanjing, 210093, P. R. China, 331302359@qq.com

Abstract

The current "government-oriented" rural construction brings prosperity, but risks are also hidden in the unification of rural governance, and pluralistic subjects need to be cultivated. At present, a series of Rural Development Experiments provides unique materials for researching on rural governance, but little literature has analyzed the governance practices of these experiments in detail. Distinguished from the general rural construction activities, Rural Development Experiments represent these rural construction activities which have clear construction goals and practices with pioneering and innovative approach. This research plans to observe the most representative Rural Development Experiments in the recent years from the perspective of the governance structure. We firstly summarize three main subjects in the rural development experiments, which includes the corporate social capital, NPO and NGO, intellectuals and local elites. After analyzing these three categories of subjects, we will conclude the governance structures into three models: the auxiliary top-down, the intermediate bridge that coordinates interests, and the bottom related bottom-up. Finally, by comparing with the unified "government-oriented" model of governance, this paper shall argue that diverse rural governance structures are capable of making up the vacancy lays in the "government-oriented" governance, and avoiding certain risks in the process of constructing. Also, multiple subjects and multi governance will be of great significance and benefit for the diverse rural construction in the future.

Key words:

Governance Structure; Rural Development Experiments; Multiple Subjects

GIS Enabled E-Governance

Bolorchuluun Chogsom, Tsogtdulam Munaa, Narantuya Davaa

Department of Geography, National University of Mongolia, bolorchuluun@num.edu.mn

Abstract

E-Governance has broader area of implications. It can be used in various aspects of governance system. With the advancement in the sector of Information and Communication Technologies (ICT), the Governments of economies have stepped forward to adopt e-governance in different service sectors. The growing application of information and communication technologies and their subsequent use on strengthening interaction with citizens has given rise to a new governance paradigm as E-Governance.

The Government of Mongolia declared ICT as one of the key economically important sectors. Approved in 2005 E-Mongolia National Program missions “enhancing people’s life quality by establishing new economic environment, improving country’s competitiveness and providing sustainable development”. Three frameworks dealt within the program that are government-legislation; business-economy; and human development; and four policies of government-to citizens, government-to-business, government-to-government and infrastructure.

In Mongolia has started applying GIS for the development of city address system, utility management and in planning roads. All of these are being addressed in achieving good urban environment through sustainable use of geoinformation management. Many other supporting initiatives had taken place among which are formulation and approval of MNS 5774:2007 (ISO 19115) Spatial information- Metadata standard, and MNS ISO/TS 19104:2012, Spatial information- terminology standard, and mapping and geodetic engineering norms. E-initiatives in the land administration is supported by legal texts stipulated in the Constitution of Mongolia, Geodesy and cartography law, Land law, Cadastral mapping and land cadaster law, Land fee law, and Land ownership by Citizen of Mongolia law etc.

This paper shall review e-governance initiative, actions and challenges faced in the case of Mongolia and develop recommendations.

Key words:

e-governance; Mongolia; Information and Communication Technologies

Government and Society Mediated by Technology in Pirai (Brazil): the Challenges of a Small Town in Context of the Information Society

Costa, A.S.V, Egler, T.T.C, Kraus, L, Oliveira, F.M.A.

PhD Student in Urban and Regional Planning, University Federal of Rio de Janeiro, Rio de Janeiro, Brazil,

alsvcosta@gmail.com

Abstract

What is the relationship between government and society mediated by information and communication technology (ICT) on the scale of a small town in Brazil? This is the question that interests us and that justifies this investigation because we start from a case study, taking the town of Pirai, within the province of Rio de Janeiro (Brazil). The study of this city is interesting because it is a small town where I had an extensive program of local development, which considered ICT as important elements for development, along with other variables. As methodology we consider on the one hand an uprising on the history of the town and local development policy to make it possible to analyze the scanning process and how this government media relations and society. On the other hand, we present data that were raised through fieldwork in the town of Pirai to comprehend our question. The whole trajectory based on a theoretical framework from the fields of Geography, Urban and Regional Planning and Political Science. As a result, it is possible to say that this local development plan with variable ICT is innovative in the country only has not changed the relationship between government and society. On the contrary, were a modernization of the governance, a governance mediated by ICT without with that mean the consolidation of governance, which is more important and democratic is configured. However, I had a transformation in the economic, educational fields, and has been removed from the impacts of privatization. Only that governance was not reached.

Changing patterns of local public service provision in Hungary

Ilona Pálné Kovács

Centre for Economic and Regional Studies, Hungarian Academy of Sciences

Pécs, Papnövelde str. 22, Hungary, palne@rkk.hu

Abstract

The evolution of the local government system in Hungary is quite a hectic story. The systemic change brought about a strongly decentralised public service model. Since that time, however, several changes have occurred. The last 25 years can be regarded as a series of mostly unsuccessful endeavours for the correction of structural problems such as the fragmentation of municipalities and the weak role of meso-level governments. Due to the postponement of these reforms, a lot of difficulties have emerged such as financial problems and the deterioration of public service quality, despite the fact that local governments have introduced innovative solutions to cope with these problems.

Structural deficiencies are not the sole factor behind the new wave of governance reforms implemented post-2010. A massive centralisation and nationalisation of many local services has occurred as a result of the new political philosophy of the government, local governments' power and independence have been significantly reduced, furthermore, centralisation is gaining ground in other European countries in the aftermath of the financial crisis.

Based on empirical researches, the paper introduces the changes of local governmental duties in Hungary after the constitutional and administrative reforms. The core question is whether the neoliberal, decentralised public policy paradigm ever fitted the Hungarian public policy system where decentralisation was only a temporal guest.

Key words:

decentralisation; public services; administrative reforms

Educational Equality and Accessibility to Community Education Facilities: A case study of Beijing

Lili Xiang

School of Geography, University of Leeds, Leeds, LS2 9JT, UK, gylx@leeds.ac.uk

Abstract

Education is key to reducing polarisation and difference and itself is an important factor of social differentiation. Accessibility to community education facilities not only directly influences residential living standards, but also acts as a critical factor of social mobility. Poor accessibility to community education facilities can result in the spatial deprivation of low-income and disadvantaged groups, thus causing further social and spatial problems. At present, there are few policies to restrict the travel distance to education facilities in China. Coupled with the continuous expansion of cities, the present layout of the education facilities in China is now very chaotic. This paper focuses on geographic and social access to primary and secondary schools in Beijing. The findings can be a reference to guide urban authorities with the distribution and allocation of the different educational resources and opportunities in the city. This will help reduce educational inequality in terms of accessibility to education facilities.

Key words:

Education inequality; Accessibility; Spatial analysis; Deprivation

Going 'Smart' in New Towns: Reflective Tales of Milton Keynes and Nansha

Mai, Q., Bulkeley, H., Marvin, S.

Department of Geography, Durham University, Durham, DH1 3LE, United Kingdom, qianqing.mai@durham.ac.uk

Abstract

Smart city and planned urbanisation resonate as intertwined logics of sustainable development. During urbanisation, designated rural lands on the outskirts of traditional urban conurbations are transformed into new towns. Milton Keynes and Nansha respectively located in the south of England and China are among these planned cities. Despite the temporal differences – Milton Keynes was born and named in 1970 while the construction of Nansha officially started in 1990, the construction pathways of these two urban towns are reckoned with important similitudes. They were both built out of the population pressures in their nearby urban centres but carried on as strategic beacons with ambitions to become “one of the UK's biggest urban areas” for Milton Keynes, and a new regional capital of Pearl River Delta megacity for Nansha. Essentially, they also echo in their institutional arrangements with strong public-led elements, such as top-down master-planning, compulsory purchase and relocating governing resources.

Recent rhetoric of smart city emerges as convenient fit for these newly engineered cities. Comprehensive smart transitions are planned out with systemic goals for transport, water, energy, digital data, and education, in Milton Keynes' MK: Smart programme started in 2014, and in Nansha's New Area Development Plan announced in 2012. Analysing the comparable cases of Milton Keynes and Nansha reflects on the smart urban trajectories in different socio-economic and regime settings. With fieldwork interviews and archival research, this paper critically examines how smartness is configured in planned cities, and how experiments with smart approaches reform the governance of urban sustainability transitions.

Governance of National Positioning Framework in Korea

So-young Park, Yoon-mo Sung

National Geographic Information Institute, Republic of Korea, soyoung331@korea.kr

Abstract

Information and Communication Technologies (ICT) have led increasingly fast and various changes in our life. Pursuing smart life increases the need for full interoperability of all systems, and position will be playing a key role as reference infrastructure.

National Geographic Information Institute (NGII), national geospatial information authority in Korea, has its responsibility to develop, manage and provide national geospatial data. As one of main products established and maintained by NGII, Korean geodetic framework is a stable and accurate positioning reference infrastructure based on the world geodetic system and has been mainly used in cartography, land development and disaster management. It consists of 4 grades; Very Long Baseline Interferometry (VLBI), GNSS Continuously Operating Reference Station (CORS), Unified Control Point (UCP), and Triangulation Point – Benchmark – Gravity Control Point.

However, spatial extent broadens from a 2D surface to 3D space, and application field becomes rapidly various such as autonomous vehicles and drones. To support the emerging fields and technologies in much more efficient and accurate environment, advanced positioning system is required.

In this paper, it would be discussed on the current status of Korean geodetic framework and its future direction, called “National Positioning System Initiative” that NGII recently set up for sustainable development of the Korean positioning system. According to the initiative, the current geodetic framework intends to be unified into CORS and UCP for multipurpose. In addition, it is expected to develop advanced positioning technologies based on Internet of Things (IoT) environment in order to determine positions in real-time and active way.

Key words:

National geodetic framework; Positioning system; Korean positioning system initiative

Quality of Spatial Structure of Administrative Areas in India: A Case Study of Punjab

Singh Harbans

Associate Professor and Head, Post Graduate Department of Geography, SCD Govt. College Ludhiana, Punjab (India)

Abstract

Quality of spatial structure of administrative areas in Indian Punjab has been analysed by picking selected indicators. In case of agricultural developed state of Punjab, the quality of spatial structure of administrative areas such as divisions, districts, sub-divisions and development blocks are judged in terms of their size (area and population), population density, centrality of headquarters and shape efficiency. Based on the assumption that in context of developing areas such as Punjab, administration would be more efficient and more effective if administrative units at any level of hierarchy are small in size, have centrally located headquarter and enjoy high shape efficiency. In such a spatial structure, improved administration would help in achieving higher and faster rate of socio-economic development. In this back drop, analysis of spatial structure administrative areas of Punjab, would be helpful in improving the quality of spatial structure of administrative areas, by way of reorganizing the space administration to achieve higher level of socio-economic development.

Keywords:

Administrative areas; spatial quality; spatial structure; socio-economic development

Technology, Infrastructure and Governance: The case of Smart Cities in India

Abhishek Dwivedi

South Asian University, New Delhi, mail.abhishekdwivedi@gmail.com

Abstract

Cities today witness a compelling link between circuits of mobile capital (Peck and Tickell 2002) and a transnational sovereignty (Ong 2006). In the Indian context, the Smart city project launched in 2015, like its predecessor JNNURM, envisions rejuvenating urban metabolism through an assemblage (McFarlane 2011) of cutting-edge technologies. But such a 'developmental State' paradigm does need look into the role of local authorities and the prospects of putting the market 'back in' as well. Following Osborne and Rose (1999), therefore, this paper scans through the smart cities initiative in India via two key questions, as to: (a) how have corporate and 'governmental' compulsions (Hollands 2014) of a certain order provided the impetus for such a discourse and (b) what potential does the smart city have to 'engineer' development in Indian cities through a collage of technocratic practices (Datta 2015). This paper is based on 20 semi-structured interviews with government officials in the Ministry of Urban Development, Government of India and other stakeholders like architectural firms and urban consultancy groups, who drafted India's new Smart city policy. In so doing, the paper quips, that in a scenario where urban planning in India still seems to grapple with the provisioning of a) an adequate municipal finance regime for infrastructure and b) a healthy local decentralised governance system, as to whether smart cities shall engender revitalization of intra community ties within the city or shall it end up smacking off elitist exclusionary spaces of the 'speculative urbanism' (Goldman 2011) mould.

Smart cities, Urban Infrastructure, Developmental State, Participatory Governance

Why and When Countries Implement Public Administration Reform

Buček, J.

Comenius University, Bratislava, Slovakia, bucek@fns.uniba.sk

Abstract

Main goal of this contribution is in search for relationships among local public administration reforms and set of factors influencing their implementation and timing. Why and when countries prepare and implement public administration reforms is enduring considerable question. Among factors influencing reforms we consider the role of administrative traditions and political legacies. Within political framework, besides political parties' role, we focus on the role of central government, its political composition, or duration in holding the power, as well as international policy framework. More detailed attention is paid to conditionality of local public administration reforms to macroeconomic development and public finance situation. Important is modernization as part of reform motivation. We perceive reforms also as governance based output, with many actors involved and calling for reforms. The role of mentioned factors is discussed on a case of Slovakia between years 1990-2015. Although dealing with reform experiences in one country means particular limits to generalization, it provides interesting knowledge for countries considering reforms e.g. during transitional period of their societal development, or offer knowledge base suitable for comparative studies. It also supposes to contribute to understanding of reforms approaches under dual model of local public administration (with separate lines of state administration and self-government adopted in Slovakia since 1990).

Key words:

public administration reform; governance

Construction of Private Cloud on Public GIS Platform of Pearl River Delta

Xiaoyan Hua*, Kunjie Cao

Land and Resources Technology Center of Guangdong Province, GuangZhou, 510075, P. R. China, 649114913@qq.com

Abstract

The public GIS platform of Pearl River Delta is a comprehensive, one-stop platform for basic geography information service in Guangdong Province. It is important to scientifically set up an effective and intensive operational environment for the platform. This paper aims at the basic construction for the operational environment of the platform. A design scheme on construction of private cloud has been proposed based on electric government network. The basic components of the platform are described, such as the physical environment, network topology, safety protection, centralized management platform and so on. The key techniques based on VMware vSphere are discussed, including virtualized network technique, virtualized storage technique and layered security technique. This work will provide experiences for promoting the construction of provincial land and resource cloud data center.

Key words:

Basic geographic information; Private Cloud; GIS Platform

Co-Presence in The Information Age

Kellerman, A.

University of Haifa, Haifa, 31905, Israel, akeller@univ.haifa.ac.il

Abstract

Co-presence in the information age has turned mobile and extensive through widely used mobile information technologies, notably the Internet, for personal use. However, virtual co-presences have been assessed as being less significant than real ones. Information technologies permit veteran and novel patterns of people's co-presences, when encountering five types of attractions/stimuli: fellow people, places, events, information, and things, or when being engaged in combinations among them, notably within urban contexts. Such co-presences differ by their coordination necessities; employed senses; number of involved partners; and by called places. It is now possible, with the pressing of a single virtual button to move from one type of co-presence, for instance among people, to another one, e.g. between a user and information. It is also possible for individuals to be engaged in two co-presences simultaneously, when a screen is divided between two types of reaching out, such as with people and information. Cities are typified, by their very nature, with passive co-presences emerging in their public spheres. However, meaningful and active co-presences require initiation and activation. The contemporary global standardizations of software for all dimensions of reaching out may contribute similarly to global standardizations of co-presence experiencing.

co-presence; mobility; Internet; people; places; events; information; things

Multichannel Retailing and the (Re) Making of Retail Space through the Lens of Embeddedness – Migros Sanal Market in Turkey

Appel, A

Institute of Geography, University of Wuerzburg (Julius-Maximilians-Universität Würzburg), Würzburg, Germany,
alexandra.appel@uni-wuerzburg.de

Abstract

The purpose of this presentation is to investigate the value of the concept of embeddedness for economic geographers. Alongside the case study of the multichannel grocery retailing brand Migros in Turkey the spatial impacts – in relational and physical terms – of digitalisation and the integration of an online shop into the profile of a supermarket chain are investigated. With applying the concept of embeddedness the paper seeks to understand these complex, diverse and uneven processes of (retail) restructurings that affect different dimensions and dynamics of networks, societies and spaces. In my case study I identify two dimensions of embeddedness processes: (1) embedding the online shop in the firm's routines and practices, whereby processes of transfer of knowledge and technology dominate, and (2) embedding online shopping in the customer's routines and practices, whereby processes of adaption to consumer culture dominate. These dimensions are reflexive and as such mirror ongoing negotiation processes between the two stakeholders. On one hand multichannel retailing thus not only alters 'where' but also 'how' people shop, and can result in new retail spaces like pick-up stores. On the other hand it can be shown, that the 'locations', where online shopping of Migros is available, reproduce spatial variations of socio-economic factors, such as income distribution or population density. As such the concept of embeddedness is useful for economic geographers – also in the realm of e-commerce – to unravel the interconnections of societal, organizational and spatial patterns as well as their variations across space. The findings are based on qualitative interviews.

Key words:

embeddedness; multichannel retailing; Turkey; e-commerce; retail space; food retailing

One Hundred and Fifty Years of International Telecommunications in the Globalization of the Modern Japan

Arai Y.

The University of Tokyo, Tokyo, 1538902, Japan, yarai@humgeo.c.u-tokyo.ac.jp

Abstract

In this presentation, I would like to discuss how telecommunication systems have been developed in the globalization of the Modern Japan. Saskia Sassen pointed out that Tokyo gained a position as a global city in the 1980s based on an analysis of finance mobility in her book, *The Global City*, published in 1991. Certainly, with respect to globalization, Tokyo, the Japanese capital, had been behind London and New York, both of which had been the political and economic centers of the world since the 19th century. However, did the globalization of Tokyo and Japan really start suddenly at the end of the 20th century? A number of studies on the history of the modernization of Japan have found out that numerous efforts targeting the internationalization of the Japanese society and economy had accumulated for more than one hundred years after the Meiji Restoration of 1868. If the globalization of Japan did not start at the end of the 20th century, then when did it begin? In this presentation, I would like to rethink the process of the internationalization or globalization of modern Japan in the context of international telecommunications.

Key words:

international telecommunications; globalization; submarine cable; Japan; Meiji Restoration

Space and Identity in German Regional Broadcasts and Locative Media

Tilo Felgenhauer, Jena

University of Jena, Institute of Geography, Germany, tilo.felgenhauer@uni-jena.de

Abstract

In contemporary societies the quest for identity and community appears to be a crucial part of both individual action and public communication. Especially, defining the self and others by referring to spatial concepts (such as place, region, nation) is a pattern deeply embedded in language, discourse, and everyday practice. In particular, media content reflects the manifold practices of spatial reference (orally and visually). Furthermore, in some cases it reveals complex political top-down-strategies of regional identity formation.

In order to show different patterns involved in the process of the formation of the region and its identity, three German examples of Brandenburg, Bavaria and Mitteldeutschland are introduced and discussed. Recurring motifs in this regard are, for example, schemata of spatial containerization, narratives of a regional historic continuity (from ancient times to the present), metaphors of a regional “quasi-organic” unity, and implicit assumptions of a cultural homogeneity of the region.

The conclusion of the talk is directed towards current changes in the main channels of mass media communication. Digital media seem to rearrange the relationship of mediated communication and regional identities – most obvious in the sense of an emancipation of the individual from spatial and material constraints. At the same time, technological innovation broadens the range of opportunities to articulate a sense of belonging. Not only an increasing availability of regional media content, but also new locative (social) media may lead (or already have lead) to a ubiquitous presence of place in everyday action. Thus, the question arises, in which regards digital media promote traditional geographies of spatially defined communities instead of transcending them.

Key words:

Media; regionalism

The Use of Geographical Approaches and Geoinformational Instruments for the Assessment of Bioeconomy Resources

Rafikova Yu.Yu., Teterina N.V., Andreenko T.I.

Lomonosov Moscow State University, Faculty of Geography, Moscow, Russia, ju.rafikova@gmail.com

Abstract

Development of bioeconomy sector in Russia and other countries of the world presents new challenges for Geographical sciences, and especially for Cartography and Geoinformatics. One of the most promising and rapidly developing areas of bioeconomy is bioenergy. The work describes the problem of methodological framework lack for assessing bioenergy resources. The authors developed new technique of the bioeconomy potential regional assessment, based on the creation of a database and a series of maps of the gross resources, technical capacity, as well as maps of geographical factors influencing the use of the resource. During the study we analyzed the bioenergy resource potential for the territory of pilot region in the Russian Federation. The conclusions were based on the collected statistical data, mapping. analysis of resources and factors spatial distribution and evaluation of their relationship. Designed recommendations for the development of the bioenergy field in the pilot region are based on interdisciplinary approaches, including great value of ecological and environmental aspects. (This work was supported by RFBR project №14-06-00385 A.)

Virtual Space Utilization in the Digital Smes Villages: Implementation of Smart City and Region

Rachmawati, Rini

Department of Development Geography, Faculty of Geography, Universitas Gadjah Mada, Indonesia,

r_rachmawati@geo.ugm.ac.id

Abstract

Discussion of the virtual space has been done by many urban experts associated with the strengthening of the role of information and communication technology (ICT) in development. Among them is strengthening of activity space, economic space, movement space and interaction space (Rachmawati, 2014). Efforts to integrate the use of ICT in various aspects of urban and regional development is the embodiment of the implementation of the smart city and region concept, it has become a new trend of urbanization (Rachmawati, 2016). One of them is in developing smart economy and smart business through Digital SMEs Villages that is launched by Telkom. Furthermore, this research is aimed to; 1) Identify the existence of Digital SMEs Villages, 2) Identify Digital SMEs Villages activities through some cases, 3) Analyze the implications of the use of virtual space on the Digital SMEs Villages activities on the aspects of smart city and region development. Secondary data of this research is related to the existence of Digital SMEs Villages in Indonesia. Meanwhile primary data about case of implementation of Digital SMEs Villages has been conducted through observation and in-depth interview. The results showed that the existence of the Digital SMEs Villages can increase the use of virtual space, make smart economy and smart business opportunities, improve the ability of community in running business and develop advance SMEs. This has contributed to the achievement of the smart city and region.

Virtual Space; Smart City and Region; Digital SMEs Villages

Research on Urban Spatial Organization Mechanism in Information Era Based on Self-Organization Theory

Nina Liu

Zhejiang University, China, zjulnn@foxmail.com

Abstract

As a self-organizing system, the city has certain rules in the process of development. Self-organization leads the mechanism of urban function and space by the way of flow form, which makes influence on urban spatial movement and location selection. Flows are the main performance when self-organization works. The space structure of a city is the outcome of flows of various elements. Information technology has a profound impact on elements of cities, thus its spatial structure has non-traditional organizational mechanism and characteristics. This paper researched on urban organizational mechanism and the stain of structure under the function of information, the concept of “flows” in the self-organization theory as a starting point. The study suggest that the flows driven the process of re-location can be divided into “geographic flows” and “information flows”. “Geographical flows” have the sensitivity to geographical proximity and is the basic mechanism of urban survival and development. “Information flows” are not bound by time and space and is the key driver of urban global network development. “Geographical flows” and “information” flows effect space with “centripetal force” and “centrifugal force”, so that the process of re-location of urban functions present a complex motions. Grasping the new law of development has profound significance to organize urban space effectively.

Analysis of Spatial Characteristics of Urban Commerce in the Information Era: A Case Study of O2O E-commerce in Chengdu, China

SHI Kun-bo, Yang Yong-chun

College of Earth and Environmental Sciences, Lanzhou University, Lanzhou, 730000, P. R. China, shikb10@lzu.edu.cn

Abstract

The shopping behaviors of China's urban residents and spatial patterns of urban commerce have been influenced significantly by the e-commerce. However, there are few research achievements about the impacts of e-commerce on urban commerce spaces in China. The Online to Offline (O2O) e-commerce combines online stores and bricks-and-mortar stores, and significantly affects the urban commercial spatial pattern. We try to explore the O2O e-commerce bringing the spatial changes to urban commerce by taking the online group-buying in Chengdu as an example. The results show that: The spatial patterns of the O2O e-commerce market clearly tend to be consistent with location theory, which are driven mainly by the distribution of bricks-and-mortar stores and consumer scale, and spatial accessibility. O2O e-commerce is a result of urban commercial informatization, so the physical space has embeddedness effects on the O2O e-commerce, and O2O e-commerce guides the spatial development of urban commerce reversely. On the impacts of O2O e-commerce, the traditional location pattern of urban commerce is broken, and new spatial pattern appears, and there is a process of both agglomeration and scatter. Due to spatial difference of the impacts of time and space on urban commerce, there is a dual spatial structure of urban commerce, to wit, the location of bricks-and-mortar stores in urban center depends mainly on the time cost factor, and the outskirts depends mainly on the physical distance factor.

Key words:

Commercial geography; O2O e-commerce; information era; Chengdu

How ICT, Activities and Service Quality Impact High Speed Rail Travel Satisfaction: A Case Study of Shanghai-Nanjing High Speed Rail

Tang J, Zhen F

School of Architecture and Urban Planning, Nanjing University, Nanjing, 210093, P. R. China, zhenfeng@nju.edu.cn

Abstract

Previous researches indicate that service quality has a great impact on high speed rail (HSR) travel satisfaction. However, with the development of information and communication technology (ICT), using electronic devices to undertake activities, such as work, leisure and others, has become a widespread phenomenon. Then this study tries to demonstrate that satisfaction with HSR trip is impacted not only by service quality but also by what passengers do in this phase, especially undertaking activities related to ICT. So this study aims to investigate the factors and their extent impacting HSR travel satisfaction in information society, including service quality, activities and electronic devices. A survey of 500 HSR passengers is made at 6 cities, 13 main stations along Shanghai-Nanjing high speed rail line during the period from Jan 10, 2016 to Mar 31, 2016. The service quality of HSR is evaluated by 19 factors reflecting tangible, reliability, responsiveness and other aspects. Activities in HSR can be divided into 3 types: leisure, work and others. And electronic devices include mobile phone, pad, computer, reading devices, audio-visual devices, game devices and so on. This study may draw the conclusion that ICT has greater influence on HSR travel satisfaction, and then better service assisting ICT activities should be added or improved in HSR. This study has a new insight into HSR travel satisfaction from a new perspective, and makes a contribution to improve HSR travel satisfaction through ICT methods.

Key words:

high speed rail; travel satisfaction; impact factors; ICT; activities; service quality

The Application of ICTs in Airspace Configuration and Time alternative mechanisms

Zi Lu, Xinru Du

Hebei Normal University, China, luzi1960@126.com

Abstract

Facing the problems between the air traffic demand and airspace utilization, it's a challenging research topic to optimize airspace configuration in the field between geography and airspace. So there is an urgent demand for new information and communication technologies. The paper is on the basis of overview the information constitution and support of NextGen and the study of the development of technique of airspace collaborative decision-makings to confirm the new features based on ICTs, promoting the study of the interaction between time and space under the social network. It will support the national flexible airspace management (FAM), releasing airspace capacity and improving the utilization of airspace to reduce flight delays and airspace changes. The paper also reveals three mechanisms: dynamic mechanism – from dynamic airspace configuration (DAC) to dynamic airspace sectorization (DAS) and then shift to 3D-DAS and 4D-DAS; division and evaluation mechanism – in condition of risky weather (RW) by using real-time data input and routes output to get the ranks of the routs in the buffer areas; interaction mechanism – cross-border management and real-time information- interaction between countries and authorities. The results not only open up a completely new airspace research field of geography, also lead the world in making full use of airspace research and replace the existing national airspace configuration and management which rely on human and non-dynamic basic form.

Key words:

Information and communication technologies; Social network; Time alternative mechanisms; Airspace

The Internet Use by University Students: Case in Japan

Takashi WADA, Wenqi HU

Prefectural University of Hiroshima, Hiroshima, Japan, t-wada1969@pu-hiroshima.ac.jp

Abstract

The purpose of this study is to clarify differences of the Internet use by university students living in urban area and those living in rural area in Japan. A questionnaire survey was conducted for 81 students who go to Hiroshima campus at urban area and 127 students who go to Shobara campus at rural area. The both students often use the Internet for content viewing (music, video, game), e-shopping and communication (LINE, Twitter, email, Facebook). They communicate through the Internet, mainly with their family members, their friends from elementary school or high school and their friends of the university to maintain and strengthen the ties with them. The students in the rural campus, who live alone away from their hometown, usually communicate with their family members and their old friends through the Internet and meet with them in real space once or twice a year. On the other hand, the students in the urban campus, who have been living there with their family members for many years, usually communicate with their old friends through the Internet and but they hardly meet with the old friends in real space because they think they can do it at any time. And the students in the rural campus tend to communicate only with the friends of the campus through the Internet. On the other hand, the students in the urban campus tend to communicate not only with the friends of the campus but also with the acquaintance outside the campus.

Key words:

the Internet; university student; social network; urban area; rural area

The Role of the Internet for Domestic Migration Policies by Peripheral Areas: A Case Study of Japanese Local Municipalities

Kenji HASHIMOTO

Waseda University, Tokyo, Japan, hashimoto@waseda.jp

Abstract

The peripheral municipalities in Japan are confronted with the challenge of long-standing depopulation in the decades after 1960s. What was particularly serious was the high proportion of decline rate among the youth. The biggest reason of such depopulation is a drift of population from peripheral areas to cities caused by the regional gaps of education and employment between cities and rural areas.

In late years, some peripheral municipalities in Japan prepare various support programs for the people who moved from cities, and are encouraging a migration to peripheral areas. This study reveals the role that the Internet achieves in such domestic emigration policy through the analysis of the websites of the local municipalities and the questionnaire survey to them.

Key words:

depopulation; peripheral area; local municipality; domestic emigration; Internet

Thriving Communities Due to E-Health Services

Andreas KOCH

University of Salzburg, Department of Geography and Geology, 5020 Salzburg, Austria, andreas.koch@sbg.ac.at

Abstract

ICT in general and e-health technologies in particular contribute to strengthen geographically remote regions economically and socially. They offer job opportunities in highly qualified labor markets and ensure thriving living conditions by substituting physically present structures and services which are lost otherwise due to a lack of an economic sustainable demand. Socially they provide local communities with basic needs on social (infra-)structures. Like almost any contemporary technology e-health has the potential to decentralize medical services toward the (skilled) individuals. Moreover, it enhances confidence in care services of regions which have to struggle with a decline of tangible infrastructures due to demographic shrinkage. E-health technologies can also support technological progress in general, e.g., the wide use of adapted apps. Apart from having broadband access questions of competence and relevance are therefore critical for a successful implementation of e-health.

This theoretical frame is applied to an empirical case study in the northern Swedish municipality of Storuman, a peripheral and sparsely populated region with approximately 6.000 inhabitants living in an area of 8.300 km². Storuman town is equipped with a hospital that has broadband access to the specialized hospitals in Umeå and Luleå. Their tele-diagnosis facilities are widely appreciated and help people living a self-determined life though living remotely to bigger centers. Doctors and patients do improve their knowledge and skills through the use of sophisticated devices, the danger of a spatial concentration of tangible medical services due to technological replacements seem to play a less crucial role.

Key words:

health technologies; social services and quality of life; remote areas; demographic shrinkage

Evaluation on principal components analysis of urban human living environment quality of LiaoNing Province

Shan YongJie, Zhao HuaYan

College of Geographical sciences, shanxi normal university, linfen, shanxi 041004, china, shayj2005@qq.com

Abstract

In order to fully understand and quickly improve the living environment of city of Liaoning Province, this paper adopts the statistical data in 2013, profits from the domestic and foreign research results, build a suitable living environment evaluation index system of liaoning province, from the level of economic development, infrastructure, public services, residents' living standard, the ecological environment, social stability, harmony and six aspects to select indicators for 39. Using SPSS software processing data, using principal component analysis method to evaluate, and according to the grade of evaluation results was carried out on the living environment quality in liaoning province, and puts forward countermeasures according to the restrictive factors of each city. High levels of living environment of the city should step up to the ecological environment, social stability, harmony and infrastructure and investment; Higher level should be paid attention to living environment of urban transformation of the mode of economic growth and optimize the industrial structure; Low, low level living environment of the city should pay attention to make full use of its coastal geographical advantages and by improving the traffic situation, to strengthen the economic exchanges and cooperation with the surrounding region, promote the development of economy.

Key words:

urban living environment; Index system; Principal component analysis; Liaoning province

Impacts of Internet Public Activities on Community Public Life - A Case Study of Nanjing

Enyu CHANG, Feng ZHEN

Department of Architecture and Urban Planning, Nanjing University, Nanjing, 210009, P.R.China, choloncey@126.com

Abstract

From the initial period of the network society, the relationship between internet usage and community public life has received much attention. With the popularizing of mobile internet and social networking, people are more willing to sharing and perusing satisfaction via using the Internet. Under this new context, how will internet public activities interfere with the community public life? From two levels of specific internet activities and Internet psychological activities, in this article, we adopt Nanjing China as a case study, and investigate the relationship between the publicity of internet usage and the community public life, using 2SLS regression, which improve the lack of Internet psychology aspect in previous studies. We also propose some suggestions for promoting the engagement of community public life in the information era.

Key words:

Innovative City and Technology Clusters: Helsinki Metropolitan Area as a Growth Platform

Inkinen, T.

University of Helsinki, Department of Geosciences and Geography, 00014-Helsinki, Finland, tommi.inkinen@helsinki.fi

Abstract

The change and renovation of urban form has been variously depicted as one of the key challenges in growing cities. Technology has been deemed as one of the enablers of change. Developments in wireless information technologies have affected information distribution on all geographical scales from global satellite transmission to local indoor networks. The notion of the “shrinking of the world” and “time-space compression”, as discussed decades ago in analyses of information networks is as fundamental as ever. Cities, whether thought as physical spaces or administrative structures, have been influenced by the growing demands, and also potential, brought about by technological progress. New solutions providing location-based services (LBS) have been seen as one of the major game changers. The question focuses on enabling direct or indirect knowledge transfer and flows of material or immaterial resources. This paper will reflect on selected theories and typologies used in the analysis of innovative cities and it will address the theories in accordance with interpretations. The data is collected from the Helsinki Metropolitan Area (HMA) representing the most important urban cluster in Finland (Helsinki, Espoo and Vantaa). The paper considers theoretical propositions in the light of the knowledge bases framework and provides a reflective discussion on the current condition of innovative city.

Innovation; city; urban design; urban planning; urban technology; economy

Smart City in China: a New Agenda for Urbanization

Feng Zhen

Nanjing University, Nanjing, 210093, P. R. China, zhenfeng@nju.edu.cn

Abstract

Smart cities, which apply the new generation information technology in all of urban construction, could promote the efficiency of urban infrastructure and services greatly. They also support the sustainable development of economy and encourage participatory governance through the elaboration management of nature resource, social capital and intellectual capital, so as to realize the high quality of urban life. In China, smart cities and the development of new urbanization have become the national strategies. The construction of smart cities is also thought as a proposed method to accelerate new urbanization, and the way to sustainable development. Firstly, the paper discusses the implication of smart city for Chinese new urbanization. Secondly, the paper analyzes the Smart City Program in Urban China, including smart city strategies initiative, evaluating indicator system, and major project for smart city construction. Thirdly, different development modes for Chinese smart city are explored with developed countries. Meanwhile, problems facing to Chinese smart city construction are also emphasized. Lastly, the paper gives the relative policy suggestions to smart city planning and construction combined with new urbanization strategy.

Smart city; new urbanization; China

The Impact of ICTs on Space-Time Use and Urban Quality of Life

Ira V.

Institute of Geography of the Slovak Academy of Sciences, Bratislava, 814 73, Slovakia, geogira@savba.sk

Abstract

A strong renewed interest in time-geography results in substantial recent theoretical extension of its approaches and concepts. The complex of ways in which the information and communication technologies (ICTs) are becoming an integral part of today's society is fascinating and is incorporated into a relatively broad spectrum of the types of research. An emphasis on space-time as being the key understanding the information and communication technology-age phenomena is identifiable in geographical research. Empirical findings indicate the multiple roles that ICTs already play in all aspects of urban (quality of) life. The aim of our contribution is to present a time-geographical approach that enables to explore how people's use of time and urban space is affected by the changing access to the information a communication technologies and to examine the impact of ICTs on everyday lives of citizens in Bratislava (Slovakia) through the integration of space-time budget data and qualitative interviews based on two surveys conducted in the last decade.

A Research on China's High Technology Industry: Spatio-Temporal Characteristics and Driving Mechanism

Li Bingxin

Liaoning Normal University of China, Dalian, 116029, 1101460925@qq.com

Abstract

High technology industry is important department of national economy and strategic leading industry. It is main power that promotes scientific and technological innovation and technological progress. The development level of high technology industry and international status represent national scientific and technological strength and potential growth in the future.

Based on the level cities as research unit and the relevant data of high technology from 1995 to 2013, measured the agglomeration degree of the high technology industry by Static agglomeration index and Dynamic cluster index, combined with Arc Gis spatial analysis software, this paper analyses the space-time evolution and driving mechanism of high technology industry. The results show that: (1) in terms of time, the output, main business income such aspects of high technology industry present high speed growth. (2) In terms of space, high technology industry exist regional differences and agglomeration trend. It mainly distributed in eastern region, the central and western regions are relatively backward. (3) According to spatial layout of high technology industry, science and technology and the mobility of human resources, government policies, infrastructure, risk investment and environment are main influencing factors of high technology industry agglomeration.

Key words:

high technology industry; spatio-temporal characteristics; driving mechanism; agglomeration index; Gis

Implementation of Smart Cities in the Developing Countries

Shahryar Azhrianfar, Ali Noori Kermani

Islamic Azad University Central Tehran Branch, Iran, Shahryar.azharianfar@gmail.com

Assistant Professor of Islamic Azad University Central Tehran Branch, Iran, ali.noori_kermani@iauctb.ac.ir

Abstract

Developing smart cities, either in the developed or in the developing counties, will help in convergence and interaction between urban agents and will result in sustainability and improvement of citizens' life quality through a long-term plan. Cities in the Third World countries are entangled with several problems such as poverty, various types of pollution, economic downturn, immigration, and environment degradation, thus technology potential based solutions can help them to improve their cities. Among others, several models have been suggested for launching Smart cities which seem proper with the environmental capacities of the developed countries. Thus, the necessity of preparing a framework proper with the special condition of the developing countries can help them to deal with some problem they face with. For this study, poverty, education, infrastructure, healthcare facilities, an integrated governmental system, enabling and promoting public participation, preventing environmental degradation and eventually improving life quality are among the most important and key factors; thus, it tries to offer propositions to improve and solve the problems through information technology in the framework of Smart city projects.

A Study on Small Firms' Growth in Ethnic Tourism Village: Sustainable Livelihood Perspectives

Tong Wen¹, Hua Guo

¹Department of Tourism Management, Management School, Jinan University, Guangzhou, China

²School of Tourism Management, South China Normal University, Guangzhou, China

Abstract

Previous research works including Butler's tourism destination life-cycle theory have revealed that in the rapid development period of a tourism district, external capital would flood in and displace local residents as the leading force of tourism development, thereby triggering some problems and conflicts. Meanwhile, some new phenomena were observed from our case study of Longji, Guilin, Guangxi, a rural tourism village mainly inhabited by ethnic minorities of Zhuang. Many migrant young workers in cities are returning to their hometown Longji, starting their own small businesses. Taking tourism as an important livelihood strategy, these young people has showed more significant abilities in entrepreneurial skills and competence in comparison to the elder generation, and has gradually been a new player in the tourism industry. This has challenged the dominant position of external capital and, to some extent, reconstructed the tourism development pattern of this district which is believed of great importance to local communities' autonomous development. This paper aims to figure out why these migrant young workers could be better in entrepreneurial competence and its impacts on the growth of local small tourism firms from the perspective of sustainable livelihood(SL).

Based on field investigation in Longji, clustered random sampling was first applied for purposive selection of interviewees and 30 semi-structured in-depth interviews were conducted. The interviews particularly focused on these sample's livelihood strategies, involvement condition in tourism, their capital assets.

Small Firms' Growth; Small tourism business; Sustainable Livelihood

An Investigation of Establishing the Indicators on Indigenous Subjectivity

Ecotourism of the Atayal People in Taiwan

Yin-Jen Chen, Su-Hsin Lee, Jui-Hsiang Lu

Assistant Professor, Graduate School of Earth Science, Chinese Culture University, ecoinns@gmail.com

Professor, Department of Geography, Taiwan Normal University

Associate Professor, Department of Tourism and Leisure Management, Vanung University

Abstract

Indigenous communities in Taiwan have risen of an upsurge of ecotourism development over the past two decades; ecotourism tends to be used to relive nature, natural, cultural, and environmental education, and create the opportunity to activate economic development of homelands. Although ecotourism provides a more proactive and positive tourism pattern to tribes, what indigenous communities care about are those indigenous cultures and their subjectivities. This study is focusing on establishing the indicators on indigenous subjectivity ecotourism of the Atayal people in Taiwan. The researchers applied Delphi method to collect the opinions from tribal elders, government authority, and local organizations. After three rounds of the Delphi method, nine categories were found: community empowerment, subjectivity, traditional culture, participation, self-identity, communication, nature-based culture, conservation, and commerce; in addition, 38 factors were included within the above nine categories. Therefore, the development of ecotourism in indigenous community must be planned with the subjectivity, broadening the participation, communication and cultural identity to enhance the power of tourism industry in traditional communities in order to lead a bottom-up approach to drive forward the sustainable development of the indigenous communities.

Conflict and Coexistence of Tourism Livelihood and Traditional Livelihood in Upland Ethnic Community, Southwest China

Jing HU, Yajuan LI

College of Urban and Environmental Sciences, Central China Normal University, Wuhan Branch of Chinese Tourism Academy, Wuhan, 430079, P.R. China, yajuan.li@mail.ccnu.edu.cn

Abstract

Rice-duck-fish ecosystem, as the traditional and typical agriculture mode, created by upland minorities in southwest China has been selected as the global agricultural heritage, which is a representative coexistence of human and nature in Southwest China (Sun 2013). However, since the late 1970s, this traditional agricultural ecosystem has faced the threat of vanishing (Cui 2009). Focusing on three case-study villages in Qiandongnan Hmong and Dong Autonomous Prefecture, Guizhou Province, we explore the selection of livelihood approaches under the background of urbanization and the impact of tourism development and population mobility on traditional livelihoods. Specifically, we compare the livelihoods of villagers from one village without tourism to date (but slated for tourism development in the near future); one with a 'medium' level of tourism; and one where tourism is in full force. Our analysis of the transitional characteristics of these communities with different level of non-agricultural activities focuses on selection of rice, usage of agricultural tools and facilities as well as raising process of duck and fish to shed light on the conflicts and coexistence of livelihood approaches under different stresses and demands from the socio-economic context. We hope that our findings may provide support for sustainable tourism livelihood and livelihood diversification in upland minority region in the future.

rice-duck-fish ecosystem; tourism livelihood; traditional livelihood; conflicts; coexistence

Does Tourism Development Reduce Poverty? On Achieving Balanced Stakeholder Relationships

Xianrong LUO, Jigang BAO

Sun Yat-sen University, China, luoxianr_sysu@163.com

abstract

It seems worldly accepted that tourism development can reduce poverty. External driving forces, such as government, enterprises and of course tourists, were considered important for tourism to reduce poverty at destinations. However, the issue how they should work and collaborate to achieve positive outcomes for the poor remains mostly unclear. This study therefore adopts a comparative research design and investigates how the key stakeholders, including government, the private sector, the tourist market and locals (including the poor), work together to results in different outcomes. The study is conducted in China given that the country recently has made great achievement in the agenda for both poverty alleviation and tourism development. Three cases are included, respectively Chongdu village in Henan, Li village in Guangxi and Liupan village in Hainan, in which the stakeholders played different roles yet resulted in either different or similar outcomes for the poor. The study primarily found that when the market plays a leading role, tourism can well benefit the poor. Yet, with the locals' ego-orientation, it may also cause the public environment unattended. If the tourism development is mainly driven by government or/and the private sector, it can effectively benefit the poor only if poverty alleviation is made one of the important purposes. By clarifying the work of the key driving forces, this study aims to enrich the understandings of the tourism-poverty nexus, and provide implications for further tourism practices in less developed areas.

tourism development;poverty alleviation;stakeholder;the poor

How Tourism Community Empowerment Influences Resident Attitude? Moderating Role of Life Cycle Perception

Sha(Elsa) Zhu, Li(tammy) Tao

Capital Normal University, Beijing, 100045, P.R.China, cici6629@163.com

Abstract

Empowerment evolved from sociology concept has recently measured by researches from tourism area to explain why resident support for tourism development. But how empowerment influences attitude of resident to tourism is still unclear since significant findings has examined in quantifying empowerment. To solve this question will require diversity evidences and specific perspectives to explain the complexity system of tourism community. Since majority of case studies come from developed countries, it is necessary to fill this gap by evidences from developing countries. As some experts recommend, on the other hand, the life cycle of destination should considerate to explore the relationship between tourism community empowerment and residents attitudes. In recognizing of those two gaps, this study was promote tourism community empowerment to further step by combining Chinese tourism community evidence and moderating role of life cycle perception.

Method

Unstructured interviews and questionnaires were both administered to residents within countryside of Beijing, China(Fangshan District, Yanqing District, Mentougou District, Pinggu District, Miyun District and Huanrou District). All of sample villages oriented by tourism industry were awarded "Folk tourism village" by Beijing Tourism Development Committee which is government organization devoting to Beijing tourism development.

Unstructured interviews were conducted firstly among resident to accurate the tourism scale of empowerment in Chinese tourism community context before collecting questionnaire data from those who engaging in tourism business. 530 questionnaires were distributed and 496 questionnaires were collected from June 1st to July 26, 2016. All of data were input to SPSS software and then analyzed by SEM. Confirmation Factor Analysis was firstly employed to examine the validity of construct and model fit, and Path analysis and regression analysis were also used to finally test the hypothesis mentioned.

Findings

The CFA revealed good model fit indicator: $\chi^2(205)=592.516(P=0.000)$, GFI=0.906, AGFI=0.873, RMSEA=0.62,

Based upon RMSEA being less than 0.08 and NFI and CFI was around 0.90, it was concluded the model's fit was good and above the standard cut off points. The 14 proposed hypotheses were tested and seven of them were supported by SEM model. It is also highlight that economic, psychological, social and political empowerment has different influence on resident attitude to support tourism in perspective of their different life cycle perception.

Conclusion

Three reasons could be concluded: Firstly, It is common that political empowerment has little opposite effect in resident attitude to support tourism, which is usually happened in centralized developing countries. Although community power is mentioned on government policies, resident still have no invitation to participate in tourism planning or making tourism decision. Secondly, economy empowerment seems double-edged sword for tourism community in Chinese countryside community due to the tradition concept of "home" meaning for Chinese peasants. They do eagerly desire to change their state by benefitting from tourism industry but, on the other hand, they also have psychological reject for the rich-poor gaps happening on their communities. It is deeply revealed that the self-assessment of Chinese peasants is mainly based on the community they living in, as well as social relationship embedded in this community.

Contribution

This study is conducted tourism community empowerment to the further step through the life cycle theory. On the other hands, it is fill the evidence from developing countries and explain that empowerment play different role in tourism community through different international context.

Key Words:

Tourism Community; Resident Attitude; Empowerment; Life cycle Perception

Preservation of Local Communities' Identity in Italy. The Role of University Research

Corinto G.L., Stara F.

Department of Education, Cultural Heritage and Tourism, University of Macerata, Macerata 62100, Italy,
gianluigi.corinto@unimc.it; f.stara@unimc.it

Abstract

In regions of the so called Third Italy, economy has been based on industrial manufacturing, spread in myriads of small and medium sized units (SMEs), within industrial districts scattered in rural areas. Local culture of both entrepreneurs and laborers still maintains distinctive know-how, skills and craft abilities, descending from farming culture fit to be used in production of consumption goods, such as shoes, furniture, household appliances. Incumbent competitors due to globalization put many SMEs in crisis, claiming for designing new strategies both for singular enterprises and territories. National and local policymakers envisaged tourism as leverage capable of giving credible alternatives for reorienting local community economies. Universities has been called to provide education and governance. The paper reports the ten-years lasting experience of the authors in teaching and researching on tourism within a small University immersed in rural-industrial region located in Central Italy. We aim at showing how research and teaching on tourism (and rural tourism) can help local communities to foster traditional skills in reorienting local economy without losing identities, and on the contrary, empowering traditional know-hows. Results show that Universities can effectively participate the governance process designed by national and local public agencies—the National Ministry of Research and the Regions—in helping territories to find new visions for local development. Time horizon is clearly cast in the medium-long period, due to the slow adaptation of entrepreneurial culture to be implemented in the tourism sector. Benefits can be spread in all regions where students come from.

Profile and determinants of Pro-poor Tourism Community residents' sense of place in Qinling & Daba Mountain Area of China: Based on the investigation of priority Pro-poor Tourism Community in Ankang City of Shaanxi Province, China

Junqing Hao^{1,2}, Jie Li², Ying Li², Yang Li², Dapeng Yi²

¹ Xi'an University of Finance and Economics, Xi'an, 710100, P. R. China, hhjq2002@163.com

² Xi'an Jiaotong University of China, Xi'an, 710049, P. R. China, jieli@xjtu.edu.cn

Abstract

Pro-poor Tourism Community is a major practice way to achieve poverty reduction and sustainable development in Qinling & Daba Mountain Area (Qin-Ba mountain area) of China. Sense of place, including perception attitude and perception behaviors, is a emotional relation degree between residents and their local place, and also a special Man-land relationship. So, we focus on residents' sense of place in Qin-Ba mountain area, analyze profile and determinants of their sense of place, then supply suggestions for the development of Pro-poor Tourism community.

Firstly, we constructed the theoretical model of residents' sense of place by two indexes: tourism participation willingness as the index of perception attitude and tourism participation ways as the index of perception behaviors, and the study framework of determinants with three perception indexes (residents' perception for poverty reduction policies, tour development corporations and environment protection).

Second, based on the investigation 187 residents of 5 priority towns and 9 priority villages in Hanbin county and Ningshan county of Ankang city by semi-structural questionnaires and interviews, we analyzed the different profile of residents' perception attitude and perception behaviors in different Pro-poor Tourism community (the exploration community, the involvement community and the development community).

Third, using multiple regression analysis, we analyzed the correction degree between residents' sense of place and residents' three above perception indexes, and then resulted respectively the major perception index for the three above communities. Therefore, we got the different determinant in different development stage of Pro-poor Tourism community in Qin-Ba mountain area.

Finally, on the view of poverty reduction policies, tour development corporations and environment protection, we supply suggestions for the construction of Pro-poor Tourism community in Qin-Ba mountain area.

Keywords: Sense of Place; Pro-poor Tourism community; Poverty reduction; perception attitude and behaviors

Research on Minority Community Participation in Tourism Based on Tourist Perspective -A Case Study of Xiao Zhuang Village of Huzhu County in Qinghai

yun ma huang

Qinghai Normal University, China, 904972986@qq.com

Abstract

Xiao Zhuang village of huzhu county is typical community of minority participation in tourism in Qinghai province. select it as the research object; make a survey of questionnaire and tourists in-depth interviews; obtain first-hand information; use SPSS statistical analysis method and studies the tourists perspective the village. The result shows that the tourist overall satisfaction is higher; Part of the index gap between expectation and reality; 30 second-grade index survey in four- quadrant diagram is divided into advantage area, improve area, opportunity area and maintain area. From the survey of 7 first-grade index tourists evaluation from high to low is traffic convenience, diet culture awareness, tourism environment, the tourism management of the village, authenticity of minority culture and tourism atmosphere. At last the paper put forward to related suggestions for further improving Xiao zhuang community participation tourism.

Key words:

Sacred and Profane: Tourism, Religious Commodification and the Politics of Place in a Tibetan Bon Monastery in Jiuzhaigou National Park, China

Nan, Y

Sichuan University, Chengdu, 610065, P. R. China, yvonnenan@qq.com

Abstract

There are different kinds of assumptions about Tibetan people's religious life in China. However, limited research has been focusing on the ways in which Tibetan institutional religion exists in contemporary marketised and modernising China. This paper seeks to explore this in a time when religion has been increasingly directly related to market economy worldwide, which is especially evident in China by the rising tourism-induced religious commodification. However, this prominent phenomenon has been greatly ignored or simply taken-for-granted by academics. A Tibetan Bon monastery in Jiuzhaigou National Park, a mature tourist destination was chosen as an empirical case study. I had stayed in Jiuzhaigou for about 8 months from 2009-2012 conducting in-depth interview and participant observation. 65 local Tibetans and 25 monks from older, middle and young generation, and 7 government officials were interviewed.

This paper reveals the ways in which tourism has reshaped the traditional dynamics of institutional Tibetan religion through religious commodification. As a traditionally isolated and sacred place, Zharu Monastery has been given a new quality, a salable tourist commodity with monetary value. Toward this, government and local people have different understandings and attitudes. First of all, rather than determined and uniformed attitudes, both the central and local government actually have ambiguous and ambivalent views toward religious commodification. On the one hand, they want to use tourism to realise economic development, on the other hand they do not want to over-publicise religion which is seen a potential threat to national integration. Here economic development and national integration, as Chinese state's two major principles of ethnic policies, are conflicting when practiced in local scale. Moreover, governments generally tend to consider the monastery as tourist product, minimising its sacredness. For the local people, monastery is more considered as a holy space. Commodification diminishes the sacredness which was taken as the core of the monastery's meaning in their lives.

Key words:

Religious commodification; Ethnic politics; religious politics; Tibet; China; tourism

The influence mechanism of community participation in tourism development of ancient towns

Hu Huan, Zhang Jinhe, Sun Jinkun, Tang Guorong, Zhang Yu

Nanjing University, Nanjing, 210023, P.R. China, hu66huan@163.com

Abstract

Community participation in tourism development plays an important role in sustainable development of tourism destination, and it is also one of the research focuses of domestic and foreign scholars. This paper builds a structural equation model reflecting influences on community participation using four structural variables based on the sustainable development theory, social exchange theory and behavioural geography. Then choose Zhouzhuang, Tongli, Shaobo and Huangqiao to conduct an empirical study. Results of this study are listed as follows: (1) "Participating ability" and "support degree" have a direct positive impact on tourism "participating behavior", in which the former is a main factor. While "the sense of place" and "perception" have an indirect positive impact on "participating behavior". (2) It is demonstrated that in the development stage, the technology and fund is the main factor among the ability of participation. And with the development of tourism industry, access to tourism policy becomes the main limiting factor. (3) "Place identity" exact a much stronger influence on "support degree" in the development stage, While in the consolidation stage, the "support degree" is influenced by "place identity" and "place dependent" together. This paper innovates in the perspective, scale and method. And the structural equation model reflecting influences on community participation is proposed and ancient towns in different life cycles are compared, to provide more effective scientific data for sustainable development in tourism destination.

Key Words:

Community participation in tourism development, Influencing mechanism, Tourism destination life cycle, Structural equation model, Ancient town

The Influence of Tourism Involvement on Tourist Authenticity Perception of Dance Performances of the Zang and Qiang Nationality

Mao L, Zhang J

Department of Land Resources and Tourism Geography, Nanjing University, Nanjing, 210023, P. R. China,

goodmorning8808@126.com

Abstract

The design of cultural tourism attractions means culture presentation of the destination. To some extent, it will be a process of local culture reproduction with the interaction between tourists and local community according to the theory of tourism gaze. How do tourists understand the reproduced culture? Does tourism involvement degree differences significantly influence tourist experience and satisfaction? This paper takes the song and dance performances of the Zang and Qiang nationality of Jiuzhaigou area for example, investigates tourism involvement and tourists' authenticity perception of performance with the method of questionnaire survey, and analyses how tourism involvement influences tourists' authenticity perception. The results show that: tourism involvement degrees among tourists with different ages, nationalities and education backgrounds are significantly different; Tourism involvement degree and authenticity perception has certain positive correlation; Tourism involvement degree differences can explain different tourists' perception, experience and satisfaction to some extent. The research conclusions of this paper give advice to the song and dance performance of national minority: strengthen product image and tourist cognition through much more publicity and marketing work to improve tourist satisfaction and revisit intention.

Key words:

tourism involvement; authenticity perception; song and dance performance; Jiuzhaigou

Tourism Management through Community Participation in Munhang settlement, Namhae Island, Korea

Okhee JUNG

Collage of Tourism, Rikkyo University, Japan, jungokhee@rikkyo.ac.jp

Abstract

Currently, recreation in rural areas is popular among urban Korean visitors; types of recreation include agriculture, fisheries, and rural life experiences. The Korean government has conducted the tourism experience village project since 2000 to promote regional development through experience tourism in rural regions, especially Munhang settlement, Namhae Island, which is famous for a national policy project pertaining to the tourism experience. Namhae Island is in a coastal area near the southern tip of Korea and Munhang settlement is in the north of the island. This research clarifies how community participation is involved in rural tourism. I gathered data through an attitude survey administered to the experience village committee and residents.

The residents of Munhang settlement make a living through agriculture and fishery. Munhang settlement was an experience village initiated in 2002 and recreated on the tidal flat. The settlement received 60,000 domestic tourists in 2014. The experience village committee demands resident participation for the project and rewards residents who participate as agriculture, fisheries, and parking management instructors. Moreover, the committee distributes a part of the business gains to all households; therefore, the project serves as a settlement community enterprise. Such a management system demanded business participation by residents and had a good effect on Munhang settlement tourism management.

Key words:

tourism experience village project; community participation; settlement community enterprise; attitude survey; Munhang settlement Namhae Island; Korea

Transferring Land Use Right in Rural Tourism Community: Questions of Sustainable Livelihood and Community Change

Wei L, Sun J X

School of Tourism Management, Sun Yat-sen University, Guangzhou, 510275, P. R. China, ppmoony@gmail.com

Abstract

In different development patterns of rural tourism, the state, market and local community have distinctive impacts on indigenous' social structure and cultural value. By conducting longitudinal quantities research in villages by Lugu Lake located at the border of Sichuan and Yunnan Province, this paper seeks to explore the community change in different stages of tourism development. We found that the villagers would reduce their risks of running and renovating family hotel through transferring usage rights to external investors, leading to breakdown of local moral economy on the one hand, but resulting in intensive conflicts in the land-use contract between local community and external investors on the other. In market-led development pattern, the conflicts also occur in contending the land use rights between local government, villagers and external investors. However, the land-renting based livelihood leads to rural degeneration including community deskilling, decrease of community cohesion and ecological degradation. The overwhelmingly inflowing capital has reinforced the excessive exploitation and disorder development. The Rectification project in illegal land use and building violations by government since 2013 undermined local family structure and social ties and thereby is largely unsuccessfully. In this sense, we claim that autonomous development is an important form of development ideas. In the stage of community-led tourism development, the knowledge and capability of community could be well considered. Indigenous social culture could also be preserved and inherited through Grassroots development. In community-centered development approach, it is also helpful to achieve the development which community defines and establish their sustainable livelihood.

Development and Evolution of the Yellow River Great Delta and the Positioning of the Hu-Kou、Tai.Shan and Lao.Shan Tourism Brand

Zheng Benxing¹, Cui Zhijiu², Shen Yongping¹

¹Cold and Arid Regions Environmental and Engineering Research Institute, Chinese Academy of Sciences, Lanzhou, 730000, China, zhengbenxing@126.com

²College of Urban and Environmental Sciences, Peking University, Beijing, 100871, China

Abstract

The Yellow River flows through the Sanmen Gorge into the sea and has developed its piedmont alluvial fan before 1.1Ma BP. During the last glaciation interstadial (30-40Ka B.P.) , the Yellow River flows the Jungong Gorge into the sea, linking the river head (Roige Basin etc.) and its lower reaches together. The northern part of Yellow River great delta plain reaches Tianjin near the Bohai and its east-southern part reaches North Jiangsu near the Yellow Sea. The fluctuation of the great delta scale is controlled by the sea level change. During the last glaciation maximum (20-15Ka B.P.) , the sea level was 150-160 m below the present sea level .The coastline of East China Sea was located at the outer margin of the continental shelf and the coastline is 600 km east of the mouth of Changjiang. About 6 ka years ago, during the Mid Holocene the sea level rise 3-4 m higher than the present sea level. The coastline was located near Tianjin, 80-100 km west of present Bo Hai Bay and the coastline was located at west Yancheng of the north Jiangsu, 60-70 km west of present Yellow Sea. The middle and lower reaches area of Yellow River is the cradleland of the Chinese civilization. There are many famous types of scenery of mountains and waters in this area. Such as Hu-Kou、Tai.Shan and Lao.Shan. Hence its tourism brand should be positioned on the superior humanistic geographic sceneries and special landscapes of geology and geomorphology , instead of focusing on so-called non-existent palaeoglacial remains.

Key words:

Yellow River great delta; non-existent palaeoglacial remains.

Impact of Tourism Development on Rural Households' Livelihoods in the Western Poor Areas: A Case of Ankang City, Shaanxi Province, China

Li Jie, Dang Peiying, Li Yang, Li Ying, Hao Junqing

Xi'an Jiaotong University of China, Xi'an, 710049, P. R. China, jieli@xjtu.edu.cn

Abstract

In recent years, rural tourism is growing rapidly in China, it plays an important role in alleviating poverty and improving rural Households' livelihood. Firstly, within the DFID sustainable livelihood analysis framework, the paper builds an operational system of livelihood analysis, and builds a framework about how rural tourism impact households' livelihoods. Secondly, we use the survey data in 9 rural communities, 5 towns in Ankang City, Shaanxi Province, China, where we adopted the method of semi-structured interviews and collected 187 valid rural household questionnaires during November 15-20, 2015. Some rural households had the income from tourism by running rural hotels, working in tourism-related companies, etc. The paper compares livelihood capitals and outcomes between households participating in tourism and non participating in tourism. Furthermore, the paper differentiates the households into five livelihood types: traditional farming, migrating work oriented, non-farming dependent, tourism participated and tourism oriented. We compare their social and demographic characteristics, livelihood capital of the five types households, and then analyzes the causes and formation of their livelihood. We have the following conclusions: Because of tourism, the rural households' livelihood has some changes. The proportion of traditional farming households and work-oriented households declined, households involving in tourism activities increased. The surveyed households' livelihood had improved after they participated in tourism activities. However, the households' livelihood capitals are still limited, and the livelihood capital differs greatly among the five types households.

Key words:

livelihood; sustainable livelihood framework; tourism; livelihood capital

Study on Modes of Community Participation in Tourism

Jin Yang

Nanjing Institute of Geography & Limnology, Chinese Academy of Sciences, China, jyang@niglas.ac.cn

Abstract

Community participation has long been a topic of research on tourism in countries outside China. It was not until 1990s, the concept of community participation began to be taken seriously in China. There have been more and more empirical studies concerning community participation in tourism. This paper makes a review of researches on the concept definition and modes of community participation. Based on diversified classification standards from different valuation models of citizen participation both home and abroad, focusing on the roles that local community, government and external capital play in community participation, this paper reduces practices of community participation in different cases to three modes, namely 'community participation which is dominated by outside forces', 'community-driven development without intervention of outside forces' and 'community-driven development with intervention of outside forces'. The most universal mode in China is the former one. Most practice still retains in the tokenism or induced community participation in which community members have chances to participate in project implementation but have no chance to enter decision-making process which would influence distribution of tourism interests and their everyday life. Community participation modes vary from place to place in participants, coordinating mechanism for profit distribution and so on. Due to higher level of local economic development and market development, and more control which local government takes of local development, most community participation in eastern China is under the impact of local government and external capital and therefore it has rich experience in game with local government and external capital. However, informal institution such as local tradition and village rule embedded in minority nationality regions can prevent the practice of community participation from free-riding behavior and properly coordinates and ingeniously solves the imbalance of members' interest distribution for taking part in tourism development and controls external investment.

Key words:

community participation; modes; tourism; China

The Construction of Residential Landscape in Tourism Destination Morphology Evolution of Tourism Localization—the Local Oral History Method Based on the Case of Hani Mushroom House

Guorong Tang, Jinghe Zhang

Department of Land Resources and Tourism Sciences Nanjing University, Nanjing, 210023, P. R. China,

To Analyze Why Indigenous Tribal Face such Demands and Difficulties After the Development of Indigenous Tribe Tourism

Kao, CHUNG-LIANG; Lin, YI-HSIEN; Chen, YUN-SEN

Da-Yeh University, Changhua, 51591, Taiwan, China, yhlin@mail.dyu.edu.tw

Abstract

Traditional territory is not only a space for daily life, but also acts an important role to promote tribe tourism as it contains the custom, history and culture of indigenous people. Many studies show that to preserve the autonomy of indigenous territory, the co-management system is necessary in tribe tourism promotion. Nowadays, however, there are many restrictions on indigenous people's autonomy on resources which make tribe tourism promotion difficult. We reviewed literatures from Smagnus Tribe and Mulumugi Tribe and examine their success and failure on tribes' tourism development. This study takes the Adiri Tribe of Rukai people in Pingtung as an example, trying to find out the problems of co-management system in tribe tourism. The results show that the main limitations are: land ownership, indigenous custom commitment, Forest Law, and Wildlife Conservation Act. In conclusion, we can refer Royal Declaration of Canada from its land and ethnic autonomous viewpoint, in return, to reduce the impact of regulations and foreign capitals; thus, establish a sound Tribal management mechanism.

Key words:

Co-management; Rukai; Indigenous Traditional Territory; Adiri Tribe

Using Ethnic Autonomous to Analysis Taiwanese Indigenous Rights in Traditional Territory

Kao, CHUNG-LIANG; Chen, YUN-SEN; Lin, YI-HSIEN

Kaohsiung Normal University, Kaohsiung, 80201, Taiwan, China, ecogeo@nknk.edu.tw

Abstract

Indigenous Traditional territory is a key part of Indigenous cultural heritage, as it is essential to Indigenous cultural identity. In 2007, the United Nations ensured and enhanced the basic human rights of Indigenous People under their resolution entitled "The United Nations Declaration on the Rights of Indigenous Peoples". In 2005, Taiwan's Legislative Yuan passed the Indigenous Basic Human Rights, then, in 2010, the proposal of indigenous ethnic autonomous law was sent to the Legislative for consideration, meaning to make for more comprehensive Indigenous rights. This study organizes how people fight for the indigenous people's autonomy of traditional territories in Canada, United States, New Zealand, and Australia. It also analyzes indigenous people's collective rights on traditional territories from the perspectives of human-environment relationships and national autonomy. The results can be the reference for further discussion on co-management of indigenous resources.

Key words:

national autonomy; Indigenous Traditional Territory Right; Indigenous Right Law; human-environment relationships

Arab Revolutions and their Impacts on Arabian Gulf States Tourism

Dr. Ibrahim Mohammed Ali Alfaggy

Associate Professor of Political Geography, Institute of Diplomatic Studies – Riyadh, Saudi Arabia, ifaggy@yahoo.com

Abstract

The end of 2010 witnessed the flare of Arab States Revolutions starting from Tunisia through Egypt, Libya, Syria, and Yemen, followed by Political, Economic, Social and Environmental turmoil, which, in turn, reflected on Arab States tourism sector in general and Arabian Gulf States in particular. In the previous period of Arab States revolutions, these countries have been a major destination for Arabian Gulf States tourists, which suffer, in turn, from weakness of tourism potential. Continuation of revolutions, without any military or political solution in the near future, tended Arabian Gulf tourists in search for a new tourist destination outside the Arabian Region. Arabian Gulf States tourists, looking for a new tourist destination in European or Asian countries, which have benefited from the dramatic changes in Arabian countries, where the flow of Arabian Gulf States tourists and their huge spending of money in Tourism Sector of these countries. By contrast, Arabian countries have witnessed a serious setback in their economic sectors, especially tourism sector that is a major source of income in many Arabian countries because of the political unrest.

The research aims to study the effects of the Arab States political and military conflicts, and its political and economic dimensions of tourism on Arabian Gulf States.

The Development of Tourism in Ukraine in Terms of Military Action

Liubitseva O., Kochetkova I.

Taras Shevchenko National University of Kyiv, Ukraine, loa13@ukr.net

Abstract

Ukraine's independence provided for the tourism industry regeneration, system was developed tourism education, formed tourism market. Tourism in Ukraine enjoys positive dynamics during the whole period as from 2000. Inbound flows grew by 3.6 and outbound ones by 1.6 times between 2000 and 2012. Thus, tour operators annually render their services to about 2-3 million foreign and some of 1 million domestic tourists travelling abroad together with 1-2 million domestic tourists and the almost the same number of sightseeing visitors. Recreation and tourism provides priority specialization for 10 of 27 administrative units of the country. For two years Ukraine living in military operations in the east. This, and the annexation of the Crimea, badly affected the tourism image of the country. Military action taking place on a small territory in the east, and the rest of life is peaceful. But the flow of tourists to Ukraine during this time decreased (in 1.7 times). The economic crisis has affected the Ukrainian travel abroad - these trips also decreased in 1.1 times. Develop discrete tourist destinations: the capital city of Kyiv, Lviv, Chernivtsi, Kharkov, Odesa and other regional centers. The biggest and most attractive destination is Kyiv where two thirds of flows are concentrated. Carpathians are popular due their springs and mud resorts as well and recently introduced festival and gastronomic tours. In the mountains themselves the ecologic, sports tourism is very widely exercised in summer time and skiing during the winter.

Key words:

tourism in Ukraine in terms of military action; tourist destinations

The Plaza De Toros MÉxico as an Urban Dark Tourism Space in Mexico City

Quintero-Venegas, G. J., López-López, A.

Geography Institute. National Autonomous University of Mexico, Mexico City, Mexico. england_km@hotmail.com

Abstract

The Plaza de Toros México, situated in Mexico City, is the world's largest bullring. Bullfighting is conceived as a Spanish heritage tradition and thus, the Plaza attracts thousands of tourists yearly during its two main seasons: the first one during April and May, the Novilladas, consisting of fights with bulls smaller than the official size; and the second one during September, the Big Season, with the majority of visitors. Furthermore, as part of the celebrations of the anniversary of the Plaza México, there is one small bullfight performed in February. Beyond the historical and cultural elements that bullfighting represents for Mexican society, visitors are motivated to go to the bullring to watch a show which sole purpose is to enjoy the abuse and violent death of an innocent living being; however, seldom, the bullfighter performing the abuse can get horned, maimed or eventually die during the show. Within the conceptualization of dark tourism, Sharpley and Stone (2009) define it as the type of tourism involving travel to places historically associated with death and tragedy. Nonetheless, their definition implies that only human lives are linked to this kind of tourism. The purpose of this work is to reveal why a tourist attraction involving non-human animal's deaths must be included in this definition as the generated tourist space profits from the death of the animal as an element of recreation.

Key words:

bullfighting; dark tourism; animal geographies

An assessment of the status of services in the rural areas of Bandar-e Anzali by means of taxometric techniques from the viewpoint of sustainable tourism

Mousapour Miandehi, P, Yahyapour Masrouri, M

Assistant Professor of Farhangian University, Guilan, Iran Dr_parimosapour@yahoo.com

Abstract

One of the most beautiful cities in Guilan Province, Iran is Bandar Anzali, which covers an area of 308.1 square kilometers and has a population of about 138004. It consists of two rural districts named Chaharfarizeh and Lijarkihassanrood and 28 villages. The present research is an assessment of the status of services in the rural areas of Bandar-e Anzali by means of taxometric techniques from the viewpoint of sustainable tourism. The statistical population includes rural households, people in charge of rural districts, and the tourists who paid a visit to this area. The independent variable is the villages of Bandar Anzali and the dependent variable is rural sustainable development tourism. This research aims to study the effects of services on the development of tourism and rural development. It also attempts to determine the degree of development and lack of progress in the study area in terms of the components of sustainable development. To achieve the goal, it makes use of the taxometric model for the development of villages. The villages were classified into three categories: 64.8%, 21.2%, 9.4% and 4.6% fell in levels 1-4, respectively. The data collected by questionnaires were analyzed using descriptive statistics and Chi- Square. It was proved that the hypothesis of improvement of welfare services could lead to the development of tourism was successfully confirmed by 99% certainty and with an SD of less than 0.01.

Balancing Commerce and Culture: On the Situation of Sami Tourism Entrepreneurs in Swedish Lapland

Dieter K. Müller

Department of Geography and Economic History, Umeå University, 90187 Umeå, Sweden, dieter.muller@umu.se

Abstract

Not least because of globalization indigenous tourism has become an important product within the cultural tourism sector and its occurrence has been explained both as a result of balancing economic decline in indigenous industries, and a way of creating understanding of the situation of indigenous peoples. Departing from the notion of an indigenous tourism system, it is argued that being a tourism entrepreneur tends to become a balancing act between commerce and the need to gain an income on the one hand, and safeguarding and presenting heritage on the other hand. Being indigenous supplies Sami tourism entrepreneurs of northern Sweden with a unique selling point, but leaves responsibility and interpretation and commodification of heritage to them. Hence they are formatively involved in producing and re-producing images of indigenous heritage but have to do so in a dissonant ethno-political context that affects what can be done and what not. This study presents results of a phone survey among all Sami tourism entrepreneurs in Sweden and demonstrates how above mentioned concerns are valued in relation to other threats and challenges faced by Sami entrepreneurs. The study reveals that Sami tourism is culturally embedded to a large degree. Concern for the indigenous culture is in fact the major driver for getting involved and stay within tourism despite lacking support also from the indigenous community itself.

Key words:

Indigenous tourism; Sami; entrepreneurs; culture; heritage; motivation

Construction and validation of a scale to measure individual heritage responsibility in World Heritage Sites

Peng Chen, Chaozhi Zhang

Sun Yat sen University, China

Abstract

Although the importance of the role responsibility in heritage tourism has begun to form an academic debate in the last decade, little effort has been invested in understanding the human being's general responsibility in World Heritage in a tourism destination and to develop a measurement scale to measure it. This study adopted the comprehensive procedures of measurement scale development recommended by prior studies. The scale development procedure yielded a five factor measurement scale with acceptable levels of reliability and validity. Five dimensions of heritage responsibility were labelled: respect, duty to remember, learning and education, accountability for self well-being, and care for the other.

Key words:

Responsibility, World Heritage site, Scale development, Heritage responsibility

Cultural Heritage of Ras Al Khaimah: An Unique or An Unified Vision in Reference to United Arab Emirates Heritage Policy?

Łukasiewicz N.

Faculty of Geography and Regional Studies, University of Warsaw, natalia.lukasiewicz@student.uw.edu.pl

Abstract

Ras Al Khaimah is the youngest of United Arab Emirates federation. The aim of the presented researches is to define the tourist potential of Ras al-Khaimah. The study will include identification of main tourist attractions in RAK emirate, both natural and cultural, including local events, festivals, historical sites, modern architecture. Maintained elements are in fact components of tangible and intangible cultural heritage. Although Ras Al Khaimah has old traditions it is hard to clarify its internal vision. This emirate is a part of Eastern Arabia historical region where two different cultures were met: hill tribes and seaside settlers. Dual tradition not only describes natural landscape but also refers to Ras Al Khaimah cultural heritage. On the other hand detailed analysis shows some specific manners and elements unique for this emirate. Another issue is the example of different types of architecture from the oldest to the present buildings, if and how national heritage of United Arab Emirates is reflected in RAK's architecture? What is the impact of Islamic, Portuguese, British art and what new brings globalization times? Various methods were used during researches to find what is the cultural heritage of Ras Al-Khaimah and national heritage of United Arab Emirates. The most important were the opportunity to conduct fieldworks, that include stocktaking of tourist attractions, interviewing tourists and members of institutions that offers tourist services. Further methods were comparison of tourist offers, spatial and heritage policy documents of the Ras Al Khaimah and whole United Arab Emirates.

Key words:

Cultural heritage, tourism potential

Dark Tourism is a Recent Research Topic in Geography; it Refers All Kind of Tourism Related to Death, Risk or Macabre Activities Where Tourists are Involved as Both Actors or Observers

López Á., Quintero G.J.

Universidad Nacional Autónoma de México, Mexico City, Mexico, lopuslopez@yahoo.com.mx

Abstract

Far from the Mexico-USA borderlands and close to Mexico City, the amusement "Eco Alberto Park" is located. Here, an indigenous community the "Hñahñu" people are involved in a tourism performance, which incorporates three different kind of performers: The Hñahñu act both as "Polleros" (guides for undocumented immigrants to US), and as "Migras" (Immigration police who tries to stop illegal immigrants, mainly Mexicans who want to cross to the USA or officers who are looking for those who have crossed in order to return them back to Mexico). On the other hand, the tourists act as "Mojados" (illegal Mexicans immigrants). The scenario is the countryside, which is crossed by the Tula river (to simulate the Rio Grande which is the real political border with USA). The aim of this presentation is to show how this spatial performance is a representation of dark tourism, because it is based in depict the suffering of illegal migrants who try to get into the USA. This work is based upon the "performance turn", because it "highlights how tourists experience places in more multi-sensory ways [...] as well as the materiality of objects and places and not just objects and places as signs" (Larsen, 2012).

Key words:

dark tourism; illegal migration; performance turn

Heritage City Development and Sustainable Livelihood Perspective: A Case Study of Chandani Chowk-Red Fort Complex (Old Delhi)

Yadav, SONALI

Jawaharlal Nehru University, New Delhi, India 110067, sonali.alld@gmail.com

Abstract

Tourism development has been perceived as the important source of revitalization for any economy. It is a symbiotic relationship between residents and that place and before developing any place as tourist spot or a major heritage center it is pertinent to look into the goodwill of the residents because the participation of any community is directly related with the development of that place. Idea is look how any place of historic or cultural importance can be converted into important tourist destination and can address issues at the places of branding and creating sustainable livelihoods with safeguarding authenticity, debate goes one level ahead from revival of city in the name of heritage development to the re-assertion of these contested spaces. Delhi being central to the theme of heritage development, being one of the largest urban agglomeration and National Capital Territory Region (NCR) attracts huge chunks of immigration to its old city complex. The study is based on Red fort –Chandni Chowk complex area and the paper aims to analyze Heritage city development and livelihood perspective in the light of stakeholders view and to what extent development of heritage city is positively related with the idea of generating economic returns. Development of the area as important tourist spot requires planning which may include relocation, inclusion or exclusion of certain areas in order to maintain and conserve them. In this case, people earning their livelihood and living in proximity can have short term and long term outcomes, may be positive or negative.

Key words:

Heritage, revival, livelihood, tourism development, stakeholders, Identity

Heritage Institutions as Abstract Machines for Producing the Local through Global Idioms

Crang, M

Durham University, Durham, UK m.a.crang@durham.ac.uk

Abstract

Far from local heritage resisting erosion by global culture, this paper explores how the regional and the local are produced through global heritage practices. The paper illustrates how shared global norms, practices and standards in heritage institutions serve to perform a notion of local heritage. The cases in point are the performativities and performances in open air museums in Northern Europe and world heritage documentation in China. In both cases it is suggested that globalised norms serve to suppress local histories of movement and entanglements of local cultures with global phenomenon. This suppression is both about the history of the places and the enactment of heritage. Heritage as an 'abstract machine' serves to align various divergent domains, such as environmental, cultural and economic discourses/practices, to produce the appearance and performance of localism. To do so heritage structures then reinscribe a notion of bounded locality and fixity through which downplays historically wider relationships. So in an age of globalisation, heritage institutions downplay past global linkages, in favour of producing a nostalgic notion of an historic and lost (or at best threatened) localised identity which now encounters global forces. To explore this the paper looks at how the cultural/natural environment is mobilised in Northern Europe and China

Key words:

Heritage, museums, identity, regionalism, locality, open air museum

Hybridization of Space by Heritage and Tourism: A Case Study of the “New I-Style Town” in Tianjin

Yue LU

University of Paris 1 Panthéon-Sorbonne, Paris, France, luyue_2009@hotmail.com

Abstract

Since the early 2000s, the landscape of tourist attractions in several Chinese metropolises has been modified by the force of heritagization and rehabilitation of former Western concessions. This article goes beyond the well-studied “trivialization” of cities by standardized touristification, and based on the assumption that the Western-style heritage does not involve a simple reproduction of alien space, but the synergy of heritage/tourism contributes to produce a new kind of hybridized consumption space in Chinese territory. This paper focuses on Tianjin, a megalopolis rarely studied and often neglected, but which is striving to tell a particular story based on its own reinterpretation of China’s historical and architectural past through the renovation of formers concessions. From the analysis of the “New I-Style Town” (a tourist center results from the regeneration of the former Italian concession in Tianjin) and based on participant observation and interviews, we propose a triple interpretation of this area. First of all, we will explore how the heritage and tourism are encountered in the strategy of revitalization of the former Italian concession driven by the local government; the second axis will concentrate on the conditions in which the Italian-style heritage is produced as consumption space, showing the hybridization characteristics of tourist products; the third part focuses on understanding how this space are consumed by individuals, exploring the experiential benefits, and the strategy of distinction and identification established by visitors.

Keywords:

hybridization, tourism, heritage, China, New I-Style Town

Interests Coordination of World Heritage Tourism from the Perspective of Social Network Analysis: Case of Hani Rice Terraces in Yunnan

SHI Shaohua, SUN Yehong

Tourism College of Beijing Union University, Beijing 100101, P. R. China, sunyehong@buu.edu.cn

Abstract

Tourism brought many disputes of different stakeholders like government, tourism enterprises, local community and tourists in heritage sites. As UNESCO world Cultural Heritage and Globally Agricultural Heritage Systems (GIAHS), Hani Rice Terraces is not an exceptional, and the local community is not satisfied with the situation of the company orientated tourism model in this area, which become the hinder of sustainable tourism development. To make the relationship of different stakeholders in world heritage site clear, this study takes Yuanyang Hani Rice Terraces as an example, analyzes the network cohesion, hierarchy and agency index by using the method of SNA(Social Network Analysis), based on the analysis, put forward five suggestions: Firstly, to shape a close interest relation between government, business and local community to form the effective interest coordination mechanism; Secondly, to strengthen the internal relationship among the interest groups to form the effective conservation and development force; Thirdly, to make full use of the high reciprocity, high transmission feature of interest Hani Rice Terraces network, to strengthen the enterprises and government institutions for benefit transfer between the set of vertices; Fourthly, to focus on decision-making power and voice power in the interests relation network in local community, in order to increase the power of the local community; Last but not the least, to cultivate coordinator and consultant role inside the interest groups, and to cultivate enterprise gatekeeper, representative and liaison role between government, communities, pressure groups, gatekeeper, and representative role among communities, government and enterprises.

Key words:

Japanese Characteristics of Dark Tourism

Akira IDE

Faculty of Management, Otemon Gakuin University

2-1-15 Nishiai Ibaraki-city, Osaka 567-8502, Japan, akiraide@gakushikai.jp

Abstract

Dark tourism is becoming a hot topic worldwide. Within the domain of dark tourism, though, regional characteristics are growing: for example, Chinese dark tourism is often connected to red tourism.

In my opinion, original European dark tourism is analysed in terms of the 'dark' side; however, in Japan, dark tourism is connected to recovery.

In my presentation, I would like to explain the reason for this strong connection, with several examples from the perspective of comparative civilization. Dark tourism has different features according to the country or culture, so there is no definitive answer to what dark tourism is. Rather, it is important to recognize that many different kinds of dark tourism exist across the world, which I will try to categorise.

Key words:

Dark tourism, culture, civilization, Japan

Nostalgia Tourism and Heritage Reproduction of Petsamo, Finland's Former Borderland to the Arctic Ocean, 1945-2015

Lähteenmäki, Maria

Professor of History, University of Eastern Finland, maria.lahteenmaki@uef.fi

Abstract

This geohistorical paper deals with the nostalgia tourism and reminiscence of the arctic community of Petsamo, located in the border region between Finland, Norway and Russia in the European High North. Finland lost the area to the Soviet Union after the Finnish-Russian War in 1944, and about 6000 Finns (including the indigenous Skolt Sami people) had to move from their home places to inner Finland. At the same time Finland lost its position as an Arctic coastal state. The idea of this study is to analyze the ways in which Finns have remembered, described, interpreted, and produced the Finnish heritage of the region, and which way increased tourism has been affected to this reconstruction process. In addition, I will ask how they have used history as an argument, and explained the region's importance to Finland and nostalgic feelings to themselves. In my ongoing study I will use both academic, popular, and newspaper texts published in Finland between 1945 and 2015 as source material. This database contains printed text which I will digitize and analyze by using modern methods of digital humanities (text mining).

Key words:

European Arctic, border region of Petsamo, nostalgia tourism, heritage, memory sites, geohistory, lost region, reminiscence, use of history, digital humanities, 1945–2015

Ontology beyond borders: tourist gaze and the sense of universal appreciation in World Heritage Sites in Sri Lanka

Ratnayake, I. and Hapugoda, M.

Sabaragamuwa University of Sri Lanka, P.O. Box. 02, Belihuloya, Sri Lanka. iraj@mgt.sab.ac.lk

Abstract

From an ontological point of view, tourism sites which host World Heritage stamp have faced an existential crisis; the reality that sustains its monumental significance gets altered and lost in the face of commercialization. The holistic appearance that attracts the tourist's nostalgia is irreparably damaged by the community who struggles for survival in these sites. However, tourism as a modern cultural phenomenon is possible only when man develops a *generalized* interest that catches the gaze of the tourists (Urry 1999) who are driven to travel beyond his particular habitat (Cohen 2000). For those who present a reality to the tourist must also have a Kantian 'public sense' of universal appreciation, aesthetic judgment and cultural awareness in things that can existentially attract and excite them. The cosmological sense of appreciation that transcends from government agencies to community stakeholders, as this paper reviews, not only preserves the historical and holistic integrity of the site itself, but may advance the tourism industry which can sustainably promote these sites for the alienated tourists (MacCannell 1975). By reviewing the empirical evidence through observations and stakeholder interviews in Kandy City and Galle Dutch Fort in Sri Lanka, where serious site mismanagement issues and stakeholder interference can be found in disturbing holistic aesthetic integrity that caters the tourist gaze, this paper suggests that tourism ontology on holistic universals should be taken into account rather than spatiotemporal particulars such as abstract individual and political interests of those who struggle in the respective sites.

Key words:

universal appreciation; tourism ontology; aesthetic integrity; Kandy City; Galle Dutch Fort

Iconic Houston: Induced Images of Gastronomy on the Official Visitors Site for Houston, Texas, USA

Velvet Nelson

Sam Houston State University, United States, vnelson@shsu.edu

Abstract

Urban tourism development in the U.S. city of Houston, Texas has been hindered by a negative reputation. This is based on persistent stereotypes, such as a predominance of chain restaurants and a limited choice of cuisine. In the past few years, however, the city has received new attention nationally, primarily based on award-winning chefs and distinctive, locally driven restaurants. Travel guides and magazines have named Houston the country's "newest capital of great food" and its "most exciting food city". With this interest in Houston's gastronomy, the Greater Houston Convention and Visitors Bureau (GHCVB) features food, drink, and restaurants prominently on the official visitors site for Houston (www.visithoustontexas.com). As the primary marketing organization for the City of Houston, the GHCVB plays an important role in influencing destination image. This research examines the induced images communicated in the fifteen gastronomic-themed pages of the Visit Houston site. Content and narrative analyses are used to identify key themes and to explore the descriptions and images employed to communicate the story of Houston as a gastronomic destination. While previous research indicates that the organic images produced in travel guides and magazines highlight the city's new gastronomic developments, findings from this study show that the GHCVB site provides a history and context for these developments. Using a locally-voiced narrative, these induced images suggest that visitors can now experience what locals have long known.

Spatial-Temporal Characteristics and Influencing Mechanism of World Natural Heritage Site and the Surrounding Towns—A Case Study Of Aba

Jiang Rong, Cheng Jing

School of Architecture and Design, Southwest Jiao Tong University, Chengdu, 611756, P. R. China, 723287189@qq.com

China City Development Academy, Sichuan Branch, Chengdu, 611756, P. R. China

Abstract

China's world natural heritage site protection has received increasing attention, but there exist many problems between the development of the surrounding towns and the protection of heritage sites, such as disorder development which had damaged heritage site and disharmony between rapid urbanization of towns and the development of the scenic area. Domestic researches are more focused on the protection of heritage sites, but there is little research about the relationship between the evolution of heritage sites and the surrounding towns. Aba state is selected as a pilot area because of its rich natural resources. First of all, this paper use GIS method, remote sensing image and statistical data to analyze the spatial-temporal features of world natural heritage site and the surrounding towns in Aba. Secondly, a further study is conducted on JiuZhaigou scenic area and the surrounding towns as an example. Finally, the interaction and influence mechanism between heritage site and the surrounding towns has been summarized. This paper offers some references for the world natural heritage site and town planning. In addition, this paper also helps to promote balanced development among world natural heritage site and the surrounding towns.

Key words:

world natural heritage; development of the surrounding towns; spatial-temporal evolution; influencing mechanism

The inner struggle of visiting dark heritage sites: Examining the relationship between perceived constraints and motivations

Chunhui Zheng ^a, Jie Zhang ^a, Lili Qian ^a, Honglei Zhang ^a

^a Department of Land Resources and Tourism Sciences, Nanjing University, 163# Xianlin Ave. Nanjing, Jiangsu, 210023, P. R. China

Abstract

Previous works suggest that the darker attributes of death actually motivate people to visit sites of death, while others argue that death and a fear of ghosts deter people from visiting. This contradiction implies subtle relationships between constraints and motivations, which have received limited attention to date. To fill this research gap, the present study first explores the underlying dimensions of constraints and motivations related to visiting sites of death and later clarifies in detail the relationship between the two. Interestingly, along with a general understanding of negative correlation, the empirical results also reveal significant positive correlations. Particularly, curious visitors with a stronger desire to contemplate death might more likely encounter higher levels of the constraint of taboos, in contrast to findings from previous studies. It is also found that the more people are motivated by social reasons, the more likely they are able to negotiate the constraint of traumatic memory. Understanding this relationship will help to broaden the theory, as well as provide suggestions for tourism marketing.

Tourism and Ethnic Landscapes: Social and Cultural Strengthening or Disintegration in Postcolonial Spaces?

Cheer, J.M.

Australia and International Tourism Research Unit (AITRU),

Faculty of Arts, Monash University, Melbourne Australia, joseph.cheer@monash.edu

Abstract

Throughout the Asia and Pacific region, ethnic landscapes are central to the expansion of tourism and to the cultivation of the tourist gaze. Ethnic landscapes are defined variously and in this paper it is considered to be the national milieu that is comprised of peoples of fundamentally different ethnic groupings including both first peoples and others introduced or following historical migration or transformational events including conflict and crises. At the core of ethnic landscapes are the legacies of colonisation, particularly European colonisation and its juxtaposition alongside indigenous or local contexts. Typically, narratives of colonisation are centred on dispossession, dominance, atrocity, belittlement and permanent and irreversible disturbance of pre-existing natural and sociocultural settings. In seeking to inject the ethnic landscapes discourse into the geographies of tourism, this paper draws on fieldwork in contexts where ethnic landscapes are underlined by present day jostling between multiple groups in the pursuit of tourism sector opportunities. Particular attention is placed on inter-ethnic relations and how the vestiges of the colonial era has shaped and continues to influence power relations and access to tourism. More importantly, the question as to whether the interrelationship between growing tourism-focused developments within prevailing ethnic landscapes strengthen or rupture social and cultural relations is posed. Fieldwork observations and analysis from Pacific Island and Southeast Asian contexts are put forward. In the main, this paper argues that cognisance of ethnic landscapes and the related latent and obvious undercurrents that emerge are essential considerations in the discourse on the nature and scope of tourism expansion in postcolonial contexts.

Critical Tourism geographies, ethnic landscapes, postcolonial, Orientalism, post-Orientalism

Tourism Spatial Structure and Its Evolution Of Star-Rating Rural Tourist Area (Point) of Changsha

CHEN Z, TANG Y

College of Resources and Environmental Sciences, Hunan Normal University, Changsha, 410081, P. R. China,
254058760@qq.com

Abstract

Select Taking the 206 star-rating rural tourist area (point) of Changsha as an example, the paper integrates qualitative and quantitative methods and the spatial analysis method of GIS to study the tourism spatial structure and evolution of Changsha star-rating rural tourist area (point). The results are shown as follows. (1) The spatial distribution patterns of the rural tourist area (point) of Changsha are congregating distribution and the spatial structure of tourism spatial distribution is not balanced. (2) Based on time and spatial overlay analysis of star-rating rural tourist area (point), counting the number of each stage, the development of rural tourism in Changsha can be divided into three stages: the early stages (before 2002), the stage of rapid development (2003-2008), the stage of industrialization (since 2009). (3) By the use of Kernel Density analysis, we can draw three different distribution patterns of Changsha star-rating rural tourist area (point). During the early period, Changsha's star-rating rural tourist area (point) presented an initial pattern of "two-center agglomeration, along the axis from South to North of the distribution to a gradient". During the stage of rapid development, the pattern shows that there are three-center agglomeration and along the axis from East to West of the distribution to a gradient. During the stage of industrialization, it presented a pattern of "three-center agglomeration and along three axes gradient".

Key words:

Changsha; Star-Rating Rural Tourist Area (Point); Tourism Spatial Structure; Evolution

Tourism to Sites with a Shadowed Past: The Global Production and Consumption of Dark Heritage

Rudi Hartmann

University of Colorado Denver, Department of Geography, USA, rudi.hartmann@ucdenver.edu

Abstract

Visitation to places with a dissonant heritage and thus a difficult legacy has become widely accepted across many cultures worldwide. The best illustration for the increased visitation of dark heritage sites are the expanding number of memorial sites of the Holocaust in Central and Eastern Europe. In the last few years a dozen sites have attracted more than three hundred thousand visitors annually including Auschwitz, the Anne Frank House in Amsterdam, the Topography of Terror exhibit in Berlin and the memorial sites of the Dachau and Buchenwald Concentration Camps. The global trend towards a greater recognition of dark heritage applies to sites with a shadowed past in more central locations like the battlefield memorials of WW I in Flanders, Belgium and the Nanjing Massacre Memorial Hall near Nanjing, China as well to destinations in relatively isolated locations. Examples of the latter are the Solovetsky Islands, generally considered the site of the first Gulag of the Soviet Era in the extreme North of Russia and Robben Island where Nelson Mandela spent eighteen years in prison in a peripheral location off Cape Town on the South African coast. Since the mid-1980s, tourism researchers have given attention to this phenomenon denoted and discussed in various ways including in the dark tourism and thanatourism research agenda and a revived geography of memory.

Dark heritage; dissonance; geography of memory

The Impact of Tourists Perceived Authenticity of Cultural Heritage on Experience Quality and Behavioral Intention in Macao

Wen Huijun, Li Xi, Shen Huawen, Ruan minqi

City University of Macau, Macau, P. R. China, huijun.wen@hotmail.com

Abstract

The prevalent of cultural tourism may strengthen Macao's historical appeal as well as giving the city a diversified tourism destination image. As an important component of tourist experience of culture heritage, authenticity plays a central role in different aspects of conservation such as cultural tourism and interpretation and presentation of heritage sites. Taking cognizance of the current paucity in this area, this study proposes to identify and evaluate the impact of tourists perceived authenticity of culture heritage on their experience quality and behavioral intention, from which implications for the sustainable development of culture heritage tourism can be derived. Both qualitative and quantitative research methodologies were used. In the first stage, tourists perceived authenticity is identified and explored by conducting relevant literature and in-depth interviews. In the first place, a well-modified scale of tourists' perceived authenticity is expected to develop under the context of Macao. Thus, in view of the current research paucity, this study is expected to enrich existing theoretical knowledge on perceived authenticity of culture heritage through its contextual peculiarities relied by Macao which combines western culture and eastern culture. Research conclusions from this study can shed light on the better management of culture heritage sites in Macao, to such an extent that the sustainability of culture heritage tourism can be enhanced as a special tourism resource.

A Future for Integrative Urbanization in Val d'Europe?

Anne-Marie d'Hauteserre

University of Waikato, Hamilton New Zealand adhautes@waikato.ac.nz

Abstract

The French state had accepted the partnership with the Walt Disney Company even though it might offer a neo-liberal approach to land development. The French profess an integrative approach to social relations and urban planning. Do French leanings embody utopian longings against current trends such as the promotion of consumption as a substitute for social engagement? Or does the current development of Val d'Europe (as a major tourism cluster) symbolise a retreat from 'public culture' exemplified in the disappearance of public spaces? Numerous French families, however, have invested in residential areas developed by the Walt Disney Company in Val d'Europe. The Company is cooperating with Pierre Vacances, the largest French builder of holiday homes and centres, to build "Villages Vacances" in the southern part of Val d'Europe. This presentation seeks to understand how the new physical and symbolic modelling of Val d'Europe today when the emphasis is once again on tourism development rather than social urbanisation might transform it into an aestheticized urban space shunned by future urbanites. Tensions have arisen due to the differing socio-economic perspectives of the partners involved, but the project had anchored one of the more successful urban planning efforts in the country and created a major tourist destination. Can such a successful partnership still bear similar fruits into the future?

Key words:

Walt Disney Company; neoliberalism; social policies; Val d'Europe; urban space

A Study on the Spatial Distribution Pattern of Restaurants in Beijing's Main Urban Area

TAN Xin^{1,2}, HUANG Daquan^{1,2}, ZHAO Xingshuo³

¹ School of Geography, Beijing Normal University, Beijing 100875, China;

² Beijing Key Laboratory for Remote Sensing of Environment and Digital Cities, Beijing 100875, China;

³ Urban-Rural Planning Management Center, Ministry of Housing and Urban-Rural Development of China, Beijing 100835, China

Abstract

In this paper, we aimed to analyze the space distribution pattern of restaurants in Beijing's main urban area and to interpret the factors that influenced the characteristics of the restaurants' spatial distribution. We explored and analyzed the spatial distribution of the restaurants using methods including data mining technology, geographic information system (GIS) spatial analysis, and statistical and econometric approaches. First, through data mining technology, we found the restaurants of the Beijing main urban area and their attributes from the Internet. Then, we divided the restaurants into five categories of different per capita consumption levels according to the attributes of the price per person. When the price per person of a restaurant was lower than 20 yuan, it was classified as a low-grade restaurant; if the price per person was lower than 50 yuan and higher than 20 yuan, it was classified as a low- to middle-grade restaurant; middle-grade restaurants' price per person was lower than 100 yuan and higher than 50 yuan; middle- to high-grade restaurants' price per person was lower than 200 yuan and higher than 100 yuan; and high-grade restaurants' price per person was higher than 200 yuan. We also divided restaurants into three grades of Internet word of mouth (IWOM) levels according to the attributes of the user ratings. When the user ratings of a restaurant were lower than 1, was classified as low quality, if the user ratings were lower than 4 and higher than 1, a restaurant was classified mid-range, and high-quality restaurants' user ratings were lower than 5 and higher than 4. Afterwards, we detailed, described, and analyzed the overall spatial distribution characteristics, the different per capita consumption levels, and different IWOM levels of the restaurants in Beijing's main urban area using the geographic information system (GIS) spatial analysis method. Our study showed that the distribution pattern of restaurants in the main urban area of Beijing can be characterized as one primary and two secondary zones with multiple centers as a whole, with the number decreasing from the city center to the periphery. The distribution of the restaurant consumption and the IWOM levels was a spindle shape, the characteristics of which can be summarized

as having more factors located in the middle and fewer at the ends. Finally, we put forward 17 indicators from six major systems, the population distribution, the regional economy, transportation convenience, infrastructure convenience, tourism resources, and Internet users' emotions, to explore and the factors that influenced the spatial distribution of the restaurants. Generally, we creatively acquired the relevant data and residents' emotional information from the Internet and applied it to a city planning instance, which was a useful reference for studying commercial and urban geography. Meanwhile, the results of this paper pertaining to the spatial distribution pattern of restaurants and influencing factors could play a positive role in the development of urban planning, the tourism industry, restaurant management, and Internet e-commerce.

Key words:

Restaurants; spatial distribution; per capita consumption; dining reputation.

Capital City Tourism: The Distinctive case of Pretoria South Africa

Rogerson, J

University of Johannesburg, Johannesburg, South Africa, jayner@uj.ac.za

Abstract

Capital city tourism as a specific form of urban tourism has received only modest recognition in the tourism literature. National capitals represent a special case of urban tourism and have distinctive qualities that attract visitors. In many capitals tourism was viewed as a problem to be managed and it is only over the past thirty years that capital cities have started to view tourism as an opportunity and have developed initiatives to encourage it. This paper will examine the specific form of capital cities tourism in one case in the global South which has attracted relatively little attention of tourism scholars of capital cities. An examination is undertaken of the specific characteristic of tourism in Pretoria which is South Africa's administrative and diplomatic capital city. The historical development of Pretoria as a capital city destination was much affected by democratic transition which resulted in a considerable expansion in the numbers of diplomatic missions hosted in the city. This paper tracks the importance of Pretoria as a business tourism destination which derives principally from the city's capital city function.

Key words:

Urban Tourism; Capital City; Pretoria; South Africa

Chinese Tourism trends in Spain: Barcelona experience

Canoves, G., Lojo, A.

Autonomous University of Barcelona, Geography Department, Edifici B, Bellaterra, 08193, Barcelona, Spain
Gemma.canoves@uab.es

Abstract

Chinese tourism in Spain is growing strongly since 2000. The paper outlines the main features of this new form of tourism, places to visit, interests which presents and motivations that lead to know Spain. At the same time shows that the city of Barcelona is the first city visited by Chinese tourists. In this regard we highlight the interest that introduces the city activities tourists, most visited sites, most popular activities, and the potential of Barcelona to adapt to this new tourist. We also highlight complicated coexistence among tourists and residents in more saturated places by tourists and the recent complaints of the inhabitants of the city with respect to a tourism model that must balance supply and demand, to a stable coexistence.

Key words:

Chinese tourism, Spain, Barcelona, urban tourism, coexistence between tourists and residents

Exploring Experiential Value Perception of Recreation around Metropolis Based on Method of Web Text Mining

Jiangmin LI, Lijuan TAN

China University of Geosciences, Wuhan, 430074, P. R. China, ljm1437@163.com

Abstract

As the national tourism leisure demand growth and holiday system implementation in our country, recreation around metropolis develops rapidly, which occupy an increasingly important position in the domestic tourism. Under the background of experience economy era, improving tourist experiential value is a powerful way to improve the competitiveness of recreation around metropolis. Basing on the wide application of network information in tourism industry, the study is to explore the experiential value construction and perception characteristic by web text mining method. On the basis of comprehensively combing previous study on experiential value dimensions and indicators, this study collected 3,938 comments of 50 recreation spots from Shanghai, Chengdu, Guangzhou, Beijing, Wuhan five cities, then using the Rost Content Mining to extract 109 high-frequency words. According Holsti formula, the study takes 109 high frequency words as the analysis unit, arranged three coders who were trained in advance to code the words into six experiential value independently. By analyzing the Holsti coefficients and depth interviewing, we got functional value, emotional value, situational value, cognitive value and economic value 5 dimensions and 26 indicators, which constitute the experiential value system of recreation around metropolis. However, the social value, which is prominent in many other sectors, does not constitute highlights in experiential value of recreation around metropolis. The study also found that situational value is the main attention among the five dimensions and the least attention is cognitive value.

Key words:

experiential value; perception; recreation around metropolis; web text mining

Museum as Flagships of Urban Tourism Development?

Shoval N

The Hebrew University of Jerusalem, Jerusalem, Israel, noamshoval@huji.ac.il

Abstract

The growing importance of culture in contemporary society and the rising importance of tourism in the economic base of post-industrial cities have led in recent years to the construction of new “Flagship-Museums” characterized by their size and spectacular architecture. Their purpose is to capture the public imagination, to attract tourists and to promote the notion that those cities have successfully transformed themselves from centres of manufacture into centres of culture.

These trends have also given rise to a new breed of museums: institutions established by foundations with value-laden educational agendas e.g. freedom, tolerance and human rights. This phenomenon is characterized too by the gigantic public and private investment in the structures that host the "collections," and by the use of signature architecture, along with the idea that the architecture itself helps convey the message of the museum.

This presentation, using the case of the newly established (September 2014) Museum of Human Rights in Winnipeg that cost \$351 CAD million to build, will examine the emergence of this new extension to the "Flagship-Museum Paradigm" of urban tourism development.

Key words:

Flagship Museums; museums; urban development; tourism; Canada; Winnipeg.

Overuse of city destinations – the example of Munich, Germany

Namberger, Ph.

University of Munich (Ludwig-Maximilians-Universität München), Department of Geography, Munich, Germany,
philipp.namberger@lmu.de

Abstract

All destinations in general can both profit and suffer from tourism and the results depend on the specific content and types of tourism. City destinations are specific forms of destinations above all because they are comparatively densely populated areas, and the inhabitants of a city and the city's tourists share a limited amount of space. This can lead to tensions and conflicts over the simultaneous use of places to live as places to explore. Munich is well known for its capacity to cope with very large numbers of people (as can be seen from the arrivals of refugees in the ongoing European migration crisis), but even in this city the destination's carrying capacity has been at issue. This paper focuses on (event) tourism within the city of Munich, a city which hosts the world's largest Volksfest, the Oktoberfest, a weighty schedule of football matches, and tourist groups from diverse cultures. A survey conducted in 2015 among the inhabitants of Munich identifies how specific aspects of tourism disturb the respondents and the extent to which they avoid places where such events occur. Munich residents see that the city is at its carrying capacity at times during the year and have well developed coping strategies. Based on these findings recommended actions are developed.

Key words:

city destinations; overuse; carrying capacity; coping strategies

Public-Private Sector Partnerships for Tourism Development: Evidence from South Africa

Rogerson C.M.

School of Tourism & Hospitality, University of Johannesburg, South Africa, crogeron@uj.ac.za

Abstract

Public-private partnerships (PPPs) are an emerging mechanism for tourism development in several countries. A PPP is instituted when a private sector entity engages with the state in a formalised arrangement for the development or operation of particular infrastructure. For national governments PPPs can offer opportunities to leverage resources through the transfer of commercial risk from the public sector to the private sector. In sub-Saharan Africa much interest surrounds the potential for leveraging PPPs for the development and upgrading of tourism infrastructure and maximisation of tourism assets. This said, the documented experience is limited of PPPs in tourism development in Africa. It is against this background that this paper examines the South African record of using PPPs in tourism development. Special focus is upon the experience of developing the heritage tourism resources of the Cradle of Humankind World Heritage Site which is a tourism product located one hour from South Africa's major metropolitan centre of Johannesburg. It is argued that the unfolding record of this particular mega-tourism project highlights certain limitations of the PPP model.

Key Words:

Public-private partnerships; South Africa; urban tourism; heritage tourism.

Spatial Structure and Business Form of Recreational Business District: A case study of qianmen district

Zhu He, Liu Jiaming

Institute of Geographic Sciences and Natural Resources Research, CAS, China, zhuhe12@mailsucas.ac.cn

Abstract

Through the analysing of inner spatial structure of urban recreational business district (RBD) can comprehensively study of the spatial structure change and the characteristic of RBD, so as to guide the internal leisure business form, construction, road planning. In this paper, using of space syntax and network data to investigate the relationship of spatial structure and commercial and passenger flow and passengers' satisfaction, to Qianmen area as an example. From three aspects including road, elements and passengers response, the author analysis of urban recreational business district's spatial structure and the characteristics of the business form development. The results show that the spatial accessibility affects the development of formats, and is directly related to customer satisfaction and customer flow. From the core area to surrounding areas gradually formed a "circle change - Retail - catering accommodation", and puts forward some suggestions on the development of the internal format planning and traffic development of the leisure business district.

Key words:

Recreational Business District; Spatial Structure; business form

Spatiotemporal Analysis of Urban Residents' Perceived Impacts of Music Festival Tourism: A Case Study of Beijing Strawberry Music Festival

Jing Han

Beijing Forestry University, Beijing, 10083, P. R. China; Nanjing University, Nanjing, 210046, P. R. China,

Jinghan@smail.nju.edu.cn

Abstract

Music festival tourism, as a new form of urban tourism, plays an increasingly important role in improving city image and driving the local economy. However, little academic attention has been paid to quantify the impacts of the music festival tourism. Monitoring local residents' perceptions in time and space is a useful way to trace the real impacts, and residents' perceptions towards the impacts are the key factors for obtaining community-wide support and sustainable tourism development. Therefore, this paper conducted a quantitative research to examine the spatiotemporal changes in residents' perceptions towards Beijing Strawberry Music Festival based on social exchange theory and core-periphery theory. Data were collected before, during and after the event with random sampling from SLA (Statistical Local Area). Results suggest that: there was obvious positive social and cultural perceptions decay while no big change in the low level of negative environmental and social perceptions, indicating that the music festival enjoyed a good reputation while produced a short-term effect; spatial differences existed both in positive and negative perceptions among three groups namely "core district", "transitional district" and "periphery district", while not all differences strictly observed the distance attenuating law, indicating the complex and dynamic impacts in a certain region. This study provides a unique geographical insight into residents' perceptions towards the impacts of music festival tourism, and has significant implications for city planners who wish to retain harmonious relationship with the local community and maximize long-term benefits.

Key words:

spatiotemporal analysis; urban residents' perception; music festival tourism

The Impact of Airbnb in the Urban Arena: Towards a Tourism-Led Gentrification? The case- study of Palma Old City (Mallorca, Spain).

Yrigoy, I

Independent Researcher, Palma, Spain, ismael.yrigoy@gmail.com

Abstract

Kevin Fox Gotham (2005) coined the term 'tourism gentrification', referring to the role of state policy in encouraging both gentrification and tourism development. This paper starts with Gotham's (2005) conceptualization, but it aims to develop it in three interrelated directions. First, it is claimed that one of the foremost ways by which tourism gentrification is taking place is through the Airbnb website. Second, it is argued that the contemporary process of Airbnb expansion in Spain is not exclusively the result of the combination of the flow of capitals and tourism, as the literature suggests, but rather, as a combination of the robustness of tourism and the impact of the crisis on households and real estate agencies. Third, it is claimed that the labour force is progressively being reconstituted as a rentier class, as with Airbnb a significant share of labour income is increasingly coming from land rents.

At a specific level, this paper aims to analyse the impact of the Airbnb accommodation expansion on the dynamics of gentrification in the Old Quarter of the city of Palma, which has become one of the most popular Spanish Airbnb destinations. Indeed, one pressing concern is that due to the expansion of Airbnb the property market is becoming increasingly less affordable in some parts of the city given that many properties are renovated specifically for the tourism accommodation sector.

Key words:

tourism gentrification; Airbnb; Palma; economic crisis; household income.

Tourism Gentrification and its social impact in Jeju Island

Choi, In-Mook, Lee, Seon Young

King's College London, London, UK, seonkings11@gmail.com

Abstract

Jeju Island in South Korea has been the most visited place for a long time, but there has not been significant conflicts between visitors and long-established residents. However, the recent changes Jeju Island has experienced seem different from the past, since Chinese investment has increased over the last ten years. In this context, this paper sheds light on the entwined effects of gentrification and tourism. First, it documents the social impact on neighbourhood and local people by the current changes. Second, it examines the endeavour of local government to attract investment in coalition with tourism and economic growth.

Key words:

Tourism; gentrification; Jeju Island; Foreign Investment

Visiting Nantong, Beibei, Canton and Nanjing: Ideal Urban Tourism in Republican

China

BARRENTO, A. E. H.

Faculty of Arts and Humanities, University of Lisbon, Alameda da Universidade, 1600-214, Portugal,
antoniobarrento@gmail.com

Abstract

In China, during the republican period, the cities of Nantong, Beibei, Canton and Nanjing emerged as multifaceted, overall enactments or visions of an idealized Chinese modernity that incorporated progressive, nationalist and republican characteristics. In this context, it is only natural that these places should have been an important aspect of a tourist culture that was gradually incorporating a set of modern attractions. This was in line with the rising importance of modernity in China, particularly as a result of growing foreign influence and increasing awareness of the need to 'save the nation' in face of foreign encroachment and threat. While these urban areas were not alone in the attraction of tourists by reason of modernity — this was the case also with Shanghai or Tianjin, for instance —, they were viewed as unique in that they represented a set of desired aspects of a modern China. In conformity, they were promoted as national models to be recognized or even followed, and reached out to travellers as places of day-to-day exceptionality and idealness. Seen as special places, and deemed therefore worthy of particular touristic attention, they were even occasionally to be described as touristically preferable to, or more touristically significant than, other touristic sites. Touristic practice did not, however, always follow such a type of touristic discourse. It is the aim of this paper to look into these different realities, which can be seen as confirmation of wider trends and tensions that were present in Republican China.

urban tourism; Republican China; modernity

What do recreationists' experience in city? Exploring Urban Image contents: a case study in Wuhan, China

LI Yan, Cheng Shaowen, Zhang Xiang

School of Urban and Environmental Science Central China Normal University, Wuhan, 430079, P.R. China,

liyan@mail.ccnu.edu.cn

Abstract

Both tourists and residents using cities can be viewed as the urban recreationists in terms of their involvement in recreational activities. A little academic attention is attracted on the fundamental questions about what recreationists' experience in city. Based on the framework of man's relationship with his environment in Ekistics, this study identifies a analysis framework within which urban image contents can be explored and distinguished. Taking one of Chinese metropolises-Wuhan-as a study case, this research employed structured interviews (n=743) for collecting data from March to May, 2013, and content analysis has been applied. Four dimensions of urban image contents have been identified, including natural environment, place and landscape, host-social environment and public infrastructure and service. It can be concluded that: 1) increasingly recreational activities in urban environment is the primary momentum transforming a non-recreational space into a recreational place. 2) The most notable elements of urban image experienced and perceived by urban recreationists include sound nature, unique place and landscape, friendly host-community and convenient infrastructure. 3) The urban administration has an important impact on recreationists' urban image. This study is helpful for further research and management practice on sustainable urban tourism development and urban image marketing.

zhongjingqiu126@126.com;

² Key Research Institute of Humanities and Social Sciences at Universities-Center for Studies of Marine Economy and Sustainable Development, Liaoning Normal University, Dalian 116029, China

Abstract

Based on the role of coastal tourism efficiency in development of tourism industry, using DEA, Global Malmquist combine with the standard deviation ellipse analysis, this paper attempts to analysis spatial-temporal evolution of coastal tourism efficiency in 53 coastal city of China. The results show that: 1) The impulsion of coastal tourism is efficient development of “people” and coastal tourism is based on collaborative system of “land-people-sea”. Coastal tourism has special resource properties in the tourism industry, and it is dominant industry of green economy in the marine industry. Its development is conditioned by the efficiency of human economic activities. 2) The sensitivity and vulnerability of coastal tourism to external economic environment change is stronger. Although government investment has a significant role in promoting efficiency of coastal tourism, investment scale and scale efficiency don’t have index effect. The scale efficiency and the space-time development law of comprehensive efficiency to be consistent in coastal tourism. In addition, the pure technical efficiency is dominant factor in promoting development of comprehensive efficiency, and policy efficiency is the main factor that influences the development efficiency of China's coastal tourism. The efficiency spatial distribution is a higher distribution in the south than the north in China's coastal tourism, but the regional disparity is gradually reducing. 3) The drive factors, influence the efficiency of coastal tourism, have the characteristics of restraining each other and coordinated development. So in the future, the coastal tourism development should pay attention to quality of tourism practitioners and professional training, guide the coastal tourist transform direction of development to civilized tourism and ecological tourism gradually, perfect the supporting policies and measures of regional tourism development to improve the efficiency of coastal tourism in the comprehensive development level, carry out targeted efficiency improvement measures to reduce the difference of regional development.

Perception of City Themes for Hong Kong: Tourists Vis-À-Vis Residents

CHAN, Chung Shing

Department of Geography and Resource Management, The Chinese University of Hong Kong, Hong Kong, China,
ccs_johnson@cuhk.edu.hk

Abstract

Thematization is a strategy used for developing positive, strong and distinctive images for cities to compete as tourism destinations and a place for residence. It refers to the patterning of resources and activities to symbolize experiences and senses from a specific time and space. Cities can attract tourists and may even retain them as potential frequent visitors or immigrants through a successful theme.

Tourists and the existing local residents may prefer a particular theme or some of its attributes differently when considering a city as destination or residence. A successful theme can become a valuable brand for different people, but an inappropriate theme may confuse a city image. In Hong Kong, where the government is attempting to develop and position the city under themes such as “green city”, “creative city” and “smart city”, it is important to understand which of these themes best attracts tourists and satisfies local people. However, little research has been done on how tourists and residents perceive the underlying elements of these themes together in a city.

This presentation considers Hong Kong as a case for an ongoing study to bring out sets of attributes for screening and measurement by reviewing the relevant literature in each of the themes of “green city”, “creative city” and “smart city”. The variables are vetted by a number of local experts in academia, government representatives, non-governmental organizations and the private sector. Preliminary results from a questionnaire survey of inbound tourists and local residents in Hong Kong will be presented.

Key words:

city thematization; creative city; green city; smart city

Spatiotemporal Differentiation of Residential Land for Coastal Town under the Background of New Urbanization: A Case Study of the Dalian Jinshitan

Jing Sun

Liaoning Normal University, China, 305861611@qq.com

Abstract

Based on SPOT5 satellite remote sensing images and land use data in five time phases covering the period 1988–2012, the distribution characteristics, spatial differentiation processes, and driving mechanisms affecting the residential land of the Jinshitan Tourist Resort were studied. The work included a combination of GIS technology, adoption of the differentiation index D , and the multi-group differentiation-measure Model $D(m)$. The results provided a basis for the following conclusions. (1) From 1988 to 2012, the degree of differentiation of the rural residential land first decreased, and then increased. The general residential, commercial residential, and garden-house land-types all showed declining trends, of which the garden-house type presented the most intense volatility. (2) The overall background of the traditional residential land type was gradually replaced by a new residential land type, and the total area of residential land increased year by year, significantly improve the overall residential conditions. The areas of the new residential land type showed growth, and were increasingly widely distributed in the coastal tourist resorts, transportation corridors, and scenic areas. (3) Government policy, social differentiation, market mechanisms, and individual choices (along with other factors) were mutually promoted, although still restrained. However, all of these factors interacted to constrain the developmental direction and the processes affecting tourism real estate in the Dalian Jinshitan Tourist Resort.

Key words:

residential space differentiation; differentiation degree; new urbanization; residential conditions; driving mechanism

The Study on the Function of Eastern Recreational Belt in Nanning based on the Behavior of Tourists

Xiaoping Huang

Guangxi Teachers Education University, Nanning, 530001, P. R. China, 1005439537@qq.com

Abstract

With the advancing of the social development and living conditions, recreational activities grows on a larger scale as well. The function perfection of the eastern recreational belt may be advantageous in forming the centre status of the Pan Beibu Gulf economic zone, in helping Nanning to further promote its ecological and livable city figure, and in developing related industries of convention, commerce and tourism.

By learning from the related research achievements from at home and abroad, and based on clearing concept and connotation of the belt and recreational value, we adopted related theories such as behavior location theory, core-edge theory and sustainable development to case study eastern recreational belt of Nanning and the behavior of the tourists of the belt. With the tour resort as the centre, places less than 1 hour of transportation are the main source of the tourists. We conclude from the space statistics from related GIS software that rounds of the belts where various tourist resorts (above level A) located has gradually been formed, and the variation course of the related location between the belt and those tour resorts.

To address the problems caused by the contradiction between the recreational belt and tourists behavior, we proposed strategies based on the perfection of tourist resorts from tourists demand so that we may coordinate tourists demand and public transportation, scientifically plan tour resort, choose plants and species suitable for local plantation, positively develop ceremonies and activities and promote brand effects of the recreational belt.

Recreational belt; Recreational function; Recreational behavior; Nanning City

Tourism, Real Estate Development, Segregation and Socio-Spatial Conflicts. The Spread of the Iberian Model for the Brazilian Northeast

FONSECA, M. A. P.

Depto. de Geografia, UFRN, Natal, Brazil, mariapontes@ufrnet.br

Abstract

Over the last two decades we have witnessed a significant increase in the development of real estate linked to tourism, which has resulted in an expressive urbanization process. The model from Iberian Peninsula spread to the northeast of Brazil in the beginning of the XXI century with emergence of new architectural standards and increased urbanization along the northeastern coast. The following research proposal aims to discuss the process of urbanization generated by leisure and tourism, based on an analysis of the expansion of the real estate market in the production of second home in tourist regions. Analysis will be based on the Costa das Dunas Tourist Pole/RN in Brazil. The central research argument is that while, on the one hand, global processes have contributed to new forms of integration and socio-spatial interactions, on the other hand they have generated new conflicts and certain forms of spatial segregation, demonstrated by urbanization based on leisure and tourism activities. Research procedures will include data collection from official government bodies, analysis of secondary sources, and interviews with three stakeholder groups that are considered key in the process of tourism-driven urbanization: real estate business owners, public administrators, and representatives from civil society associations. Globalization has contributed to bringing places closer together virtually. However, the increased integration of global spaces driven by new tourist/migratory shifts to locations with more amenities, strongly stimulated by the real estate market, have given way to new forms of socio-spatial segregation at a local level, and merit research.

Empirical Mobility Intentions Analysis and Mobility Research of Social Housing in Xi'an Based on Location Factors

Yanbo Hao, Xin Dong

Northwest University, Xi'an City, Shaanxi Province, 710127, China, 1185307862@qq.com

Abstract

The fundamental difference between social housing and commercial housing is mobility of residents. Only by maintaining the dynamic balance of inward and outward residential flow, can social housing benefit the society to the fullest extent possible.

Detailed information and data of the social housing community in Xi'an has been collected and gradient analysis has been performed by Arcgis to determine the space-time pattern of this community. This study indicates that as time goes on, the location of social housing gradually moves away from the urban center and is always remote. Further investigations prove that the remote location is inconvenient for residents' daily commuting, usage of public service facilities, while increasing their daily expenditure and hindering social communication. Therefore, tenants generally show high mobility intentions in those areas. Based on the findings above, researches used SPSS for PCA (Principal Component Analysis) and multivariate linear regression analysis to study factors which can affect residential mobility, such as housing location and household income. Furthermore, AHP (Analytic Hierarchy Process) was also utilized to evaluate the potential changes of those factors.

The study indicates that level of household income primarily affects people's mobility intentions in Xi'an to a certain extent. Beyond that, the remote location characteristics are likely to become the principal factor of the outward residential flow. In the worst case scenario, those remote social housings would turn into 'vacuum space' or 'slum' in a short period of time.

With significant theoretical and practical values, this study could be a guide to generate effective macro policies of social housing and managements of dynamic construction based on an accurate mobility prediction, so that preventing the waste of land and fund on social welfare.

Evaluating Social Tourism and its Linkage to Sustainability Development of Scenic Spots in Taiwan

Jamy C.S. Chen, Robert Y.S. Chen, Chung Lian Kao

Kaohsiung Normal University, Kaohsiung, Taiwan, China, jamyisno1@yahoo.com.tw

Abstract

Social tourism has become an important element to democratize public tourism since the 20th century. It not only benefits the individuals, but helps to create a solid family relationship, sense of well-being and fairer human rights (McCabe & Johnson, 2012). Sirgy(2010) claims that tourism is not one's basic need, but a deprived one. In this viewpoint, tourism can be even more important for poor people because of the happiness it creates. In Taiwan, the fact that most elders are supported and waited upon their children prevents the poor elders from experiencing tourism. However, neither the academic field nor the government has any correspondent studies or policies to this situation. The research takes qualitative methods including participant observation and interviews to realize the benefits and patterns of how elder people living in suburban areas in Taiwan participate in social tourism. The study will further figure out the relationship of participation, subjective well-being and quality of life resulted from social tourism to evaluate the sustainable tourism development in Taiwan.

Key words:

social tourism; sustainable development; suburban area

How Accurately do Respondents Report? A Comparison between Space-Time Diary and GPS Tracking Data

Ying Zhao, Xiaoting Huang

Assistant Professor, School of Tourism Management, Sun Yat-sen University, Guangzhou, Guangdong, P.R. China, zhaoy233@mail.sysu.edu.cn

Abstract

The space-time diary of paper-and-pencil-based questionnaires is the basic form used to collect data. Tracking technology could help provide high-quality information to verify the conventional methods. This paper aims to explore the differences between recall using a space-time diary and GPS data in a case study in Ocean Park, Hong Kong. The results show that differences from the data comparison among selected attractions with show-activities exist. The bias in a temporal interval is more representative than that in a temporal locus, and the departure time reported in the questionnaire is more accurate than the arrival time. Based on a multi-level model, we find that the impacts of duration, attraction function, satisfaction and show participation on temporal interval bias are significant.

Key words:

space-time activity; bias; questionnaire; Global Positioning System; Ocean Park Hong Kong

Impacts of Tourism Development on Residents' Welfare In Aba Tibetan And Qiang Autonomous Prefecture, China

Xiaoping Qiu, Yiping Fang

Institute of Mountain Hazards and Environment, CAS, Chengdu, 610041, P. R. China, qiu_xiaoping@foxmail.com

Abstract

Welfare is a concept that includes a wide range of subjective and objective matters, which can be divided into economic welfare, social welfare and ecological welfare. Aba Tibetan and Qiang Autonomous Prefecture was selected as the research areas, which is located in the northwest of Sichuan province, and has abundant resources of tourism. However, due to the poor traffic conditions and the fragile ecological environment, the region has a low residents' welfare. Because tourism has been the major industry in the region, it is crucial to explore the impact of tourism development on residents' welfare and identify effective measures. Based on the economic welfare, social welfare and ecological welfare, an integrated welfare index was defined. The results indicate that from 2000 to 2013, the economic welfare increases from 0.329 to 0.471, the social welfare increases from 0.487 to 0.628, the ecological welfare declines from 0.559 to 0.474, and the integrated welfare increases from 0.519 to 0.648 respectively. Using an econometric model, the effects of tourism development on residents' welfare were analysed. This is a significant positive correlation, more integrated welfare when there is more tourism income and more tourists. The findings show that the shape of sound and robust tourism institutions and policies would matter for increasing the standards of residents' welfare, and the active participation of local communities is also an effective way.

Key words:

impacts; tourism development; residents' welfare

Lifestyle Entrepreneurs' Migration: From Imagination to Experience

Sun, Xu

Centre for Tourism Planning & Research, Sun Yat-sen University, Guangzhou, China, sunxiaoxia605@163.com

Abstract

The lifestyle migration has been observed rising due to the increasing mobilities worldwide and lifestyle migrants also show the change of social structure in the modern society. While lifestyle mobilities have raised the increasing interests among the social science scholars, most of current studies focus on the consumption-oriented lifestyle migrant in western world. Limited researches have been carried out in the non-western country. This study would examine the behaviors and experiences of rising lifestyle tourism entrepreneurs in China who have shown a complicated mobility pattern. The study especially attempts to understand the relationship between their imagination and their experience of the destination. The field work was conducted in Dali and Lijiang. Data is collected through depth interview and participant observation. It is found out that entrepreneurial migrants' imagination of life in Dali/Lijiang include the charming physical environment and idyll lifestyle, which comes from mass media and their personal tourism experiences. To operate a small bar or guest house is often imaged as an easy, relax and enjoyable life. For most of the entrepreneurs, the actual experience is frequently much more difficult than expectation. They need to adapt and adjust to reduce the gap between imagination and experience. The failure to meet the gap will produce new mobility- either return or move to the next ideal destination.

Keywords:

lifestyle migrant; entrepreneur; imagination; experience; Dali/Lijiang

Livelihood Transition Study of Local Residents in the Tourist Resort Area: A Case of Jinshitan, Dalian

WANG Xinge^{1,2}, XI Jianchao^{1*}

¹ Institute of Geographical Sciences and Natural Resources Research, Beijing 100101, China, wangxg.15b@igsnrr.ac.cn

² University of Chinese Academy of Sciences, Beijing 100049, China

Abstract

As a new type of urbanization in China, tourism urbanization has been an important driven force for the livelihood transition of the local residents. However, research has not adequately analyzed changes caused by tourism on traditional livelihood. This study, therefore, uses the sustainable development of livelihoods analysis framework of DFID to analyze changes on traditional livelihood caused by tourism. Taking Jinshitan resort as the case study, combining with longitudinal sequence survey data from 1992 to 2012, we analyzed the transformation process of livelihood of local residents during the past 20 years. We found that dramatic livelihood changes have occurred in Jinshitan. On the whole, livelihood of the local residents has changed from farmer to citizen, which can be seen as follows: Firstly, the amount of local residents' livelihood capital increased with the background of the tourism development and moreover, its structure changed dramatically from "the pentagon" to "square" with the loss of natural capital. Secondly, livelihood strategies diversification due to multiple off-farm growing was more severe with decline of traditional farming livelihood activities; Finally, the overall standard of living of local residents present the improving trend. However, even though changes in livelihood may be an indication of the realization of urbanization in study villages, this type of livelihood transition reflects an unsustainable development of the resort because of: (1) extrusion of the local residents' living space and the deprivation of the natural assets; (2) few tourism livelihood of local residents; (3) poverty of the local residents seen from the structure of the income which depends mainly on subsidies. Therefore, we proposed that: (1) protect the original natural villages from being demolished as far as possible; (2) strengthen the tourism resort area residents themselves as a mining and development of tourism resources; (3) build a multi-level employment post system for absorbing residents.

Key words:

resort; local residents; livelihood transition; Jinshitan

Research on Interactions in Kailash Ritual Space: Perspective of Study on Tourists

Luo Qiuju, Yu Mengjiao

School of Tourism Management, Sun Yat-sen University, Guangzhou, 510275, P. R. China, bettyluoqiuju@126.com

Abstract

2014 A.D is Tibetan year of horse, the legend of walking around mountain can accumulate merit 13 times than peacetime attracts plenty of tourists to come to Mt Kailash in Ngari Prefecture, Tibet, China. Walking around sacred mountain is a traditional ritual of Tibetan Buddhism, and Kailash Walking Path is the carrier of pilgrims and tourists' religious rituals, in other words, ritual space. This paper chooses the background of pilgrimage tourism, views Kailash ritual space as cultural context, aims to portrays the man-land interactions and explain the interpersonal interactions and the spatial influence on interactions by using qualitative research methods: collecting data from participant observation, interviews and Internet blogs. The paper demonstrates that: 1) In Kailash ritual space, tourists' man-land interactions and interpersonal interactions are inevitable, and present particularities; 2) Interpersonal interactions and man-land interactions cannot be separated in Kailash ritual space, there are interacted and interconnected relationship; 3) As a whole, tourists' interactions are influenced by Kailash ritual space, tourists' man-land interactions accelerate with ritual landscape, and interpersonal interactions fluctuant with changing spatial landform. This paper explores the uniqueness of tourists' man-land interactions and interpersonal interactions in ritual space, helps understand different context of interaction, divides tourists in ritual space into two parts by analysing tourists' interaction, responds the "pilgrim-tourist axis" theory proposed by Smith in 1992, discusses the relationship between man-land interactions and interpersonal interactions, responds to the model put forward by Peng (2011), and explores different conclusions.

Key words:

Ritual space; Tourist; Man-land interaction; Interpersonal interaction; Kailash

Social Integration Structure and Determinant of Tourism Migration in Ancient Village: Taking Hongcun as Example

Zhang Ye-Chen, Lu Song, Yu Ling-Lian

College of Territorial Resources and Tourism, Anhui Normal University, Wuhu, Anhui, 241003,

zhangyechenxiazhi@163.com

Abstract

As a typical ancient village tourism area, Hongcun attracts a large number of workers, business owners, and even retirees settling here in the tourism development stage. They are defined tourism migration. This paper takes the tourism migration in Hongcun as the research object, and discusses the social intergration structure and level by the method of exploratory factor analysis. Trying to reveal the influence of tourism on the social and cultural changes of the host community from the perspective of the floating population. At the same time, the multiple regression equation is introduced to analyze the factors that affect the social integration. Research results show that: Firstly, the social integration of tourism migration in Hongcun contains 4 dimensions, which are cultural fusion, psychological fusion, identity fusion and economic integration. Secondly, the level of social integration is not high. And, psychological intergration is best of all, the factor score 3.57 points. Then cultural interation and identity interation do not reach the medium level. The internal discrete of cultural fusion dimension is strong. Economic integration owns the lowest intergration degree. Thirdly, the main factors that affect the social integration of tourism migration are divided into individual factors and local factors. Among them, the extent of local factors is greater than the individual factors.

Key words:

Tourism migration; Social integration; Influencing factor; Hongcun

Chinese Seasonal Retirement Community and Their Making of Home

Yuefang Wu, Honggang Xu, Lirong Kou

Foshan Polytechnic; Sun Yat-sen University, China, 2556083143@qq.com

Abstract

Compared to the international retirement migration surpassing national boundaries and transcending cultural diversity, domestic population movement spanning long distance across China by the retired is an interesting and important social phenomenon. The consumption-led retirement migration, diverges significantly to the previous production-led labor migration is leading the transformation of Chinese society. And the traditionally static Chinese home is challenged with increased socio-spatial mobility. A qualitative research is conducted to deal with the changing experience and meanings of home for the elderly people in China, with increasing lifestyle mobility nowadays. The heuristic framework on domains of meaning of home in old age by Oswald & Wahl (2005) is employed for structuring the analysis. The research focus on the physical, social and personal domains of home by retirement migrants, and closer investigations are conducted in the behavioral, cognitive and emotional aspects concerning personal domain. The research finds out that, retirement migration is motivated both by globalization and the coming of mobility society, and by changes in Chinese family relationship and parents' concern on health. Although physical home is maintained by means of materialization of homeland and continuation of daily routine in second homes, the social and personal home is susceptible to change. Migrants are lost in the orientation and disorientation of home in the constant changes. Laoxiang and Quanzi, which are rules in traditional social operation, once again take prominence to manage migrant's society. An acquaintance society is formed in destination and continue the home making process.

Key words:

retirement migration; home making; meanings; acquaintance society

The Relationship between the Human and Automobile in Self-Driving Tourism

Peng Yang, Honggang Xu

School of Tourism Management, Sun Yat-Sen University, Guangzhou, China, yangp55@mail2.sysu.edu.cn

Abstract

With the increasing dependence of the human on the automobile, the emotional relationship between them becomes more and more intense and complex. Not only daily commute, self-driving tourism has also become a new way for people to use automobile and a lifestyle of many people. Researchers having noticed the profound influence of the automobile on people's life, there are also some research on the tourists' driving behaviour, but little attention have been paid to the special relationship between the human and automobile in self-driving tourism. This article sheds light upon the relationship between them through network travel notes and in-depth interviews. Results show that the driving tourists see the automobile as a vehicle at the beginning, they concerned about its safety, performance, comfortable capability and access distance, etc. In addition, automobile has become a symbol of people's way of life; it represents different levels of the driver and their life attitude. An automobile also compose tour experience of self-driving tourist, people appreciate the landscape in the isolated space which the experience is highly dependent on. At last, the automobile has become emotional support to driving tourists, they express more attention and greater reliance on the automobile and their tour activities are often revolves around it. In self-driving tourism, the relationship between the human and the automobile is not just the human controlling over technology and tools, technology and tools are also controlling, shaping and affecting the human's body, behaviour and attitude conversely.

Key words:

automobile; self-driving tourism; human-automobile relationship

Unnecessary Old 'New' Friends? Finnish and Polish Second-Home Owners in Local People's Perceptions

Adam Czarnecki, PhD

Institute of Rural and Agricultural Development, Polish Academy of Sciences ,Nowy Świat 72, 00-330 Warsaw, Poland ,
aczarnecki@irwirpan.waw.pl

Abstract

In recent years, second-home tourism has experienced a renaissance gaining a lot of popularity among the European societies. It has been manifested in the growing number of secondary residences, e.g. in Finland there are about 500.000 second homes and their number has doubled over past 33 years (Statistics Finland 2014); in Poland second-home ownership has gradually increased from 7.6% to 12.4% households in period 2000-2013 (Social Diagnosis 2014).

Moreover, latest Finnish and Polish studies have proved that the spatial patterns of the second homes development have had distinct changes in recent years (Rehunen 2011, Heffner & Czarnecki 2011) since second homes have not occurred exclusively in suburban and tourism-based communities but also in rural heartland and remote areas challenging negative tendencies, e.g. strong depopulation.

Given that several research questions raise: how this phenomenon can be perceived by local people? Do they consider it in positive way as an economic opportunity, a boost of vitality to local communities or do they see it mainly as a disadvantage, emerging environmental and social concerns? To answer these questions a comparative study between Finland and Poland was conducted addressed to 467 and 398 local residents respectively living in communities with high concentration of secondary residences. The structural equation model was applied to assess the significance of the second-home phenomenon for local community based on rural people's opinions.

Key words:

second homes; local community; perceptions; rural areas

Wellness Tourism and Local Landscapes: a Successful Match

Terkenli, Theano S.; Kakkouli, Eirini-Nektaria

University of the Aegean, Lesvos 81100, Greece, t.terkenli@aegean.gr

Abstract

This paper illustrates a sustainable alternative to negative impacts of tourism development on small destinations, such as overwhelming environmental, economic, social and cultural/ aesthetic pressures on local destinations. Such an alternative (re)lies on centring, promoting and developing wellness tourism, in mid-range tourism destinations, on the basis of the local landscape, both incorporating natural and cultural attractions as well as various types of tourism infrastructure, and amenable to the principles of locality, sustainability, multifunctionality, identity and democracy. The objective of this study was to assess tourists' perceptions, values and understandings of the significance of landscape to wellness tourism, an alternative form of tourism very much on the rise, in recent times, as well as highly connected to landscape appreciation and consumption.

Towards this goal, 150 (foreign and domestic) tourists were surveyed with the aid of an intensive interview questionnaire, in three very different resorts exhibiting varying interrelationships to wellness tourism, on the island of Chios, a mid- to small-scale tourism destination in Greece. The results indicate and elucidate the central role of landscape in wellness tourism, in the context of tourists' quest for beauty, peace and calm, closeness to nature, but also cultural amenities as well as specific landscape services to health and well-being. The findings also point to the qualified, variable and contingent basis of successful landscape-related wellness tourism development, in intricate and mutually beneficial relationship with local societies, economies and landscapes.

Cross Cultural Adaptation of Third Culture Individuals' Cultural Identity

ZHENG Peng

School of Tourism Management, Zhengzhou University, Zhengzhou 450001, China, zhengpeng511@163.com

Abstract

"Third culture individuals" is complex and interesting in the field of sociology. They are the product of globalization, the promoter is globalization, is of great significance to adapt and spread of Chinese culture. This study of 12 sojourners who has third cultural features is about the cultural adaptation in the sense of belonging, cultural identity, intercultural communication ability. The results showed that TCI has a sense of belonging to different degrees, they in the childhood stage experience two or more cultural fusion created a multicultural identity, this experience did not disturb their cultural identity, but to make them possess the ability to adapt to the different culture quickly, and this ability is natural to come, and without any effort.

Key words:

Third culture individuals ; Cultural adaptation ; Cultural identity ; Sense of belonging ; Intercultural communication ability

Measure the Impact of Tourism on Cultural Security in Ethnic Regions: Taking Kashgar as an Example

You Yanan

Xinjiang University Of Finance&Economics College Of Tourism, China, youyanan2008@126.com

Abstract

This study takes Kashgar as an example, using the method of principal component analysis and fuzzy mathematics comprehensive evaluation method, research the influence of tourism on the cultural security of ethnic areas. Results of the calculation show that the tourism industry has great influence on the cultural security. The influence degree of the culture subsystem is followed by: Spiritual culture security, material culture security and living environment culture security. The measure-valued of spiritual cultural security is higher than material culture and living environment culture, which conforms to the mechanism of cultural change. That indicates the ethnic culture core layer has been in the active state, but so far it has not been fully expressed in the form of material. According to the calculation results and combining the connotation of the culture safety, this study presents countermeasures in the aspects of against alien culture intrusive excessively and enhancing the vitality of the national culture, to ensure national culture "static" and "dynamic" comprehensive security.

Key words:

Tourism industry; Cultural security measure; Kashgar

Study on The Process of the Tourism Migrants Social Integration based on the Theory of Community Filed: Taking Hongcun as Example

Lu Song, Zhang Yechen

College of Territorial Resources and Tourism, Anhui Normal University, China, ahlusong@126.com

Abstract

Though a growing number of transient people springing up in the tourist destination, but the research on this topic has not yet received enough attention. This research, which has based on the community theory and combined with the qualitative research -depth interviews- and the quantitative research, study on the tourism migrants of the world heritage sites-hongcun in order to reveal its social integration process and results with the local community. The study found that the social atmosphere between the travel community immigration in hongcun and the local people are harmonious and no obviously conflict, which can be divided into three stages, 'dual community', 'casual acquaintances' and 'community field'. The three stages are not a progressive layers, but exist side by side, and the "casual acquaintances" occupy the mainstream. The social environment which combined with the various of cultural degree, the lack of communication opportunities and the space obstacle, made the communicate between the locals and the immigrants mainly are ordinary exchanges in stead of forming the social integration. This is an obstacle to create community field and may lead to the immigrants lack of engagement in the community construction and cause community development unsustainable.

Key words:

Community field; Tourism immigrants; Social integration; Hongcun

Abstract

Global climate change is one of the most important and challenging problems facing the world today. The tourism sector is the world's biggest industry, and the measurement and control of tourism-related carbon emissions or its carbon footprint is of great significance if the global emission reduction targets are to be met. This paper discusses the deficiencies and weaknesses in existing research; and proposes the emphasis and direction that future research should take. The literature review shows that there has been considerable research on carbon emissions by the tourism sector, and its carbon footprint. However, few of these studies included uncertainty analyses, and their reliability and validity is hard to identify. Studies are difficult to compare, and the carbon intensity and ecological efficiency of the tourism sector or tourism consumption cannot be confirmed because there is no consensus about the intension and extension, system boundary, accounting caliber, and measurement methods. Finally, the emphasis and direction of the future research, which includes defining the intension and extension of carbon emissions or the carbon footprint that unifies the system boundary, and combines the strength of two methods, i.e., bottom-up based Process Analysis (PA) and top-down based Input-Output Analysis (IOA), to construct a detailed and comprehensive hybrid approach, are presented.

Key words:

Tourism sector; Tourism Consumption; Carbon emission; Carbon footprint

Do Low-Carbon Tourist Routes Exist? - Empirical Evidence from China

Jinkun Sun, Jinhe Zhang, Jingjing Cao, Yu Zhang, Hongsong Peng, Huan Hu

Nanjing University, Nanjing, 210023, P. R. China, Jinkunsun2014@gmail.com

Abstract

Tourism products are the terminal and core parts of tourism. With the gradual favour of low-carbon products, green and ecological are becoming the important factors of choosing tourist routes. The difference between the carbon emissions from kinds of tourist routes mainly lies in the different vehicles in travel. Taking China as the example, this paper chooses 60 actual tourist routes (from a city to another) based on different travel distance, including five ranges ($\leq 100\text{km}$, $100\text{-}300\text{km}$, $300\text{-}500\text{km}$, $500\text{-}1000\text{km}$, $\geq 1000\text{km}$), to calculate the carbon emissions from tourism transportation. The main vehicles contain airplane, train, coach and car. Every tourist route is finished by a main vehicle and other auxiliary. By this, we can uncover the characteristic of carbon emissions in different tourist routes. The results will provide decision support in publicity of low-carbon and green in tourism from government and buying tourism products from the public.

Key words:

Tourist routes; low-carbon; tourism products; carbon emission; China

The Influencing Factors on Carbon Emission for Tourism Industry in Destination from the perspective of tourism area life-cycle model

Tang Cheng-cai

School of Tourism Management, Beijing International Studies University, Beijing 100024, China, tcc5808@163.com

Abstract

The factor decomposition model on the changing carbon emission in energy consumption of tourism industry in destinations was established in this paper. The Wulingyuan Scenic and Historic Interest Area was chosen as research case, and the influencing factors on carbon emission for tourism industry in the Wulingyuan Scenic and Historic Interest Area were analyzed from the different stages of life-cycle. The research results indicated that: when the tourist destinations are in the stages of exploration and consolidation, the scale of tourists and tourism output are being larger and larger and they are combined to promote the rapid development of carbon emissions for tourism industry, while it has been restrained by the constant decrease of energy intensity. Making the policy of energy-saving and emission-reduction should focus on the improvement of energy efficiency and the optimization of inner structure in tourism industry for tourism destinations in the stages of consolidation. Electric power is one of the most important energy consumed in tourism industry in China, and the low-carbon development of tourism destinations in China can't rely on the mass use of electricity to achieve the target of cleaner production. Virtually, it is a space transfer of carbon emission from the electricity-consuming place to producing place, which cause a lot of problems, such as the regional ecological ethic problems and carbon compensation. We should be encouraged to use low-carbon energy (eg. natural gas, zero-energy) to substitute high-carbon ones (eg. petroleum, coal).

Key words:

tourism destination; tourism area life-cycle model; LMDI method; low-carbon development; the Wulingyuan Scenic and Historic Interest Area.

The Optimal Allocation Calculating Model of Sightseeing Car in National Park Based on Carbon Emission

Jinhe Zhang, Huan Hu, Ming Chen

Geographic and Oceanographic Sciences, Nanjing University, Nanjing, 210023, P. R. China, zhangjinhe@nju.edu.cn

Abstract

The internal traffic of national park is not only an important tool for tourists, but also the profit means of the enterprise and the main carbon source. In general, there are three major contradictions of tourist traffic allocation inside the national park, such as rigid supply and flexible demand, environmental protection and personal effectiveness, environmental protection and economic interests. How to solve these three conflicts is very critical. This paper put forward three principles, maximizing the tourist satisfaction, maximizing the enterprises' efficiency and minimizing the environment impact. Accordingly, this paper constructs the optimal allocation calculating model of sightseeing car and takes Jiuzhaigou and Huangshan national park as two cases studies.

Key words:

carbon emission; optimal allocation model; tourism transportation; national park

Carbon footprint evaluation research on the tourism transportation system at tourist attractions: a case study in Hengshan

B.H. LI, Y.P.LIU, P.L.LIU, and Y.D. DOU

College of Urban and Tourism, Hengyang Normal University, Hengyang, 421002, P. R. China, libeny_2058@163.com

Abstract

It is difficult to achieve sustainable development of the tourism industry because of increasing carbon emissions associated with tourist attractions. In this article, we focused on Hengshan as the case study and applied a life cycle evaluation theory to construct a carbon footprint calculation model of the tourism transportation system at a scenic spot in Hengshan. The following results were obtained: first, in terms of total volume, different types of transportation have different carbon footprints. The most energy-expensive method of reaching tourist attractions is tourist highways, which have a carbon footprint that is 2.6 times that of tourist cableways and 46.1 times that of tourist walkways. Second, in terms of the stages in which the carbon footprint is distributed, the majority of the carbon footprint of tourist highways (79%) and tourist cableways (96%) is in the operation and use stage of the life cycle. For tourist walkways, most of the energy consumption is at the construction and the later operation stages. Third, in terms of source constitution, the carbon footprint of tourist highways occupies the largest proportion (about 71%) during its useful life, followed by tourist cableways (27%) and tourist walkways (2%). The model described in this article will not only help to achieve the goals of low-carbon tourism development, but will also provide the theoretical support for saving energy and reducing emissions at tourist attractions.

Key Words:

tourism transportation system; life cycle; carbon footprint; tourist attractions; Hengshan

CO₂ Emissions Measurement and Dynamic Changes Oof Regional Tourism Industry in Jiangsu Province

Hu Huan,Zhang Jinhe,Sun Jinkun,Peng Hongsong,Wang Chang

Nanjing University,Nnaging,210023,P.R.China,hu66huan@163.com

Abstract

The CO₂ emissions is an important indicator of the environmental impact of regional tourism industry, and analysis of decoupling effects in tourism industry is an important basis for formulate the carbon emission reduction measures of different stages in the tourism industry. The study adopted a bottom-up approach to explore the influences of tourism transportation, accommodation and activities on the total CO₂ emissions of the tourism industry over the period 2001-2013 in Jiangsu Province. In addition, a decoupling index was applied to analyze the decoupling effects between tourism-related CO₂ emissions and the tourism economy from 2001 to 2013. The results showed that: the total CO₂ emissions in tourism industry was increasing, but the annual growth rate was lower than the growth rate of tourism economy. The total CO₂ emissions from the tourism industry rose from $188.5747 \times 10^4 \text{t}$ in 2001 to $478.0887 \times 10^4 \text{t}$ in 2013, with an increase of 153.53%, an average annual growth rate of 8.06%, lower than the average annual growth rate of tourism economy 9.74%. In addition, Tourism transportation was the main component of CO₂ emissions of regional tourism industry. From 2001 to 2013, the CO₂ emissions of the tourism traffic was 79.20%, the accommodation was 16.10%, the tourism activity was 4.70%. Thirdly, the development trend of tourism is green, the decoupling of CO₂ emissions from tourism economy growth is mainly weak decoupling, tourism economic development is sustainable.

Key words:

tourism CO₂ emissions; decoupling index; Jiangsu Province

Constructing A New Preliminary Evaluation System Model for Green Tourism

Lien, C. Y., Hoowen, C. A. Longckey

Professor, School of Tourism, Sanming University, Sanming, Fujian, P. R. China, 2661907438@qq.com

Abstract

The evaluation system of green tourism is derived from the conceptual framework of green tourism. The main purpose of this study is to define a clear conceptual connotation of green tourism evaluation system and sort out the assessment indicator systems of low-carbon tourism, eco-tourism as well as sustainable tourism respectively. This study integrated the literature research, comparative research and AHP analysis methods. China must vigorously promote green development and green consumption to protect the green environment under full consideration background. The development of green tourism in tourism industry involves economic, social, cultural, ecological and other multi-attribute characteristics. The result of this study proposes a new initial evaluation system model for green tourism. This evaluation system model includes five first-level evaluation indicators, which are natural environment indicators, socio-cultural indicators, economic indicators, business involvement and government spending indicators. Meanwhile, we also designed 12 second-level indicators and 40 third-level indicators. The three levels for evaluating the indicator system model of green tourism are more complete, structured and very clear logical relationships. This study would more importantly provide the values of related theoretical bases on literature reference for in-depth continuing study of this research field.

Key words:

green tourism; evaluation indicators; evaluation system model; multi-attribute characteristics

Interpretation of Low-carbon Tourism Value and Reconstructing the Developing Model

Yong MA, Yang YANG, Na LI, Yun Tong

Tourism Development Institute, Hubei University, Wuhan, China, mytcn@126.com

Abstract

As the new way to upgrade tourism industry, the practices of low-carbon tourism are challenged by many factors. Most of the existing low-carbon resorts are still in the transition to a low-carbon destination--"gray" stage, which is not conducive to the sustainable development of scenic spots. In the first place, the article analyzes the connotation of low-carbon tourism, and then extract the four core values that is functional value, symbolic value, experience value and social value, from the perspective of production and tourism consumption. After that, according to the highlighting extent of low-carbon tourism, the paper divides the model into the original ecological developing model and sub-ecological developing model, what's more, basing the comparison of the two developing models, the paper build low-carbon tourism development model called "driving force - state - response - potential" model on the basis of DSRP reconstruction framework, which promotes the low-carbon area by the "passive, controlled" original mode to the "active, attack type" sub-ecological upgrading model. As a result, we can realize the low-carbon tourism value overflowing to promote low-carbon build tourist destination.

Key words:

low carbon tourism; the value of developing model; reconstruction

Community-Based Tourism in Gashaka-Gumti National Park, Nigeria: Potential for Poverty Alleviation

Adewumi I. B.

Graduate School of Integrated Arts and Sciences, Hiroshima University, Japan, d132431@hiroshima-u.ac.jp

Abstract

The designation of Gashaka-Gumti National Park (GGNP) resulted in the placement of various restrictions on the resources used by people living within and around the park, who are mainly farmers, hunters and pastoralists. Hence, various illegal activities arose within the park because the local people were deprived of their livelihood derived from the locally available natural resources. The people living within and around GGNP suffer from the effect of poverty, poor infrastructure and services. Community-based tourism (CBT) can serve as a tool to balance the negative effects from the national park designation by meeting the social, environmental and economic needs of the local communities through the offering of a tourism product. The aim of the research was to assess the potential of CBT as a tool for poverty alleviation. To achieve this, 250 questionnaires were administered in 9 communities while focused group discussions were conducted in five communities. The main complaints of the respondents were unemployment, insufficient land for farming and grazing, and lack of infrastructures. They showed willingness to participate in tourism projects if given the opportunity because it would not only create employment opportunities but also help in bringing about development. This suggests that the people are ready to accept the development of tourism projects, which is a good prospect for CBT. The management of GGNP therefore needs to facilitate the local people's involvement in tourism in order to reduce poverty while at the same time, solve most of the challenges the park faces.

Key words:

Gashaka-Gumti National Park; Poverty alleviation; Community-based tourism; Unemployment

Creating a Framework to Analyze the Sustainability of Mega-Cruise-Ship Tourism in Japan

Funck, C.

Hiroshima University, Hiroshima, Japan, funckc@hiroshima-u.ac.jp

Abstract

Within the global increase in cruise passengers, Asia, especially the growing Chinese market, has seen exponential growth. Many of the new mega-cruise-ships are destined for Asia, and ports in Japan compete to attract what they see as strong shoppers from abroad making up for the decline in Japan's own population. However, the sustainability of cruise tourism has been questioned for various reasons. Environmental issues like air pollution, garbage and sewage treatment, the highly concentrated industry structure where a few operators control the world market as well as social and cultural issues arising from large number of visitors arriving for short term visits have been documented. This paper aims to establish a geographical framework for the evaluation of mega-cruise-ship tourism by examining environmental, economic, social and cultural issues from the example of Japan. Research was conducted in four steps: analysis of literature and data on cruise tourism in general and in Japan, interviews with local government agencies involved in the acquisition of cruise tourism, questionnaires with international cruise ship passengers arriving in Hiroshima Port and interviews with local tourist attractions, shops and restaurant. Results revealed that the economic effect has been negligible and that the passenger management at the destination poses severe problems. Based on the results, a list of issues will be identified that need to be addressed to improve the sustainability of mega-cruise-ship tourism.

Key words:

Cruise tourism, Japan, sustainability, mega-cruise-ship

Development of Major Tourist Destinations of Madhya Pradesh sState of India: A Case Study of Khajuraho Tourist Spot

Yadav D. S., Dr. Tomar Shivraj Singh, Dr. Chauhan G.S.

Jiwaji University, Gwalior, 474002, Madhya Pradesh, India, devyadavgis@gmail.com

Abstract

The tourism industry has emerged as one of the key drivers of global economic growth. Tourism is termed as “sunrise” industry and it is multi-oriented employment generator. Madhya Pradesh state of India is known as heart of incredible India and is gradually attracting & alluring the tourists worldwide. The state has three world famous tourist destinations which are included in the list of UNESCO world heritage sites viz. (i) Khajuraho (Chhatarpur), (ii) Sanchi (Vidisha) and (iii) Bhimbetika (Raisen), Khajuraho is a very popular tourist destination among the overseas tourists. The other well-known tourist centers of the state are Orchha, Bandhavgarh, Gwalior, Kanha, Panna, Sanchi, Mandu, Panch, Pachmarhi, and Ujjain. The Madhya Pradesh holds 7th rank in domestic tourists arrival and 13th rank in foreign tourists' arrival at national level. The Govt. of Madhya Pradesh has launched various popular slogans and schemes to attract foreign travellers. The total no. of foreign tourist arrival was merely 89,169 in 2008 which has increased to 97,356 in 2012. While in 2014 the figures of foreign tourists has substantially gone down up to 71,898. The figures of foreign tourists reveal that the study region is on the top in order to attract maximum tourists making a visit to M.P. and it is the most sought after tourists' destination for foreign tourists. An attempt has been in the research paper to highlight the spatio – temporal analysis of tourists and strategies to attract maximum tourists to the heart of incredible India.

Key words:

employment generator; economically viable; world heritage sites; year of tourism; sunrise.

Evolution of Rural Tourism Landscape Character Network: The case of Jiangxiang Village

Hu Xianyang, Bao Jigang

School of Geography and Planning of Sun Yat-sen University, Guangzhou 510275, China

Center for Tourism Planning&Research of Sun Yat-sen University, Guangzhou 510275, China

Abstract

The process and mechanism of rural tourism landscape character network evolution are overlooked in rural geography studies. Basing on field theory, this paper tries to reveal the evolution process through social network analysis and provides an interpretation of the mechanism by actor-net analysis. The results suggest that the network density becomes higher and the relationship between nodes gets closer in the three periods. The themes of the network are overall stable, but the landscape character of high degree centrality has fluctuated: Chang Desheng's celebrity effect and service environment are assumed increasingly important while the rural atmosphere being the opposite. The second part illustrates the logic behind the phenomenon. The actor network includes the central government, local government, village committee, political elites, the villagers, enterprise in the village and the local resources and environmental factors. Governmental guidance, professional ability of the political elites and actors' reaction to the changing social environment are crucial to the landscape character network evolution. Power and benefits are driving forces of role definition, distribution and conversion. This article also demonstrates that SNA and ANT have a good applicability in description of the process and mechanism of rural tourism landscape character network evolution. Additionally, this study discusses the connection between the landscape character and socio-spatial restructuring, the logic of space, power and interests as well as institutional logics behind the case.

Key words:

landscape character network; evolution; tourism field; power relations; Jiangxiang Village

Music-scene Harmony: According to The Dimensions and Characteristics of the Perception of Musical Soundscape

Zhang, H; Zhang, J

Department of Land Resources and Tourism Science, Nanjing University, Nanjing, 210093, P. R. China,

zhhui93@outlook.com

Abstract

The dominate researches in physical geography are relatively visual-oriented, neglecting the acoustic features. A Canadian environmentalist Schafer defined the concept of “soundscape” in 1960 for acoustic ecology. But up to now, most researches of the perception of soundscape are based on physical characteristics, and neglect the attributes of geographical. This research aims to find if the basic characteristics of the musical soundscape can be explored by the investigation of the perceptual dimensions, and uses the information processing theory of cognitive paradigm to test if the musical soundscape can call up people's imagination about the scene. By the open-ended questionnaires, undergraduate students were investigated in December in 2015. A total of 132 valid questionnaires were collected finally. After context encoding and weight processing, we find that several dimensions are concluded in the perceptual dimension of the musical soundscape, includes perceptual time, the musical carrier form, environmental features, individual psychology and so on. It has a certain concentration in environmental features and individual psychology, and these two aspects related to the scene which form the geographical feature of the musical soundscape. Schafer limited soundscape with three main elements: keynote sounds, sound signals and sound marks, and we find that as to musical soundscape, localization and time identifiability are the two key points to soundscape. This research has contributed to the empirical study of soundscape with a valid method, and can be used by designers in tourism scenic spots.

Key words:

musical soundscape; perceptual dimensions; open-ended questionnaires; geographical feature

Public Participation in Tourism planning: perspectives, process and outcomes in Southern China

Dan Lin , David.Simmons

¹ Lecturer, Shenzhen Tourism College Jinan University, Shenzhen, P. R. China, lindan@sz.jnu.edu.cn

² Professor, Lincoln Univeristy, New Zealand, David.Simmons@lincoln.ac.nz

Abstract

Public participation is considered a cornerstone of sustainable tourism planning. While well established and tested in western democracies, there is an emerging trend to develop such processes within the liberalising Chinese tourism economy. This paper applies the theoretical construct of community participation in tourism planning to the analysis of a purposeful attempt to engage various publics in the tourism planning process in Jiao Chang Wei, Shenzhen, China, using both qualitative and quantitative methods. It is found that: 1) new management structure has been created incorporating various interest groups involving local governments, local residents, outside investors, and social institutions. What sets at the core of this structure is a demoralising decision-making process and an interest shared mechanism; 2) at the operational level, high efficiency and effectiveness in public participation was evidenced in the case study in comparison with other Chinese tourism destinations; 3) interest groups report higher overall satisfaction of the participatory planning, with high quantity of conservative supporters and positive supporters for tourism development. The paper concludes with discussions on limitations and potentials of the present mode of public participation in tourism planning in China.

Public participation, tourism planning, community development, Shenzhen, China

State of Wine Tourism Development in South Africa: Managing and Planning for Sustainability

Ferreira SLA, Hunter C

Geography and Environmental Studies, Stellenbosch University, Stellenbosch, South Africa, slaf@sun.ac.za

Abstract

On a global scale the phenomenon of wine tourism is growing and is considered to be a driver of economic and social development in rural areas. Limited job opportunities and unemployment is a reality in most rural areas and especially in the rural areas of South Africa. In 2013 the wine industry in South Africa has generated more than 300 000 direct and indirect job opportunities. The main aim of this paper is to present the current state of wine tourism development in SA, the role that the sector plays in regional development, the social responsibility of two leading wine estate farms and how to manage and plan for sustainability. A mixed-methods research approach was used in this study comprising of one questionnaire-survey (farm-level survey) and two in-depth case studies. The results from the questionnaire survey enabled the classification of 16 wine routes according to their level of development and has disclosed certain critical issues that need to be addressed in the future planning of each of the 16 wine routes.

Wine tourism development; wine routes; tourism area lifecycle; responsible planning

Sustainable Development and Tourism: A Case Study from Lashi Hai (China)

Hurlemann S.

Institute for Geography and Sustainability, University of Lausanne, Switzerland Seraina.Hurlemann@unil.ch

Abstract

Tourism often serves as strategy to promote sustainable development in China's remote rural areas that have not yet profited of the economic boom. But to what degree does this kind of development align with the principles of sustainability? How does it affect local communities? And what effect does it have on the environment? This research takes a holistic approach to tourism development by analysing a case study conducted in five villages in the Lashi Lake Wetland Area (Yunnan, China), that takes into account as many socio economic, political as well as ecological factors as possible. Consequently, the findings are able to generate profound insights on the changing processes stimulated by tourism development within the local community, economy and environment. It further demonstrates the conflicts between the idea of sustainability and the characteristics of Lashi Lake's development. Even though social inequalities and environmental degradation rose with the economic growth brought by tourism, living standards have increased as well, and existential problems faced by local households on everyday bases have diminished. Furthermore, there appears to be an increasing awareness of environmental and social issues among the local residents, which may play an important role in directing the regions future development.

Key words:

Tourism; sustainable rural development; local empowerment; environmental conservation

The Effect of Tourism Development on Local Community Identity

Hamdollah Sojasi Qeidari, Tahereh sadeghloo

Assistant, Geography and rural planning, Ferdowsi University of Mashhad, Mashhad, Iran, ssojasi@yahoo.com)

Abstract

Tourism development in rural area has been introduced as a one of the basic needs for rural economic diversification and tourist's recreation. Tourism industry cause to transmission of financial and monetary resource to rural area by tourism potential that create employment and entrepreneurial opportunities in these rural. In addition of financial resource, tourists enter external culture to rural environment. Thus, with tourism development and tourist's entrance to rural area, the context of rural identity changing will be provided in different aspects. Rural identity changing in developing countries is more than developed countries and often observed in economic, social and cultural dimensions. Therefore, in this study the main goal is identification of most important changes through of tourists presence in rural area especially in peripheral rural of Iran, by using of Quantitative Methodology. Findings show that these changes in cultural and social dimension are more than the other aspects. The result of these changes on rural architect, social – economical relationship and rural livelihood is more obvious.

Key words:

Tourism development; rural identity; social- cultural changes; rural area.

Tourism Sustainability in Himalayas: A study on Land Use Shift and Solid Waste Generation in Accommodation Sector of Leh

Shah Ahmad Shamim, Wani Ahmad Muzafar and Dar Nabi Sajad

Associate professor, Department of Geography and Regional Development University of Kashmir Srinagar, India, shamimcrocus@gmail.com

Research scholar, Department of Geography and Regional Development, University of Kashmir Srinagar, India, muzafargo@gmail.com

Abstract

In the present day world of rapid urbanization, mountains tourist destinations like Leh, are gaining grounds as preferred destinations for the people world over, because they offer unique opportunities and experiences in order to escape from the stress of urbanization. The Leh town has witnessed phenomenal growth in terms of tourist flow, accommodation sector and transportation in a very short span of time than other Himalayan tourist destinations. The present research was under taken with the objectives of analyzing the growth of tourism, dynamics of land use change and scenario of waste generation in Leh town. Remote sensing data was used to analyze the magnitude of land use change which has occurred over the period. For determining generation of solid waste from accommodation sector a detailed survey was conducted using direct waste estimation method. The main findings of the study reveals that there is shift in land use patterns especially agricultural land has changed to built-up area. The area under built-up was just 168 hectares in 2001 which went to 294 hectares in 2011. The results also show that category A and B hotels are generating 3.5 kg and 2.5kgs solid waste per room per day which is more than international standards. The main conclusion of the study is that that sustainable tourism management needs integration of geospatial technology for planning and development of tourist destinations.

Tourism-Induced Livelihood Changes at Mount Sanqingshan World Heritage Site, China

Su, M.M., Wall, G., Xu, K.J.

School of Environment and Natural Resources, Renmin University of China, Beijing, 100872, P.R. China,
smm52@hotmail.com

Abstract

Striking a balance among conservation, tourism and the needs of residents is among the key development goals of World Heritage Sites. Although tourism has the potential to improve livelihoods, it may disrupt livelihood systems, social processes and cultural traditions. Proper planning and management is required to ensure positive results on local livelihoods. This study assessed the livelihood changes at three rural villages at Mount Sanqingshan World Heritage Site, China to determine whether and to what extent tourism-related livelihood strategies are contributing to local livelihoods. A sustainable livelihood framework is adopted to guide the analysis. Semi-structure interviews were conducted at three villages with residents, site management agency, village mayors or committee members through three field investigations in 2014. It was found that the three villages exhibited different development patterns due to institutional, organizational and location factors. The new livelihood strategies involving tourism that were constructed and incorporated into the traditional livelihood systems resulted in different outcomes for residents of different villages. Village location, including the relationship to site tourism plan, affected the implications for rural livelihoods. High dependency on tourism with the loss of traditional livelihoods has diminishing effects on livelihood sustainability despite the short-term positive economic benefits. Thus the need to diversify livelihood opportunities from tourism is pertinent. Moreover, insufficient attention was given by both the site level government and village level management authorities to the socio-cultural aspect of livelihood sustainability. Practical implications are then suggested to enhance livelihood sustainability at such rural heritage tourism sites.

Tourism; community; sustainable livelihood; World Heritage

Understanding Tourism Flow Structure from GPS Trajectory and Social Network

Model within a Destination: Case Study of Gulangyu

Yuan Li, Jiacheng Xie, De Wang, Yu Ye

Xiamen University, Xiamen, 361005, P. R. China, liyuan79@xmu.edu.cn

Abstract

The study of tourism flow structure is an important direction of tourism geography, however, few paying attentions within a destination. Under the background of smart tourism and human-oriented tourism management, the calls for understanding tourist's behavior within a destination and tourism flow structure is emerging. As a response to this trend, this paper explores a workable approach with the use of GPS trajectory and social network model. The proposed approach mainly includes two parts. The first part is processing individual tourist's GPS trajectory into *Behavior Chain*, which is used for recording the visiting sequences of scenic areas. The second part is integrating and converting individual tourist's behavior chain into *Choice Matrix*, which is used for recording the relationships of scenic areas. Based on the choice matrix, social network model is applied to calculate the *Point Centrality*, *Closeness Centrality* and *Betweenness Centrality*. In order to justify the proposed approach, the case of Xiamen Gulangyu Island is adopted as an example, and 341 GPS trajectories with questionnaires are obtained during 2015. The finding of case study shows: 1) core-periphery structure of the tourism flow is very clear on Gulangyu island, and the number of core and periphery districts is respectively 19 and 35; 2) land use of core areas are mainly containing commercial and hot scenic spots, showing the over-commercialization phenomena; 3) the tourism flow structures under the three parameters are related but slightly different. From the research, we could understand the tourism flow structure in more rational way and some potential development strategies could be suggested.

Key words:

Tourist's Behavior; GPS; Social Network Model; Gulangyu

A Quantitative Division for Each Stage of the TALC Model Based on the Logistic Model: And Discussing the Tourism Life Cycle Types of the Ten National Parks in The United States

Zhang Chengming(Simon)

School Of Geography and Planning, Sun Yat-Sen University, Guangzhou 510275, China

Abstract

This paper tries to use Logistic model to divide each stage of the TALC model quantitatively. Based on the analysis of the mathematical properties of Logistic model, this paper analyzes the applicability of Logistic model to the quantitative division of LATC model, meanwhile, uses the data of ten national parks in the United States to discuss the development types of these ten national parks. Results show that:(1)the Logistic model can fit the first five stages of LATC model fairly well: Exploration-Involvement stage, Development stage, Consolidation stage, and Stagnation stage; (2)using the mathematical properties of the logistic model, obtained divided the various stages of the three time nodes $(t_1, \frac{K}{4.732})$ 、 $(\frac{a}{r}, \frac{K}{2})$ 、 $(t_2, \frac{K}{1.268})$; (3), the tourism life cycle types of national parks in the United States can be classified into three ones: Type I-Standard type, Type II - Cliff type, Type III - Leap type.

Key words:

Logistic model; TALC model; national parks in US; tourism development types

A Regional Analysis of Tourism Promotion in India: Evidence from Large Scale

Survey Data of Domestic Visitor

Chowdhary Ravindra¹, Kumar Suraj² & Kumar Rakesh³

^{1&3} International Institute for Population Sciences, Mumbai

¹ Jiwaji University, Gwalior, chowdhary1191@gmail.com¹

Abstract

In the year 2002, the Incredible India campaign was launched on the world stage by the Government of India, Ministry of Tourism and Culture to promote Indian tourism. India is a vast and diverse country, which attracts much attention as domestic as well as International tourist in major destination of India. This paper examines the household member or visitor aware about Incredible India campaign and state tourism promotional campaign at states and regional level. Using secondary sets of data on NSSO 65 round of domestic tourism in India and statistical software ARC GIS tool to identify the colour coded map of India and regional level. Finding suggest that there are 6.14 per cent person are aware about incredible India campaign at national level and there are few state performing well in context of knowledge. However, at the regional level using 88 region of National Sample Survey of India result found that there is some pocket of region were person are more aware about the campaign. This paper will be more helpful for the policy maker, tour operator and stakeholders at destination level as well as Indian tourism development.

A Study of Tourists' Perception of the Tourism Image of Xi'an Based on Micro-blog Data

Yang Min, Li Xinyi

Business School, Xi'an University of Finance and Economics, Xi'an 710010, Shanxi, China

Abstract

With the rapid development of tourism and the fierce market competition, the images of the tourism destinations are playing an increasingly important role in attracting potential tourists and enhancing the competitiveness of the destinations. This paper intends to make an in-depth analysis of the domestic tourists' perception of the tourism image of Xi'an and the influencing factors on it by collecting the micro-blog data published by tourists in Xi'an, using content analysis and ROST, the word frequency analysis software. The research has found that the tourists' perception of the tourism image of Xi'an centers around the representative areas, the overall image perception, and the tourists' expression words. In general, the tourists have a good perception of the tourism image of Xi'an. But there are also some negative perceptions, the key influencing factors being the weather, the traffic, and the overcrowding in scenic spots etc. Using micro-blog data to systematically study tourists' perception of tourism image of Xi'an can help the administrative departments to decide on the tourism image of Xi'an clearly, and improve tourism images.

Keywords:

micro-blog; content analysis; Xi'an; image perception

A Study on the Optimization of Tourism Spatial Pattern in Qinba Mountain Area Based on Pole-Axis Theory

Jian Jiao ,Jian Ruan

College of Architecture, Xi'an University of Architecture & Technology, Xi'an Shaanxi, 710000, P.R.China,
13759915102@163.com

Abstract

As the carrier of tourism, the rationality of tourism spatial structure will influence the development of tourism industry directly. Qinba mountain area, located in the geographical center of China, is a cross border tourism area of six provinces and cities, which forms a complete economic, social and cultural circle. As an important Chinese culture birthplace and biological gene pool, Qinba has an important strategic position in China's culture and tourism development. In order to make better use of tourism resources in Qinba mountain area and promote the sustainable development of tourism economy, based on the study of the types and space distribution of tourism resources and the present situation of regional tourism spatial structure features, this paper analyses and calculates the important tourism nodes and developing axis by applying the pole-axis system theory and build the network of tourism spatial structure consists of "points", "axis" and "plate" in Qinba mountain area which integrates into the regional tourism development pattern, to lay the foundation of the tourism development on the spatial level.

Key words:

Analysis on Characteristics of Spatial Structure in Great Nanyue Tourism Circle

LI Bohua, LUO Danyun, LIU Hongli, DOU Yindi, LIU Peilin

Research Establishment for Hunan Settlement, Hengyang421002 China; libeny_2058@163.com

Abstract

For taking full advantage of tourism resources in Great Nanyue Tourism Circle, this paper analyzed the resource type and spatial structure characteristics of Great Nanyue Tourism Circle by graphical method and spatial econometrics model. The samples were the 47 tourist attractions in the study area. The space distributions showed characteristics of uniformly distributed. The scenic spots tended to concentrate around 10 — 12. 5km of Hengshan. The level of space connection between scenic spots in Great Nanyue Tourism Circle was relatively weak, the same as the level of connectivity and accessibility of tourist traffic web. At last, some recommendations were given for optimization of the spatial structure of tourist attractions in Great Nanyue Tourism Circle.

Key words:

tourist attraction; spatial structure; optimization; Great Nanyue Tourism Circle

Building, Managing and Developing a New Destination after Natural Disaster: A Case Study of Beichuan Qiang Cheng Tourism Zone

Wu Chuntao

China, Sichuan University

Abstract

Natural disaster tourism is an activity to visit sites associated with dead or tragic events caused by natural disaster such as earthquake, typhoon, tsunami, debris flow, or volcanic. In China, the natural disaster tourism developed quickly in the “5•12” Wenchuan Earthquake affected areas after 2008. There two study purposes of this paper: to interpret the strategies of design and the practices in building tourism zone in the devastated areas; to find out some suitable methods to develop the zone sustainably, focused on the effects of exactly site on visitor experiences. Documents analysis, semi-structure interviews with elites from local tourism industries, and questionnaire survey with tourists are methods used. The questionnaire survey results indicate that, in 2014, the top three key motivations of visit were: to see the old town of Beichuan earthquake ruins, to feel the earthquake disaster closely, as well as to experience the Qiang culture. After the trip, the deepest experience was “felt the terrible nature of earthquakes and reverence of the nature” felt the solidarity spirit of disaster resistance” and “felt the value of the life”. However, only 9% of the visitors said that the most impressive experiences was relax, and only 16% of the visitors regarded that it was disaster prevention education. Regarding to the correction between each site and the deepest experience, the old town of Beichuan earthquake ruins was positively correlated with “experienced the terrible nature of earthquakes and reverence of the nature” or “experienced the value of the life”, but significantly negatively corrected with the “relax”. Meanwhile, the earthquake museum was positively correlated with a patriotism education item “the human life contains genuine feeling”; and Qiang shopping street was positively correlated with “had a relax”. Thus, in order to develop the Qiang Cheng tourism zone sustainably, the destination managers should develop more attractive tourism products such as visiting Qiang ethnic village, reducing preservation scale of the earthquake ruins, or re-writing the interpretation of the disaster sites to reduce the sad atmosphere of the zone. Furthermore, the managers should emphasis the role of tourism in natural disaster education, as it could increase visitors’ satisfaction and revisiting willingness.

Key words:

natural disaster tourism; destination brand; Beichuan; interpretation; tourist experience

Characteristics of the Cultural Space of Guanzhong Ancient Emperor Graves

QUAN Dong-Ji;ZHU Hai-Xia

Research Centre of the Great Sites Conservation and Regional Development, College of Urban and Environmental Science, Northwest University

Abstract

Guanzhong Ancient Emperor Graves are the subject of the Cultural Heritage in Guanzhong-tianshui Economic Zone. Also, it is a major component of Chinese civilization. Along with its historical evolution, the original cultural space and features has significantly changed. It is an urgent task to activate the value of cultural heritage and to better highlight the Chinese civilization. This paper, from multiple perspectives including archeology, history and human geography, analyzes the cultural connotation of space and character of Guanzhong Ancient Emperor Graves. There are six characteristics: 1. The natural and human environment is the fundamental base of the generation and evolution of the Guanzhong Ancient Emperor Graves; 2. Guanzhong Ancient Emperor Graves cultural space has a special place in the history of Chinese Mausoleum development; 3. It provides magnificent cultural landscape; 4. Guanzhong Ancient Emperor Graves cultural space has a strict system and rich cultural connotations. 5. The current situation of the cultural space is complex and contradictory; 6. The protection and utilization of the cultural space differs greatly.

Key words:

Guanzhong Ancient Emperor Graves, Cultural Space, Cultural Heritage, Features

Determinants of Island Tourism Development: The Example of Dachangshan Island

Yuting Ge

Liaoning Normal University

Abstract

Islands possess their own patterns of spatial and temporal evolution as tourist destinations. Taking Dachangshan Island as an example, two key stages were identified: a 'landscape-oriented' period from 2002 to 2009, and a 'background' stage from 2009-2012. Co-existing with both periods was changing spatial and land-use patterns of expansion and intensification. Using spatial mapping techniques, it was found that tourist resources were found to be the original driving force, tourist transportation and social and economic factors were endogenous determinants of change, and tourist enterprises and source markets subject to government policies the exogenous factors.

Development of Tourist Destinations in and Around Bhopal, Madhya Pradesh, India

Khan A.R, Dr. Chauhan G.S.

C.R. Institute of Management UTD Barkatullah University, Bhopal, India, reach2raoof@gmail.com

Abstract

It is seen that international tourism has come out as a cultural interaction to the industry during the last few decades and it's become a major sector for generating employment, income and foreign exchange for a country all over the world. This study has taken Bhopal the capital of Madhya Pradesh in India as a study area because it has numerous inherent characteristics of tourism like historical, heritage, cultural and natural. There are number of tourist point and destination in and around Bhopal which has lot of potential and of scope of tourism development due to its geographical advantage because it is centrally located and well-connected to the other parts of the country. The city has number of historical tourist points like Moti masjid, Jama masjid and Tajul masajid, Bhojpur temple, World heritage Bhimbetka, Sanchi stupas, and various other religious, economic, social destinations in and around. The basic objective of the study is to investigate present status of the tourist destination and analyze the development of tourist sites in and around Bhopal by randomly selected respondent response of different group of society from the various parts of the city. The information has been collected on the tested questionnaire regarding the indicators of development of tourist destination. Various statistical tools have been applied for result and found that there is a positive response among respondents about the development of tourist destinations in and around Bhopal.

Key words:

Destination; Development; Tourism; Scenario; Bhopal

Harnessing the Tourism Potential and its Promotion in Madhya Pradesh State of India

Chauhan Dr. G.S.

Deputy Secretary, University Grants Commission, Central Regional Office, Tawa Complex (Bitten Market),
E-5, Arera Colony, Bhopal, Madhya Pradesh, India, chauhanugc@gmail.com

Abstract

In the 21st Century, the global economic scenario is changing very rapidly and in the process of global transformation, tourism is considered to be one of the largest and fast growing industries. The occupation of tourism is providing very useful and fruitful avenues especially to those people who are engaged in tourism activities because through this smokeless industry, they are not only enhancing their standard of living but also generating income and employment opportunities. In the contemporary era of globalization and industrialization, the whole world has shrunk into a “global village”. In the last couple of years, the Madhya Pradesh has attracted considerable number of foreign & domestic tourists due to its climatic, scenic beauty and ecological resources. In the whole state, there are about 450 tourist destinations which are located at various important geographical locations and offer the rare opportunity to see them. Therefore, keeping in view, alluring and attracting maximum tourists in Madhya Pradesh, the State govt. has designated 2015-16 as “**Year of Tourism**”. According to the tourist statistics of Madhya Pradesh, the total number of domestic tourists arrivals has gone up from 22.08 million in 2008 to 63.6 million in 2014, while foreign tourists arrivals has also increased from 2,51,733 in 2008 to 3,16,195 in 2014. The current statistical figures of 2014 reveals that the percentage share of Madhya Pradesh at national level in domestic tourism is 4.93 per cent, while the foreign tourism share is merely 1.40 per cent. The state has 7th rank in domestic tourism and 13th rank in foreign tourist arrival according to the figures of 2014. The major centres of tourist attraction in the state are Khajuraho, Orchha, Bandhavgarh, Gwalior, Kanha, Panna, Sanchi, Mandu, Panch, Omkareshwar, Maheshwar, Panchmarhi and Ujjain. The research paper deals with to assess the tourism potential & its promotion in the state and to highlight the major hurdles for the promotion & development of tourism sector in the study region. The research paper also suggests important measures to promote the tourism in the state to harness its full potential.

Key Words:

Tourism Potential; Smokeless industry; Global village, Year of Tourism; Madhya Pradesh.

Prospects of Application of an Integrated Information System for the Tourism Development of the Baikal Region

Kuklina M.V.

Irkutsk National Technical University, Irkutsk, Russia, kuklina-kmv@yandex.ru

Abstract

Every year the number of tourists visiting the Lake Baikal increases by 10%. In 2015 it reached about 1.5 million, although only 10% were foreign tourists. Meanwhile, proximity to China has a lot of potential for attraction of Chinese tourists.

One of the main impediments for the development of international tourism is the lack of an integral image of the Baikal region since it is divided administratively by three subjects: Irkutskaya oblast, Republic of Buryatia, and Zabaykalsky Krai. There is no interactive map of Baikal region, although the one that would include the points of tourist destinations, accommodation, dining, shops, historical, religious and architectural attractions, etc. is needed. Also there is no multilingual information resources on the Baikal region.

Construction of the integral image of the Baikal region is the matter of federal policy that should provide a base for the different administrative units, private enterprises, and local communities to combine their informational resources under one united conception. Moreover, from the environmental point of view, the watershed of the Selenga river in Mongolia is also part of the Baikal watershed. Currently quite often international tourists visiting the Lake Baikal also visit Mongolia. So construction of the transboundary Baikal watershed regional image would benefit not only environmental, but also tourist purposes and therefore socio-economic development of the territory. The main informational resources of the region, the prospects and the main challenges of application of an integrated information system will be discussed in the presented paper.

Space Differences and Sustainable Development of Summer Tourism Climatic Resource in Qinghai-Tibet Plateau

LI Chunhua, LIU Fenggui, CHEN Rong

College of Life and Geography, Qinghai Normal University, Xining 810008, China)

Abstract

The study of tourism climatic resource provides important reference to tourists, tour operators and managers. The simple rough plateau landscape and mysterious colorful religion culture in Qinghai-Tibet Plateau have attracted a large number of domestic and foreign tourists every year. The quantitative assessment of tourism climate resource can provide a scientific basis for developing the resources and for visitors to select the proper travel time. Based on the meteorological data of meteorological stations in Qinghai-Tibet Plateau, mainly including monthly average temperature, relative humidity and average wind speed in summer (June, July and August) during 1971-2011, tourism climate resource spatial differentiation were analyzed. The result shows that: climate resource distribution in Qinghai-Tibet Plateau has obvious regional characteristics, the more comfortable places lie in the Hehuang valley and Southern Tibetan valley, whereas the uncomfortable climate regions are in the northern, western and central areas of the Plateau. The ways to develop tourism climate resources are as follows: improve the tourism public weather services; expand the breadth and depth of the development of the tourism climate resources; protect the environment of Qinghai tourism climate environment.

Key words:

Space Differences; Qinghai-Tibet Plateau; Summer Tourism Climatic Resource; Sustainable development

Spatial Differentiation and Influencing Factors of Rural Tourism Resources

Sun Jingrong

Nanjing Xiaozhuang University, Nanjing, 211171, P. R. China, wenjing581@126.com

Abstract

It is a important meaning of regional rural tourism reasonable planning to study spatial characteristics, distribution and influencing factors of rural tourism resources. This paper researches the spatial differentiation characteristics and the influence factors of rural tourism resources in Jiangsu Province by the gini coefficient and related analysis. The results show that: (1) The rural tourism resources in Jiangsu Province in both interurban level and international level has obvious imbalance, and the distribution of evenness is very low; (2) From the point of spatial distribution density of regional rural tourism resources, rural tourism resources in Jiangsu Province can be divided into high density zones, medium density zones and low density, high density zones including Wuxi, Suzhou, Changzhou and Zhenjiang, medium density zones including Lianyungang, Nanjing and Yangzhou, low density community including Taizhou, Nantong, Yancheng, Xuzhou, Huaian and Suqian. From regional level, the spatial distribution density of the rural tourism resources in Jiangsu Province presents "southern above middle in Jiangsu Province, middle is higher than the north in Jiangsu Province " spatial pattern; (3) The spatial distribution of regional rural tourism resources affected by the regional economic development level and the impact of tourism economic development level.

Key words:

rural tourism resources; spatial distribution; the influence factors; Jiangsu Province

The Equilibrium Analysis Model of Ethnic Village Tourism Sustainable Development

XIA Bing

Northwest Normal University, Lanzhou, 730070, P. R. China, 178383415@qq.com

Abstract

Ethnic village tourism is the core of China's national tourism attraction, is the basic unit of the whole industry chain of comprehensive tourism, is a new direction and a new growth point in the future development of ethnic tourism. The goals of sustainable development of ethnic village should include economic, cultural, ecological, human and social values, and also should include many other dimensions. Based on the analysis of the basic attributes of tourism function on the influencing factors to seek universal influence factors and general conditions through the analysis of the behaviours and the notion of stakeholders, this study finds out the influence variables of the tourism economic value, cultural value, ecological value and human value. It also analyzes the functional relationship and hierarchical relationship between the influence variables. With introducing Cobb Douglas production function, the study takes the core variables as the input of production factors of the sustainable development, after that, constructs the equilibrium model of sustainable development for ethnic village tourism.

Key words:

ethnic village tourism; sustainable development; equilibrium analysis model; tourism value

Tourist behavior analysis and tourism destination evaluation study

Han Cao, Zhenxuan Wang

The College of Computer Science, Shaanxi Normal University, Xian, 710119, P. R. China, caohan@snnu.edu.cn

Abstract

The number of domestic tourists and the number of domestic tourism destinations have increased rapidly as tourism industry has encountered its explosive growth in recent years, which leads to travel business to be one of the most important incentives of economic. The research of spatial-temporal behaviors of tourists is helpful for tourism market managers in many ways, such as customizing sophisticated promotions, conducting effective traffic control. On the other hand, number of tourism destinations has increased a lot recently, which strengthen competition between different tourism destinations. In order to be more competitive and attract tourists from all over country or even all over the world, concerned organizations of destination firstly needs to identify weak points there exists, thus the requirement for effective evaluation model of tour destination has increased.

In tradition, researchers conduct tourism researches using tourists and destination data collected by manually approaches, such as questionnaire et al. Nowadays, with the development of Web 2.0 technology, more and more tourists choose to share their travel experiences with friends and strangers in Internet, which generates lots of UGC data (User Generated Contents) and provides researchers with a new reliable data source. This study analyzes domestic tourists spatial-temporal behaviors based on UGC data. Meanwhile, there are still some shortcomings in current destinations evaluation models, this paper proposes a new destination evaluation model that evaluate attractiveness of destinations.

Key words:

tourism destination; tourists spatial-temporal behavior; destination evaluation model; clustering analysis

Tourists' Wayfinding and Spatial Behaviors in Mountain Sanqingshan Based on the Analysis of Space Syntax and Decision Tree

Liu Peixue^{1,2}, Wu Ronghua¹, Zhang Jie¹, Wu Chen¹

¹School of Geographic and Oceanographic Sciences, Nanjing University, Nanjing 210023, China, lpx1555@gmail.com

²Guangzhou Urban Planning & Design Survey Research Institute, Guangzhou 510060, China

Abstract

This paper analysis tourist's spatial behavior in the interior space at the micro level, taking the factors of complex objective environments, perceiver characteristics, cognition and abstract persons (team) into account in tourists' spatial behavior. Using questionnaires to get tourists' spatial behavioral data and perception data, etc. (received 558 valid questionnaires). Applied the method of space syntax, kernel density analysis to analyze the internal spatial structure of tourist trails and spatial layout of scenic spots in Sanqingshan. And analyze the relationships between spatial structure and tourists' spatial behavior. Choosing cluster analysis is used to sum the 120 kinds of tourist paths in six major types of spatial patterns, and Mann-Whitney U test and variance analysis are used to test the difference in variables, the tourists' spatial behavior has largely depended on the demographic and travel characteristics of individual. Motivation affects the tourists' spatial behavior through space choice preferences. Basing on decision tree approach to establish the tourist-based spatial choice rule models in which the tourists' spatial behavior index is as independent variable and the individual characteristics, tourism characteristics, motivation and perceived criterias for space choice indexes are as dependent variable. The perception scale of criteria for space choice can be divided into four categories: objective environmental factors, soft environmental factors, expected arrangement factors and their characteristics factors. Tourists cognition differences in whether or not objective environmental factors affect spatial behavior are very important to determining the subsequent spatial behavior.

Key words:

Space syntax; Decision tree; Spatial behavior; Wayfinding behaviors

A Perspective on the Heritage of Dai People's Simple Ecological Cultural Tradition in Winter Resort Xishuangbanna

Chen Ying¹, Lin Jinping^{*1,2}, Luo Yumei³, Huang Zhuqun¹, Guo Yanqin⁴

¹School of Resource Environment and Earth Science, Yunnan University, Kunming 650091, Yunnan, China;

² Institute of Geography Yunnan, Kunming 650223, Yunnan, China;

³School of Business Administration and Tourism Management, Yunnan University, Kunming 650091, Yunnan, China;

⁴College English Teaching Department, Yunnan University, Kunming 650091, Yunnan, China

Abstract

By choosing 9 Dai villages in winter resort Xishuangbanna as its research areas, taking the heritage of Dai people's ecological cultural tradition as a highlight and using questionnaires and interviews as its research methods, this paper attempts to analyze villagers' environmental knowledge, attitudes, comments and anticipatory behavior, and penetrate into the ecosystem of "harmony between man and nature" and "reverence for life" formed by Dai people's ecological views which are contained in their traditional culture. These ecological views include such things as their simple religion, mode of production and life, and language and culture. Dai people's unique ecological cultural tradition and the winter resort climate tourism resources in Xishuangbanna will form a coupling effect. It will cater for the dramatic increase in the tourist needs for winter resort caused by the current extreme weather, and promote the sustainable development of ecological tourism in Xishuangbanna.

Key Words:

winter resort; Dai people in Xishuangbanna; the heritage of ecological cultural tradition; coupling effect

City Space, Tourism and Livestock Management in Gaborone, Botswana

Lenao, M and Saarinen, J

University of Botswana, Department of Tourism and Hospitality Management, Gaborone, Botswana,
semonle@yahoo.com

Abstract

Many cities around the world pride themselves on their ability to attract visitors from within their regions and beyond. Even those without adequate independent appeal as tourist destinations in their own right sometimes have roles as important gateways to more popular destinations within their countries and regions. Either way, these cities should always strive for higher levels of competitiveness, through among others, maintaining considerable standards of cleanliness, security and safety. Gaborone city, in Botswana, is not only the administrative capital of the country but also a critical gateway to such places as the Okavango Delta and Chobe National Park. In recent times this city has experienced an upsurge in numbers of domestic livestock (especially cattle) from neighbouring villages and localities. The presence of such large populations of cattle on the city spaces has prompted some reaction from different sections of society including the media, political leadership, residents and road users. This paper uses data from personal interviews, media commentaries and other sources to analyse the relationship between tourism and livestock management on the city spaces of Gaborone. The results show that owing to, inter alia, erratic livestock management practices, poor bye law enforcement and urban encroachment the increased population of livestock in Gaborone presents a challenge to the city's tourism competitiveness as it spoils the general ambience, tempers with landscape decors, as well as with the safety of travellers. The paper argues for review of current livestock management practices as well as bye-law enforcement practices.

Key words:

Tourism development; city spaces; livestock management; competitiveness; Gaborone

Climate Change and its Impacts on Tourism and Livelihood in Manaslu Conservation Area, Nepal

K.C., Anup

Environment and Social Studies Department, Nepal Electricity Authority, Kharipati, Bhaktapur, Nepal;
kcanup04@gmail.com

Abstract

The Hindukush Himalayan region including Nepal, a country reliant on tourism, is particularly sensitive to climate change. However, there are considerable gaps in research regarding tourism, livelihood and climate change in Nepal. The present research assesses the impact of climate change on tourism and livelihood in the Manaslu Conservation Area (MCA) of Nepal. Seventy-six households were interviewed followed by three focus group discussions and five key informant interviews. The empirical data collected at the site are complemented by secondary data on climate and tourism. Correlation, regression and graphical analysis was carried out for the presentation of data. Local people perceived that temperature and rainfall have been increasing in the study site as a result of climate change. Socioeconomic variables such as marital status, size of household, education and landholding status had positive effect on tourism participation while livestock-holding status and occupation of the household had negative effect on tourism participation. Number of visitors is increasing in MCA in recent years, and tourism participation is helping local people to earn more money and improve their living standard. In response to gradually warming temperature and decreasing snowfall, there seems an urgent need for tourism promotional activities in the study area. Also awareness and education related to tourism, gender empowerment of women, advertisement and publicity on tourism promotion, adequate subsidy and training on ecotourism and skill development trainings on handicraft are recommended.

Key words:

Climate change; tourism; livelihood; MCA; Nepal

Does the Space Shape Residents Attitudes towards Tourism Development? Evidence from Residents in Hong Kong

Lei Fang, Hanqin Qiu, Shenjun Yao

Department of Geography, The University of Hong Kong, HongKong SAR, China, rainfield.f@gmail.com

Abstract

In this study, we analyze attitudes toward tourism development in Hong Kong, using survey questions and a logistic regression method for measuring spatial and demographic factors affecting tourism development. Results show that neither residence distance from the tourism core nor economic dependency significantly influenced tourism growth and development in Hong Kong, while gender and age factors had significant relationship with local resident attitudes towards tourism development. Women and the youth are more likely to agree with the Individual Visit Scheme (IVS) for mainland China visitors. They stand for social vulnerable groups but are more inclusive than others. Hence, policy on inclusive development should be adopted in tourism industry of Hong Kong.

Key words:

Spatial factors; Resident attitudes; GIS; Ordinal logistic regression model

Environmental Ethics and Its Effect on Sustainable Tourism Behavior, A Review

Feifei Xu

Southeast University, Nanjing, P. R. China, 101011780@seu.edu.cn

Abstract

The human nature relationship is fundamental in resource management, while environmental ethics is critical to sustainable development (Schroeder 2007). Sustainable tourism has become a research focus in the past decades (Clarke 1997; Swarbrooke 1999; Liu 2003; Gossling, Hall & Weaver 2009). However, Buckley (2012 p534) argue that mainstream tourism is still “far from sustainable”.

Through extensive literature review, this conceptual work seeks to answer the following research questions:

1) What are the key components of environmental ethics and how to measure them? 2) What factors influence a person’s environmental ethics, and in a tourism context, what shapes tourists environmental ethics, as tourism activities usually happens beyond our daily lives. 3) Is there a casual relationship between environmental ethics and sustainable tourism behavior?

Preliminary results suggest environmental morality, environmental belief and environmental attachment are key components of environmental ethics, although sometimes, it is not easy to differentiate environmental morality and environmental belief. Among all the factors, value system is the most influential factor in developing tourists’ environmental ethics, while cultural is another critical factor. The Value Basis Theory (Stern & Dietz 1994) suggests a person’s belief about the environment significantly influences his attitude towards the use of the nature resources. A casual relationship can be found between environmental ethics and sustainable tourism behavior (Xu & Fox 2014), which suggest changing to a more ecocentric attitude would significantly improve sustainable tourism development.

Key words:

Environmental ethics; environmental belief; environmental attachment; sustainable tourism behavior

Flood Risk Assessment of Coastal Tourism Affected by Sea Level Rise and Storm Surge: A Case Study in Zhejiang Province, China

Yan Fang¹, Jie Yin^{2*}, Bihu Wu¹

¹ College of Urban and Environmental Sciences, Peking University, China

² School of Geographic Sciences, East China Normal University, China

Abstract

Sea level rise (SLR) and storm surge have significant impacts on tourism properties and activities in the low-lying coastal region. Coastal tourism in Zhejiang province, China is physically and socio-economically susceptible to the flood risk posed by accelerated SLR and intensified storm surge. In this paper, within a scenario design of SLR and storm surge, a GIS-based dataset of major coastal tourism properties in coastal Zhejiang is created to assess their potential flood risk by using a simple inundation model and a risk matrix. It is estimated that only 2 resorts would be directly flooded by a SLR of 1 ~ 2 m but extensive inundation of coastal tourism communities may occur during low frequency surges, especially after adding predicted 1 m SLR. The risk assessment further show that a majority of the exposed sites is subject to moderate and low risk at current state but would be at higher (moderate and high) risk categories in the future. In the long term, a combination of adaption measures are presented for policy-makers and other stakeholders for sustainable flood risk management in coastal tourism destinations.

Key words:

Climate change; Coastal tourism; Risk assessment; Adaptation; Zhejiang province

Fragile Mountain Ecosystem: Need for Sustainable Tourism a Case study of Kedarnath

Kaur Dr. Ushvinder

Associate Professor, Swami Shraddhanand College, University of Delhi. ushvinder.kaur@gmail.com

Abstract

Mountains are an important source of water, energy and biological diversity, and of key resources as minerals, forest and agricultural products. As a major ecosystem representing the complex and interrelated ecology of our planet, mountain environments are essential to the survival of the global ecosystem. Mountain ecosystems are, however, rapidly changing. They are susceptible to accelerated soil erosion, landslides and rapid loss of habitat and genetic diversity. As a result, most global mountain areas are experiencing environmental degradation. Hence, proper management of development of mountain resources deserves immediate action.

Today, tourism is one of the largest and dynamically developing sectors of external economic activities. Its high growth and development rates, considerable volumes of foreign currency inflows, infrastructure development, and introduction of new management and educational experience actively affect various sectors of economy, which positively contribute to the social and economic development of the country as a whole. But it is known that this industry has its negative and disastrous impacts also, for example, attractive landscapes and scenic destinations are spoiled by tourist buildings. The fragile zone without any proper checks and balances causes disastrous impacts. Kedarnath became vulnerable to natural disasters in the area as a result of increasing anthropogenic activities and large scale increase in the number of pilgrims related to religious tourism.

Sustainable development requires participatory decision-making processes and enhancing the carrying capacity of the region. Sustainable tourism has three “pillars”: environmental, economic, and socio-cultural. Tourism has to be sustainable in all three areas to truly be considered “sustainable tourism.”

Key words:

fragile mountain ecosystem; sustainable tourism; carrying capacity

Identification of Ecotourism Potential Villages in Ecological Sensitive Zone of Northern Part of Western Ghats in Maharashtra, India

Jaybhaye R. G, Shelar T. C.

Professor, Dept. of Geography, Savitribai Phule Pune University, Pune, 411007, India, jaybhayerg@gmail.com

Abstract

The Western Ghats is rich in biodiversity and cultural heritage but due to significant human interference like mining, industrialization, mass tourism etc. getting rapidly degraded environment and declared as biodiversity hotspot. The Indian government took the cognizance and the area identified as ecologically sensitive zone to impose restrictions on economic and development activities. It created unrest among the local people. Similarly, the area has number of famous natural and cultural tourism attractions. On this background of dilemma on environment or development, ecotourism could be the one of the best alternative for conservation of natural and cultural resources with well-being of local communities. The main objective of the paper is to find out ecotourism potential sites suitability by using Analytical Hierarchical Process in Arc GIS platform. The area covers 294 ecologically sensitive villages. The assessment is based on the major factors such as natural landscape, wildlife, topography, accessibility and cultural environment and nine sub criteria like visibility, land use/cover, reserved forest, species diversity, elevation, slope, proximity to cultural sites, historic sites and natural landscape and distance from roads by overlaying the hierarchy wise weighted these parameters. The result obtained in four level of suitability like high, medium, marginal and not suitable. The outcome of analysis revealed that out of the total, around 50 villages are highly suitable for ecotourism development. The ecotourism development in these villages may resolve dilemma of environment and development to truly achieve sustainable development.

Key words:

Ecotourism; Western Ghats; Ecological sensitive zone

Research on Formation Mechanism of Petty Bourgeoisie Operational Types in Ancient Town Tourist Destinations from the Perspectives of Taste and Distinction: Case Study of Xitang Ancient Town

Weng LS, Weng SX

Center for Tourism Planning and Research, School of Geography and Planning, Sun Yat-sen University, Guangzhou, 510275, P. R. China, 934699343@qq.com

Abstract

Commercialization of ancient town tourism is one of hot issues in tourism research. Past researches mostly focus on phenomenon and result of tourism commercialization, but only a few studies explore formation mechanism of commercial types in ancient town tourist destinations from the perspectives of evolution. Taking Xitang Ancient Town as the case, this paper conducts field survey and combines semi-structural interview method with observation method and applies taste and distinction theory of Bourdieu to interpret formation mechanism of petty bourgeoisie tourism operational types in Xitang Ancient Town, indicating that petty bourgeoisie tourism operational types initially originate from aesthetic taste of petty bourgeoisie tourists, and secondly, reception and imitation of consumption preference of petty bourgeoisie group by mass tourists promotes the rise and development of petty bourgeoisie tourism operational types. Finally, as it is difficult to “escape” from mass tourists spatially, petty bourgeoisie group pursues to show their difference in aesthetic taste and consumption taste from mass tourists when they are at the same space with mass tourists and try to get rid of mass tourists’ imitation, make efforts to search for new consumption taste for their re-distinction from mass tourists, all of which will upgrade petty bourgeoisie tourism operational types. The discovery has certain meaning for studying evolution rules of commercial types in tourist destinations.

Key words:

aesthetic taste; distinction; petty bourgeoisie; petty bourgeoisie tourism operational types

Study on the Driving Mechanism of the Tourists' Pro-environment Behavior Based on the Cognition of the Soundscape

Qiu Mengyuan, Zhang Jie, Zhang Honglei, Yan Bingjin, Chen junjie, Mao Ling

Department of Land Resource and Tourism Sciences, Nanjing University, Nanjing 210046, P.R. China,

q.q.881123@163.com

Abstract

soundscape is a combination of various sounds in the environment. It not only embodies the natural properties of the acoustic environment, but also reflects the historical and cultural connotation of the place. It is an important part of the tourist landscape system. However, research on how tourists perceive soundscape and the relationship between soundscape and tourists' pro-environment behaviour remain blank. In this paper, we based on the relationship between tourists' place attachment and pro-environment behaviour, introducing soundscape cognition as an exogenous variable, to analysis the driving mechanism of pro-environment behaviour. We totally collect 565 questionnaires in Gulangyu Islet, using SEM (structural equation model) for data analysis. The results illustrate that soundscape cognition is an important factor for the construction of place attachment and can indirectly influence tourists' pro-environment behaviour. The two major soundscape cognition indicators, soundscape perception and soundscape association, play a different role. In China, tourists show more high effort pro-environmental behaviours than low effort pro-environmental behaviours. This paper provides a new idea for to explore tourists' behaviour. We believe the results will have significant implications for the sustainable development of tourist destination and the protection of soundscape.

Key words:

soundscape; cognition; place attachment; pro-environment behavior

Study on the Potentiality of Tourist Resources in Winter Resorts Driven by Elderly Consumers' Needs

Lin Jinping^{1,2}, Luo Yumei³, Guo Yanqin⁴, Chen Ying¹, Huang Zhuqun¹

¹School of Resource Environment and Earth Science, Yunnan University, Kunming 650091, Yunnan, China;

² Institute of Geography Yunnan, Kunming 650223, Yunnan, China;

³School of Business Administration and Tourism Management, Yunnan University, Kunming 650091, Yunnan, China;

⁴College English Teaching Department, Yunnan University, Kunming 650091, Yunnan, China

Abstract

Consumers' new needs bring creative potentiality for the winter resorts destination. In recent years, extreme weather conditions such as extreme cold, fog and haze, snow disasters and ice rain have affected our country greatly. Extreme weather conditions lead to many types of diseases such as respiratory problems, angiocardopathy and diseases of the digestive tract, resulting in the increasing rates of sickness and death. Meanwhile, such problems as the energy consumption, air pollution and PM2.5 dust brought out by the heating system in north China bring great harm to people's health. The sharp conflict occurs between the dramatic increase in tourists' needs for winter resort and the scarcity of resources of winter resort. By taking as examples the destination of winter resort tourism such as Xishuangbanna, and using the driving force of elderly consumers' needs as a sally port, this research is going to discuss how to combine the scarce climate resources of winter resort and the opportunities of sustainable ecological tourism development so as to exert the advantages of energy saving, low-carbon life of winter resort tourism and explore and analyze the potentiality of tourist resources in winter resort.

Key words:

the elderly consumers' needs; scarce resources of winter resort tourism; low-carbon life; developing potentiality; sustainable ecological tourism

The Sound of a Destination: Soundscape Perception and Its Influence on Tourist Satisfaction

Liu A, Wang X L, Liu F, Deng Z, Yao C

Capital Normal University, Beijing, 100048, P. R. China, beyondtour@163.com

Abstract

Soundscape, as an integral part of tourism destination, could affect tourist experience. However, understanding of the relationship between soundscape and tourists remains to be limited. This paper argues that tourist satisfaction could be perceived from the perspective of sensory experiences and aims to address the neglected area of tourism study by examining the relationship between soundscape satisfaction and tourist satisfaction. Factors including sound preference, soundscape expectation and soundscape perception as well as their influences on tourist satisfaction are also discussed in the paper. A typical case, Hongcun, an ancient village that became UNESCO world heritage site in 2000, located in the tranquil countryside setting of Anhui Province in China was chosen to conduct the empirical study through self-administrated questionnaire. The results derived from the structure equation model revealed that there is significant correlation between soundscape satisfaction and tourist satisfaction, which implies that the soundscape of destinations should be improved in order to enhance tourist satisfaction in practice. Findings also revealed that sound preference has no influence on soundscape satisfaction and tourist satisfaction, while soundscape expectation has influence on tourist satisfaction and soundscape perception has influences on soundscape satisfaction, which shows that soundscape satisfaction has no effect mediating role for cultivating positive tourist satisfaction. The findings of this study contribute to tourism management literature by addressing the importance of soundscape and how soundscape perception could influence tourist satisfaction. We argue that effective management of soundscape is as important as managing a destination's visual image.

Key words:

soundscape; tourist satisfaction; sensory experience; Hongcun Village

Tourism, Protected Areas and Conservation in Northern Botswana: Can Game Reserves Provide a Lasting Solution to Human Wildlife Conflicts?

Mbaiwa, J.E., Thakadu, O.T.

University of Botswana, Okavango Research Institute, Private Bag 285, Maun, Botswana, JMbaiwa@ori.ub.bw

Abstract

Human Wildlife Conflicts (HWCs) are a threat to natural resource sustainability, food security and livelihoods in northern Botswana. Using the concept of sustainability, this paper analysis whether the creation of tourism of game reserves around existing Protected Areas cannot provide a lasting solution to human wildlife conflicts in northern Botswana. Both secondary and primary data sources are used in this study. Preliminary results indicate that the creation of game reserves for tourism development around existing protected areas such as Moremi Game Reserve especially along the Buffalo Fence in the Okavango Delta, Chobe National Park in the Chobe District and Makgadikgadi Nxai Pans National Park has the potential to provide a lasting solution to human wildlife conflicts in the region. The creation of game reserve around existing PAs suggests a modification from the current land use planning to include small land units around PAs. These land units should be leased out to private tourism investors for tourism development especially for photographic tourism. The land units should have game fences electrified separating agro-pastoral land uses with wildlife-based tourism zones. While this has the potential to increase land for tourism development, it also has the potential to mitigate against HWC. Managing HWCs is critical to achieve sustainability in northern Botswana. Sustainability requires agreed land use zonation for agro-pastoralism on one the hand and wildlife and tourism on the other.

Key words:

Human-wildlife conflicts; game reserves; protected areas; sustainability; predation; crop damage

Wetland as a Source of Sustainable Livelihood -A Case Study of Mansar Wetland, J & K- India

Asgher. Sarfaraz, Bhatt. Gulshan

Department of Geography, University of Jammu, Jammu. J&K, India-180006. sasgher20@gmail.com

Abstract

Since the evolution of mankind on this earth, water bodies act as a source of attraction for human settlement due to diverse facilities provided by it. The facilities like habitat, food, connectivity, strategic importance etc. provided by water bodies attracted human being in the past to settle near it. The wetlands in India play an important role in human life due to their scenic beauty and ecological importance. The Mansar wetland in Jammu and Kashmir has its own importance in terms of livelihood and sustainability for the inhabitants residing nearby. Despite being a source of pilgrimage as well as other type of tourism due to its religious and scenic beauty, this wetland also has its ecological importance due to its diverse flora and fauna. The influx of tourist for different purposes makes it a good source of income for many local inhabitants. The economic importance of wetland attracts many people from nearby to settle near the wetland. Looking at the multifarious benefits and importance of the wetland, the present study has been done to find out the dependence of local for their livelihood; efforts of various agencies to develop the tourism structure, and the present problems prevailing there. The present study is primarily based on primary sources of data and collected data was assessed to draw the conclusion based on identified objectives.

Key Words:

Mansar; Pilgrimage; Wetland; Tourist; Ecological; settlement

A scenario simulation based study on forming mechanism and dynamic evaluation of natural hazard related risks to tourists

yong shi

Zhengzhou University, China, yongshi@zzu.edu.cn

Abstract

Ensuring the safety of tourists is critical to tourism development; and risk to tourists has been a serious inhabiting factor to the long-term sustainability of Chinese tourism. As such, tourist risk management has become an important field of research in recent years. Based on a systematic analysis of literature on risk management in the contexts of tourism and natural disasters both at home and abroad, this study will conduct an in-depth investigation into the unique characteristics and patterns of evolvement of risks to tourists in a background of increasing occurrence of natural disaster as a result of global warming and an era of mass tourism, comprehensive tourism and self-organized tourism. The Songshan Mountain is selected as the study area, acting as the simulation environment for the demonstration of formation mechanism and dynamic evaluation of the risk to tourists. Based on scenario analysis, this paper will focus on the tourists – a key stakeholder group in tourism development, the study will analyze the destructive mechanism of torrential floods on tourists, quantitatively evaluate the spatial–temporal characteristics of the torrential flood caused risks under different levels of hazard, exposure and vulnerability based on scenario simulation, various statistical analyses and field research. The study will involve a number of stages, focusing on risk identification, risk analysis, risk assessment and risk response, in order to construct a more comprehensive workflow and best practice model of risk management. A spatiotemporal approach will be used in the analysis of risks, aiming to demonstrate the evolution of flood risk over time and space for various receptors. A framework for assessing future tourist risk, including the evolving hazard characteristics, changing vulnerability and convoluted flood damages will be established. This will provide a strong scientific basis for the prevention, management and mitigation of risks to tourists in an increasingly uncertain future for various stakeholders.

Key words:

tourist risk; scenario simulation; natural hazards

Analysis of the impact of recreational trail usage for prioritizing management decisions: a regression tree approach

Tomczyk A.M., Ewertowski M.W., White P.C.L., Kasprzak L.

Adam Mickiewicz University, Faculty of Geographical and Geological Sciences, Poznan, Poland, alto@amu.edu.pl

Abstract

The dual role of many Protected Natural Areas in providing benefits for both conservation and recreation poses challenges for management and requires decisions to be made about how to prioritise and direct management actions. Trails are commonly used to divert visitors from the most vulnerable areas of a site, but high visitor pressure can lead to increases in trail width and a concomitant increase in soil erosion. Here we use detailed field data on condition of recreational trails in Gorce National Park, Poland, as the basis for a regression tree analysis to determine the factors influencing trail deterioration, and link specific trail impacts with environmental, use related and managerial factors. We distinguished 12 types of trails, characterised by four levels of degradation: (1) trails with an acceptable level of degradation; (2) threatened trails; (3) damaged trails; and (4) heavily damaged trails. We also proposed five types of monitoring of recreational trail conditions: (1) rapid inventory of negative impacts; (2) monitoring visitor numbers and variation in type of use; (3) change-oriented monitoring focusing on sections of trail which were subjected to changes in type or level of use or subjected to extreme weather events; (4) monitoring of dynamics of trail conditions; and (5) full assessment of trail conditions, to be carried out every 10-15 years. The application of the proposed framework can enhance the ability of park managers to prioritise their trail management activities, minimising adverse impacts on the conservation value of the ecosystem.

Key words:

protected areas; condition class assessments; recreational impact; trail degradation; Gorce National Park; Geographical Information Systems

Characteristics and Development Potential of Tourism Resources in Xinjiang

AERSILANG, MAMUTI

College of Geographical Science and Tourism, Xinjiang Normal University, Urumqi 830054, Xinjiang, P.R.China,
arsilan60@xjnu.edu.cn

Abstract

Cultural tourism resources mainly include two aspects, natural resources and human resources. Human resources are deposited culture of a long time and are a concentrated reflection of people's thinking, where culture is the carrier. The cultural tourism resources have relatively broader category, it is the cultural integration of natural resources into the beautiful landscape with strong ethnic style and the perfect fusion of the natural and cultural landscapes. Regional culture and natural beauty are the two basic elements of the regional tourism resources, and together they laid an objective foundation for tourism development. The ethnic culture is the most unique tourism resources, ethnic villages, architectural forms, lifestyle, clothing, diet, religion, music, dance, festivals and other cultural resources is a typical representative of the modern tourism products. Cultural tourism resources is the prerequisite and basis for cultural tourism, efficient use of resources and development of cultural tourism has become an important indicator to measure the level of development of cultural tourism industry. Xinjiang is located in the hinterland of the Eurasian continent, having served, since ancient times, as a national migration corridor, multi-ethnic enclaves, and east and west mingled for a variety of cultural, it is a concentrated and representatives of the world-famous "Silk Road", and its cultural characteristics differs from the mainland, Central Asia, and the Middle East. Over the years, various ethnic groups live together and develop together here, their culture influence each other, penetrate and interact with each other, has formed a cultural and multi-source generated, coexistent and development cultural system and local characteristics of ethnic cultural resource type. In short, Xinjiang is one of the areas in China that has the largest proportion of China's ethnic minority population, and the richest ethnic cultural tourism resources types. It has a series of characteristics like wide range of cultural resources, rich cultural heritage, high visibility and uniqueness. Among which, minority culture, cultural relics and red culture are the three pillars of the cultural tourism resources in Xinjiang. Therefore, re-analysis of the tourism resources in Xinjiang and the correct classification, evaluation and positioning, is an important and urgent major issue to study. It can better demonstrate the characteristics and development potential of tourism resources in Xinjiang as well as its unique charm.

Key words: Xinjiang; tourism resources; development potential

Measure and empirical analysis of eco-efficiency in tourism destinations based on an SBM-DEA model

Peng H S, Zhang J H

Department of Land Resources and Tourism Science, Nanjing University, Nanjing, 210023, P. R. China,

zhangjinhe@niu.edu.cn

Abstract

Many tourism destinations are characterized by interactions between people and the environment. Typically, research on the eco-efficiency of tourism destinations is the basis for the formulation and implementation of inclusive, sustainable development policies and measures. Based on a time series Slack Based Measure-Data Envelopment Analysis (SBM-DEA) model including unexpected output, we built a model to measure the eco-efficiency of tourism destinations and an evaluation index system. We chose the Huangshan scenic area as an example, using input and output data from 1981 to 2014 to measure the eco-efficiency of the tourist destination composite system, and analyzed its evolution characteristics and phases. We used a Tobit regression model to empirically test the influence factors. The results showed the following: (1) Eco-efficiency (technical efficiency) has grown continually and has great development potential. In the decomposition, pure technical efficiency is the most influential and scale efficiency the second most. Scale efficiency is a decisive factor for technical efficiency. (2) The evolution of tourism ecological efficiency has four stages: initial-inefficient stage, rapid growth stage, mature-efficient stage and downside risks stage. The eco-efficiency characteristics and influencing factors in different stages are different. (3) The level of tourism development, industrial structure and technical level have a significantly positive impact on eco-efficiency, but investment levels have a significant negative impact. The environmental regulation that emphasizes the management of waste is not effective in promoting eco-efficiency.

Key words:

tourism eco-efficiency; time series of SBM-DEA model; Tobit regression analysis; Huangshan scenic area

Relationships among Hearing-Impaired College Students' Leisure Motivation, Participation and Satisfaction

Fujia Tang, Zhenfang Huang

Nanjing Normal University, China, suuntt@163.com

Abstract

In order to explore the characteristics of hearing-impaired college students, this paper takes the hearing-impaired college students of Nanjing Normal University of Special Education as a typical example, adopts mathematical statistics and structural equation model methods on the basis of questionnaire survey and depth interview, and analyzes the relationships among the leisure motivation, participation and satisfaction of the hearing-impaired college students. The results showed: (1) the path "leisure motivation" → "social leisure activities participation" → "leisure satisfaction" is positively affected while affection isn't remarkably on the path "leisure motivation" → "personal leisure activities participation" → "leisure satisfaction". (2) this paper verifies leisure satisfaction feedback model, and explains leisure behavior is constantly changing under the amendment of satisfaction infecting motivation. It provides support to the further improvement of the leisure satisfaction of hearing-impaired students.

Key words:

hearing-impaired college student; leisure motivation; leisure participation; leisure satisfaction

Scientific approach in recreational development in protected areas in Russia:

Eastern Lake Baikal case studies

Myadzelets A.V., Luzhkova N.

V.B. Sochava Institute of Geography SB RAS, Irkutsk, Russia, anastasia@irigs.irk.ru

Abstract

The development conception of natural protected areas has been updated in past several years in Russia. Federal reserves used to be areas with limited access with exception to staff and certain researchers. Now the Russian government aims to introduce ecological or educational tourism in protected areas to the society. It will help learn more about the nature and raise environmental awareness. Recognized by the UNESCO, biosphere reserves had practiced ecotourism before the changes, therefore, the new concept was adopted in Barguzinsky State Biosphere Reserve. It is located in the northeastern part of Lake Baikal in Siberia and is the oldest PA in Russia. Barguzinsky Reserve and Zabaikalsky National Park have one management body – Federal State Establishment “Zapovednoe Podlemorye”, which is in charge of protection, educational and ecotourism. Tourism planning here faces several challenges such as remoteness and inaccessibility of the territory, poor tourist infrastructure and difficulties merging protection politics and economic development. Scientific approaches and applied investigations can bring a solution. Next steps have been made in Barguzinsky: Determining of “points of growth” with historical infrastructure and tourist attractions. Field work for review of the chosen points of growth, planning of possible routes around them and data collecting for the landscape description. Applying of geosystem approach for justification of tourist routes. It includes landscape mapping, assessment of potential sustainability and sensitiveness to anthropogenic loads, preparation of ecosystem monitoring plots at points of growth.

Sustainable Thermal Tourism in Turkey: Afyonkarahisar Example

Baş İ., Taro A

Selcuk University Aksehir Vocational High School, Aksehir / Konya / Turkey,

Corresponding author: ibrahimbass@selcuk.edu.tr

Abstract

Turkey is a very rich country in terms of diversity of tourism activities. Turkey is currently the 6th most popular tourist destination in the World with 41,6 million tourist visits and 31,5 billion \$ tourism revenue. If Turkey is planned to evaluate more efficient its natural beauty and cultural richness, Turkey can reap a greater share of World Tourism pie. However, the protection and nurturing of tourism destinations during this process is required. It is seen that the irreversible damage and unprotected of natural and cultural structure in areas with rapid tourism activity. By this type of damages the importance of sustainability in tourism is better understood.

Thermal Tourism which is a type of Health Tourism. Turkey is one of the best rapidly growing country of the World in Health Tourism. Some of the areas to be treated to 60 percent cheaper in Turkey compared to most European countries. In 2014 the number of arrivals to Turkey for health tourism 400 thousand.

Afyonkarahisar is one of the leading thermal tourism centers in terms of high level of mineral water quality. It is seen a rapid increase in thermal plants since 2000 in Afyonkarahisar.

Therefore, protecting efficiently and using thermal sources is important. The most important principle of Ministry of Culture and Tourism is sustainability objectives in the 2023 strategy. In this strategy, it has been targeted construction plans and effectively distribution of geothermal water in thermal tourism centers.

A Study on Methods of Designing and Managing Nature Disaster Heritage Sites

Chuntao Wu, Qian Dai

School of Tourism, Sichuan University, Chengdu City 610064, PR China, chuntao@scu.edu.cn

Abstract

In China, the natural disaster tourism developed quickly after the “5.12” Wenchuan Earthquake. This paper aims to explore the methods of designing and managing dark heritage sites at the nature disaster devastated areas, by taking Beichuan Qiang Cheng Tourism Zone and Wenchuan Special Tourist Area as study regions. Both of those two sites are located at the actual sites of death/suffering and adopted educational orientation. Semi-structure interviews with elites from local tourism industries and questionnaire survey with tourists are methods used by this paper. Particularly, the questionnaire survey focused on the effects of different interpretation or display methods on tourists’ visit experience and revisit willingness. The results show that Beichuan Qiang Cheng Tourism Zone is darker than Wenchuan Special Tourist Area, in term of interpretation, display and size of earthquake ruin. The deepest experiences of the tourists were “felt the terrible nature of earthquakes and reverence of the nature” “felt the solidarity spirit of disaster resistance” and “felt the value of the life”, but many tourists in Wenchuan have a feeling of relaxation. Thus, in order to attract more tourists, the destination managers in Qiang Cheng tourism zone need to reduce the sad atmosphere of the zone, and the destination managers in Wenchuan can re-build Yingxiu a new image as a town of leisure.

Key words:

natural disaster tourism; destination management; Beichuan; Yingxiu in Wenchuan; “5.12” Wenchuan Earthquake

Forming Process of a Comprehensive Tourist Destination in the Higashi-Kishu District of Mie Prefecture, Japan

Isono T.

Tokushima University, Tokushima, Tokushima, 7708501, Japan, takumitakumitakumi.january@gmail.com

Abstract

This study describes the forming process of a comprehensive tourist destination in the Higashi-Kishu district through an analysis of local residents' efforts. Based on the district's rich natural environment, local residents have historically engaged in the key industry of forestry and fishing. However, this primary industry has fallen into decline due to recent depopulation. Under the circumstances, local governments have begun to focus on tourism development utilising local resources, particularly Kumano Kodo Iseji. Higashi-Kishu was originally an unremarkable overland tourist destination located among the major seaside resorts, despite its partial involvement with the Kumano-Yoshino National Park and some nature-based tourism implemented by local residents. In the 1990s, local governments and residents of the district established a regional organisation to cooperatively promote tourism development with the Kumano Kodo Iseji. After the Kumano Kodo Pilgrimage Routes were registered on the UNESCO World Heritage List in 2004, they have been regarded as a symbol of tourism in the Higashi-Kishu district. As a result, the regional organisation offers various circuit-tour programs allowing tourists to visit not just the Kumano Kodo Iseji but the surrounding tourism resources. Furthermore, the organisation emphasizes human resources development to allow interpretation of the relationship between the Kumano Kodo Iseji and other natural and cultural tourism resources. Thus, the local people have practiced tourism development based on a bottom-up system, and the comprehensive tourist destination, which links with some existing natural and cultural resources, has been formed with a central focus on the Kumano Kodo Iseji in the Higashi-Kishu district.

Key words:

comprehensive tourist destination; tourism resource; tourism development; regional cooperation; Japan

GPS+ Based Time and Spatial Characters of Recreation Behaviour in Forest Park:

Taking Gongqing Forest Park in Shanghai City as an Example

Chengzhao WU, Wenqiang LIU

Department of Landscape Studies, CAUP, Tongji Univ. Shanghai, wuchzhao@vip.sina.com

Abstract

Recreation behavior is a kind of interactive mechanism of human-nature in natural protected areas. Its research has been making in developed countries since 1960s, and management model of national park based the mechanism has been practiced in 1990s and widely applied by most countries in the world now. Research of dynamic interactive mechanism is a few in China, most research focus on tourism flow of destination, some research focus on ecological impact of recreation, but dynamic ecological impact research is a few, interactive mechanism research based information technology is just beginning in China. This paper study the characters of time and space of recreation behavior of different group recreationists based on dynamic GPS monitoring data of recreation behavior trails, and GIS spatial analysis with information lists of recreationists, taking Gongqin Forest Park of Shanghai as an example. Three hierarchy system of spatial distribution is a common character for different group recreationists, and discovering the law of centralization and scale grade diffusion of recreation behaviour. Distance decayed rule is also useful for spatial distribution of park recreationists, the highest density of recreationists is nearby main entrance of forest park, then gradually quantity decaying with distance adding. Facilities are the key attractions and supporters of park recreationists. There are obvious differences in recreation time, ages, activities, sites and places for different group recreationists of park.

Key words:

Natural Protected Areas; Forest Park; Recreation Behaviour; Time and Spatial Character; GPS+ Technique

Physical Carrying Capacity Assessment for Floating House Tourism in Ratchaprapa Dam, Khao Sok National Park Area

PHROMSIN Chomchid, JITJONG Niorn

Geography Department, Social Sciences Faculty, Kasetsart University, Bangkok, 10900, Thailand fsoccci@ku.ac.th

Abstract

Tourism is one of the most important sectors in the economy of Thailand. The balance of trade in tourism is the source of country's income and related with growing gross domestic products (GDP) of country. Khao Sok National Park, southern part of Thailand, is one of popular for natural and eco-tourism. The well-known and popular place in Khao Sok National Park for travel is floating house in Ratchaprapa dam. In 2010-2014, there were more than 200,000 arrivals visited the national park and also some visited to the dam. However, the largest visitors also give big impact to tourism carrying capacity. At that point, this research aim to assess the physical carrying capacity of floating house tourism located in Ratchaprapa Dam. The data was collected in low and high season in Khao Sok National Park. The result showed that there were 25.00% of floating houses had exceeding carrying capacity. The highest visitors came to floating house and make exceeding carrying capacity were 33 visitors per day. The over exploitation of the visitors can result in pollution and destruction of ecosystem. The 56.25% of floating house shad approaching carrying capacity and 18.75% of floating houses had below carrying capacity. The suitable visitors should below 19 people per a floating house area per day which will be appropriate for ecosystem in dam.

Key words:

physical carrying capacity; floating house tourism; Ratchaprapa dam; Khao Sok national park; Thailand

Potential Ecotourism Areas Through Gis Application in Nainital District,

Uttarakhand

Bhakuni Kalpana

Associate Professor, University of Delhi, INDIA, bhakunik@gmail.com

Abstract

Ecotourism is a nature based travel experience which can be envisaged to help in conservation of natural and cultural resources alike. Ecotourism as an alternative tourism has been evoked by the planners and developers but on the ground reality its conceptualisation and implementation remain quite vague. However, ecotourism is not all about randomly carrying out activities like camping, biking, nature walks etc. It needs to be planned systematically by identifying the areas with high potential of ecotourism, prepare an inventory of nature and culture present there and evolve a strategy to realize their worth in a cautious manner. In a mountain system like the Himalayas where the natural scenery reigns supreme, instead of mass tourism, nature-based tourism is the most viable development option for stimulating eco-friendly development that contribute to local welfare. The present work undertakes to identify the potential eco-tourism areas in each administrative block of Nainital district in the Kumaon Himalayas through the GIS approach. The use of GIS is far more effective in terms of time, location and resources than any manual procedure or field survey. The identification of the potential ecotourism through GIS based approach work with the natural elements such as relief, altitude, aspect, water bodies, forest, etc. and cultural elements like the historical monuments, old temples, folk traditions, fairs and festivals etc. Apart from presence of these features, accessibility and population are regarded other important criteria to assess the potentiality in the region. In the present study the layering, classification, querying and buffering – all the important functions of GIS are meaningfully applied to identify the potential ecotourism areas in Nainital district.

Key words:

Ecotourism; Nature based; GIS application; Alternative tourism; the Himalayan region

Potential for special tourism development in Dzongu, Sikkim, India

Dr. Purkayastha S.

Department of Geography, North Eastern Hill University, Shillong, India, subratashg@yahoo.com

Abstract

Dzongu valley of North Sikkim can be regarded, as a *Shangri-La* in the Himalayan state of Sikkim in India, it is home to a small shrinking community- the *Lepchas*, who still retain ancient cultural practices intricately, related to their physical environment. In order to preserve the *Lepcha* culture, Dzongu has been declared a *Lepcha* reserve; but at present is facing ecological and cultural crises as this valley has high hydropower potential that is being tapped for development purpose. The local population resents this. It is in this context that the present paper seeks an alternative approach for ushering in the much-needed socio-economic development of *Lepchas* in Dzongu. The natural resource base with swift flowing streams, rich in vegetation and lofty snow clad mountains as its locale; along with the unique culture of the *Lepchas* can be showcased as tourism product in a sustainable manner. It is in this context that the present paper identifies and develops an inventory on types of tourism activities that may come up in the different tourism attraction spots located within Dzongu. An attempt has also been made to measure and rank the existing tourist spots as per the levels of attraction from the perception of the tourists visiting Dzongu in the tourist season of Oct 2013 to Jan 2014.

Key words:

Lepcha culture; natural resource base; conservation; sustainable tourism

Revisit is due to the soundscape? The role of perception image and participation to nature soundscape

Jinde Jiang^{1,2}, Jie Zhang¹

¹ School of Geographic and Oceanographic Sciences, Nanjing University, Nanjing, 210023, P. R. China,

² School of History Culture and Tourism, Fuyang Normal college, fuyang, 236000, P. R. China,

jiangjinde01@163.com

Abstract

Nature soundscape is an important tourism attraction. Currently, many studies have focused on the temporal and spatial differentiation of soundscape from a geographical perspective, but little on the view of tourism. The purpose of this study is to investigate the influence of attitude, perceived image, and tourists' participation on tourists' loyalty to nature soundscape at Gulangyu Island, China. It also attempts to examine the mediating effect of participation to nature soundscape on the paths from emotion image and cognition image to tourists' loyalty to nature soundscape. Data were collected via an on-site survey and analyzed using a structural equation modeling approach. Results indicate that cognition attitude to nature sound positively influences the perceived image of nature soundscape and ultimately contributes to some participation activities to soundscape. Tourists' participation is positively associated with tourists' loyalty. Tourists' participation to nature soundscape fully mediates the relationship from emotion image and cognition image to tourists' loyalty. Based on these findings, both theoretical and practical implications of this investigation are discussed.

Key words:

nature soundscape; perceived image; participation; revisit intention.

Special Features of Educational Tourism in Federal Protected Areas of Lake Baikal Region

Natalia Luzhkova, Leonid Korytnyy

V.B. Sochava Institute of Geography SB RAS, FSE "Zapovednoe Podlemorye", Russian Fed, kor@irigs.irk.ru

Abstract

Russian system of protected areas (PAs) celebrates its centennial anniversary in 2017. Over the years priorities have changed from fur species preservation to total conservation and educational tourism (a branch of ecotourism) development. Lake Baikal region has been a pioneer in most of crucial protection innovations: Barguzinsky Nature Reserve was established here in 1916, the first educational tourism program included two Baikal Federal PAs in 2011, and the inaugural merge of PA administrations happened on the eastern shore in 2012. Despite of long-term experience in PA management in the region, educational tourism faces socio-economical and environmental challenges. The goal of research was to demonstrate features for educational tourism in seven Federal PAs around Lake Baikal. Objectives included analysis of tourism strategies in PAs, assessment of environmental approaches in development, tourist data estimation. Main tourism features included different level of area access, additional funding for infrastructure development, and lack of connection between PAs in order to provide joint services. Two national parks and two wildlife sanctuaries had high tourist demand however capacity level could cause environmental damage. Three nature reserves managed remote areas, additionally they could have only 5 percent of territory developed for educational tourism. In order to present Lake Baikal as an educational tourism destination common strategy should be considered by management bodies. Environmentally friendly approaches should be applied for infrastructure creation and further visitor management. After a 100 years of nature conservation PAs in Lake Baikal region have potential to incorporate educational tourism in their function.

educational tourism; Lake Baikal; protected area

Study on Geoscience Landscape System Regionalization of the Mid-Southern

Section of Hengduan Mountains, Southwest China

Chen Xing¹, Shi Xian-Lin², Qin Jian-Xiong³

¹Tourism and Urban-Rural Planning College, Chengdu University of Technology, Chengdu 610059, Sichuan, China;

² Earth Sciences College, Chengdu University of Technology, Chengdu 610059, Sichuan China;

³ College of Tourism and Historical Culture, Southwest University for Nationalities, Chengdu 610041, Sichuan, China

Abstract

Landscape system regionalization is an important scientific basis for landscape protection and tourism development. Combining with perspectives of geology and geography, this paper comes up with grading standards of geoscience landscape system, and makes empirical study of mid-southern section of Hengduan Mountains. The mid-southern section of Hengduan Mountains, which crosses Sichuan, Yunnan and Tibet, is a core region of Hengduan Mountains. It contains the most typical geomorphic features of Hengduan Mountains and the landscape diversity in this region is very obvious. It is an important resource enrichment region for tourism development in western China. According to grading standards of geoscience landscape system and forming background analysis of regional stratigraphic system, fault marks of tectonic and characteristics of geomorphological zoning, this paper divides geoscience landscape system of Mid-Southern Section of Hengduan Mountains into 2 Grade I geoscience landscape system tracts, 8 Grade II geoscience landscape systems, 21 Grade III geoscience landscape areas and 165 representative Grade IV geoscience landscape attractions. And then the geoscience landscape types of the Mid-Southern Section of Hengduan Mountains are presented. Combining with the landscape regionalization, this paper finally systematically analyzes the geo-spatial characteristics of geosciences landscape system in the Mid-Southern Section of Hengduan Mountains. This paper provides an important research sample and method reference for geoscience landscape system regionalization, and owns important theoretical direction significance on tourism planning and development in the Mid-Southern Section of Hengduan Mountains.

Key words: landscape system; landscape regionalization; geoscience landscape; alpine and gorge regions; Hengduan Mountains

Study on the Sustainable Rural Tourism Toward the Supply Side in Ajimu Town, Oita, Japan

Shuai Y

Graduate School of Integrated Arts and Sciences at Hiroshima University, Higashi-Hiroshima, Japan,
d144058@hiroshima-u.ac.jp

Abstract

Tourism development in rural areas in Japan started based on changes in urban residents' values, rural economy and the rural environment in the 1980s. The Japanese definition for rural tourism emphasizes exchange between visitors and local people as an important element. Accommodation like farm inns plays an important role as an economic activity, but also as a place for exchange. Research on the role of farm inns in Japan so far has focused on comparison with examples from Europe, the image tourists from urban areas hold on rural tourism, managerial aspects of farm inns and the challenges presented to farmers (Yamazaki 1996, Takada 2000, Zeng 2010). However, there is little research about the aspects of farm inn owners' life histories, their motivation and their connection with local communities. From research conducted by the author in several locations in Japan, a shortage of farm-inn managers as well as the problem of aging owners and visitors were identified as major challenges. As a consequence, rural destinations face difficulties in responding to the growing demand by international tourists. This paper takes rural tourism in Ajimu town in Oita, which started rural tourism very early, as an example to analyse the role farm inn owners play in the development of rural tourism. Through questionnaires and interview surveys, we distinguished three indicators that will influence the further development of rural tourism. These are (1) rural tourism awareness, (2) satisfaction of management (supply side) or work (personnel) and (3) interest in international tourism.

Key words:

Sustainable tourism; rural tourism-Japan; accommodation; life history

Constructing a New Conceptual System of Green Tourism

Lien, C. Y., Hoowen, C. A. Longckey, Li, M. L.

Professor, School of Tourism, Sanming University, Sanming, Fujian, P. R. China, 2661907438@qq.com

Abstract

A clear definition to the conceptual system of green tourism is the cornerstone of in-depth study and practice activities for green tourism. In this study, the basic concept of green tourism is similar to sustainable tourism, eco-tourism and low-carbon tourism. This study indicates the connotation of green tourism is a wide range of attributes, fit the new concepts of the green development, focus on green tourism products and effective service supply as well as promote the consumptions of green tourism vigorously. In this study, we adopt the literature analysis method to discriminate the similar connotations of green tourism in order to determine the infrastructure conceptual system of green tourism through discourse analysis. The result of this study proposes that a new conceptual system of green tourism contains the following elements: (1) To promote green travel, reduce carbon emissions, and promote energy recycling and sustainable use; (2) To pay attention the tourism actors, environment and society as well as between each harmonious and symbiotic relationship; (3) Looking forward to the development of green tourism in the tourism industry can be contributed to local communities, investors, operators, local governments and other stakeholders parties; (4) To cultivate the green consumption concept of tourists and protect the better green surroundings.

Key words:

green tourism; conceptual system; green consumption; green development

Japanese and International Tourists' Perceptions and Attitudes Toward the Free-Roaming Sika Deer (*Cervus Nippon*) in Miyajima Island, Hiroshima, Japan

Usui R and Funck C

Graduate School of Integrated Arts and Sciences at Hiroshima University, Higashi-Hiroshima, Japan,
leahrieusui@hiroshima-u.ac.jp

Abstract

Sustaining wildlife resources is essential for tourism that takes place in nature. Yet, how to achieve sustainability is a common challenge that many tourism operators face. One way to plan and assess effective management policy is to measure visitors' perceptions (Marin et al., 2009). Miyajima Island in Hiroshima, Japan attracts approximately four million tourists annually (Hatsukaichi City, 2016). Because the island itself was once regarded as the site where the Gods resided, free-roaming sika deer (*Cervus nippon*) inhabiting the island have long been protected from being harmed and have become part of the tourism resources. However, an emerging human-deer conflicts and growing concerns for vegetation damage by the increased number of deer in recent years resulted in a ban of deer feeding since 2007 (Hatsukaichi City, 2014). Still, some tourists were observed feeding the deer. During the observational study that we conducted previously, we saw the deer given items that they naturally do not feed on (e.g., maps) and tourists showed dissimilarities in their reactions toward the deer. This is assumed to be partially due to multi-nationalization of tourist groups in recent years and further examination can help in understanding these differences. Thus, the objective of this study is to investigate Japanese and international tourists' perceptions and attitudes toward the deer on the island. Using a direct questionnaire survey, we explore the following aspects: 1) knowledge about the deer (e.g., feeding ecology), 2) perceptions about the deer, and 3) opinions about the current management policy.

Key words:

attitude; Japan; perception; questionnaire; sika deer; tourist; wildlife; wildlife management

National Park Management: An Analysis from the Perspective of the Relationship between Residents' Awareness of Environmental Consequences and Pro-Environmental Behaviors

Zhang Y-L

Geography of Guangzhou Institute, 510070, P. R. China, zhyld@163.com

Abstract

Progress in exploration of the relationship between hand-foot-mouth disease (HFMD) and environmental variables has revealed impacts of the climate on the transmission of HFMD. However, research on how the relationship changes over space and time remains blank. In this paper, we combine geographically and temporally weighted regression (GTWR) with visualization of isosurfaces to analyse the spatiotemporal complexity of HFMD and environmental variables with an aim to understand their relationship and its spatiotemporal change. With recent data for Shandong Province, China, we explore the spatiotemporal heterogeneity of the relationship quantitatively with the assistance of visualization. The results illustrate that in the study area, the two major climate indicators, temperature and rainfall have a significant influence during the months of... than other months and spatially affect areas such as more heavily than other areas. Change trend is described as in fig... We believe the proposed approach will have significant implications for similar health and environmental research.

This research focuses on management of national park in the perspective of the relationship between residents' diverse awareness of environmental consequences and pro-environmental behaviors in the Jiuzhaigou National Park, China. Descriptive statistics from a sample of 342 residents indicated that residents had high level of awareness of positive consequences of environmental protection, followed by awareness of disaster consequences, finally awareness of negative environmental consequences of tourism. Results of the regression analysis showed that the prominent role of awareness of positive consequences of environmental protection and awareness of disaster consequences on residents' pro-environmental behaviors, while awareness of negative environmental consequences of tourism hadn't impacts on pro-environmental behaviors. So management of national park especially in environment aspect should focus on locals' interests, wellbeings and disasters education which could activate residents' pro-environmental behaviors. In addition, publicizing harmful environmental impacts caused by the tourism and educating residents with environment knowledge (such as the relationship among tourist sites' environment, tourism and locals' interests) are urgent.

Key words:

national park management; awareness of environmental consequences; pro-environmental behaviors

Nature-Based Tourist'S Environmental Attitude and Behavior: A Comparison Study of Visitors in Huangshan Scenic Area

Hong Xueting, Zhang Hongmei

College of Territorial Resources and Tourism Management, Anhui Normal University, Wuhu, 241003, P. R. China,
394718688@qq.com

Abstract

The serious problems such as global climate change, decline in biodiversity, haze and sandstorm have prompted great concern for environmental issues. Nature-based tourism is believed to influence environmental attitude, environmental knowledge and environmental behavior of tourists, which has become an important field of researchers who focus on environmental issues. Previous studies have examined the changes, influencing factors and relationships in tourist's environment attitudes, knowledge and behavior, yet, few studies have focused on nature-based tourism destination in China. In China, the high-quality nature-based tourism destinations attract so many tourists that it has had the characteristics of mass tourism, such as over-exploitation, crowded, lack of nature interpretation of tourists, etc. Under this circumstances, nature-based tourists' environmental attitudes and behavior need more specific and deliberated study. Huangshan Scenic Area is one of the earliest natural-based tourist destinations in China, and was named the World Natural and Cultural Heritage in 1990. But few study has explored the tourists' environmental attitude and behavior in Huangshan, and fewer study compare the differences in environmental attitude and behavior of different groups. Huangshan provides visitors with cableway and walking trails as tourist trails. Relatively speaking, the walking trails is more environmental friendly, low-carbon and sustainable. The purpose of this study is to explore the differences in environment attitude and behavior between the two groups which select different modes of transportation. This study will collect data by questionnaire survey, and will statistically control the social desirability bias which probably exist in self-reported environmental attitude and behavior.

Key words:

nature-based tourism; environmental attitude; environmental behavior; Huangshan Scenic Area; socially desirable effect

Research on community tourist attraction in national park: a case study on Kaihua Qianjiangyuan National Park Pilot Area

Zhou Rui A, Zhong Linsheng B, Liu Jiaming C

Institute of Geographic Sciences and Natural Resources Research, CAS, Beijing 100101, P. R. China, Catherine-rui@hotmail.com

Abstract

Community tourist attraction of national park which driving tourists refers to all tourism resource and service facilities and other factors in community spatial scale. Evaluation on community tourist attraction should be on a basic of comparing attractions' scale and quality with tourist perception. A push-pull model was constructed to test tourist attraction of 74 communities in Kaihua Qianjiangyuan National Park Pilot Area. The results shown that the pull and push factors were highly coincided in community spatial scale. Besides, evaluation on tourist perception was superior to that on tourist attractions. Moreover, 59.46% communities were in an imbalance situation. In them, 36.49% communities in which the pull factor was greater than push ones indicated that level of tourist attractions was superior to the evaluation of the perception of tourism. The defect of this article lied in insufficient amounts of tourist questionnaire and five segments score system throughout the whole evaluation process, which may affect the overall evaluation result.

Key words:

national park; community tourism; attraction; evaluation; Kaihua Qianjiangyuan National Park Pilot Area

The Change in the Relationship between the City Dwellers and the Farm Families in terms of the City Farming

Kodama Eri

Graduate student, University of Tsukuba, Tsukuba, JAPAN, eri.622.pearl@gmail.com

Abstract

The appreciation of city farming has been increased among city dwellers. At the same time, it is expected that the urban farmland is conserved and the city farming is maintained, improving their functions. However, it has not been clear as to how the city dwellers and the farmers should relate each other in terms of the city farming. The object of this study is to clarify the change in the relationship between the city dwellers and the farm families in terms of the city farming. The city farming is generally a family business where the farm families performs the function of supplying the agricultural products. The recent problems in the aging agricultural population and the short of successors have make it necessary to effectively utilize the agricultural land or find a new work force in order to solve them. Private farmlands have been developed under the governmental support, so that the city dwellers participate in the agriculture under the guidance of the farmers. The labor-consuming pesticide-free cultivation needs a lot of work force. Thus, the participation of flexible city dwellers as agricultural work force makes it possible to grow high-quality vegetables without pesticide. There is a mutual complement between the farmers needing the cooperation with the city dwellers as supplemental work force and the city dwellers wanting to participate in the agricultural activity for refreshment. The farmers in the city farming have changed to provide opportunities of participating the agricultural activities to the city dwellers along supplying fresh agricultural products.

Key words:

city farming; city dwellers; urban farmland; vegetables without pesticide; agricultural work force; agricultural activities; supplemental work force

Eco-Tourism in Ecologically-Fragile Zones of India – A Social Marketing Approach

Sengupta Soma, Sen Anjan

Kamala Nehru College, University of Delhi, New Delhi – 110049, India, dr.somasengupta@gmail.com

Abstract

Inhospitable and uninhabited terrain marks India's land frontier, which are also ecologically fragile. One way to preserve these zones is to make them strictly "no-entry" zones, but such exclusion is not a solution. Hence, eco-tourism, if practiced strictly according to norms could be solution to promoting a healthy and mutually beneficial relation between man and nature. The purpose of the present study is to explore how social marketing approach based on Environment-Technology-Society (ETS) Model can be used to make the "Eco-tourism" a success in India.

Case studies of different eco-tourist resorts in India revealed a serious flaw in marketing and management of such resorts. Lack of professionalism, high tariffs, less facilities, and difficult accessibility are the issues that negatively affects the occupancy rate. An analysis of data collected from 250 respondents from Delhi and NCR revealed that people are not concerned about environment. A behavioural change of the target audience can be ensured through social marketing.

This strategy includes designing and operating such resorts as a strictly green resort, ensuring no harm to the environment and enhancing sustainable development; presenting the green aspect of the resort as the unique selling proposition; setting affordable tariffs to reduce psychological fears of costs; providing pick and drop facilities, and providing eco-friendly alternatives to modern amenities; administering an integrated promotion mix; building linkages with travel agents and corporate houses; employment of local people; generating the raw materials indigenously; and a partnership between the stakeholders, while setting up and running such a resort.

Key words:

Eco-tourism; Psychological Cost/Fears; Social Marketing; Green Marketing; Environment-Technology-Society (ETS) model

Empowerment and Benefit-sharing: The Dilemma of Rural Tourism Development in Post-disaster Reconstruction under China's Beautiful Village Strategy

Liu, Ting Xi¹; Cheng, Li²

¹Institute for disaster reconstruction and management, Sichuan University-Hong Kong Polytechnic University, Chengdu, 610207, P. R. China, liuting4519@sina.com

²Tourism School, Sichuan university, Chengdu, 610041, P. R. China, chengli@scu.edu.cn

Abstract

Tourism is an effective path for post-disaster reconstruction and development in rural areas. In particular, the coupling relation between national rural development strategy and reconstruction plan has a significant impact on rural tourism. Empowerment and benefit-sharing are the key factors to achieve tourism sustainable development. This research, taking the disaster area of Lushan earthquake in China as the field site which implemented with China's Beautiful Village Strategy (CBVS) in 2013, adopting in-depth interview, participant observation and questionnaire survey with local residents, sought to assess the situation of rural empowerment and benefit-sharing. This empirical study probes relationships among rural empowerment, benefit-sharing and perceived satisfaction during the course of post-disaster reconstruction from the perspective of the villagers; Moreover, the role, status and influences of rural tourism in CBVS are major issues within the framework as well. The results indicate that rural tourism has become a representative form of China's beautiful village strategy in the process of post-disaster reconstruction. Massive infrastructure and landscape restoration embody state's will-power, while the villagers remain a passive role (powerlessness) or sharing unfair perceived interests in post-disaster reconstruction and tourism planning. The deficiency of empowerment and benefit-sharing inevitably leads to the dilemma of rural livelihoods and culture. Thus based on the special circumstances of the disaster area, this study aims to update a reasonable mechanism of empowerment and benefit-sharing. Meanwhile, the findings and implications from empowerment and benefit-sharing economically, psychologically, socially, and politically would further promote post-disaster reconstruction and rural tourism sustainable development.

Key words:

empowerment and benefit-sharing; dilemma of rural tourism development; post-disaster reconstruction; China's Beautiful Village Strategy

Island Planning for Tourism Resilience: Hainan, China

Jinjin Wan¹, Qi Chen²

¹ School of Management, Nanjing University of Posts and Telecommunications, Nanjing, China,

Abstract

The aims of this study are to increase island resilience of tourism system and reduce vulnerability to establish a basis of tourism sustainability, and to maximize economic, environmental, and socio-cultural benefits in tropical island destination. The study presents a case study in international tourism island in China, Hainan to illustrate island planning in comprehensive benefits for tourism resilience. Along with a creative framework corresponding to panarchy model, the study analyzes variabilities and responses in Hainan Tourism, and explores resilience insights in human and ecosystems respectively to increase tourism resilience and attempts to open up new adaptive measures for island tourism industry when experiencing a broad array of changes.

Resilience Approach to Managing Mountain Hazards Risks during Emergency Avoidance Process in Tourism Places of Western China

Chen Rong, Cui Peng

Key Laboratory of Mountain Hazards and Earth Surface Process, Chinese Academy of Sciences, Institute of Mountain Hazards and Environment, Chinese Academy of Sciences, Chengdu, 610041, P. R. China, rongchen@imde.ac.cn

Abstract

Emergency avoidance is one of the most important mountain disaster mitigation measures at mountainous region, which directly influence the severity of casualties. Tourism place is highly populated with tourists whose consciousness and behaviors against mountain hazards are unpredictable, which has made it very difficult to organize and manage the risk when mountain hazards occur. This study focuses on this issue and concentrates on mountain disaster risk management during the emergency avoidance process in tourism places. Based on analysis of recent mountain disaster events and semi-structured interviews with 70 local people in country resort areas of western China, we identified the whole process of emergency avoidance and the potential risks, and found that the owners of farmhouse and the monitoring personnel play great roles in emergency avoidance process. The evacuation model led by monitoring personnel was summarized and feasible measures to reduce loss of mountain disasters were proposed and applied in empirical research of Longmenshan town, Pengzhou County. This study will look for resilience approach to managing mountain hazards risks during emergency avoidance process in tourism places of western China and provide scientific support of hazard prevention and mitigation at mountainous region.

mountain hazards; emergency avoidance; resilience approach; tourism place

The Consequences of Tourism Strategies as a Tool for Rural Revitalisation in Kasumi, Japan.

Crowe-Delaney, L.J.

Curtin University, Perth, Australia. lesley.crowe-delaney@postgrad.curtin.edu.au

Abstract

In order for the remote fishing and tourism town of Kasumi (now Kami-cho) in Hyogo Prefecture to reinvigorate its economy, multiple level government and municipal business strategies were instigated as part of Tajima district's revitalisation within the Japanese Northern Kinki tourism region. A micro-strategy to enhance the flailing tourism industry fostered the Kasumi snow-crab, gourmet tourism that had been in place since the 1980s as part of the national government strategy of 'one village one product' aimed to improve regional tourism by linking a specific product or attraction to a locality. Additionally, home-town themed regional tourism strategies were also initiated to attract urban tourists. The Kasumi Renaissance Plan(R-Plan), a large resort development focussed on successfully attracting various sources of government and local funding. Local business participants were expected to contribute 1% from their 'development of new events and products' budget for a 'home town living with the sea'. Community expectations were enthusiastic for the success of this project to further revitalise the local economy and rundown tourism attractions. Meanwhile, in the period of 2001-2002 an 'ongoing' construction project, the Kasumi bypass section of the Kyoto-Tottori route and the (R-plan) created a complex and confused situation for the community, compromising local tourism. By 2005, there was no clear distinction between various development projects, sequencing of works and several projects were in mid and final stages of funding. This paper demonstrates a proud fisheries community's reaction to tourism development and how change has been managed in a nature based community.

Research Technique of Private Accommodation Establishments and Abundance Estimate of Non-Organized Tourists

Volkova T., Minenkova V., Filobok A., Karpova J.

Kuban State University, Krasnodar, 350040, Russian Federation, mist-next4@inbox.ru

Abstract

The development of one of the main recreation regions of the Russian Federation has the following trends: growth of service volumes of tourism complex organizations, growth of volume of health resorts and health improvement services as well as growth of hotel services volumes. The obvious fact is that collective establishments play a special part among all types of lodging facilities. The actual number of individual tourists staying in private accommodation establishments in the Krasnodar region is much higher than official data. Almost all the interviewers pointed out that the private accommodation establishments often "hide" tourists, introducing them as relatives in order such data not to reach the Tax Inspection Office. The sphere of hotel services needs an improvement of the material and technical facilities and further government help for the tourism development as well as the aligning of the seasonal disbalance of the health-resorts and touristic organizations occupation.

Key words:

tourism complex organizations; private accommodation establishments; tourism and recreation sphere;
Russian Federation; individual tourists

Vulnerability and Resilience of a Tourism-based Social-ecological System in Qinling Mountains, China

Yang Xin-jun¹, Sun Jing², Huang Xiao-jun¹

¹ College of Urban and Environmental Sciences, Northwest University, Xi'an 710127, P.R.China, yangxj@nwu.edu.cn

² Center for Systems Integration and Sustainability, Michigan State University, East Lansing, 48823, USA

Abstract

Based on the social-ecological system (SES) and resilience theory, we build a tourism-based local SES for Qinling Mountains, China. Our work includes: (1) to quantify the vulnerability of tourism-based SES; to analyze the spatial difference of vulnerability across three dimensions, including exposure, sensitivity, and adaptability; to summarize the influencing mechanism; and advance the countermeasures of adaptive management. (2) to construct an adaptive framework for tourism impact analysis based on the adaptability of SES; to discuss the behavioral models and mechanism that influences the local farmers' adaptation under the development of rural tourism. (3) Taking the rural area as a local tourism-based SES, we integrate environmental, socioeconomic, and tourism development factors to study human-environmental interactions of rural tourism. We identify the key variables of stable state and the degradation coefficients in the local tourism-based SES. (4) At the local and community scales, we analyze the deep influence of road paving on the local SES in Qinling Mountain Area. We explore the relationship between the road paving and the local community resilience. (5) To identify the driving force of the local SES, we conduct a field survey and interview different stakeholders, then measure the acceptability of different groups toward different scenarios based on a social-ecological matrix analysis.

An actor-network Analysis of Reproduction of Nature Landscape in Community-based Tourism

Chien Yu Tsao, Chin Cheng Ni

Department of Geography, Taiwan University, Taipei, Taiwan, China, tsaocy@ntu.edu.tw

Department of Environmental and Cultural Resources, Hsin-chu University of Education, Hsinchu, Taiwan

Abstract

With the growing occurrence of extreme weather events, the resilience of tourism landscape are core issues for the sustainable development for community-based tourism. Resilience theory refers to the capacity of social ecosystems to recover and reorganize when faced with disaster. Thus, local stakeholders play important roles during the process of reproduction of tourism landscape. Owing to ignoring the characteristic of nonhuman, it enhances this study to focus on the role of physical and ecological environment, especially in marginal regions. Referring to the actor-network theory, the physical environment could be regarded as a subjective stakeholder along with the other factors in the tourism region. This study applied actor-network theory to identify the critical role of human and nonhuman actors at community level. The Shanmei community is located on the boundary of the world-renowned Alishan National Scenic Area in the Alishan Township of Chiayi County in Taiwan, following Typhoon Morakot in 2009, as a case study. We analysis the dynamic process of destruction and reproduction of the tourism landscape. Observed how the actors through the translation process, to recruit human and non-human actors and formed a heterogeneous network alliance. The findings indicate that nature-based tourism model are sensitive the effects of climate change. Nonhuman actants have high influence on tourism development. Therefore, local communities and private industry sector, as well as public sector, must actively cooperate with them, and adapt the constantly change of the natural environment.

Analyzing the Evolution of Tourism Geographies Research Topics in Asia Through Dynamic Co-Word Networks

Jiarong Zhang

Nanjing University, Nanjing, 210023, P. R. China, jszhangjiarong@foxmail.com

Abstract

It is of great importance to understand the evolution of research topics in a certain research field like tourism geographies. This study focuses on exploring how the topics of tourism geographies in Asia change over time. It analyses the research literatures of tourism geographies research literatures retrieved from Science Citation Index Expanded and Social Sciences Citation Index databases, visualizes the topics and its change using alluvial diagrams and coloring networks through the co-word networks. The study discovers that the main topics nowadays are the temporal and spatial relationship of tourism, the planning methods to achieve sustainable development of tourism, the topics concerning climate change and the tourism development and each country in Asia has its unique approach to deal with these topics.

Carrying Capacity and Satisfaction of Kinmen National Park

Lee, S-H., Hou J-S.

Taiwan Normal University, Taipei, Taiwan, China, houma0507@gmail.com

Abstract

Kinmen National Park has become a popular tourism destination for domestic and international tourists, due to its rich natural resources, historical war monuments, and traditional architectures. The purpose of this project is to estimate the tourism carrying capacity of exhibition areas and to establish suitable tourist service strategies in Kinmen National Park. This project selected 21 in-door exhibition areas to estimate their recreational carrying capacity, and to evaluate tourist satisfaction, service quality, tourists' willingness to re-visit and recommend through questionnaires. In total, 1644 valid questionnaires were collected. Each exhibition hall is given an evaluation on its tourism capacity and information, spatial and recreation management strategy. The results showed the tourists' satisfaction after visiting Kinmen National Park are significantly higher than their expectation before visiting. Tourists also show high recognition for service quality and professional commentary, and high willingness to re-visit and to recommend. Based on the number of tourist and tourist behavior, different tourist service management models are proposed.

Key words:

crowding; carrying capacity; satisfaction; service quality.

Pan Asia-Pacific Perspectives of Tourism Geographies and Traditional Culture: Sustainable and Beneficial or Profane and Incongruous?

Joseph Cheer

Monash University, joseph.cheer@monash.edu

Abstract

Traditional Culture in this paper is defined as the unique cultural heritage of people and place. For the most part, this comprises cultural landscapes that have existed in situ and passed down via previous generations. The traditional culture spectrum is personified variously and can include particular ways of living, livelihoods, ritualistic and performative actions, culinary practices, art, music, languages, modes of agriculture, building and construction methods, gendered observances, historic legacies, animisms and spirituality amongst others. For peoples steeped in the practice of traditional culture, tourism expansion provides a ready outlet for livelihoods and economic diversification and resilience building, especially where few alternatives exist and where tourism is actively embraced at community, provincial and national levels. The exigencies of alleviating hardship and poverty makes the monetisation and commodification of traditional culture through tourism imperative and necessary, thus raising a multitude of concerns including issues of curatorial and cultural management, intellectual property ownership, dividend distribution, cultural bastardisation, authenticity (and inauthenticity), culture and heritage policy development, grassroots empowerment and legacy development. This paper draws from recent fieldwork in the Pacific Islands (Vanuatu, Fiji, Solomon Islands and Hawaii) principally and in Southeast Asia (Myanmar and Indonesia). In all locations, the tourism-traditional culture nexus is prominent, stimulating international tourist visitation and local-level economic development. A pan Asia-Pacific comparative perspective is provided that interrogates the tourism-traditional culture nexus and predicated around the development of a conceptual framework for research and policy development.

Key words:

Resilience; Traditional Culture; cultural heritage; livelihoods; Pacific Islands; Asia

Situating Tourism Geography in China: A Comparatively Critical Reflection

Guosheng Han

Department of Tourism Management, Shandong University at Weihai, China, hanguosheng@sdu.edu.cn

Abstract

Although some researches on tourism geography in China have been published in some prestigious international geographical and tourism journals, more are on what tourism geographers in China have done and few on explaining why. We try to understand tourism geography research in China linking research issues to research practices of scientific community, traditional Chinese philosophical style, disciplinary identity and imagination and current academic evaluation systems and meanwhile situating tourism geography against mainstream geographical thoughts, and eventually extending Michael Hall's work (Framing tourism geographies, 2013). This research might contribute to an understanding of complexity and diversity of tourism geography internationally.

Key words:

tourism geography; research practices; disciplinarity; geographical thoughts; academic evaluation systems

A Grounded Theory Oriented Approach to Motivation of Pua Travelers

Junjie Chen

Nanjing university, China, 378658481@qq.com

Abstract

PUA(pick-up artist) is a kind of culture community where the member inside are pursuing the factors and strategies about how to pick up others and PUA is also a short term call of the member within the group. They like to use their invented method to chat-up with others when taking trips to the destination. Tourism motivation study has shared some of the push and pull factors of traveler. This paper takes a qualitative study with a grounded theory method to explore distinguished motivation from the previous study. This factors including both inner side and destination-related side. The finding indicates social interacting itself may be the tourism attractions. This hidden desire would be implemented during the trip.

Key words:

tourism motivation; grounded theory; push and pull factors; PUA; pick up group
